3. (c), $x = 3 \sec \theta$
4. (b), $x = \frac{5}{2} \sin \theta$

Skill Building

5. Let $x = 2 \sin \theta$, then $dx = 2 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}\int \sqrt{4-x^2} dx &= \int \sqrt{4-(2 \sin \theta)^2} (2 \cos \theta) d\theta \\&= 2 \int \sqrt{4-4 \sin^2 \theta} \cos \theta d\theta \\&= 2 \int \sqrt{4(1-\sin^2 \theta)} \cos \theta d\theta \\&= 2 \int \sqrt{4 \cos^2 \theta} \cos \theta d\theta \\&= 2 \int (2 \cos \theta) \cos \theta d\theta \\&= 4 \int \cos^2 \theta d\theta \\&= 4 \int \frac{1+\cos(2\theta)}{2} d\theta \\&= 2 \int (1+\cos(2\theta)) d\theta \\&= 2\left(\theta + \frac{1}{2} \sin(2\theta)\right) + C \\&= 2\theta + \sin(2\theta) + C \\&= 2\theta + 2 \sin \theta \cos \theta + C.\end{aligned}$$

We have $\theta = \sin^{-1}\left(\frac{x}{2}\right)$, and $\cos \theta = \sqrt{1-\sin^2 \theta} = \sqrt{1-(x/2)^2} = \frac{1}{2}\sqrt{4-x^2}$. We obtain

$$\begin{aligned}\int \sqrt{4-x^2} dx &= 2 \sin^{-1}\left(\frac{x}{2}\right) + 2\left(\frac{x}{2}\right)\left(\frac{1}{2}\sqrt{4-x^2}\right) + C \\&= \boxed{2 \sin^{-1}\left(\frac{x}{2}\right) + \frac{1}{2}x\sqrt{4-x^2} + C}.\end{aligned}$$

6. Let $x = 4 \sin \theta$, then $dx = 4 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{16 - x^2} dx &= \int \sqrt{16 - (4 \sin \theta)^2} (4 \cos \theta) d\theta \\
 &= 4 \int \sqrt{16 - 16 \sin^2 \theta} \cos \theta d\theta \\
 &= 4 \int (4 \cos \theta) \cos \theta d\theta \\
 &= 16 \int \cos^2 \theta d\theta \\
 &= 16 \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= 8 \int (1 + \cos(2\theta)) d\theta \\
 &= 8 \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\
 &= 8\theta + 4 \sin(2\theta) + C \\
 &= 8\theta + 8 \sin \theta \cos \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} \left(\frac{x}{4} \right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/4)^2} = \frac{1}{4} \sqrt{16 - x^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{16 - x^2} dx &= 8 \sin^{-1} \left(\frac{x}{4} \right) + 8 \left(\frac{x}{4} \right) \left(\frac{1}{4} \sqrt{16 - x^2} \right) + C \\
 &= \boxed{8 \sin^{-1} \left(\frac{x}{4} \right) + \frac{1}{2} x \sqrt{16 - x^2} + C}.
 \end{aligned}$$

7. Let $x = 4 \sin \theta$, then $dx = 4 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{16 - x^2}} dx &= \int \frac{(4 \sin \theta)^2}{\sqrt{16 - (4 \sin \theta)^2}} (4 \cos \theta) d\theta \\
 &= 64 \int \frac{\sin^2 \theta}{\sqrt{16 - 16 \sin^2 \theta}} \cos \theta d\theta \\
 &= 64 \int \frac{\sin^2 \theta}{\sqrt{16(1 - \sin^2 \theta)}} \cos \theta d\theta \\
 &= 64 \int \frac{\sin^2 \theta}{\sqrt{16 \cos^2 \theta}} \cos \theta d\theta \\
 &= 16 \int \frac{\sin^2 \theta}{\cos \theta} \cos \theta d\theta \\
 &= 16 \int \sin^2 \theta d\theta \\
 &= 16 \int \frac{1 - \cos(2\theta)}{2} d\theta \\
 &= 8 \int (1 - \cos(2\theta)) d\theta \\
 &= 8 \left(\theta - \frac{1}{2} \sin 2\theta \right) + C \\
 &= 8\theta - 8 \sin \theta \cos \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1}\left(\frac{x}{4}\right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/4)^2} = \frac{1}{4}\sqrt{16 - x^2}$. We obtain

$$\begin{aligned}\int \frac{x^2}{\sqrt{16 - x^2}} dx &= 8 \sin^{-1}\left(\frac{x}{4}\right) - 8\left(\frac{x}{4}\right)\left(\frac{1}{4}\sqrt{16 - x^2}\right) + C \\ &= \boxed{8 \sin^{-1}\left(\frac{x}{4}\right) - \frac{1}{2}x\sqrt{16 - x^2} + C}.\end{aligned}$$

8. Let $x = 6 \sin \theta$, then $dx = 6 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}\int \frac{x^2}{\sqrt{36 - x^2}} dx &= \int \frac{(6 \sin \theta)^2}{\sqrt{36 - (6 \sin \theta)^2}} (6 \cos \theta) d\theta \\ &= 216 \int \frac{\sin^2 \theta}{\sqrt{36 - 36 \sin^2 \theta}} \cos \theta d\theta \\ &= 216 \int \frac{\sin^2 \theta}{\sqrt{36(1 - \sin^2 \theta)}} \cos \theta d\theta \\ &= 216 \int \frac{\sin^2 \theta}{\sqrt{36 \cos^2 \theta}} \cos \theta d\theta \\ &= 36 \int \frac{\sin^2 \theta}{\cos \theta} \cos \theta d\theta \\ &= 36 \int \sin^2 \theta d\theta \\ &= 36 \int \frac{1 - \cos(2\theta)}{2} d\theta \\ &= 18 \int (1 - \cos(2\theta)) d\theta \\ &= 18\left(\theta - \frac{1}{2} \sin 2\theta\right) + C \\ &= 18\theta - 18 \sin \theta \cos \theta + C.\end{aligned}$$

We have $\theta = \sin^{-1}\left(\frac{x}{6}\right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/6)^2} = \frac{1}{6}\sqrt{36 - x^2}$. We obtain

$$\begin{aligned}\int \frac{x^2}{\sqrt{36 - x^2}} dx &= 18 \sin^{-1}\left(\frac{x}{6}\right) - 18\left(\frac{x}{6}\right)\left(\frac{1}{6}\sqrt{36 - x^2}\right) + C \\ &= \boxed{18 \sin^{-1}\left(\frac{x}{6}\right) - \frac{1}{2}x\sqrt{36 - x^2} + C}.\end{aligned}$$

9. Let $x = 2 \sin \theta$, then $dx = 2 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{\sqrt{4-x^2}}{x^2} dx &= \int \frac{\sqrt{4-(2\sin\theta)^2}}{(2\sin\theta)^2} (2\cos\theta) d\theta \\
 &= \frac{1}{2} \int \frac{\sqrt{4-4\sin^2\theta}}{\sin^2\theta} \cos\theta d\theta \\
 &= \frac{1}{2} \int \frac{\sqrt{4(1-\sin^2\theta)}}{\sin^2\theta} \cos\theta d\theta \\
 &= \frac{1}{2} \int \frac{\sqrt{4\cos^2\theta}}{\sin^2\theta} \cos\theta d\theta \\
 &= \int \frac{\cos\theta \cos\theta}{\sin^2\theta} d\theta \\
 &= \int \cot^2\theta d\theta \\
 &= \int (\csc^2\theta - 1) d\theta \\
 &= -\cot\theta - \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1}\left(\frac{x}{2}\right)$, and $\cos\theta = \sqrt{1-\sin^2\theta} = \sqrt{1-(x/2)^2} = \frac{1}{2}\sqrt{4-x^2}$. So $\cot\theta = \frac{\frac{1}{2}\sqrt{4-x^2}}{x/2} = \frac{\sqrt{4-x^2}}{x}$. We obtain

$$\int \frac{\sqrt{4-x^2}}{x^2} dx = \boxed{-\frac{\sqrt{4-x^2}}{x} - \sin^{-1}\left(\frac{x}{2}\right) + C}.$$

10. Let $x = 3 \sin \theta$, then $dx = 3 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{\sqrt{9-x^2}}{x^2} dx &= \int \frac{\sqrt{9-(3\sin\theta)^2}}{(3\sin\theta)^2} (3\cos\theta) d\theta \\
 &= \frac{1}{3} \int \frac{\sqrt{9-9\sin^2\theta}}{\sin^2\theta} \cos\theta d\theta \\
 &= \frac{1}{3} \int \frac{\sqrt{9(1-\sin^2\theta)}}{\sin^2\theta} \cos\theta d\theta \\
 &= \frac{1}{3} \int \frac{\sqrt{9\cos^2\theta}}{\sin^2\theta} \cos\theta d\theta \\
 &= \int \frac{\cos\theta \cos\theta}{\sin^2\theta} d\theta \\
 &= \int \cot^2\theta d\theta \\
 &= \int (\csc^2\theta - 1) d\theta \\
 &= -\cot\theta - \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1}\left(\frac{x}{3}\right)$, and $\cos\theta = \sqrt{1-\sin^2\theta} = \sqrt{1-(x/3)^2} = \frac{1}{3}\sqrt{9-x^2}$. So $\cot\theta = \frac{\frac{1}{3}\sqrt{9-x^2}}{x/3} = \frac{\sqrt{9-x^2}}{x}$. We obtain

$$\int \frac{\sqrt{9-x^2}}{x^2} dx = \boxed{-\frac{\sqrt{9-x^2}}{x} - \sin^{-1}\left(\frac{x}{3}\right) + C}.$$

11. Let $x = 2 \sin \theta$, then $dx = 2 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int x^2 \sqrt{4 - x^2} dx &= \int (2 \sin \theta)^2 \sqrt{4 - (2 \sin \theta)^2} (2 \cos \theta) d\theta \\
 &= 8 \int (\sin^2 \theta) \sqrt{4 - 4 \sin^2 \theta} \cos \theta d\theta \\
 &= 8 \int (\sin^2 \theta) \sqrt{4(1 - \sin^2 \theta)} \cos \theta d\theta \\
 &= 8 \int (\sin^2 \theta) \sqrt{4 \cos^2 \theta} \cos \theta d\theta \\
 &= 8 \int (\sin^2 \theta) (2 \cos \theta) \cos \theta d\theta \\
 &= 16 \int \sin^2 \theta \cos^2 \theta d\theta \\
 &= 16 \int \left(\frac{\sin 2\theta}{2} \right)^2 d\theta \\
 &= 4 \int \sin^2 (2\theta) d\theta \\
 &= 4 \int \frac{1 - \cos (4\theta)}{2} d\theta \\
 &= 2 \int (1 - \cos (4\theta)) d\theta \\
 &= 2 \left(\theta - \frac{1}{4} \sin (4\theta) \right) + C \\
 &= 2\theta - \frac{1}{2} \sin (4\theta) + C \\
 &= 2\theta - \sin 2\theta \cos 2\theta + C \\
 &= 2\theta - (2 \sin \theta \cos \theta) (1 - 2 \sin^2 \theta) + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} \left(\frac{x}{2} \right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/2)^2} = \frac{1}{2} \sqrt{4 - x^2}$. We obtain

$$\begin{aligned}
 \int x^2 \sqrt{4 - x^2} dx &= 2 \sin^{-1} \left(\frac{x}{2} \right) - 2 \left(\frac{x}{2} \right) \left(\frac{1}{2} \sqrt{4 - x^2} \right) \left(1 - 2 \left(\frac{x}{2} \right)^2 \right) + C \\
 &= \boxed{\frac{x(x^2 - 2)}{4} \sqrt{4 - x^2} + 2 \sin^{-1} \left(\frac{x}{2} \right) + C}.
 \end{aligned}$$

12. Let $x = 4 \sin \theta$, then $dx = 4 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int x^2 \sqrt{16 - x^2} dx &= \int (4 \sin \theta)^2 \sqrt{16 - (4 \sin \theta)^2} (4 \cos \theta) d\theta \\
 &= 64 \int (\sin^2 \theta) \sqrt{16 - 16 \sin^2 \theta} \cos \theta d\theta \\
 &= 64 \int (\sin^2 \theta) \sqrt{16(1 - \sin^2 \theta)} \cos \theta d\theta \\
 &= 64 \int (\sin^2 \theta) \sqrt{16 \cos^2 \theta} \cos \theta d\theta \\
 &= 64 \int (\sin^2 \theta) (4 \cos \theta) \cos \theta d\theta \\
 &= 256 \int \sin^2 \theta \cos^2 \theta d\theta \\
 &= 256 \int \left(\frac{\sin 2\theta}{2} \right)^2 d\theta \\
 &= 64 \int \sin^2 (2\theta) d\theta \\
 &= 64 \int \frac{1 - \cos (4\theta)}{2} d\theta \\
 &= 32 \int (1 - \cos (4\theta)) d\theta \\
 &= 32 \left(\theta - \frac{1}{4} \sin (4\theta) \right) + C \\
 &= 32\theta - 8 \sin (4\theta) + C \\
 &= 32\theta - 16 \sin 2\theta \cos 2\theta + C \\
 &= 32\theta - 16(2 \sin \theta \cos \theta)(1 - 2 \sin^2 \theta) + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} \left(\frac{x}{4} \right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/4)^2} = \frac{1}{4} \sqrt{16 - x^2}$. We obtain

$$\begin{aligned}
 \int x^2 \sqrt{16 - x^2} dx &= 32 \sin^{-1} \left(\frac{x}{4} \right) - 32 \left(\frac{x}{4} \right) \left(\frac{1}{4} \sqrt{16 - x^2} \right) \left(1 - 2 \left(\frac{x}{4} \right)^2 \right) + C \\
 &= \boxed{32 \sin^{-1} \left(\frac{x}{4} \right) - \frac{1}{4} x \sqrt{16 - x^2} (8 - x^2) + C}.
 \end{aligned}$$

13. Let $x = 2 \sin \theta$, then $dx = 2 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{1}{(4 - x^2)^{3/2}} dx &= \int \frac{1}{(4 - 4 \sin^2 \theta)^{3/2}} (2 \cos \theta) d\theta \\
 &= 2 \int \frac{1}{4^{3/2} (\cos^2 \theta)^{3/2}} \cos \theta d\theta \\
 &= \frac{1}{4} \int \frac{\cos \theta}{\cos^3 \theta} d\theta \\
 &= \frac{1}{4} \int \sec^2 \theta d\theta \\
 &= \frac{1}{4} \tan \theta + C.
 \end{aligned}$$

We have $\sin \theta = \frac{x}{2}$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/2)^2} = \frac{1}{2}\sqrt{4 - x^2}$. So $\tan \theta = \frac{x/2}{\frac{1}{2}\sqrt{4 - x^2}} = \frac{x}{\sqrt{4 - x^2}}$. We obtain

$$\begin{aligned} \int \frac{1}{(4 - x^2)^{3/2}} dx &= \frac{1}{4} \tan \theta + C \\ &= \boxed{\frac{x}{4\sqrt{4 - x^2}} + C}. \end{aligned}$$

14. Let $x = \sin \theta$, then $dx = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{1}{(1 - x^2)^{3/2}} dx &= \int \frac{1}{(1 - \sin^2 \theta)^{3/2}} (\cos \theta) d\theta \\ &= \int \frac{1}{(\cos^2 \theta)^{3/2}} \cos \theta d\theta \\ &= \int \frac{\cos \theta}{\cos^3 \theta} d\theta \\ &= \int \sec^2 \theta d\theta \\ &= \tan \theta + C. \end{aligned}$$

We have $\sin \theta = x$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - x^2}$. So $\tan \theta = \frac{x}{\sqrt{1 - x^2}}$. We obtain

$$\int \frac{1}{(1 - x^2)^{3/2}} dx = \boxed{\frac{x}{\sqrt{1 - x^2}} + C}.$$

15. Let $x = 2 \tan \theta$, then $dx = 2 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \sqrt{4 + x^2} dx &= \int \sqrt{4 + (2 \tan \theta)^2} (2 \sec^2 \theta) d\theta \\ &= 2 \int \sqrt{4 + 4 \tan^2 \theta} \sec^2 \theta d\theta \\ &= 2 \int (2 \sec \theta) \sec^2 \theta d\theta \\ &= 4 \int \sec^3 \theta d\theta \\ &= 4 \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right] + C \\ &= 2 \sec \theta \tan \theta + 2 \ln |\sec \theta + \tan \theta| + C. \end{aligned}$$

We have $\tan \theta = \frac{x}{2}$, and $\sec \theta = \sqrt{1 + \tan^2 \theta} = \sqrt{1 + (x/2)^2} = \frac{1}{2}\sqrt{4 + x^2}$. We obtain

$$\begin{aligned} \int \sqrt{4 + x^2} dx &= 2 \left(\frac{1}{2} \sqrt{4 + x^2} \right) \left(\frac{x}{2} \right) + 2 \ln \left| \frac{1}{2} \sqrt{4 + x^2} + \left(\frac{x}{2} \right) \right| + C \\ &= \boxed{\frac{1}{2} x \sqrt{4 + x^2} + 2 \ln \left| \frac{\sqrt{4 + x^2} + x}{2} \right| + C} \end{aligned}$$

16. Let $x = \tan \theta$, then $dx = \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{1+x^2} dx &= \int \sqrt{1+(\tan \theta)^2} (\sec^2 \theta) d\theta \\
 &= \int (\sec \theta) \sec^2 \theta d\theta \\
 &= \int \sec^3 \theta d\theta \\
 &= \frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\tan \theta = x$, and $\sec \theta = \sqrt{1+\tan^2 \theta} = \sqrt{1+x^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{1+x^2} dx &= \frac{1}{2} \sqrt{1+x^2}(x) + \frac{1}{2} \ln |\sqrt{1+x^2} + x| + C \\
 &= \boxed{\frac{1}{2} x \sqrt{1+x^2} + \frac{1}{2} \ln |\sqrt{1+x^2} + x| + C}.
 \end{aligned}$$

17. Let $x = 4 \tan \theta$, then $dx = 4 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2+16}} &= \int \frac{1}{\sqrt{(4 \tan \theta)^2 + 16}} (4 \sec^2 \theta) d\theta \\
 &= 4 \int \frac{1}{\sqrt{16 \tan^2 \theta + 16}} (\sec^2 \theta) d\theta \\
 &= 4 \int \frac{1}{\sqrt{16(\tan^2 \theta + 1)}} (\sec^2 \theta) d\theta \\
 &= 4 \int \frac{1}{\sqrt{16 \sec^2 \theta}} (\sec^2 \theta) d\theta \\
 &= \int \frac{1}{\sec \theta} (\sec^2 \theta) d\theta \\
 &= \int \sec \theta d\theta \\
 &= \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\tan \theta = \frac{x}{4}$, and $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{(x/4)^2 + 1} = \frac{1}{4} \sqrt{x^2 + 16}$. We obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2+16}} &= \ln \left| \frac{1}{4} \sqrt{x^2+16} + \left(\frac{x}{4} \right) \right| + C \\
 &= \boxed{\ln \left| \frac{\sqrt{x^2+16}+x}{4} \right| + C}.
 \end{aligned}$$

18. Let $x = 5 \tan \theta$, then $dx = 5 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 + 25}} &= \int \frac{1}{\sqrt{(5 \tan \theta)^2 + 25}} (5 \sec^2 \theta) d\theta \\
 &= 5 \int \frac{1}{\sqrt{25 \tan^2 \theta + 25}} (\sec^2 \theta) d\theta \\
 &= 5 \int \frac{1}{\sqrt{25(\tan^2 \theta + 1)}} (\sec^2 \theta) d\theta \\
 &= 5 \int \frac{1}{\sqrt{25 \sec^2 \theta}} (\sec^2 \theta) d\theta \\
 &= \int \frac{1}{\sec \theta} (\sec^2 \theta) d\theta \\
 &= \int \sec \theta d\theta \\
 &= \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\tan \theta = \frac{x}{5}$, and $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{(x/5)^2 + 1} = \frac{1}{5} \sqrt{x^2 + 25}$. We obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 + 25}} &= \ln \left| \frac{1}{5} \sqrt{x^2 + 25} + \left(\frac{x}{5} \right) \right| + C \\
 &= \boxed{\ln \left| \frac{\sqrt{x^2 + 25} + x}{5} \right| + C}.
 \end{aligned}$$

19. Let $x = \frac{1}{3} \tan \theta$, then $dx = \frac{1}{3} \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{1 + 9x^2} dx &= \int \sqrt{1 + 9 \left(\frac{1}{3} \tan \theta \right)^2} \left(\frac{1}{3} \sec^2 \theta \right) d\theta \\
 &= \frac{1}{3} \int \sqrt{1 + \tan^2 \theta} \sec^2 \theta d\theta \\
 &= \frac{1}{3} \int (\sec \theta) \sec^2 \theta d\theta \\
 &= \frac{1}{3} \int \sec^3 \theta d\theta \\
 &= \frac{1}{3} \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right] + C \\
 &= \frac{1}{6} \sec \theta \tan \theta + \frac{1}{6} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\tan \theta = 3x$, and $\sec \theta = \sqrt{1 + \tan^2 \theta} = \sqrt{1 + (3x)^2} = \sqrt{1 + 9x^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{1 + 9x^2} dx &= \frac{1}{6} (\sqrt{1 + 9x^2}) (3x) + \frac{1}{6} \ln |\sqrt{1 + 9x^2} + (3x)| + C \\
 &= \boxed{\frac{1}{2} x \sqrt{1 + 9x^2} + \frac{1}{6} \ln (\sqrt{1 + 9x^2} + 3x) + C}.
 \end{aligned}$$

20. Let $x = \frac{3}{2} \tan \theta$, then $dx = \frac{3}{2} \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{9+4x^2} dx &= \int \sqrt{9+4\left(\frac{3}{2} \tan \theta\right)^2} \left(\frac{3}{2} \sec^2 \theta\right) d\theta \\
 &= \frac{3}{2} \int \sqrt{9+9 \tan^2 \theta} \sec^2 \theta d\theta \\
 &= \frac{3}{2} \int \sqrt{9(1+\tan^2 \theta)} \sec^2 \theta d\theta \\
 &= \frac{3}{2} \int \sqrt{9 \sec^2 \theta} \sec^2 \theta d\theta \\
 &= \frac{3}{2} \int (3 \sec \theta) \sec^2 \theta d\theta \\
 &= \frac{9}{2} \int \sec^3 \theta d\theta \\
 &= \frac{9}{2} \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right] + C \\
 &= \frac{9}{4} \sec \theta \tan \theta + \frac{9}{4} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\tan \theta = \frac{2x}{3}$, and $\sec \theta = \sqrt{1+\tan^2 \theta} = \sqrt{1+\left(\frac{2x}{3}\right)^2} = \frac{1}{3} \sqrt{9+4x^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{9+4x^2} dx &= \frac{9}{4} \left(\frac{1}{3} \sqrt{9+4x^2} \right) \left(\frac{2x}{3} \right) + \frac{9}{4} \ln \left| \frac{1}{3} \sqrt{9+4x^2} + \frac{2x}{3} \right| + C \\
 &= \boxed{\frac{1}{2} x \sqrt{9+4x^2} + \frac{9}{4} \ln \left| \frac{\sqrt{9+4x^2}+2x}{3} \right| + C}.
 \end{aligned}$$

21. Let $x = \frac{2}{3} \tan \theta$, then $dx = \frac{2}{3} \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{4+9x^2}} dx &= \int \frac{\left(\frac{2}{3} \tan \theta\right)^2}{\sqrt{4+9\left(\frac{2}{3} \tan \theta\right)^2}} \left(\frac{2}{3} \sec^2 \theta\right) d\theta \\
 &= \frac{8}{27} \int \frac{\tan^2 \theta}{\sqrt{4+4 \tan^2 \theta}} \sec^2 \theta d\theta \\
 &= \frac{8}{27} \int \frac{\tan^2 \theta}{\sqrt{4(1+\tan^2 \theta)}} \sec^2 \theta d\theta
 \end{aligned}$$

$$\begin{aligned}
&= \frac{8}{27} \int \frac{\tan^2 \theta}{\sqrt{4 \sec^2 \theta}} \sec^2 \theta d\theta \\
&= \frac{4}{27} \int \frac{\tan^2 \theta}{\sec \theta} \sec^2 \theta d\theta \\
&= \frac{4}{27} \int \tan^2 \theta \sec \theta d\theta \\
&= \frac{4}{27} \int (\sec^2 \theta - 1) \sec \theta d\theta \\
&= \frac{4}{27} \int (\sec^3 \theta - \sec \theta) d\theta \\
&= \frac{4}{27} \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| - \ln |\sec \theta + \tan \theta| \right] + C \\
&= \frac{2}{27} \sec \theta \tan \theta - \frac{2}{27} \ln |\sec \theta + \tan \theta| + C.
\end{aligned}$$

We have $\tan \theta = \frac{3x}{2}$, and $\sec \theta = \sqrt{1 + \tan^2 \theta} = \sqrt{1 + \left(\frac{3x}{2}\right)^2} = \frac{1}{2} \sqrt{4 + 9x^2}$. We obtain

$$\begin{aligned}
\int \frac{x^2}{\sqrt{4 + 9x^2}} dx &= \frac{2}{27} \left(\frac{1}{2} \sqrt{4 + 9x^2} \right) \left(\frac{3x}{2} \right) - \frac{2}{27} \ln \left| \frac{1}{2} \sqrt{4 + 9x^2} + \frac{3x}{2} \right| + C \\
&= \boxed{\frac{1}{18} x \sqrt{4 + 9x^2} - \frac{2}{27} \ln \left(\frac{\sqrt{4 + 9x^2} + 3x}{2} \right) + C}.
\end{aligned}$$

22. Let $x = 4 \tan \theta$, then $dx = 4 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
\int \frac{x^2}{\sqrt{x^2 + 16}} dx &= \int \frac{(4 \tan \theta)^2}{\sqrt{(4 \tan \theta)^2 + 16}} (4 \sec^2 \theta) d\theta \\
&= 64 \int \frac{\tan^2 \theta}{\sqrt{16 \tan^2 \theta + 16}} \sec^2 \theta d\theta \\
&= 64 \int \frac{\tan^2 \theta}{\sqrt{16(\tan^2 \theta + 1)}} \sec^2 \theta d\theta \\
&= 16 \int \frac{\tan^2 \theta}{\sec \theta} \sec^2 \theta d\theta \\
&= 16 \int \tan^2 \theta \sec \theta d\theta \\
&= 16 \int (\sec^2 \theta - 1) \sec \theta d\theta \\
&= 16 \int (\sec^3 \theta - \sec \theta) d\theta \\
&= 16 \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| - \ln |\sec \theta + \tan \theta| \right] + C \\
&= 8 \sec \theta \tan \theta - 8 \ln |\sec \theta + \tan \theta| + C.
\end{aligned}$$

We have $\tan \theta = \frac{x}{4}$, and $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{\left(\frac{x}{4}\right)^2 + 1} = \frac{1}{4}\sqrt{x^2 + 16}$. We obtain

$$\begin{aligned} \int \frac{x^2}{\sqrt{x^2 + 16}} dx &= 8 \sec \theta \tan \theta - 8 \ln |\sec \theta + \tan \theta| + C \\ &= 8 \left(\frac{1}{4} \sqrt{x^2 + 16} \right) \left(\frac{x}{4} \right) - 8 \ln \left| \frac{1}{4} \sqrt{x^2 + 16} + \frac{x}{4} \right| + C \\ &= \boxed{\frac{1}{2} x \sqrt{x^2 + 16} - 8 \ln \left(\frac{\sqrt{x^2 + 16} + x}{4} \right) + C}. \end{aligned}$$

23. Let $x = 2 \tan \theta$, then $dx = 2 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{x^2 + 4}} &= \int \frac{2 \sec^2 \theta}{(2 \tan \theta)^2 \sqrt{(2 \tan \theta)^2 + 4}} d\theta \\ &= \frac{1}{2} \int \frac{\sec^2 \theta}{\tan^2 \theta \sqrt{4 \tan^2 \theta + 4}} d\theta \\ &= \frac{1}{2} \int \frac{\sec^2 \theta}{\tan^2 \theta \sqrt{4(\tan^2 \theta + 1)}} d\theta \\ &= \frac{1}{4} \int \frac{\sec^2 \theta}{\tan^2 \theta \sec \theta} d\theta \\ &= \frac{1}{4} \int \frac{\sec \theta}{\tan^2 \theta} d\theta \\ &= \frac{1}{4} \int \frac{\cos \theta}{\sin^2 \theta} d\theta. \end{aligned}$$

Let $u = \sin \theta$, then $du = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{x^2 + 4}} &= \frac{1}{4} \int \frac{1}{u^2} du \\ &= \frac{1}{4} \left(-\frac{1}{u} \right) + C \\ &= -\frac{1}{4} \csc \theta + C. \end{aligned}$$

We have $\tan \theta = \frac{x}{2}$, so $\cot \theta = \frac{2}{x}$, and $\csc \theta = \sqrt{1 + \cot^2 \theta} = \sqrt{1 + \left(\frac{2}{x}\right)^2} = \frac{1}{x} \sqrt{x^2 + 4}$. We obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{x^2 + 4}} &= -\frac{1}{4} \frac{1}{x} \sqrt{x^2 + 4} + C \\ &= \boxed{-\frac{\sqrt{x^2 + 4}}{4x} + C}. \end{aligned}$$

24. Let $x = \frac{1}{2} \tan \theta$, then $dx = \frac{1}{2} \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{4x^2 + 1}} &= \int \frac{\frac{1}{2} \sec^2 \theta}{\left(\frac{1}{2} \tan \theta\right)^2 \sqrt{4\left(\frac{1}{2} \tan \theta\right)^2 + 1}} d\theta \\ &= 2 \int \frac{\sec^2 \theta}{\tan^2 \theta \sqrt{\tan^2 \theta + 1}} d\theta \\ &= 2 \int \frac{\sec^2 \theta}{\tan^2 \theta \sec \theta} d\theta \\ &= 2 \int \frac{\sec \theta}{\tan^2 \theta} d\theta \\ &= 2 \int \frac{\cos \theta}{\sin^2 \theta} d\theta. \end{aligned}$$

Let $u = \sin \theta$, then $du = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{4x^2 + 1}} &= 2 \int \frac{1}{u^2} du \\ &= 2 \left(-\frac{1}{u} \right) + C \\ &= -2 \csc \theta + C. \end{aligned}$$

We have $\tan \theta = 2x$, so $\cot \theta = \frac{1}{2x}$, and $\csc \theta = \sqrt{1 + \cot^2 \theta} = \sqrt{1 + \left(\frac{1}{2x}\right)^2} = \frac{1}{2x} \sqrt{4x^2 + 1}$. We obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{4x^2 + 1}} &= -2 \left(\frac{1}{2x} \sqrt{4x^2 + 1} \right) + C \\ &= \boxed{-\frac{\sqrt{4x^2 + 1}}{x} + C}. \end{aligned}$$

25. Let $x = 2 \tan \theta$, then $dx = 2 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{(x^2 + 4)^{3/2}} &= \int \frac{2 \sec^2 \theta}{\left((2 \tan \theta)^2 + 4\right)^{3/2}} d\theta \\ &= 2 \int \frac{\sec^2 \theta}{(4 \tan^2 \theta + 4)^{3/2}} d\theta \\ &= 2 \int \frac{\sec^2 \theta}{(4(\tan^2 \theta + 1))^{3/2}} d\theta \\ &= \frac{1}{4} \int \frac{\sec^2 \theta}{\sec^3 \theta} d\theta \\ &= \frac{1}{4} \int \cos \theta d\theta \\ &= \frac{1}{4} \sin \theta + C. \end{aligned}$$

We have $\tan \theta = \frac{x}{2}$, so $\cot \theta = \frac{2}{x}$, and $\csc \theta = \sqrt{1 + \cot^2 \theta} = \sqrt{1 + \left(\frac{2}{x}\right)^2} = \frac{1}{x} \sqrt{x^2 + 4}$. So $\sin \theta = \frac{x}{\sqrt{x^2 + 4}}$ and we obtain

$$\begin{aligned} \int \frac{dx}{(x^2 + 4)^{3/2}} &= \frac{1}{4} \frac{x}{\sqrt{x^2 + 4}} + C \\ &= \boxed{\frac{x}{4\sqrt{x^2 + 4}} + C}. \end{aligned}$$

26. Let $x = \tan \theta$, then $dx = \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{(x^2 + 1)^{3/2}} &= \int \frac{\sec^2 \theta}{\left((\tan \theta)^2 + 1\right)^{3/2}} d\theta \\ &= \int \frac{\sec^2 \theta}{\sec^3 \theta} d\theta \\ &= \int \cos \theta d\theta \\ &= \sin \theta + C. \end{aligned}$$

We have $\tan \theta = x$, so $\cot \theta = \frac{1}{x}$, and $\csc \theta = \sqrt{1 + \cot^2 \theta} = \sqrt{1 + \left(\frac{1}{x}\right)^2} = \frac{1}{x} \sqrt{x^2 + 1}$. So $\sin \theta = \frac{x}{\sqrt{x^2 + 1}}$ and we obtain

$$\int \frac{dx}{(x^2 + 1)^{3/2}} = \boxed{\frac{x}{\sqrt{x^2 + 1}} + C}.$$

27. Let $x = 5 \sec \theta$, then $dx = 5 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{x^2}{\sqrt{x^2 - 25}} dx &= \int \frac{(5 \sec \theta)^2}{\sqrt{(5 \sec \theta)^2 - 25}} (5 \sec \theta \tan \theta) d\theta \\ &= 125 \int \frac{\sec^2 \theta}{\sqrt{25 \sec^2 \theta - 25}} \sec \theta \tan \theta d\theta \\ &= 25 \int \frac{\sec^2 \theta}{\sqrt{\sec^2 \theta - 1}} \sec \theta \tan \theta d\theta \\ &= 25 \int \frac{\sec^2 \theta}{\tan \theta} \sec \theta \tan \theta d\theta \\ &= 25 \int \sec^3 \theta d\theta \\ &= 25 \left(\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right) + C \\ &= \frac{25}{2} \sec \theta \tan \theta + \frac{25}{2} \ln |\sec \theta + \tan \theta| + C. \end{aligned}$$

We have $\sec \theta = \frac{x}{5}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{5}\right)^2 - 1} = \frac{1}{5} \sqrt{x^2 - 25}$. We obtain

$$\begin{aligned} \int \frac{x^2}{\sqrt{x^2 - 25}} dx &= \frac{25}{2} \left(\frac{x}{5} \right) \left(\frac{1}{5} \sqrt{x^2 - 25} \right) + \frac{25}{2} \ln \left| \frac{x}{5} + \frac{1}{5} \sqrt{x^2 - 25} \right| + C \\ &= \boxed{\frac{1}{2} x \sqrt{x^2 - 25} + \frac{25}{2} \ln \left| \frac{x + \sqrt{x^2 - 25}}{5} \right| + C}. \end{aligned}$$

28. Let $x = 4 \sec \theta$, then $dx = 4 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{x^2 - 16}} dx &= \int \frac{(4 \sec \theta)^2}{\sqrt{(4 \sec \theta)^2 - 16}} (4 \sec \theta \tan \theta) d\theta \\
 &= 64 \int \frac{\sec^2 \theta}{\sqrt{16 \sec^2 \theta - 16}} \sec \theta \tan \theta d\theta \\
 &= 16 \int \frac{\sec^2 \theta}{\sqrt{\sec^2 \theta - 1}} \sec \theta \tan \theta d\theta \\
 &= 16 \int \frac{\sec^2 \theta}{\tan \theta} \sec \theta \tan \theta d\theta \\
 &= 16 \int \sec^3 \theta d\theta \\
 &= 16 \left(\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right) + C \\
 &= 8 \sec \theta \tan \theta + 8 \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\sec \theta = \frac{x}{4}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{4}\right)^2 - 1} = \frac{1}{4} \sqrt{x^2 - 16}$. We obtain

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{x^2 - 16}} dx &= 8 \left(\frac{x}{4} \right) \left(\frac{1}{4} \sqrt{x^2 - 16} \right) + 8 \ln \left| \frac{x}{4} + \frac{1}{4} \sqrt{x^2 - 16} \right| + C \\
 &= \boxed{\frac{1}{2} x \sqrt{x^2 - 16} + 8 \ln \left| \frac{x + \sqrt{x^2 - 16}}{4} \right| + C}.
 \end{aligned}$$

29. Let $x = \sec \theta$, then $dx = \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{\sqrt{x^2 - 1}}{x} dx &= \int \frac{\sqrt{(\sec \theta)^2 - 1}}{\sec \theta} (\sec \theta \tan \theta) d\theta \\
 &= \int \frac{\tan \theta}{\sec \theta} \sec \theta \tan \theta d\theta \\
 &= \int \tan^2 \theta d\theta \\
 &= \int (\sec^2 \theta - 1) d\theta \\
 &= \tan \theta - \theta + C.
 \end{aligned}$$

We have $\theta = \sec^{-1} x$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{x^2 - 1}$. We obtain

$$\int \frac{\sqrt{x^2 - 1}}{x} dx = \boxed{\sqrt{x^2 - 1} - \sec^{-1} x + C}.$$

30. Let $x = \sec \theta$, then $dx = \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{\sqrt{x^2 - 1}}{x^2} dx &= \int \frac{\sqrt{(\sec \theta)^2 - 1}}{\sec^2 \theta} (\sec \theta \tan \theta) d\theta \\
 &= \int \frac{\tan \theta}{\sec^2 \theta} \sec \theta \tan \theta d\theta \\
 &= \int \frac{\tan^2 \theta}{\sec \theta} d\theta \\
 &= \int \frac{\sec^2 \theta - 1}{\sec \theta} d\theta \\
 &= \int (\sec \theta - \cos \theta) d\theta \\
 &= \ln |\sec \theta + \tan \theta| - \sin \theta + C.
 \end{aligned}$$

We have $\sec \theta = x$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{x^2 - 1}$. And $\cos \theta = \frac{1}{x}$, so $\sin \theta = \sqrt{1 - \left(\frac{1}{x}\right)^2} = \frac{\sqrt{x^2 - 1}}{x}$. We obtain

$$\int \frac{\sqrt{x^2 - 1}}{x} dx = \boxed{\ln |x + \sqrt{x^2 - 1}| - \frac{\sqrt{x^2 - 1}}{x} + C}.$$

31. Let $x = 6 \sec \theta$, then $dx = 6 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{x^2 \sqrt{x^2 - 36}} &= \int \frac{6 \sec \theta \tan \theta}{(6 \sec \theta)^2 \sqrt{(6 \sec \theta)^2 - 36}} d\theta \\
 &= \frac{1}{6} \int \frac{\sec \theta \tan \theta}{\sec^2 \theta \sqrt{36 \sec^2 \theta - 36}} d\theta \\
 &= \frac{1}{36} \int \frac{\tan \theta}{\sec \theta \sqrt{\sec^2 \theta - 1}} d\theta \\
 &= \frac{1}{36} \int \frac{\tan \theta}{\sec \theta \tan \theta} d\theta \\
 &= \frac{1}{36} \int \cos \theta d\theta \\
 &= \frac{1}{36} \sin \theta + C.
 \end{aligned}$$

We have $\sec \theta = \frac{x}{6}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{6}\right)^2 - 1} = \frac{1}{6} \sqrt{x^2 - 36}$. So $\sin \theta = \frac{\tan \theta}{\sec \theta} = \frac{\frac{1}{6} \sqrt{x^2 - 36}}{\frac{x}{6}} = \frac{\sqrt{x^2 - 36}}{x}$. We obtain

$$\int \frac{dx}{x^2 \sqrt{x^2 - 36}} = \boxed{\frac{1}{36} \frac{\sqrt{x^2 - 36}}{x} + C}.$$

32. Let $x = 3 \sec \theta$, then $dx = 3 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{x^2 \sqrt{x^2 - 9}} &= \int \frac{3 \sec \theta \tan \theta}{(3 \sec \theta)^2 \sqrt{(3 \sec \theta)^2 - 9}} d\theta \\
 &= \frac{1}{3} \int \frac{\sec \theta \tan \theta}{\sec^2 \theta \sqrt{9 \sec^2 \theta - 9}} d\theta \\
 &= \frac{1}{9} \int \frac{\tan \theta}{\sec \theta \sqrt{\sec^2 \theta - 1}} d\theta \\
 &= \frac{1}{9} \int \frac{\tan \theta}{\sec \theta \tan \theta} d\theta \\
 &= \frac{1}{9} \int \cos \theta d\theta \\
 &= \frac{1}{9} \sin \theta + C.
 \end{aligned}$$

We have $\sec \theta = \frac{x}{3}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{3}\right)^2 - 1} = \frac{1}{3} \sqrt{x^2 - 9}$. So $\sin \theta = \frac{\tan \theta}{\sec \theta} = \frac{\frac{1}{3} \sqrt{x^2 - 9}}{\frac{x}{3}} = \frac{\sqrt{x^2 - 9}}{x}$. We obtain

$$\int \frac{dx}{x^2 \sqrt{x^2 - 9}} = \boxed{\frac{1}{9} \frac{\sqrt{x^2 - 9}}{x} + C}.$$

33. Let $x = \frac{3}{2} \sec \theta$, then $dx = \frac{3}{2} \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{4x^2 - 9}} &= \int \frac{\frac{3}{2} \sec \theta \tan \theta}{\sqrt{4\left(\frac{3}{2} \sec \theta\right)^2 - 9}} d\theta \\
 &= \frac{3}{2} \int \frac{\sec \theta \tan \theta}{\sqrt{9 \sec^2 \theta - 9}} d\theta \\
 &= \frac{3}{2} \int \frac{\sec \theta \tan \theta}{\sqrt{9(\sec^2 \theta - 1)}} d\theta \\
 &= \frac{1}{2} \int \frac{\sec \theta \tan \theta}{\tan \theta} d\theta \\
 &= \frac{1}{2} \int \sec \theta d\theta \\
 &= \frac{1}{2} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\sec \theta = \frac{2x}{3}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{2x}{3}\right)^2 - 1} = \frac{1}{3} \sqrt{4x^2 - 9}$. We obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{4x^2 - 9}} &= \frac{1}{2} \ln \left| \frac{2x}{3} + \frac{1}{3} \sqrt{4x^2 - 9} \right| + C \\
 &= \boxed{\frac{1}{2} \ln \left| \frac{2x + \sqrt{4x^2 - 9}}{3} \right| + C}.
 \end{aligned}$$

34. Let $x = \frac{2}{3} \sec \theta$, then $dx = \frac{2}{3} \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{9x^2 - 4}} &= \int \frac{\frac{2}{3} \sec \theta \tan \theta}{\sqrt{9\left(\frac{2}{3} \sec \theta\right)^2 - 4}} d\theta \\
 &= \frac{2}{3} \int \frac{\sec \theta \tan \theta}{\sqrt{4 \sec^2 \theta - 4}} d\theta \\
 &= \frac{2}{3} \int \frac{\sec \theta \tan \theta}{\sqrt{4(\sec^2 \theta - 1)}} d\theta \\
 &= \frac{1}{3} \int \frac{\sec \theta \tan \theta}{\tan \theta} d\theta \\
 &= \frac{1}{3} \int \sec \theta d\theta \\
 &= \frac{1}{3} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\sec \theta = \frac{3x}{2}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{3x}{2}\right)^2 - 1} = \frac{1}{2} \sqrt{9x^2 - 4}$. We obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{9x^2 - 4}} &= \frac{1}{3} \ln \left| \frac{3x}{2} + \frac{1}{2} \sqrt{9x^2 - 4} \right| + C \\
 &= \boxed{\frac{1}{3} \ln \left| \frac{3x + \sqrt{9x^2 - 4}}{2} \right| + C}.
 \end{aligned}$$

35. Let $x = 3 \sec \theta$, then $dx = 3 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{(x^2 - 9)^{3/2}} &= \int \frac{3 \sec \theta \tan \theta}{\left((3 \sec \theta)^2 - 9\right)^{3/2}} d\theta \\
 &= 3 \int \frac{\sec \theta \tan \theta}{(9 \sec^2 \theta - 9)^{3/2}} d\theta \\
 &= 3 \int \frac{\sec \theta \tan \theta}{(9(\sec^2 \theta - 1))^{3/2}} d\theta \\
 &= \frac{1}{9} \int \frac{\sec \theta \tan \theta}{\tan^3 \theta} d\theta \\
 &= \frac{1}{9} \int \frac{\sec \theta}{\tan^2 \theta} d\theta \\
 &= \frac{1}{9} \int \frac{\cos \theta}{\sin^2 \theta} d\theta.
 \end{aligned}$$

Let $u = \sin \theta$, then $du = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{(x^2 - 9)^{3/2}} &= \frac{1}{9} \int \frac{du}{u^2} \\
 &= \frac{1}{9} \left(-\frac{1}{u} \right) + C \\
 &= -\frac{1}{9} \csc \theta + C.
 \end{aligned}$$

We have $\sec \theta = \frac{x}{3}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{3}\right)^2 - 1} = \frac{1}{3} \sqrt{x^2 - 9}$. Then $\csc \theta = \frac{\sec \theta}{\tan \theta} =$

$\frac{x/3}{\frac{1}{3}\sqrt{x^2-9}} = \frac{x}{\sqrt{x^2-9}}$. We obtain

$$\int \frac{dx}{(x^2-9)^{3/2}} = \boxed{-\frac{1}{9} \frac{x}{\sqrt{x^2-9}} + C}.$$

36. Let $x = \frac{1}{5} \sec \theta$, then $dx = \frac{1}{5} \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{(25x^2-1)^{3/2}} &= \int \frac{\frac{1}{5} \sec \theta \tan \theta}{\left(25\left(\frac{1}{5} \sec \theta\right)^2-1\right)^{3/2}} d\theta \\ &= \frac{1}{5} \int \frac{\sec \theta \tan \theta}{(\sec^2 \theta - 1)^{3/2}} d\theta \\ &= \frac{1}{5} \int \frac{\sec \theta \tan \theta}{\tan^3 \theta} d\theta \\ &= \frac{1}{5} \int \frac{\sec \theta}{\tan^2 \theta} d\theta \\ &= \frac{1}{5} \int \frac{\cos \theta}{\sin^2 \theta} d\theta. \end{aligned}$$

Let $u = \sin \theta$, then $du = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{(25x^2-1)^{3/2}} &= \frac{1}{5} \int \frac{du}{u^2} \\ &= \frac{1}{5} \left(-\frac{1}{u} \right) + C \\ &= -\frac{1}{5} \csc \theta + C. \end{aligned}$$

We have $\sec \theta = 5x$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{(5x)^2 - 1} = \sqrt{25x^2 - 1}$. Then $\csc \theta = \frac{\sec \theta}{\tan \theta} = \frac{5x}{\sqrt{25x^2-1}}$. We obtain

$$\begin{aligned} \int \frac{dx}{(25x^2-1)^{3/2}} &= -\frac{1}{5} \frac{5x}{\sqrt{25x^2-1}} + C \\ &= \boxed{-\frac{x}{\sqrt{25x^2-1}} + C}. \end{aligned}$$

37. Let $x = 3 \sec \theta$, then $dx = 3 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2 dx}{(x^2 - 9)^{3/2}} &= \int \frac{(3 \sec \theta)^2 (3 \sec \theta \tan \theta)}{\left((3 \sec \theta)^2 - 9\right)^{3/2}} d\theta \\
 &= 27 \int \frac{\sec^3 \theta \tan \theta}{(9 \sec^2 \theta - 9)^{3/2}} d\theta \\
 &= 27 \int \frac{\sec^3 \theta \tan \theta}{(9(\sec^2 \theta - 1))^{3/2}} d\theta \\
 &= \int \frac{\sec^3 \theta \tan \theta}{\tan^3 \theta} d\theta \\
 &= \int \frac{\sec^3 \theta}{\tan^2 \theta} d\theta \\
 &= \int \frac{\sec \theta (\tan^2 \theta + 1)}{\tan^2 \theta} d\theta \\
 &= \int \left(\sec \theta + \frac{\sec \theta}{\tan^2 \theta} \right) d\theta \\
 &= \ln |\sec \theta + \tan \theta| + \int \frac{\cos \theta}{\sin^2 \theta} d\theta.
 \end{aligned}$$

Let $u = \sin \theta$, then $du = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2 dx}{(x^2 - 9)^{3/2}} &= \ln |\sec \theta + \tan \theta| + \int \frac{du}{u^2} \\
 &= \ln |\sec \theta + \tan \theta| + \left(-\frac{1}{u} \right) + C \\
 &= \ln |\sec \theta + \tan \theta| - \csc \theta + C.
 \end{aligned}$$

We have $\sec \theta = \frac{x}{3}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{3}\right)^2 - 1} = \frac{1}{3} \sqrt{x^2 - 9}$. Then $\csc \theta = \frac{\sec \theta}{\tan \theta} = \frac{\frac{x}{3}}{\frac{1}{3} \sqrt{x^2 - 9}} = \frac{x}{\sqrt{x^2 - 9}}$. We obtain

$$\begin{aligned}
 \int \frac{x^2 dx}{(x^2 - 9)^{3/2}} &= \ln \left| \frac{x}{3} + \frac{1}{3} \sqrt{x^2 - 9} \right| - \frac{x}{\sqrt{x^2 - 9}} + C \\
 &= \boxed{\ln \left| \frac{x + \sqrt{x^2 - 9}}{3} \right| - \frac{x}{\sqrt{x^2 - 9}} + C}.
 \end{aligned}$$

38. Let $x = 2 \sec \theta$, then $dx = 2 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2 dx}{(x^2 - 4)^{3/2}} &= \int \frac{(2 \sec \theta)^2 (2 \sec \theta \tan \theta)}{\left((2 \sec \theta)^2 - 4\right)^{3/2}} d\theta \\
 &= 8 \int \frac{\sec^3 \theta \tan \theta}{(4 \sec^2 \theta - 4)^{3/2}} d\theta \\
 &= 8 \int \frac{\sec^3 \theta \tan \theta}{(4(\sec^2 \theta - 1))^{3/2}} d\theta \\
 &= \int \frac{\sec^3 \theta \tan \theta}{\tan^3 \theta} d\theta \\
 &= \int \frac{\sec^3 \theta}{\tan^2 \theta} d\theta \\
 &= \int \frac{\sec \theta (\tan^2 \theta + 1)}{\tan^2 \theta} d\theta \\
 &= \int \left(\sec \theta + \frac{\sec \theta}{\tan^2 \theta} \right) d\theta \\
 &= \ln |\sec \theta + \tan \theta| + \int \frac{\cos \theta}{\sin^2 \theta} d\theta.
 \end{aligned}$$

Let $u = \sin \theta$, then $du = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2 dx}{(x^2 - 4)^{3/2}} &= \ln |\sec \theta + \tan \theta| + \int \frac{du}{u^2} \\
 &= \ln |\sec \theta + \tan \theta| + \left(-\frac{1}{u} \right) + C \\
 &= \ln |\sec \theta + \tan \theta| - \csc \theta + C.
 \end{aligned}$$

We have $\sec \theta = \frac{x}{2}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{2}\right)^2 - 1} = \frac{1}{2}\sqrt{x^2 - 4}$. Then $\csc \theta = \frac{\sec \theta}{\tan \theta} = \frac{\frac{x}{2}}{\frac{1}{2}\sqrt{x^2 - 4}} = \frac{x}{\sqrt{x^2 - 4}}$. We obtain

$$\begin{aligned}
 \int \frac{x^2 dx}{(x^2 - 4)^{3/2}} &= \ln \left| \frac{x}{2} + \frac{1}{2}\sqrt{x^2 - 4} \right| - \frac{x}{\sqrt{x^2 - 4}} + C \\
 &= \boxed{\ln \left| \frac{x + \sqrt{x^2 - 4}}{2} \right| - \frac{x}{\sqrt{x^2 - 4}} + C}.
 \end{aligned}$$

39. Let $x = 4 \tan \theta$, then $dx = 4 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{16 + x^2} dx &= \int \frac{(4 \tan \theta)^2}{16 + (4 \tan \theta)^2} (4 \sec^2 \theta) d\theta \\
 &= 64 \int \frac{\tan^2 \theta}{16 + 16 \tan^2 \theta} \sec^2 \theta d\theta \\
 &= 4 \int \frac{\tan^2 \theta}{\sec^2 \theta} \sec^2 \theta d\theta \\
 &= 4 \int \tan^2 \theta d\theta \\
 &= 4 \int (\sec^2 \theta - 1) d\theta \\
 &= 4(\tan \theta - \theta) + C \\
 &= 4\left(\frac{x}{4}\right) - 4 \tan^{-1} \left(\frac{x}{4}\right) + C \\
 &= \boxed{x - 4 \tan^{-1} \left(\frac{x}{4}\right) + C}.
 \end{aligned}$$

40. Let $x = \frac{1}{4} \tan \theta$, then $dx = \frac{1}{4} \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{1 + 16x^2} dx &= \int \frac{\left(\frac{1}{4} \tan \theta\right)^2}{1 + 16\left(\frac{1}{4} \tan \theta\right)^2} \left(\frac{1}{4} \sec^2 \theta\right) d\theta \\
 &= \frac{1}{64} \int \frac{\tan^2 \theta}{1 + \tan^2 \theta} \sec^2 \theta d\theta \\
 &= \frac{1}{64} \int \frac{\tan^2 \theta}{\sec^2 \theta} \sec^2 \theta d\theta \\
 &= \frac{1}{64} \int \tan^2 \theta d\theta \\
 &= \frac{1}{64} \int (\sec^2 \theta - 1) d\theta \\
 &= \frac{1}{64} (\tan \theta - \theta) + C \\
 &= \frac{1}{64} (4x) - \frac{1}{64} \tan^{-1} (4x) + C \\
 &= \boxed{\frac{x}{16} - \frac{1}{64} \tan^{-1} (4x) + C}.
 \end{aligned}$$

41. Let $x = \frac{2}{5} \sin \theta$, then $dx = \frac{2}{5} \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{4 - 25x^2} dx &= \int \sqrt{4 - 25\left(\frac{2}{5} \sin \theta\right)^2} \left(\frac{2}{5} \cos \theta\right) d\theta \\
 &= \frac{2}{5} \int \sqrt{4 - 4 \sin^2 \theta} \cos \theta d\theta \\
 &= \frac{2}{5} \int \sqrt{4(1 - \sin^2 \theta)} \cos \theta d\theta \\
 &= \frac{4}{5} \int \cos^2 \theta d\theta \\
 &= \frac{4}{5} \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{2}{5} \int (1 + \cos(2\theta)) d\theta \\
 &= \frac{2}{5} \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\
 &= \frac{2}{5} \theta + \frac{1}{5} \sin(2\theta) + C \\
 &= \frac{2}{5} \theta + \frac{2}{5} \sin \theta \cos \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} \left(\frac{5x}{2} \right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \left(\frac{5x}{2} \right)^2} = \frac{1}{2} \sqrt{4 - 25x^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{4 - 25x^2} dx &= \frac{2}{5} \sin^{-1} \left(\frac{5x}{2} \right) + \frac{2}{5} \left(\frac{5x}{2} \right) \left(\frac{1}{2} \sqrt{4 - 25x^2} \right) + C \\
 &= \boxed{\frac{2}{5} \sin^{-1} \left(\frac{5x}{2} \right) + \frac{1}{2} x \sqrt{4 - 25x^2} + C}.
 \end{aligned}$$

42. Let $x = \frac{3}{4} \sin \theta$, then $dx = \frac{3}{4} \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{9 - 16x^2} dx &= \int \sqrt{9 - 16\left(\frac{3}{4} \sin \theta\right)^2} \left(\frac{3}{4} \cos \theta\right) d\theta \\
 &= \frac{3}{4} \int \sqrt{9 - 9 \sin^2 \theta} \cos \theta d\theta \\
 &= \frac{3}{4} \int \sqrt{9(1 - \sin^2 \theta)} \cos \theta d\theta \\
 &= \frac{9}{4} \int \cos^2 \theta d\theta \\
 &= \frac{9}{4} \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{9}{8} \int (1 + \cos(2\theta)) d\theta \\
 &= \frac{9}{8} \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\
 &= \frac{9}{8} \theta + \frac{9}{16} \sin(2\theta) + C \\
 &= \frac{9}{8} \theta + \frac{9}{8} \sin \theta \cos \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} \left(\frac{4x}{3} \right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \left(\frac{4x}{3} \right)^2} = \frac{1}{3} \sqrt{9 - 16x^2}$. We obtain

$$\begin{aligned} \int \sqrt{9 - 16x^2} \, dx &= \frac{9}{8} \sin^{-1} \left(\frac{4x}{3} \right) + \frac{9}{8} \left(\frac{4x}{3} \right) \left(\frac{1}{3} \sqrt{9 - 16x^2} \right) + C \\ &= \boxed{\frac{9}{8} \sin^{-1} \left(\frac{4x}{3} \right) + \frac{1}{2} x \sqrt{9 - 16x^2} + C}.. \end{aligned}$$

43. Let $x = \frac{2}{5} \sin \theta$, then $dx = \frac{2}{5} \cos \theta \, d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{1}{(4 - 25x^2)^{3/2}} \, dx &= \int \frac{1}{\left(4 - 25 \left(\frac{2}{5} \sin \theta \right)^2 \right)^{3/2}} \left(\frac{2}{5} \cos \theta \right) d\theta \\ &= \frac{2}{5} \int \frac{1}{4^{3/2} (\cos^2 \theta)^{3/2}} \cos \theta \, d\theta \\ &= \frac{1}{20} \int \frac{\cos \theta}{\cos^3 \theta} \, d\theta \\ &= \frac{1}{20} \int \sec^2 \theta \, d\theta \\ &= \frac{1}{20} \tan \theta + C. \end{aligned}$$

We have $\sin \theta = \frac{5x}{2}$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \left(\frac{5x}{2} \right)^2} = \frac{1}{2} \sqrt{4 - 25x^2}$. So $\tan \theta = \frac{5x/2}{\frac{1}{2} \sqrt{4 - 25x^2}} = \frac{5x}{\sqrt{4 - 25x^2}}$. We obtain

$$\begin{aligned} \int \frac{1}{(4 - 25x^2)^{3/2}} \, dx &= \frac{1}{20} \left(\frac{5x}{\sqrt{4 - 25x^2}} \right) + C \\ &= \boxed{\frac{x}{4\sqrt{4 - 25x^2}} + C}. \end{aligned}$$

44. Let $x = \frac{1}{3} \sin \theta$, then $dx = \frac{1}{3} \cos \theta \, d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{1}{(1 - 9x^2)^{3/2}} \, dx &= \int \frac{1}{\left(1 - 9 \left(\frac{1}{3} \sin \theta \right)^2 \right)^{3/2}} \left(\frac{1}{3} \cos \theta \right) d\theta \\ &= \int \frac{1}{(1 - \sin^2 \theta)^{3/2}} \left(\frac{1}{3} \cos \theta \right) d\theta \\ &= \frac{1}{3} \int \frac{1}{(\cos^2 \theta)^{3/2}} \cos \theta \, d\theta \\ &= \frac{1}{3} \int \frac{\cos \theta}{\cos^3 \theta} \, d\theta \\ &= \frac{1}{3} \int \sec^2 \theta \, d\theta \\ &= \frac{1}{3} \tan \theta + C. \end{aligned}$$

We have $\sin \theta = 3x$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (3x)^2} = \sqrt{1 - 9x^2}$. So $\tan \theta =$

$\frac{3x}{\sqrt{1-9x^2}}$. We obtain

$$\begin{aligned}\int \frac{1}{(1-9x^2)^{3/2}} dx &= \frac{1}{3} \left(\frac{3x}{\sqrt{1-9x^2}} \right) + C \\ &= \boxed{\frac{x}{\sqrt{1-9x^2}} + C}.\end{aligned}$$

45. Let $x = \frac{2}{5} \tan \theta$, then $dx = \frac{2}{5} \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}\int \sqrt{4+25x^2} dx &= \int \sqrt{4+25\left(\frac{2}{5} \tan \theta\right)^2} \left(\frac{2}{5} \sec^2 \theta\right) d\theta \\ &= \frac{2}{5} \int \sqrt{4+4 \tan^2 \theta} \sec^2 \theta d\theta \\ &= \frac{2}{5} \int \sqrt{4(1+\tan^2 \theta)} \sec^2 \theta d\theta \\ &= \frac{2}{5} \int (2 \sec \theta) \sec^2 \theta d\theta \\ &= \frac{4}{5} \int \sec^3 \theta d\theta \\ &= \frac{4}{5} \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right] + C \\ &= \frac{2}{5} \sec \theta \tan \theta + \frac{2}{5} \ln |\sec \theta + \tan \theta| + C.\end{aligned}$$

We have $\tan \theta = \frac{5x}{2}$, and $\sec \theta = \sqrt{1+\tan^2 \theta} = \sqrt{1+\left(\frac{5x}{2}\right)^2} = \frac{1}{2} \sqrt{4+25x^2}$. We obtain

$$\begin{aligned}\int \sqrt{4+25x^2} dx &= \frac{2}{5} \left(\frac{1}{2} \sqrt{4+25x^2} \right) \left(\frac{5x}{2} \right) + \frac{2}{5} \ln \left| \frac{1}{2} \sqrt{4+25x^2} + \frac{5x}{2} \right| + C \\ &= \boxed{\frac{1}{2} x \sqrt{4+25x^2} + \frac{2}{5} \ln \left(\frac{\sqrt{4+25x^2}+5x}{2} \right) + C}.\end{aligned}$$

46. Let $x = \frac{3}{4} \tan \theta$, then $dx = \frac{3}{4} \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}\int \sqrt{9+16x^2} dx &= \int \sqrt{9+16\left(\frac{3}{4} \tan \theta\right)^2} \left(\frac{3}{4} \sec^2 \theta\right) d\theta \\ &= \frac{3}{4} \int \sqrt{9+9 \tan^2 \theta} \sec^2 \theta d\theta \\ &= \frac{3}{4} \int \sqrt{9(1+\tan^2 \theta)} \sec^2 \theta d\theta \\ &= \frac{3}{4} \int (3 \sec \theta) \sec^2 \theta d\theta \\ &= \frac{9}{4} \int \sec^3 \theta d\theta \\ &= \frac{9}{4} \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right] + C \\ &= \frac{9}{8} \sec \theta \tan \theta + \frac{9}{8} \ln |\sec \theta + \tan \theta| + C.\end{aligned}$$

We have $\tan \theta = \frac{4x}{3}$, and $\sec \theta = \sqrt{1 + \tan^2 \theta} = \sqrt{1 + \left(\frac{4x}{3}\right)^2} = \frac{1}{3}\sqrt{9 + 16x^2}$. We obtain

$$\begin{aligned} \int \sqrt{9 + 16x^2} \, dx &= \frac{9}{8} \left(\frac{1}{3} \sqrt{9 + 16x^2} \right) \left(\frac{4x}{3} \right) + \frac{9}{8} \ln \left| \frac{1}{3} \sqrt{9 + 16x^2} + \frac{4x}{3} \right| + C \\ &= \boxed{\frac{1}{2}x\sqrt{9 + 16x^2} + \frac{9}{8} \ln \left(\frac{\sqrt{9 + 16x^2} + 4x}{3} \right) + C}. \end{aligned}$$

47. Let $x = 4 \sec \theta$, then $dx = 4 \sec \theta \tan \theta \, d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{x^3 \sqrt{x^2 - 16}} &= \int \frac{4 \sec \theta \tan \theta}{(4 \sec \theta)^3 \sqrt{(4 \sec \theta)^2 - 16}} \, d\theta \\ &= \frac{1}{16} \int \frac{\sec \theta \tan \theta}{\sec^3 \theta \sqrt{16 \sec^2 \theta - 16}} \, d\theta \\ &= \frac{1}{64} \int \frac{\tan \theta}{\sec^2 \theta \sqrt{\sec^2 \theta - 1}} \, d\theta \\ &= \frac{1}{64} \int \frac{\tan \theta}{\sec^2 \theta \tan \theta} \, d\theta \\ &= \frac{1}{64} \int \cos^2 \theta \, d\theta \\ &= \frac{1}{64} \int \frac{1 + \cos(2\theta)}{2} \, d\theta \\ &= \frac{1}{128} \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\ &= \frac{1}{128} \theta + \frac{1}{256} (2 \sin \theta \cos \theta) + C \\ &= \frac{1}{128} \theta + \frac{1}{128} \sin \theta \cos \theta + C. \end{aligned}$$

We have $\theta = \sec^{-1} \left(\frac{x}{4} \right)$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{4} \right)^2 - 1} = \frac{1}{4} \sqrt{x^2 - 16}$. So $\sin \theta = \frac{\tan \theta}{\sec \theta} = \frac{\frac{1}{4} \sqrt{x^2 - 16}}{\frac{x}{4}} = \frac{\sqrt{x^2 - 16}}{x}$, and $\cos \theta = \frac{4}{x}$. We obtain

$$\begin{aligned} \int \frac{dx}{x^3 \sqrt{x^2 - 16}} &= \frac{1}{128} \sec^{-1} \left(\frac{x}{4} \right) + \frac{1}{128} \left(\frac{\sqrt{x^2 - 16}}{x} \right) \left(\frac{4}{x} \right) + C \\ &= \boxed{\frac{1}{128} \sec^{-1} \left(\frac{x}{4} \right) + \frac{\sqrt{x^2 - 16}}{32x^2} + C}. \end{aligned}$$

48. Let $x = \sec \theta$, then $dx = \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{x^3 \sqrt{x^2 - 1}} &= \int \frac{\sec \theta \tan \theta}{(\sec \theta)^3 \sqrt{(\sec \theta)^2 - 1}} d\theta \\
 &= \int \frac{\sec \theta \tan \theta}{\sec^3 \theta \sqrt{\sec^2 \theta - 1}} d\theta \\
 &= \int \frac{\tan \theta}{\sec^2 \theta \tan \theta} d\theta \\
 &= \int \cos^2 \theta d\theta \\
 &= \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{1}{2} \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\
 &= \frac{1}{2} \theta + \frac{1}{4} (2 \sin \theta \cos \theta) + C \\
 &= \frac{1}{2} \theta + \frac{1}{2} \sin \theta \cos \theta + C.
 \end{aligned}$$

We have $\theta = \sec^{-1} x$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{x^2 - 1}$. So $\sin \theta = \frac{\tan \theta}{\sec \theta} = \frac{\sqrt{x^2 - 1}}{x}$, and $\cos \theta = \frac{1}{x}$. We obtain

$$\begin{aligned}
 \int \frac{dx}{x^3 \sqrt{x^2 - 1}} &= \frac{1}{2} \sec^{-1} x + \frac{1}{2} \left(\frac{\sqrt{x^2 - 1}}{x} \right) \left(\frac{1}{x} \right) + C \\
 &= \boxed{\frac{1}{2} \sec^{-1} x + \frac{\sqrt{x^2 - 1}}{2x^2} + C}.
 \end{aligned}$$

49. Let $x = \sin \theta$, then $dx = \cos \theta d\theta$. The lower limit of integration is $\theta = \sin^{-1} 0 = 0$, and the upper limit of integration is $\theta = \sin^{-1} 1 = \frac{\pi}{2}$. We substitute and obtain

$$\begin{aligned}
 \int_0^1 \sqrt{1 - x^2} dx &= \int_0^{\pi/2} \sqrt{1 - \sin^2 \theta} (\cos \theta) d\theta \\
 &= \int_0^{\pi/2} \cos^2 \theta d\theta \\
 &= \int_0^{\pi/2} \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{1}{2} \left[\theta + \frac{1}{2} \sin(2\theta) \right]_0^{\pi/2} \\
 &= \frac{1}{2} \left[\left(\frac{\pi}{2} + \frac{1}{2} \sin \left(2 \left(\frac{\pi}{2} \right) \right) \right) - \left(0 + \frac{1}{2} \sin(2(0)) \right) \right] \\
 &= \boxed{\frac{1}{4} \pi}.
 \end{aligned}$$

50. Let $x = \frac{1}{2} \sin \theta$, then $dx = \frac{1}{2} \cos \theta d\theta$. The lower limit of integration is $\theta = \sin^{-1}(2(0)) = 0$, and the upper limit of integration is $\theta = \sin^{-1}(2(\frac{1}{2})) = \frac{\pi}{2}$. We substitute and obtain

$$\begin{aligned}
 \int_0^{1/2} \sqrt{1-4x^2} dx &= \int_0^{\pi/2} \sqrt{1-4\left(\frac{1}{2} \sin \theta\right)^2} \left(\frac{1}{2} \cos \theta\right) d\theta \\
 &= \frac{1}{2} \int_0^{\pi/2} \sqrt{1-\sin^2 \theta} (\cos \theta) d\theta \\
 &= \frac{1}{2} \int_0^{\pi/2} \cos^2 \theta d\theta \\
 &= \frac{1}{2} \int_0^{\pi/2} \frac{1+\cos(2\theta)}{2} d\theta \\
 &= \frac{1}{4} \left[\theta + \frac{1}{2} \sin(2\theta) \right]_0^{\pi/2} \\
 &= \frac{1}{4} \left[\left(\frac{\pi}{2} + \frac{1}{2} \sin\left(2\left(\frac{\pi}{2}\right)\right) \right) - \left(0 + \frac{1}{2} \sin(2(0)) \right) \right] \\
 &= \boxed{\frac{1}{8}\pi}.
 \end{aligned}$$

51. Let $x = \tan \theta$, then $dx = \sec^2 \theta d\theta$. The lower limit of integration is $\theta = \tan^{-1} 0 = 0$, and the upper limit of integration is $\theta = \tan^{-1} 1 = \frac{\pi}{4}$. We substitute and obtain

$$\begin{aligned}
 \int_0^1 \sqrt{1+x^2} dx &= \int_0^{\pi/4} \sqrt{1+(\tan \theta)^2} (\sec^2 \theta) d\theta \\
 &= \int_0^{\pi/4} (\sec \theta) \sec^2 \theta d\theta \\
 &= \int_0^{\pi/4} \sec^3 \theta d\theta \\
 &= \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right]_0^{\pi/4} \\
 &= \frac{1}{2} \sec \frac{\pi}{4} \tan \frac{\pi}{4} + \frac{1}{2} \ln \left| \sec \frac{\pi}{4} + \tan \frac{\pi}{4} \right| - \left(\frac{1}{2} \sec 0 \tan 0 + \frac{1}{2} \ln |\sec 0 + \tan 0| \right) \\
 &= \boxed{\frac{\sqrt{2} + \ln(\sqrt{2}+1)}{2}}.
 \end{aligned}$$

52. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 3 \tan \theta$, then $dx = 3 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{9+x^2}} dx &= \int \frac{(3 \tan \theta)^2}{\sqrt{9+(3 \tan \theta)^2}} (3 \sec^2 \theta) d\theta \\
 &= 27 \int \frac{\tan^2 \theta}{\sqrt{9 \tan^2 \theta + 9}} \sec^2 \theta d\theta \\
 &= 9 \int \frac{\tan^2 \theta}{\sec \theta} \sec^2 \theta d\theta \\
 &= 9 \int \tan^2 \theta \sec \theta d\theta \\
 &= 9 \int (\sec^2 \theta - 1) \sec \theta d\theta \\
 &= 9 \int (\sec^3 \theta - \sec \theta) d\theta \\
 &= \frac{9}{2} \sec \theta \tan \theta - \frac{9}{2} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

Since $\tan \theta = \frac{x}{3}$, $\sec \theta = \sqrt{1 + \tan^2 \theta} = \sqrt{1 + \left(\frac{x}{3}\right)^2} = \frac{1}{3} \sqrt{9 + x^2}$. So

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{9+x^2}} dx &= \frac{9}{2} \sec \theta \tan \theta - \frac{9}{2} \ln |\sec \theta + \tan \theta| + C \\
 &= \frac{9}{2} \left(\frac{1}{3} \sqrt{9+x^2} \right) \left(\frac{x}{3} \right) - \frac{9}{2} \ln \left| \frac{1}{3} \sqrt{9+x^2} + \frac{x}{3} \right| + C \\
 &= \frac{1}{2} x \sqrt{x^2+9} - \frac{9}{2} \ln \left| \frac{1}{3} x + \frac{1}{3} \sqrt{x^2+9} \right| + C
 \end{aligned}$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_0^2 \frac{x^2}{\sqrt{9+x^2}} dx &= \left[\frac{1}{2} x \sqrt{x^2+9} - \frac{9}{2} \ln \left| \frac{1}{3} x + \frac{1}{3} \sqrt{x^2+9} \right| \right]_0^2 \\
 &= \left(\frac{1}{2} 2 \sqrt{2^2+9} - \frac{9}{2} \ln \left| \frac{1}{3} 2 + \frac{1}{3} \sqrt{2^2+9} \right| \right) \\
 &\quad - \left(\frac{1}{2} 0 \sqrt{0^2+9} - \frac{9}{2} \ln \left| \frac{1}{3} 0 + \frac{1}{3} \sqrt{0^2+9} \right| \right) \\
 &= \left(\sqrt{13} - \frac{9}{2} \ln \left(\frac{1}{3} \sqrt{13} + \frac{2}{3} \right) \right) - 0 \\
 &= \boxed{\sqrt{13} - \frac{9}{2} \ln \left(\frac{1}{3} \sqrt{13} + \frac{2}{3} \right)}.
 \end{aligned}$$

53. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 3 \sec \theta$, then $dx = 3 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{x^2-9}} dx &= \int \frac{(3 \sec \theta)^2}{\sqrt{(3 \sec \theta)^2-9}} (3 \sec \theta \tan \theta) d\theta \\
 &= 27 \int \frac{\sec^2 \theta}{\sqrt{9 \sec^2 \theta-9}} \sec \theta \tan \theta d\theta \\
 &= 9 \int \frac{\sec^2 \theta}{\sqrt{\sec^2 \theta-1}} \sec \theta \tan \theta d\theta \\
 &= 9 \int \frac{\sec^2 \theta}{\tan \theta} \sec \theta \tan \theta d\theta \\
 &= 9 \int \sec^3 \theta d\theta \\
 &= \frac{9}{2} \sec \theta \tan \theta + \frac{9}{2} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

Since $\sec \theta = \frac{x}{3}$, $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{3}\right)^2 - 1} = \frac{1}{3} \sqrt{x^2 - 9}$. So

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{x^2-9}} dx &= \frac{9}{2} \left(\frac{1}{3} \sqrt{x^2-9} \right) \frac{x}{3} + \frac{9}{2} \ln \left| \frac{1}{3} \sqrt{x^2-9} + \frac{x}{3} \right| + C \\
 &= \frac{1}{2} x \sqrt{x^2-9} + \frac{9}{2} \ln \left| \frac{1}{3} \sqrt{x^2-9} + \frac{x}{3} \right| + C.
 \end{aligned}$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_4^5 \frac{x^2}{\sqrt{x^2-9}} dx &= \left[\frac{1}{2} x \sqrt{x^2-9} + \frac{9}{2} \ln \left| \frac{1}{3} \sqrt{x^2-9} + \frac{x}{3} \right| \right]_4^5 \\
 &= \left(\frac{1}{2} 5 \sqrt{5^2-9} + \frac{9}{2} \ln \left| \frac{1}{3} \sqrt{5^2-9} + \frac{5}{3} \right| \right) - \left(\frac{1}{2} 4 \sqrt{4^2-9} + \frac{9}{2} \ln \left| \frac{1}{3} \sqrt{4^2-9} + \frac{4}{3} \right| \right) \\
 &= \frac{9}{2} \ln 3 + 10 - \left(\frac{9}{2} \ln \left(\frac{1}{3} \sqrt{7} + \frac{4}{3} \right) + 2\sqrt{7} \right) \\
 &= \frac{9}{2} \ln 3 + 10 - \frac{9}{2} \ln (\sqrt{7} + 4) + \frac{9}{2} \ln 3 - 2\sqrt{7} \\
 &= \boxed{10 - 2\sqrt{7} + 9 \ln 3 - \frac{9}{2} \ln (4 + \sqrt{7})}.
 \end{aligned}$$

54. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = \frac{1}{2} \sec \theta$, then $dx = \frac{1}{2} \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{4x^2 - 1}} dx &= \int \frac{\left(\frac{1}{2} \sec \theta\right)^2}{\sqrt{4\left(\frac{1}{2} \sec \theta\right)^2 - 1}} \left(\frac{1}{2} \sec \theta \tan \theta\right) d\theta \\
 &= \frac{1}{8} \int \frac{\sec^2 \theta}{\sqrt{\sec^2 \theta - 1}} \sec \theta \tan \theta d\theta \\
 &= \frac{1}{8} \int \frac{\sec^2 \theta}{\sqrt{\sec^2 \theta - 1}} \sec \theta \tan \theta d\theta \\
 &= \frac{1}{8} \int \frac{\sec^2 \theta}{\tan \theta} \sec \theta \tan \theta d\theta \\
 &= \frac{1}{8} \int \sec^3 \theta d\theta \\
 &= \frac{1}{16} \sec \theta \tan \theta + \frac{1}{16} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

Since $\sec \theta = 2x$, $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{(2x)^2 - 1} = \sqrt{4x^2 - 1}$. So

$$\begin{aligned}
 \int \frac{x^2}{\sqrt{4x^2 - 1}} dx &= \frac{1}{16} (2x) \sqrt{4x^2 - 1} + \frac{1}{16} \ln |2x + \sqrt{4x^2 - 1}| + C \\
 &= \frac{1}{8} x \sqrt{4x^2 - 1} + \frac{1}{16} \ln |2x + \sqrt{4x^2 - 1}| + C.
 \end{aligned}$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_1^2 \frac{x^2}{\sqrt{4x^2 - 1}} dx &= \left[\frac{1}{8} x \sqrt{4x^2 - 1} + \frac{1}{16} \ln |2x + \sqrt{4x^2 - 1}| \right]_1^2 \\
 &= \left(\frac{1}{8} 2 \sqrt{4(2)^2 - 1} + \frac{1}{16} \ln |2(2) + \sqrt{4(2)^2 - 1}| \right) \\
 &\quad - \left(\frac{1}{8} (1) \sqrt{4(1)^2 - 1} + \frac{1}{16} \ln |2(1) + \sqrt{4(1)^2 - 1}| \right) \\
 &= \left(\frac{1}{16} \ln (\sqrt{15} + 4) + \frac{1}{4} \sqrt{15} \right) - \left(\frac{1}{16} \ln (\sqrt{3} + 2) + \frac{1}{8} \sqrt{3} \right) \\
 &= \boxed{\frac{1}{16} \ln (\sqrt{15} + 4) - \frac{1}{16} \ln (\sqrt{3} + 2) - \frac{1}{8} \sqrt{3} + \frac{1}{4} \sqrt{15}}.
 \end{aligned}$$

55. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 4 \sin \theta$, then $dx = 4 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{(16-x^2)^{3/2}} dx &= \int \frac{(4 \sin \theta)^2}{(16 - (4 \sin \theta)^2)^{3/2}} (4 \cos \theta) d\theta \\
 &= 64 \int \frac{\sin^2 \theta}{(16 \cos^2 \theta)^{3/2}} \cos \theta d\theta \\
 &= \int \frac{\sin^2 \theta \cos \theta}{\cos^3 \theta} d\theta \\
 &= \int \tan^2 \theta d\theta \\
 &= \int (\sec^2 \theta - 1) d\theta \\
 &= \tan \theta - \theta + C \\
 &= \frac{\sin \theta}{\cos \theta} - \theta + C.
 \end{aligned}$$

Since $\sin \theta = \frac{x}{4}$, $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \left(\frac{x}{4}\right)^2} = \frac{1}{4} \sqrt{16 - x^2}$. So we have

$$\begin{aligned}
 \int \frac{x^2}{(16-x^2)^{3/2}} dx &= \frac{\frac{x}{4}}{\frac{1}{4} \sqrt{16-x^2}} - \sin^{-1} \frac{x}{4} + C \\
 &= \frac{x}{\sqrt{16-x^2}} - \sin^{-1} \frac{x}{4} + C.
 \end{aligned}$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_0^2 \frac{x^2}{(16-x^2)^{3/2}} dx &= \left[\frac{x}{\sqrt{16-x^2}} - \sin^{-1} \frac{x}{4} \right]_0^2 \\
 &= \left(\frac{2}{\sqrt{16-2^2}} - \sin^{-1} \frac{2}{4} \right) - \left(\frac{0}{\sqrt{4-0^2}} - \sin^{-1} \frac{0}{4} \right) \\
 &= \frac{\sqrt{3}}{3} - \frac{\pi}{6} - 0 \\
 &= \boxed{\frac{\sqrt{3}}{3} - \frac{\pi}{6}}.
 \end{aligned}$$

56. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 5 \sin \theta$, then $dx = 5 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{(25-x^2)^{3/2}} dx &= \int \frac{(5 \sin \theta)^2}{(25 - (5 \sin \theta)^2)^{3/2}} (5 \cos \theta) d\theta \\
 &= 125 \int \frac{\sin^2 \theta}{(25 \cos^2 \theta)^{3/2}} \cos \theta d\theta \\
 &= \int \frac{\sin^2 \theta \cos \theta}{\cos^3 \theta} d\theta \\
 &= \int \tan^2 \theta d\theta \\
 &= \int (\sec^2 \theta - 1) d\theta \\
 &= \tan \theta - \theta + C.
 \end{aligned}$$

Since $\sin \theta = \frac{x}{5}$, $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \left(\frac{x}{5}\right)^2} = \frac{1}{5}\sqrt{25 - x^2}$. So $\tan \theta = \frac{\frac{x}{5}}{\frac{1}{5}\sqrt{25 - x^2}} = \frac{x}{\sqrt{25 - x^2}}$, and $\theta = \sin^{-1} \frac{x}{5}$. So

$$\int \frac{x^2}{(25 - x^2)^{3/2}} dx = \frac{x}{\sqrt{25 - x^2}} - \sin^{-1} \frac{x}{5} + C.$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned} \int_0^1 \frac{x^2}{(25 - x^2)^{3/2}} dx &= \left[\frac{x}{\sqrt{25 - x^2}} - \sin^{-1} \frac{x}{5} \right]_0^1 \\ &= \left(\frac{1}{\sqrt{25 - 1^2}} - \sin^{-1} \frac{1}{5} \right) - \left(\frac{0}{\sqrt{25 - 0^2}} - \sin^{-1} \frac{0}{5} \right) \\ &= \left(\frac{1}{12}\sqrt{6} - \sin^{-1} \frac{1}{5} \right) - (0) \\ &= \boxed{\frac{1}{12}\sqrt{6} - \sin^{-1} \frac{1}{5}}. \end{aligned}$$

57. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 3 \tan \theta$, then $dx = 3 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{x^2}{9 + x^2} dx &= \int \frac{(3 \tan \theta)^2}{9 + (3 \tan \theta)^2} (3 \sec^2 \theta) d\theta \\ &= 27 \int \frac{\tan^2 \theta}{9 \tan^2 \theta + 9} \sec^2 \theta d\theta \\ &= 3 \int \frac{\tan^2 \theta}{\sec^2 \theta} \sec^2 \theta d\theta \\ &= 3 \int \tan^2 \theta d\theta \\ &= 3 \int (\sec^2 \theta - 1) d\theta \\ &= 3(\tan \theta - \theta) + C. \end{aligned}$$

Since $\tan \theta = \frac{x}{3}$, and $\theta = \tan^{-1} \frac{x}{3}$. So

$$\begin{aligned} \int \frac{x^2}{9 + x^2} dx &= 3 \left(\frac{x}{3} - \tan^{-1} \frac{x}{3} \right) + C \\ &= x - 3 \tan^{-1} \frac{x}{3} + C. \end{aligned}$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned} \int_0^3 \frac{x^2}{9 + x^2} dx &= \left[x - 3 \tan^{-1} \frac{x}{3} \right]_0^3 \\ &= \left(3 - 3 \tan^{-1} \frac{3}{3} \right) - \left(0 - 3 \tan^{-1} \frac{0}{3} \right) \\ &= \left(3 - \frac{3}{4}\pi \right) - (0) \\ &= \boxed{3 - \frac{3}{4}\pi}. \end{aligned}$$

58. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 5 \tan \theta$, then $dx = 5 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^2}{25 + x^2} dx &= \int \frac{(5 \tan \theta)^2}{25 + (5 \tan \theta)^2} (5 \sec^2 \theta) d\theta \\
 &= 125 \int \frac{\tan^2 \theta}{25 \tan^2 \theta + 25} \sec^2 \theta d\theta \\
 &= 5 \int \frac{\tan^2 \theta}{\sec^2 \theta} \sec^2 \theta d\theta \\
 &= 5 \int \tan^2 \theta d\theta \\
 &= 5 \int (\sec^2 \theta - 1) \sec \theta d\theta \\
 &= 5 (\tan \theta - \theta) + C.
 \end{aligned}$$

Since $\tan \theta = \frac{x}{5}$ and $\theta = \tan^{-1} \frac{x}{5}$, we have

$$\begin{aligned}
 \int \frac{x^2}{25 + x^2} dx &= 5 \left(\frac{x}{5} - \tan^{-1} \frac{x}{5} \right) + C \\
 &= x - 5 \tan^{-1} \frac{x}{5} + C.
 \end{aligned}$$

So by the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_0^1 \frac{x^2}{25 + x^2} dx &= \left[x - 5 \tan^{-1} \frac{x}{5} \right]_0^1 \\
 &= 1 - 5 \tan^{-1} \frac{1}{5} - \left(0 - 5 \tan^{-1} \frac{0}{5} \right) \\
 &= \boxed{1 - 5 \tan^{-1} \frac{1}{5}}.
 \end{aligned}$$

Applications and Extensions

59. Let $x = a \sin \theta$, then $dx = a \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{a^2 - x^2} dx &= \int \sqrt{a^2 - (a \sin \theta)^2} (a \cos \theta) d\theta \\
 &= a \int \sqrt{a^2 - a^2 \sin^2 \theta} \cos \theta d\theta \\
 &= a^2 \int \cos^2 \theta d\theta \\
 &= a^2 \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{a^2}{2} \int (1 + \cos(2\theta)) d\theta \\
 &= \frac{a^2}{2} \left(\theta + \frac{1}{2} \sin 2\theta \right) + C \\
 &= \frac{a^2}{2} (\theta + \sin \theta \cos \theta) + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} \left(\frac{x}{a} \right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/a)^2} = \frac{1}{a} \sqrt{a^2 - x^2}$. We obtain

$$\begin{aligned} \int \sqrt{a^2 - x^2} dx &= \frac{a^2}{2} \left(\sin^{-1} \left(\frac{x}{a} \right) + \left(\frac{x}{a} \right) \left(\frac{1}{a} \sqrt{a^2 - x^2} \right) \right) + C \\ &= \frac{1}{2} a^2 \sin^{-1} \left(\frac{x}{a} \right) + \frac{1}{2} x \sqrt{a^2 - x^2} + C. \end{aligned}$$

The area of the ellipse is given by $A = 4 \int_0^a \frac{b}{a} \sqrt{a^2 - x^2} dx$, so we obtain

$$\begin{aligned} A &= 4 \left(\frac{b}{a} \right) \left[\frac{1}{2} a^2 \sin^{-1} \left(\frac{x}{a} \right) + \frac{1}{2} x \sqrt{a^2 - x^2} \right]_0^a \\ &= 4 \left(\frac{b}{a} \right) \left[\frac{1}{2} a^2 \sin^{-1} \left(\frac{a}{a} \right) + \frac{1}{2} a \sqrt{a^2 - a^2} - \left(\frac{1}{2} a^2 \sin^{-1} \left(\frac{0}{a} \right) + \frac{1}{2} (0) \sqrt{a^2 - 0^2} \right) \right] \\ &= \boxed{\pi ab}. \end{aligned}$$

60. (a) We recognize $\int_0^2 \sqrt{4 - x^2} dx$ as the area of the quarter-circle in the first quadrant, centered at $(0, 0)$, with radius 2. So $\int_0^2 \sqrt{4 - x^2} dx = \left(\frac{1}{4} \right) \pi (2)^2 = \boxed{\pi}$.

(b) Let $x = 2 \sin \theta$, then $dx = 2 \cos \theta d\theta$. The lower limit of integration is $\theta = \sin^{-1} \left(\frac{0}{2} \right) = 0$, and the upper limit of integration is $\theta = \sin^{-1} \left(\frac{2}{2} \right) = \frac{\pi}{2}$. We substitute and obtain

$$\begin{aligned} \int_0^2 \sqrt{4 - x^2} dx &= \int_0^{\pi/2} \sqrt{4 - (2 \sin \theta)^2} (2 \cos \theta) d\theta \\ &= 2 \int_0^{\pi/2} \sqrt{4 - 4 \sin^2 \theta} \cos \theta d\theta \\ &= 4 \int_0^{\pi/2} \cos^2 \theta d\theta \\ &= 4 \int_0^{\pi/2} \frac{1 + \cos(2\theta)}{2} d\theta \\ &= 2 \int_0^{\pi/2} (1 + \cos(2\theta)) d\theta \\ &= 2 \left[\theta + \frac{1}{2} \sin 2\theta \right]_0^{\pi/2} \\ &= 2 \left(\frac{\pi}{2} + \frac{1}{2} \sin \left(2 \left(\frac{\pi}{2} \right) \right) \right) - 2 \left(0 + \frac{1}{2} \sin(2(0)) \right) \\ &= \boxed{\pi}. \end{aligned}$$

(c) The area is given by $\int_{-a}^a \sqrt{a^2 - x^2} dx = 2 \int_0^a \sqrt{a^2 - x^2} dx$. Let $x = a \sin \theta$, then $dx = a \cos \theta d\theta$. The lower limit of integration is $\theta = \sin^{-1} \left(\frac{0}{a} \right) = 0$, and the upper

limit of integration is $\theta = \sin^{-1}\left(\frac{a}{a}\right) = \frac{\pi}{2}$. We substitute and obtain

$$\begin{aligned}
 2 \int_0^a \sqrt{a^2 - x^2} \, dx &= 2 \int_0^{\pi/2} \sqrt{a^2 - (a \sin \theta)^2} (a \cos \theta) \, d\theta \\
 &= 2a \int_0^{\pi/2} \sqrt{a^2 - a^2 \sin^2 \theta} \cos \theta \, d\theta \\
 &= 2a^2 \int_0^{\pi/2} \cos^2 \theta \, d\theta \\
 &= 2a^2 \int_0^{\pi/2} \frac{1 + \cos(2\theta)}{2} \, d\theta \\
 &= a^2 \int_0^{\pi/2} (1 + \cos(2\theta)) \, d\theta \\
 &= a^2 \left[\theta + \frac{1}{2} \sin 2\theta \right]_0^{\pi/2} \\
 &= a^2 \left(\frac{\pi}{2} + \frac{1}{2} \sin \left(2 \left(\frac{\pi}{2} \right) \right) \right) - a^2 \left(0 + \frac{1}{2} \sin(2(0)) \right) \\
 &= \boxed{\frac{1}{2} \pi a^2}.
 \end{aligned}$$

61. The average value is given by $\frac{1}{1-0} \int_0^1 \frac{1}{\sqrt{9-4x^2}} \, dx = \int_0^1 \frac{1}{\sqrt{9-4x^2}} \, dx$. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = \frac{3}{2} \sin \theta$, then $dx = \frac{3}{2} \cos \theta \, d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{1}{\sqrt{9-4x^2}} \, dx &= \int \frac{1}{\sqrt{9-4\left(\frac{3}{2} \sin \theta\right)^2}} \left(\frac{3}{2} \cos \theta \right) \, d\theta \\
 &= \frac{3}{2} \int \frac{1}{\sqrt{9-9 \sin^2 \theta}} (\cos \theta) \, d\theta \\
 &= \frac{1}{2} \int \frac{\cos \theta}{\cos \theta} \, d\theta \\
 &= \frac{1}{2} \int d\theta \\
 &= \frac{1}{2} \theta + C \\
 &= \frac{1}{2} \sin^{-1} \frac{2x}{3} + C.
 \end{aligned}$$

So by the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_0^1 \frac{1}{\sqrt{9-4x^2}} \, dx &= \left[\frac{1}{2} \sin^{-1} \frac{2x}{3} \right]_0^1 \\
 &= \left(\frac{1}{2} \sin^{-1} \frac{2(1)}{3} \right) - \left(\frac{1}{2} \sin^{-1} \frac{2(0)}{3} \right) \\
 &= \left(\frac{1}{2} \sin^{-1} \frac{2}{3} \right) - (0) \\
 &= \boxed{\frac{1}{2} \sin^{-1} \left(\frac{2}{3} \right)}.
 \end{aligned}$$

62. The average value is given by $\frac{1}{7-2} \int_2^7 \sqrt{x^2-4} dx = \frac{1}{5} \int_2^7 \sqrt{x^2-4} dx$. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 2 \sec \theta$, then $dx = 2 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned} \frac{1}{5} \int \sqrt{x^2-4} dx &= \frac{1}{5} \int \sqrt{(2 \sec \theta)^2 - 4} (2 \sec \theta \tan \theta) d\theta \\ &= \frac{2}{5} \int \sqrt{4 \sec^2 \theta - 4} \sec \theta \tan \theta d\theta \\ &= \frac{4}{5} \int \sec \theta \tan^2 \theta d\theta \\ &= \frac{4}{5} \int (\sec^3 \theta - \sec \theta) d\theta \\ &= \frac{4}{5} \left(\frac{1}{2} \sec \theta \tan \theta - \frac{1}{2} \ln |\sec \theta + \tan \theta| \right) + C. \end{aligned}$$

Since $\sec \theta = \frac{x}{2}$, $\tan \theta = \sqrt{\left(\frac{x}{2}\right)^2 - 1} = \frac{1}{2} \sqrt{x^2 - 4}$. So

$$\begin{aligned} \frac{1}{5} \int \sqrt{x^2-4} dx &= \frac{4}{5} \left(\frac{1}{2} \left(\frac{x}{2} \right) \left(\frac{1}{2} \sqrt{x^2-4} \right) - \frac{1}{2} \ln \left| \frac{x}{2} + \frac{1}{2} \sqrt{x^2-4} \right| \right) + C \\ &= \frac{1}{10} x \sqrt{x^2-4} - \frac{2}{5} \ln \left| \frac{1}{2} x + \frac{1}{2} \sqrt{x^2-4} \right| + C. \end{aligned}$$

So by the Fundamental Theorem of Calculus,

$$\begin{aligned} \frac{1}{5} \int_2^7 \sqrt{x^2-4} dx &= \left[\frac{1}{10} x \sqrt{x^2-4} - \frac{2}{5} \ln \left| \frac{1}{2} x + \frac{1}{2} \sqrt{x^2-4} \right| \right]_2^7 \\ &= \left(\frac{1}{10} 7 \sqrt{7^2-4} - \frac{2}{5} \ln \left| \frac{1}{2} 7 + \frac{1}{2} \sqrt{7^2-4} \right| \right) \\ &\quad - \left(\frac{1}{10} 2 \sqrt{2^2-4} - \frac{2}{5} \ln \left| \frac{1}{2} 2 + \frac{1}{2} \sqrt{2^2-4} \right| \right) \\ &= \frac{21}{10} \sqrt{5} - \frac{2}{5} \ln \left(\frac{3}{2} \sqrt{5} + \frac{7}{2} \right) - (0) \\ &= \boxed{\frac{21}{10} \sqrt{5} - \frac{2}{5} \ln \left(\frac{3}{2} \sqrt{5} + \frac{7}{2} \right)}. \end{aligned}$$

63. The area under the graph is given by $\int_0^2 \frac{x^3}{\sqrt{9-x^2}} dx$. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 3 \sin \theta$, then

$dx = 3 \cos \theta \, d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{x^3}{\sqrt{9-x^2}} \, dx &= \int \frac{(3 \sin \theta)^3}{\sqrt{9-(3 \sin \theta)^2}} (3 \cos \theta) \, d\theta \\
 &= 81 \int \frac{\sin^3 \theta}{\sqrt{9-9 \sin^2 \theta}} \cos \theta \, d\theta \\
 &= 27 \int \frac{\sin^3 \theta}{\cos \theta} \cos \theta \, d\theta \\
 &= 27 \int (1 - \cos^2 \theta) \sin \theta \, d\theta \\
 &= 27 \int (\sin \theta - \sin \theta \cos^2 \theta) \sin \theta \, d\theta \\
 &= 27 \left(-\cos \theta + \frac{1}{3} \cos^3 \theta \right) + C.
 \end{aligned}$$

Since $\sin \theta = \frac{x}{3}$, $\cos \theta = \sqrt{1 - \left(\frac{x}{3}\right)^2} = \frac{1}{3} \sqrt{9-x^2}$. So

$$\begin{aligned}
 \int \frac{x^3}{\sqrt{9-x^2}} \, dx &= 27 \left(-\frac{1}{3} \sqrt{9-x^2} + \frac{1}{3} \left(\frac{1}{3} \sqrt{9-x^2} \right)^3 \right) + C \\
 &= \frac{1}{3} (9-x^2)^{\frac{3}{2}} - 9\sqrt{9-x^2} + C.
 \end{aligned}$$

So by the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_0^2 \frac{x^3}{\sqrt{9-x^2}} \, dx &= \left[\frac{1}{3} (9-x^2)^{\frac{3}{2}} - 9\sqrt{9-x^2} \right]_0^2 \\
 &= \left(\frac{1}{3} (9-2^2)^{\frac{3}{2}} - 9\sqrt{9-2^2} \right) - \left(\frac{1}{3} (9-0^2)^{\frac{3}{2}} - 9\sqrt{9-0^2} \right) \\
 &= -\frac{22}{3} \sqrt{5} - (-18) \\
 &= \boxed{18 - \frac{22}{3} \sqrt{5}}.
 \end{aligned}$$

64. The area under the graph is given by $\int_0^4 x \sqrt{16-x^2} \, dx$. Let $u = 16-x^2$, then $du = -2x \, dx$, so $x \, dx = (-\frac{1}{2}) du$. The lower limit of integration is $u = 16-0^2 = 16$, and the upper limit of integration is $u = 16-(4)^2 = 0$. We substitute and obtain

$$\begin{aligned}
 \int_0^4 x \sqrt{16-x^2} \, dx &= \int_{16}^0 \sqrt{u} \left(-\frac{1}{2} \right) du \\
 &= \frac{1}{2} \int_0^{16} u^{1/2} \, du \\
 &= \frac{1}{2} \left[\frac{2}{3} u^{\frac{3}{2}} \right]_0^{16} \\
 &= \frac{1}{2} \left[\frac{2}{3} (16)^{\frac{3}{2}} - \frac{2}{3} (0)^{\frac{3}{2}} \right] \\
 &= \boxed{\frac{64}{3}}.
 \end{aligned}$$

65. The area under the graph is given by $\int_3^5 \frac{x^2}{\sqrt{x^2-1}} dx$. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = \sec \theta$, then $dx = \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{x^2}{\sqrt{x^2-1}} dx &= \int \frac{(\sec \theta)^2}{\sqrt{(\sec \theta)^2-1}} (\sec \theta \tan \theta) d\theta \\ &= \int \frac{\sec^2 \theta}{\tan \theta} \sec \theta \tan \theta d\theta \\ &= \int \sec^3 \theta d\theta \\ &= \frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| + C. \end{aligned}$$

Since $\sec \theta = x$, $\tan \theta = \sqrt{x^2-1}$. So

$$\int \frac{x^2}{\sqrt{x^2-1}} dx = \frac{1}{2} x \sqrt{x^2-1} + \frac{1}{2} \ln |x + \sqrt{x^2-1}| + C.$$

So by the Fundamental Theorem of Calculus,

$$\begin{aligned} \int_3^5 \frac{x^2}{\sqrt{x^2-1}} dx &= \left(\frac{1}{2} 5 \sqrt{5^2-1} + \frac{1}{2} \ln |5 + \sqrt{5^2-1}| \right) - \left(\frac{1}{2} 3 \sqrt{3^2-1} + \frac{1}{2} \ln |3 + \sqrt{3^2-1}| \right) \\ &= \frac{1}{2} \ln (2\sqrt{6} + 5) + 5\sqrt{6} - \left(\frac{1}{2} \ln (2\sqrt{2} + 3) + 3\sqrt{2} \right) \\ &= \boxed{\frac{1}{2} \ln (2\sqrt{6} + 5) - \frac{1}{2} \ln (2\sqrt{2} + 3) - 3\sqrt{2} + 5\sqrt{6}}. \end{aligned}$$

66. The force due to hydrostatic pressure is given by the integral $\int_{-2}^2 (1000(9.8)(3-y))(2\sqrt{4-y^2}) dy$. We expand, and recognize the final integral as the area of a quarter-circle to obtain

$$\begin{aligned}\int_{-2}^2 (9800(3-y))(2\sqrt{4-y^2}) dy &= 58800 \int_{-2}^2 \sqrt{4-y^2} dy - 196000 \int_{-2}^2 y\sqrt{4-y^2} dy \\ &= 117600 \int_0^2 \sqrt{4-y^2} dy - 0 \\ &= 117600 \left(\frac{1}{4} \pi (2)^2 \right) \\ &= \boxed{117600\pi \text{ N}}.\end{aligned}$$

67. (a) We equate $x^2 = 4 - y^2$ with $x^2 = 1 - (y-2)^2$ to get the points of intersection. We obtain

$$\begin{aligned}4 - y^2 &= 1 - (y-2)^2 \\ 4 - y^2 &= -y^2 + 4y - 3 \\ 4 &= 4y - 3 \\ \frac{7}{4} &= y.\end{aligned}$$

So $x^2 = 4 - \left(\frac{7}{4}\right)^2 = \frac{15}{16}$, and $x = \pm \frac{\sqrt{15}}{4}$. The area is given by

$$A = \int_{-\frac{\sqrt{15}}{4}}^{\frac{\sqrt{15}}{4}} \left[\sqrt{4-x^2} - \left(2 - \sqrt{1-x^2}\right) \right] dx = 2 \int_0^{\frac{\sqrt{15}}{4}} \left[\sqrt{4-x^2} - \left(2 - \sqrt{1-x^2}\right) \right] dx.$$

We expand to obtain

$$\begin{aligned}A &= 2 \int_0^{\frac{\sqrt{15}}{4}} \sqrt{4-x^2} dx + 2 \int_0^{\frac{\sqrt{15}}{4}} \sqrt{1-x^2} dx - 2 \int_0^{\frac{\sqrt{15}}{4}} 2 dx \\ &= 2 \int_0^{\frac{\sqrt{15}}{4}} \sqrt{4-x^2} dx + 2 \int_0^{\frac{\sqrt{15}}{4}} \sqrt{1-x^2} dx - \sqrt{15}\end{aligned}$$

For the first integral, we evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 2 \sin \theta$, then $dx = 2 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}2 \int \sqrt{4-x^2} dx &= 2 \int \sqrt{4-(2 \sin \theta)^2} (2 \cos \theta) d\theta \\ &= 4 \int \sqrt{4-4 \sin^2 \theta} \cos \theta d\theta \\ &= 8 \int \cos^2 \theta d\theta \\ &= 8 \int \frac{1 + \cos(2\theta)}{2} d\theta \\ &= 4 \int (1 + \cos(2\theta)) d\theta \\ &= 4 \left(\theta + \frac{1}{2} \sin 2\theta \right) + C \\ &= 4\theta + 4 \cos \theta \sin \theta + C.\end{aligned}$$

Since $\sin \theta = \frac{x}{2}$, $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \left(\frac{x}{2}\right)^2} = \frac{1}{2}\sqrt{4 - x^2}$, and $\theta = \sin^{-1} \frac{x}{2}$. We obtain

$$\begin{aligned} 2 \int \sqrt{4 - x^2} \, dx &= 4 \sin^{-1} \frac{x}{2} + 4 \left(\frac{1}{2} \sqrt{4 - x^2} \right) \left(\frac{x}{2} \right) + C \\ &= 4 \sin^{-1} \frac{x}{2} + x \sqrt{4 - x^2} + C. \end{aligned}$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned} 2 \int_0^{\frac{\sqrt{15}}{4}} \sqrt{4 - x^2} \, dx &= \left[4 \sin^{-1} \frac{x}{2} + x \sqrt{4 - x^2} \right]_0^{\frac{\sqrt{15}}{4}} \\ &= \left(4 \sin^{-1} \left(\frac{\frac{\sqrt{15}}{4}}{2} \right) + \frac{\sqrt{15}}{4} \sqrt{4 - \left(\frac{\sqrt{15}}{4} \right)^2} \right) - \left(4 \sin^{-1} \frac{0}{2} + 0 \sqrt{4 - 0^2} \right) \\ &= \left(4 \sin^{-1} \left(\frac{\sqrt{15}}{8} \right) + \frac{7\sqrt{15}}{16} \right) - 0 \\ &= 4 \sin^{-1} \left(\frac{\sqrt{15}}{8} \right) + \frac{7\sqrt{15}}{16}. \end{aligned}$$

For the second integral, we evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = \sin \theta$, then $dx = \cos \theta \, d\theta$. We substitute and obtain

$$\begin{aligned} 2 \int \sqrt{1 - x^2} \, dx &= 2 \int \sqrt{1 - \sin^2 \theta} (\cos \theta) \, d\theta \\ &= 2 \int \cos^2 \theta \, d\theta \\ &= 2 \int \frac{1 + \cos(2\theta)}{2} \, d\theta \\ &= \int (1 + \cos(2\theta)) \, d\theta \\ &= \theta + \frac{1}{2} \sin 2\theta + C \\ &= \theta + \cos \theta \sin \theta + C. \end{aligned}$$

Since $\sin \theta = x$, $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - x^2}$, and $\theta = \sin^{-1} x$. We obtain

$$\begin{aligned} 2 \int \sqrt{1 - x^2} \, dx &= \sin^{-1} x + \sqrt{1 - x^2} (x) + C \\ &= \sin^{-1} x + x \sqrt{1 - x^2} + C. \end{aligned}$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned}
 2 \int_0^{\frac{\sqrt{15}}{4}} \sqrt{1-x^2} dx &= \left[\sin^{-1} x + x\sqrt{1-x^2} \right]_0^{\frac{\sqrt{15}}{4}} \\
 &= \left(\sin^{-1} \frac{\sqrt{15}}{4} + \frac{\sqrt{15}}{4} \sqrt{1 - \left(\frac{\sqrt{15}}{4} \right)^2} \right) - \left(\sin^{-1} 0 + 0\sqrt{1-0^2} \right) \\
 &= \left(\sin^{-1} \frac{\sqrt{15}}{4} + \frac{\sqrt{15}}{16} \right) - 0 \\
 &= \sin^{-1} \frac{\sqrt{15}}{4} + \frac{\sqrt{15}}{16}.
 \end{aligned}$$

So we obtain $A = 2 \int_0^{\frac{\sqrt{15}}{4}} \sqrt{4-x^2} dx + 2 \int_0^{\frac{\sqrt{15}}{4}} \sqrt{1-x^2} dx - \sqrt{15} = \left(4 \sin^{-1} \frac{\sqrt{15}}{8} + \frac{7\sqrt{15}}{16} \right) + \left(\sin^{-1} \frac{\sqrt{15}}{4} + \frac{\sqrt{15}}{16} \right) - \sqrt{15} = \boxed{\sin^{-1} \frac{\sqrt{15}}{4} + 4 \sin^{-1} \frac{\sqrt{15}}{8} - \frac{1}{2}\sqrt{15}}.$

(b) Here we subtract the area of the smaller lune from the area of the upper circle. We obtain

$$\begin{aligned}
 A &= \pi(1)^2 - \left(\sin^{-1} \frac{\sqrt{15}}{4} + 4 \sin^{-1} \frac{\sqrt{15}}{8} - \frac{1}{2}\sqrt{15} \right) \\
 &= \boxed{\pi - \sin^{-1} \frac{\sqrt{15}}{4} - 4 \sin^{-1} \frac{\sqrt{15}}{8} + \frac{1}{2}\sqrt{15}}.
 \end{aligned}$$

68. (a) The points of intersection are determined by $y^2 = 16\left(\frac{6^2}{9} - 1\right) = 48$, so $y = \pm 4\sqrt{3}$.

The area is given by $A = \int_{-4\sqrt{3}}^{4\sqrt{3}} \left(6 - \frac{3}{4}\sqrt{y^2 + 16} \right) dy$. We expand to obtain

$$\begin{aligned}
 A &= 2 \int_0^{4\sqrt{3}} \left(6 - \frac{3}{4}\sqrt{y^2 + 16} \right) dy \\
 &= 12 \int_0^{4\sqrt{3}} dy - \frac{3}{2} \int_0^{4\sqrt{3}} \sqrt{y^2 + 16} dy \\
 &= 48\sqrt{3} - \frac{3}{2} \int_0^{4\sqrt{3}} \sqrt{y^2 + 16} dy.
 \end{aligned}$$

Let $y = 4 \tan \theta$, then $dy = 4 \sec^2 \theta d\theta$. The lower limit of integration is $\theta = \tan^{-1} \left(\frac{0}{4} \right) = 0$, and the upper limit of integration is $\theta = \tan^{-1} \left(\frac{4\sqrt{3}}{4} \right) = \frac{\pi}{3}$. We substitute and

obtain

$$\begin{aligned}
 A &= 48\sqrt{3} - \frac{3}{2} \int_0^{\pi/3} \sqrt{(4 \tan \theta)^2 + 16} (4 \sec^2 \theta) d\theta \\
 &= 48\sqrt{3} - 24 \int_0^{\pi/3} \sec^3 \theta d\theta \\
 &= 48\sqrt{3} - 24 \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right]_0^{\pi/3} \\
 &= 48\sqrt{3} - 24 \left[\frac{1}{2} \sec \frac{\pi}{3} \tan \frac{\pi}{3} + \frac{1}{2} \ln \left| \sec \frac{\pi}{3} + \tan \frac{\pi}{3} \right| \right] \\
 &\quad + 24 \left[\frac{1}{2} \sec 0 \tan 0 + \frac{1}{2} \ln |\sec 0 + \tan 0| \right] \\
 &= \boxed{24\sqrt{3} - 12 \ln (\sqrt{3} + 2)}.
 \end{aligned}$$

(b)

69. The length of the graph is given by $L = \int_0^5 \sqrt{1 + \left[\frac{d}{dx}(5x - x^2)\right]^2} dx = \int_0^5 \sqrt{1 + (5 - 2x)^2} dx$. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $u = 5 - 2x$, so $du = -2 dx$ and $dx = -\frac{1}{2} du$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{1 + (5 - 2x)^2} dx &= \int \sqrt{1 + u^2} \left(-\frac{1}{2} du\right) \\
 &= -\frac{1}{2} \int \sqrt{1 + u^2} du.
 \end{aligned}$$

Let $u = \tan \theta$, then $du = \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{1 + (5 - 2x)^2} dx &= -\frac{1}{2} \int \sqrt{1 + \tan^2 \theta} \sec^2 \theta d\theta \\
 &= -\frac{1}{2} \int \sec^3 \theta d\theta \\
 &= -\frac{1}{4} \sec \theta \tan \theta - \frac{1}{4} \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

Since $\tan \theta = u$, $\sec \theta = \sqrt{1 + \tan^2 \theta} = \sqrt{1 + u^2}$, and also substituting $u = 5 - 2x$, we obtain

$$\begin{aligned}
 \int \sqrt{1 + (5 - 2x)^2} dx &= -\frac{1}{4} \sqrt{1 + u^2} (u) - \frac{1}{4} \ln |\sqrt{1 + u^2} + u| + C \\
 &= -\frac{1}{4} (5 - 2x) \sqrt{1 + (5 - 2x)^2} - \frac{1}{4} \ln \left| \sqrt{1 + (5 - 2x)^2} + (5 - 2x) \right| + C.
 \end{aligned}$$

By the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_0^5 \sqrt{1+(5-2x)^2} dx &= \left[-\frac{1}{4}(5-2x)\sqrt{1+(5-2x)^2} - \frac{1}{4} \ln \left| \sqrt{1+(5-2x)^2} + (5-2x) \right| \right]_0^5 \\
 &= \left(-\frac{(5-2(5))\sqrt{1+(5-2(5))^2}}{4} - \frac{\ln \left| \sqrt{1+(5-2(5))^2} + 5-2(5) \right|}{4} \right) \\
 &\quad - \left(-\frac{(5-2(0))\sqrt{1+(5-2(0))^2}}{4} - \frac{\ln \left| \sqrt{1+(5-2(0))^2} + 5-2(0) \right|}{4} \right) \\
 &= \frac{5}{4}\sqrt{26} - \frac{1}{4} \ln(\sqrt{26}-5) - \left(-\frac{1}{4} \ln(\sqrt{26}+5) - \frac{5}{4}\sqrt{26} \right) \\
 &= \boxed{\frac{1}{4} \ln(\sqrt{26}+5) - \frac{1}{4} \ln(\sqrt{26}-5) + \frac{5}{2}\sqrt{26}}.
 \end{aligned}$$

70. The length of the graph is given by $L = \int_{\sqrt{3}/3}^{\sqrt{3}} \sqrt{1 + \left[\frac{d}{dx}(\ln x) \right]^2} dx = \int_{\sqrt{3}/3}^{\sqrt{3}} \sqrt{1 + \left(\frac{1}{x} \right)^2} dx = \int_{\sqrt{3}/3}^{\sqrt{3}} \frac{\sqrt{1+x^2}}{x} dx$. Let $x = \tan \theta$, then $dx = \sec^2 \theta d\theta$. The lower limit of integration is $\theta = \tan^{-1} \frac{\sqrt{3}}{3} = \frac{\pi}{6}$ and the upper limit of integration is $u = \tan^{-1} \sqrt{3} = \frac{\pi}{3}$. We substitute and obtain

$$\begin{aligned}
 L &= \int_{\pi/6}^{\pi/3} \frac{\sqrt{1+\tan^2 \theta}}{\tan \theta} \sec^2 \theta d\theta \\
 &= \int_{\pi/6}^{\pi/3} \frac{\sec \theta}{\tan \theta} \sec^2 \theta d\theta \\
 &= \int_{\pi/6}^{\pi/3} \frac{\sec^3 \theta}{\tan \theta} d\theta \\
 &= \int_{\pi/6}^{\pi/3} (\sec \theta \tan \theta + \csc \theta) d\theta \\
 &= [\sec \theta - \ln |\csc \theta + \cot \theta|]_{\pi/6}^{\pi/3} \\
 &= \left[\sec \frac{\pi}{3} - \ln \left| \csc \frac{\pi}{3} + \cot \frac{\pi}{3} \right| \right] - \left[\sec \frac{\pi}{6} - \ln \left| \csc \frac{\pi}{6} + \cot \frac{\pi}{6} \right| \right] \\
 &= \left(2 - \ln \sqrt{3} \right) - \left(\frac{2}{3}\sqrt{3} - \ln(\sqrt{3}+2) \right) \\
 &= \boxed{\ln(\sqrt{3}+2) - \ln \sqrt{3} - \frac{2}{3}\sqrt{3} + 2}.
 \end{aligned}$$

71. The volume is given by $\int_0^1 \pi \left(\frac{1}{x^2+4} \right)^2 dx$. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 2 \tan \theta$, then

$dx = 2 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \pi \left(\frac{1}{x^2 + 4} \right)^2 dx &= \pi \int \left(\frac{1}{(2 \tan \theta)^2 + 4} \right)^2 (2 \sec^2 \theta) d\theta \\
 &= 2\pi \int \left(\frac{1}{4 \sec^2 \theta} \right)^2 \sec^2 \theta d\theta \\
 &= \frac{\pi}{8} \int \frac{\sec^2 \theta}{\sec^4 \theta} d\theta \\
 &= \frac{\pi}{8} \int \cos^2 \theta d\theta \\
 &= \frac{\pi}{8} \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{\pi}{16} \int (1 + \cos(2\theta)) d\theta \\
 &= \frac{\pi}{16} \left(\theta + \frac{1}{2} \sin(2\theta) \right) \\
 &= \frac{\pi}{16} (\theta + \sin \theta \cos \theta) + C \\
 &= \frac{\pi}{16} \left(\theta + \frac{\tan \theta}{\sec^2 \theta} \right) + C.
 \end{aligned}$$

Since $\tan \theta = \frac{x}{2}$, $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{\left(\frac{x}{2}\right)^2 + 1} = \frac{1}{2}\sqrt{x^2 + 4}$, and $\theta = \tan^{-1} \frac{x}{2}$. We have

$$\begin{aligned}
 \int \pi \left(\frac{1}{x^2 + 4} \right)^2 dx &= \frac{\pi}{16} \left(\tan^{-1} \frac{x}{2} + \frac{\frac{x}{2}}{\left(\frac{1}{2}\sqrt{x^2 + 4}\right)^2} \right) + C \\
 &= \frac{\pi}{16} \left(\tan^{-1} \frac{x}{2} + \frac{2x}{x^2 + 4} \right) + C.
 \end{aligned}$$

So by the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \int_0^1 \pi \left(\frac{1}{x^2 + 4} \right)^2 dx &= \left[\frac{\pi}{16} \left(\tan^{-1} \frac{x}{2} + \frac{2x}{x^2 + 4} \right) \right]_0^1 \\
 &= \left(\frac{\pi}{16} \left(\tan^{-1} \frac{1}{2} + \frac{2(1)}{(1)^2 + 4} \right) \right) - \left(\frac{\pi}{16} \left(\tan^{-1} \frac{0}{2} + \frac{2(0)}{(0)^2 + 4} \right) \right) \\
 &= \frac{\pi}{16} \left(\tan^{-1} \frac{1}{2} + \frac{2}{5} \right) - 0 \\
 &= \boxed{\frac{\pi}{40} + \frac{\pi}{16} \tan^{-1} \frac{1}{2}}.
 \end{aligned}$$

72. The volume is given by $\int_0^2 \pi \left(\frac{1}{\sqrt{9-x^2}} \right)^2 dx = \pi \int_0^2 \frac{1}{9-x^2} dx$. We evaluate the corresponding indefinite integral, and then apply the Fundamental Theorem of Calculus. Let $x = 3 \sin \theta$,

then $dx = 3 \cos \theta$. We substitute and obtain

$$\begin{aligned}
 \pi \int \frac{1}{9-x^2} dx &= \pi \int \frac{1}{9-(3 \sin \theta)^2} (3 \cos \theta) d\theta \\
 &= 3\pi \int \frac{\cos \theta}{9-9 \sin^2 \theta} d\theta \\
 &= \frac{\pi}{3} \int \frac{\cos \theta}{\cos^2 \theta} d\theta \\
 &= \frac{\pi}{3} \int \sec \theta d\theta \\
 &= \frac{\pi}{3} \ln |\sec \theta + \tan \theta| + C \\
 &= \frac{\pi}{3} \ln \left| \frac{1 + \sin \theta}{\cos \theta} \right| + C
 \end{aligned}$$

Since $\sin \theta = \frac{x}{3}$, $\cos \theta = \sqrt{1 - \left(\frac{x}{3}\right)^2} = \frac{1}{3}\sqrt{9-x^2}$. So

$$\begin{aligned}
 \pi \int \frac{1}{9-x^2} dx &= \frac{\pi}{3} \ln \left| \frac{1 + \frac{x}{3}}{\frac{1}{3}\sqrt{9-x^2}} \right| + C \\
 &= \frac{\pi}{3} \ln \left| \frac{x+3}{\sqrt{9-x^2}} \right| + C.
 \end{aligned}$$

So by the Fundamental Theorem of Calculus,

$$\begin{aligned}
 \pi \int_0^2 \frac{1}{9-x^2} dx &= \left[\frac{\pi}{3} \ln \left| \frac{x+3}{\sqrt{9-x^2}} \right| \right]_0^2 \\
 &= \left(\frac{\pi}{3} \ln \left| \frac{2+3}{\sqrt{9-2^2}} \right| \right) - \left(\frac{\pi}{3} \ln \left| \frac{0+3}{\sqrt{9-0^2}} \right| \right) \\
 &= \left(\frac{\pi}{3} \ln |\sqrt{5}| \right) - \left(\frac{\pi}{3} \ln |1| \right) \\
 &= \boxed{\frac{\pi}{6} \ln 5}.
 \end{aligned}$$

73. Let $u = x - 2$, then $du = dx$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{1-(x-2)^2}} &= \int \frac{du}{\sqrt{1-u^2}} \\
 &= \sin^{-1} u + C \\
 &= \boxed{\sin^{-1}(x-2) + C}.
 \end{aligned}$$

74. Let $u = x + 2$, then $du = dx$. We substitute and obtain

$$\int \sqrt{4-(x+2)^2} dx = \int \sqrt{4-u^2} du.$$

Let $u = 2 \sin \theta$, then $du = 2 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{4 - (x + 2)^2} dx &= \int \sqrt{4 - (2 \sin \theta)^2} (2 \cos \theta) d\theta \\
 &= 2 \int \sqrt{4 - 4 \sin^2 \theta} \cos \theta d\theta \\
 &= 4 \int \cos^2 \theta d\theta \\
 &= 4 \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= 2 \int (1 + \cos(2\theta)) d\theta \\
 &= 2 \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\
 &= 2\theta + 2 \sin \theta \cos \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} \left(\frac{u}{2} \right)$, so $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \left(\frac{u}{2} \right)^2} = \frac{1}{2} \sqrt{4 - u^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{4 - (x + 2)^2} dx &= 2 \sin^{-1} \left(\frac{u}{2} \right) + 2 \left(\frac{u}{2} \right) \left(\frac{1}{2} \sqrt{4 - u^2} \right) + C \\
 &= 2 \sin^{-1} \left(\frac{u}{2} \right) + \frac{1}{2} u \sqrt{4 - u^2} + C.
 \end{aligned}$$

And since $u = x + 2$, we have

$$\int \sqrt{4 - (x + 2)^2} dx = \boxed{2 \sin^{-1} \left(\frac{x+2}{2} \right) + \frac{1}{2} (x + 2) \sqrt{4 - (x + 2)^2} + C}.$$

75. Let $u = x - 1$, then $du = dx$. We substitute and obtain

$$\int \frac{dx}{\sqrt{(x - 1)^2 - 4}} = \int \frac{du}{\sqrt{u^2 - 4}}.$$

Let $u = 2 \sec \theta$, then $du = 2 \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{(x - 1)^2 - 4}} &= \int \frac{2 \sec \theta \tan \theta}{\sqrt{(2 \sec \theta)^2 - 4}} d\theta \\
 &= 2 \int \frac{\sec \theta \tan \theta}{\sqrt{4 \sec^2 \theta - 4}} d\theta \\
 &= \int \frac{\sec \theta \tan \theta}{\tan \theta} d\theta \\
 &= \int \sec \theta d\theta \\
 &= \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\sec \theta = \frac{u}{2}$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{u}{2} \right)^2 - 1} = \frac{1}{2} \sqrt{u^2 - 4}$. We obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{(x - 1)^2 - 4}} &= \ln \left| \frac{u}{2} + \frac{1}{2} \sqrt{u^2 - 4} \right| + C \\
 &= \ln \left| u + \sqrt{u^2 - 4} \right| - \ln 2 + C \\
 &= \ln \left| u + \sqrt{u^2 - 4} \right| + C.
 \end{aligned}$$

And since $u = x - 1$, we have

$$\int \frac{dx}{\sqrt{(x-1)^2 - 4}} = \boxed{\ln \left| x - 1 + \sqrt{(x-1)^2 - 4} \right| + C}.$$

76. Let $u = x - 2$, then $du = dx$. We substitute and obtain

$$\int \frac{dx}{(x-2)\sqrt{(x-2)^2 + 9}} = \int \frac{du}{u\sqrt{u^2 + 9}}.$$

Let $u = 3 \tan \theta$, then $du = 3 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{(x-2)\sqrt{(x-2)^2 + 9}} &= \int \frac{3 \sec^2 \theta}{(3 \tan \theta)\sqrt{(3 \tan \theta)^2 + 9}} d\theta \\ &= \int \frac{\sec^2 \theta}{\tan \theta \sqrt{9 \tan^2 \theta + 9}} d\theta \\ &= \frac{1}{3} \int \frac{\sec^2 \theta}{\tan \theta \sec \theta} d\theta \\ &= \frac{1}{3} \int \frac{\sec \theta}{\tan \theta} d\theta \\ &= \frac{1}{3} \int \csc \theta d\theta \\ &= -\frac{1}{3} \ln |\csc \theta + \cot \theta| + C. \end{aligned}$$

We have $\tan \theta = \frac{u}{3}$, so $\cot \theta = \frac{3}{u}$, and $\csc \theta = \sqrt{1 + \cot^2 \theta} = \sqrt{1 + \left(\frac{3}{u}\right)^2} = \frac{1}{u} \sqrt{u^2 + 9}$. We obtain

$$\int \frac{dx}{(x-2)\sqrt{(x-2)^2 + 9}} = -\frac{1}{3} \ln \left| \frac{\sqrt{u^2 + 9}}{u} + \frac{3}{u} \right| + C.$$

And since $u = x - 2$, we have

$$\int \frac{dx}{(x-2)\sqrt{(x-2)^2 + 9}} = -\frac{1}{3} \ln \left| \frac{\sqrt{(x-2)^2 + 9}}{x-2} + \frac{3}{x-2} \right| + C.$$

77. Let $u = e^x$, then $du = e^x dx$. We substitute and obtain

$$\int e^x \sqrt{25 - e^{2x}} dx = \int \sqrt{25 - u^2} du.$$

Let $u = 5 \sin \theta$, then $du = 5 \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int e^x \sqrt{25 - e^{2x}} dx &= \int \sqrt{25 - (5 \sin \theta)^2} (5 \cos \theta) d\theta \\
 &= 5 \int \sqrt{25 - 25 \sin^2 \theta} \cos \theta d\theta \\
 &= 25 \int \cos^2 \theta d\theta \\
 &= 25 \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{25}{2} \int (1 + \cos(2\theta)) d\theta \\
 &= \frac{25}{2} \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\
 &= \frac{25}{2} \theta + \frac{25}{2} \sin \theta \cos \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} \left(\frac{u}{5} \right)$, so $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \left(\frac{u}{5} \right)^2} = \frac{1}{5} \sqrt{25 - u^2}$. We obtain

$$\begin{aligned}
 \int e^x \sqrt{25 - e^{2x}} dx &= \frac{25}{2} \sin^{-1} \left(\frac{u}{5} \right) + \frac{25}{2} \left(\frac{u}{5} \right) \left(\frac{1}{5} \sqrt{25 - u^2} \right) + C \\
 &= \frac{25}{2} \sin^{-1} \left(\frac{u}{5} \right) + \frac{1}{2} u \sqrt{25 - u^2} + C.
 \end{aligned}$$

And since $u = e^x$, we have

$$\int e^x \sqrt{25 - e^{2x}} dx = \boxed{\frac{25}{2} \sin^{-1} \left(\frac{e^x}{5} \right) + \frac{1}{2} e^x \sqrt{25 - e^{2x}} + C}.$$

78. Let $u = e^x$, then $du = e^x dx$. We substitute and obtain

$$\int e^x \sqrt{4 + e^{2x}} dx = \int \sqrt{4 + u^2} du.$$

Let $u = 2 \tan \theta$, then $du = 2 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int e^x \sqrt{4 + e^{2x}} dx &= \int \sqrt{4 + (2 \tan \theta)^2} (2 \sec^2 \theta) d\theta \\
 &= 2 \int \sqrt{4 + 4 \tan^2 \theta} \sec^2 \theta d\theta \\
 &= 2 \int (2 \sec \theta) \sec^2 \theta d\theta \\
 &= 4 \int \sec^3 \theta d\theta \\
 &= 4 \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right] + C \\
 &= 2 \sec \theta \tan \theta + 2 \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\tan \theta = \frac{u}{2}$, and $\sec \theta = \sqrt{1 + \tan^2 \theta} = \sqrt{1 + (u/2)^2} = \frac{1}{2}\sqrt{4 + u^2}$. We obtain

$$\begin{aligned}\int e^x \sqrt{4 + e^{2x}} dx &= 2 \left(\frac{1}{2} \sqrt{4 + u^2} \right) \left(\frac{u}{2} \right) + 2 \ln \left| \frac{1}{2} \sqrt{4 + u^2} + \left(\frac{u}{2} \right) \right| + C \\ &= \frac{1}{2} u \sqrt{4 + u^2} + 2 \ln \left| \sqrt{4 + u^2} + u \right| - 2 \ln 2 + C \\ &= \frac{1}{2} u \sqrt{4 + u^2} + 2 \ln \left| \sqrt{4 + u^2} + u \right| + C.\end{aligned}$$

And since $u = e^x$, we have

$$\int e^x \sqrt{4 + e^{2x}} dx = \boxed{\frac{1}{2} e^x \sqrt{4 + e^{2x}} + 2 \ln \left| \sqrt{4 + e^{2x}} + e^x \right| + C}.$$

79. Let $u = \sin^{-1} x$ and $dv = x dx$. Then $du = \frac{1}{\sqrt{1-x^2}} dx$ and $v = \frac{1}{2}x^2$. We use integration by parts and obtain

$$\begin{aligned}\int x \sin^{-1} x dx &= \frac{1}{2} x^2 \sin^{-1} x - \int \left(\frac{1}{2} x^2 \right) \left(\frac{1}{\sqrt{1-x^2}} \right) dx \\ &= \frac{1}{2} x^2 \sin^{-1} x - \frac{1}{2} \int \frac{x^2}{\sqrt{1-x^2}} dx.\end{aligned}$$

Let $x = \sin \theta$, then $dx = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}\int x \sin^{-1} x dx &= \frac{1}{2} x^2 \sin^{-1} x - \frac{1}{2} \int \frac{\sin^2 \theta}{\sqrt{1 - \sin^2 \theta}} (\cos \theta) d\theta \\ &= \frac{1}{2} x^2 \sin^{-1} x - \frac{1}{2} \int \sin^2 \theta d\theta \\ &= \frac{1}{2} x^2 \sin^{-1} x - \frac{1}{2} \int \frac{1 - \cos(2\theta)}{2} d\theta \\ &= \frac{1}{2} x^2 \sin^{-1} x - \frac{1}{4} \int (1 - \cos(2\theta)) d\theta \\ &= \frac{1}{2} x^2 \sin^{-1} x - \frac{1}{4} \left(\theta - \frac{1}{2} \sin 2\theta \right) + C \\ &= \frac{1}{2} x^2 \sin^{-1} x - \frac{1}{4} \theta + \frac{1}{4} \sin \theta \cos \theta + C.\end{aligned}$$

We have $\theta = \sin^{-1} x$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - x^2}$. We obtain

$$\int x \sin^{-1} x dx = \boxed{\frac{1}{2} x^2 \sin^{-1} x - \frac{1}{4} \sin^{-1} x + \frac{1}{4} x \sqrt{1 - x^2} + C}.$$

80. Let $u = \cos^{-1} x$ and $dv = x dx$. Then $du = -\frac{1}{\sqrt{1-x^2}} dx$ and $v = \frac{1}{2}x^2$. We use integration by parts and obtain

$$\begin{aligned}\int x \cos^{-1} x dx &= \frac{1}{2} x^2 \cos^{-1} x - \int \left(\frac{1}{2} x^2 \right) \left(-\frac{1}{\sqrt{1-x^2}} \right) dx \\ &= \frac{1}{2} x^2 \cos^{-1} x + \frac{1}{2} \int \frac{x^2}{\sqrt{1-x^2}} dx.\end{aligned}$$

Let $x = \sin \theta$, then $dx = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int x \cos^{-1} x \, dx &= \frac{1}{2} x^2 \cos^{-1} x + \frac{1}{2} \int \frac{\sin^2 \theta}{\sqrt{1 - \sin^2 \theta}} (\cos \theta) d\theta \\
 &= \frac{1}{2} x^2 \cos^{-1} x + \frac{1}{2} \int \sin^2 \theta d\theta \\
 &= \frac{1}{2} x^2 \cos^{-1} x + \frac{1}{2} \int \frac{1 - \cos(2\theta)}{2} d\theta \\
 &= \frac{1}{2} x^2 \cos^{-1} x + \frac{1}{4} \int (1 - \cos(2\theta)) d\theta \\
 &= \frac{1}{2} x^2 \cos^{-1} x + \frac{1}{4} \left(\theta - \frac{1}{2} \sin 2\theta \right) + C \\
 &= \frac{1}{2} x^2 \cos^{-1} x + \frac{1}{4} \theta - \frac{1}{4} \sin \theta \cos \theta + C.
 \end{aligned}$$

We have $\theta = \sin^{-1} x$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - x^2}$. We obtain

$$\int x \cos^{-1} x \, dx = \boxed{\frac{1}{2} x^2 \cos^{-1} x + \frac{1}{4} \sin^{-1} x - \frac{1}{4} x \sqrt{1 - x^2} + C}.$$

81. (a) Let $x = a \tan \theta$, then $dx = a \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{x^2 + a^2} \, dx &= \int \sqrt{(a \tan \theta)^2 + a^2} (a \sec^2 \theta) d\theta \\
 &= a^2 \int \sec^3 \theta d\theta \\
 &= a^2 \left(\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| \right) + C \\
 &= \frac{a^2}{2} (\sec \theta \tan \theta + \ln |\sec \theta + \tan \theta|) + C.
 \end{aligned}$$

We have $\tan \theta = \frac{x}{a}$, and $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{\left(\frac{x}{a}\right)^2 + 1} = \frac{1}{a} \sqrt{x^2 + a^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{x^2 + a^2} \, dx &= \frac{a^2}{2} \left(\frac{1}{a} \sqrt{x^2 + a^2} \left(\frac{x}{a} \right) + \ln \left| \frac{1}{a} \sqrt{x^2 + a^2} + \frac{x}{a} \right| \right) + C \\
 &= \boxed{\frac{1}{2} a^2 \ln \left| \frac{x + \sqrt{a^2 + x^2}}{a} \right| + \frac{1}{2} x \sqrt{a^2 + x^2} + C}.
 \end{aligned}$$

(b) Let $x = a \sinh \theta$, then $dx = a \cosh \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{x^2 + a^2} dx &= \int \sqrt{(a \sinh \theta)^2 + a^2} (a \cosh \theta) d\theta \\
 &= a^2 \int \sqrt{\sinh^2 \theta + 1} \cosh \theta d\theta \\
 &= a^2 \int \cosh^2 \theta d\theta \\
 &= a^2 \int \left(\frac{e^\theta + e^{-\theta}}{2} \right)^2 d\theta \\
 &= \frac{a^2}{4} \int (e^{2\theta} + 2 + e^{-2\theta}) d\theta \\
 &= \frac{a^2}{4} \left(\frac{1}{2} e^{2\theta} + 2\theta - \frac{1}{2} e^{-2\theta} \right) + C \\
 &= \frac{1}{2} a^2 \theta + \frac{a^2}{8} (e^{2\theta} - e^{-2\theta}) + C \\
 &= \frac{1}{2} a^2 \theta + \frac{a^2}{2} \left(\frac{e^\theta - e^{-\theta}}{2} \right) \left(\frac{e^\theta + e^{-\theta}}{2} \right) + C \\
 &= \frac{1}{2} a^2 \theta + \frac{a^2}{2} \sinh \theta \cosh \theta + C.
 \end{aligned}$$

Since $\sinh \theta = \frac{x}{a}$, $\cosh \theta = \sqrt{\sinh^2 \theta + 1} = \sqrt{(x/a)^2 + 1} = \frac{1}{a} \sqrt{x^2 + a^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{x^2 + a^2} dx &= \frac{1}{2} a^2 \sinh^{-1} \left(\frac{x}{a} \right) + \frac{a^2}{2} \left(\frac{x}{a} \right) \left(\frac{1}{a} \sqrt{x^2 + a^2} \right) + C \\
 &= \boxed{\frac{1}{2} a^2 \sinh^{-1} \left(\frac{x}{a} \right) + \frac{1}{2} x \sqrt{a^2 + x^2} + C}.
 \end{aligned}$$

82. Let $x = a \sin \theta$, then $dx = a \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{a^2 - x^2}} &= \int \frac{a \cos \theta}{\sqrt{a^2 - (a \sin \theta)^2}} d\theta \\
 &= \int \frac{a \cos \theta}{\sqrt{a^2 - a^2 \sin^2 \theta}} d\theta \\
 &= \frac{1}{a} \int \frac{a \cos \theta}{\sqrt{1 - \sin^2 \theta}} d\theta \\
 &= \int \frac{\cos \theta}{\cos \theta} d\theta \\
 &= \theta + C \\
 &= \boxed{\sin^{-1} \left(\frac{x}{a} \right) + C}.
 \end{aligned}$$

83. Let $x = a \tan \theta$, then $dx = a \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{a^2 + x^2} &= \int \frac{a \sec^2 \theta}{a^2 + (a \tan \theta)^2} d\theta \\
 &= \int \frac{a \sec^2 \theta}{a^2 + a^2 \tan^2 \theta} d\theta \\
 &= \frac{1}{a} \int \frac{\sec^2 \theta}{\sec^2 \theta} d\theta \\
 &= \frac{1}{a} \theta + C \\
 &= \boxed{\frac{1}{a} \tan^{-1} \left(\frac{x}{a} \right) + C}.
 \end{aligned}$$

84. Let $x = a \sec \theta$, then $dx = a \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{x\sqrt{x^2 - a^2}} &= \int \frac{a \sec \theta \tan \theta}{a \sec \theta \sqrt{(a \sec \theta)^2 - a^2}} d\theta \\
 &= \frac{1}{a} \int \frac{\tan \theta}{\sqrt{\sec^2 \theta - 1}} d\theta \\
 &= \frac{1}{a} \int \frac{\tan \theta}{\tan \theta} d\theta \\
 &= \frac{1}{a} \theta + C \\
 &= \boxed{\frac{1}{a} \sec^{-1} \left(\frac{x}{a} \right) + C}.
 \end{aligned}$$

85. Let $x = a \sec \theta$, then $dx = a \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 - a^2}} &= \int \frac{1}{\sqrt{(a \sec \theta)^2 - a^2}} (a \sec \theta \tan \theta) d\theta \\
 &= \int \frac{\sec \theta \tan \theta}{\tan \theta} d\theta \\
 &= \int \sec \theta d\theta \\
 &= \ln |\sec \theta + \tan \theta| + C.
 \end{aligned}$$

We have $\sec \theta = \frac{x}{a}$, and $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{a}\right)^2 - 1} = \frac{1}{a} \sqrt{x^2 - a^2}$. We obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 - a^2}} &= \ln \left| \frac{x}{a} + \frac{1}{a} \sqrt{x^2 - a^2} \right| + C \\
 &= \boxed{\ln \left| \frac{x + \sqrt{x^2 - a^2}}{a} \right| + C}.
 \end{aligned}$$

86. Let $x = a \tan \theta$, then $dx = a \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{1}{\sqrt{x^2 + a^2}} dx &= \int \frac{1}{\sqrt{(a \tan \theta)^2 + a^2}} (a \sec^2 \theta) d\theta \\ &= \int \frac{\sec^2 \theta}{\sec \theta} d\theta \\ &= \int \sec \theta d\theta \\ &= \ln |\sec \theta + \tan \theta| + C_1. \end{aligned}$$

We have $\tan \theta = \frac{x}{a}$, and $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{\left(\frac{x}{a}\right)^2 + 1} = \frac{1}{a} \sqrt{x^2 + a^2}$. We obtain

$$\begin{aligned} \int \frac{1}{\sqrt{x^2 + a^2}} dx &= \ln \left| \frac{1}{a} \sqrt{x^2 + a^2} + \frac{x}{a} \right| + C_1 \\ &= \ln \left| x + \sqrt{x^2 + a^2} \right| - \ln |a| + C_1 \\ &= \boxed{\ln (x + \sqrt{x^2 + a^2}) + C}, \end{aligned}$$

where $C = -\ln |a| + C_1$.

Challenge Problems

87. We complete the square: $3x - x^2 = \frac{9}{4} - \left(x^2 - 3x + \frac{9}{4}\right) = \left(\frac{3}{2}\right)^2 - \left(x - \frac{3}{2}\right)^2$. Then

$$\int \frac{dx}{\sqrt{3x - x^2}} = \int \frac{dx}{\sqrt{\left(\frac{3}{2}\right)^2 - \left(x - \frac{3}{2}\right)^2}}.$$

Let $u = x - \frac{3}{2}$, then $du = dx$. We substitute, use the result of exercise 92, and obtain

$$\begin{aligned} \int \frac{dx}{\sqrt{3x - x^2}} &= \int \frac{du}{\sqrt{\left(\frac{3}{2}\right)^2 - u^2}} \\ &= \sin^{-1} \left(\frac{u}{(3/2)} \right) + C \\ &= \sin^{-1} \left(\frac{2(x - \frac{3}{2})}{3} \right) + C \\ &= \boxed{\sin^{-1} \left(\frac{2x-3}{3} \right) + C}. \end{aligned}$$

88. Let $x = a \sec \theta$, then $dx = a \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned}
 \int \sqrt{x^2 - a^2} dx &= \int \sqrt{(a \sec \theta)^2 - a^2} (a \sec \theta \tan \theta) d\theta \\
 &= a^2 \int (\tan \theta)(\sec \theta \tan \theta) d\theta \\
 &= a^2 \int \tan^2 \theta \sec \theta d\theta \\
 &= a^2 \int (\sec^2 \theta - 1) \sec \theta d\theta \\
 &= a^2 \int (\sec^3 \theta - \sec \theta) d\theta \\
 &= a^2 \left[\frac{1}{2} \sec \theta \tan \theta + \frac{1}{2} \ln |\sec \theta + \tan \theta| - \ln |\sec \theta + \tan \theta| \right] + C \\
 &= a^2 \left[\frac{1}{2} \sec \theta \tan \theta - \frac{1}{2} \ln |\sec \theta + \tan \theta| \right] + C.
 \end{aligned}$$

We have $\sec \theta = \frac{x}{a}$, and $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{\left(\frac{x}{a}\right)^2 - 1} = \frac{1}{a} \sqrt{x^2 - a^2}$. We obtain

$$\begin{aligned}
 \int \sqrt{x^2 - a^2} dx &= a^2 \left[\frac{1}{2} \left(\frac{x}{a}\right) \left(\frac{1}{a} \sqrt{x^2 - a^2}\right) - \frac{1}{2} \ln \left| \frac{x}{a} + \frac{1}{a} \sqrt{x^2 - a^2} \right| \right] + C \\
 &= \frac{1}{2} x \sqrt{x^2 - a^2} - \frac{1}{2} a^2 \ln \left| x + \sqrt{x^2 - a^2} \right| + \frac{1}{2} a^2 \ln |a| + C \\
 &= \boxed{\frac{1}{2} x \sqrt{x^2 - a^2} - \frac{1}{2} a^2 \ln \left| x + \sqrt{x^2 - a^2} \right| + C}.
 \end{aligned}$$

89. Let $u = \sinh^{-1} \left(\frac{x}{a}\right)$, so $x = a \sinh u$, and $dx = a \cosh u du$. We substitute and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 + a^2}} &= \int \frac{a \cosh u}{\sqrt{(a \sinh u)^2 + a^2}} du \\
 &= \int \frac{\cosh u}{\sqrt{\sinh^2 u + 1}} du \\
 &= \int \frac{\cosh u}{\cosh u} du \\
 &= u + C \\
 &= \sinh^{-1} \left(\frac{x}{a}\right) + C.
 \end{aligned}$$

From the identity $\sinh^{-1} x = \ln(x + \sqrt{x^2 + 1})$ we obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 + a^2}} &= \ln \left(\frac{x}{a} + \sqrt{\left(\frac{x}{a}\right)^2 + 1} \right) + C \\
 &= \ln \left(\frac{x}{a} + \frac{1}{a} \sqrt{x^2 + a^2} \right) + C \\
 &= \boxed{\ln \left(\frac{x + \sqrt{x^2 + a^2}}{a} \right) + C}.
 \end{aligned}$$

90. Let $u = \tan x$, then $du = \sec^2 x \, dx$. We substitute and obtain

$$\begin{aligned} \int \frac{\sec^2 x}{\sqrt{\tan^2 x - 6 \tan x + 8}} dx &= \int \frac{du}{\sqrt{u^2 - 6u + 8}} \\ &= \int \frac{du}{\sqrt{u^2 - 6u + 9 - 1}} \\ &= \int \frac{du}{\sqrt{(u-3)^2 - 1}}. \end{aligned}$$

Let $y = u - 3$, then $dy = du$. We substitute and obtain

$$\int \frac{\sec^2 x}{\sqrt{\tan^2 x - 6 \tan x + 8}} dx = \int \frac{dy}{\sqrt{y^2 - 1}}.$$

Let $y = \sec \theta$, then $dy = \sec \theta \tan \theta \, d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{\sec^2 x}{\sqrt{\tan^2 x - 6 \tan x + 8}} dx &= \int \frac{\sec \theta \tan \theta}{\sqrt{\sec^2 \theta - 1}} d\theta \\ &= \int \frac{\sec \theta \tan \theta}{\tan \theta} d\theta \\ &= \int \sec \theta \, d\theta \\ &= \ln |\sec \theta + \tan \theta| + C. \end{aligned}$$

We have $\sec \theta = y$, and $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{y^2 - 1}$. We obtain

$$\int \frac{\sec^2 x}{\sqrt{\tan^2 x - 6 \tan x + 8}} dx = \ln |y + \sqrt{y^2 - 1}| + C.$$

Since $y = u - 3 = \tan x - 3$, we now have

$$\begin{aligned} \int \frac{\sec^2 x}{\sqrt{\tan^2 x - 6 \tan x + 8}} dx &= \ln \left| \tan x - 3 + \sqrt{(\tan x - 3)^2 - 1} \right| + C \\ &= \boxed{\ln \left| \tan x - 3 + \sqrt{\tan^2 x - 6 \tan x + 8} \right| + C}. \end{aligned}$$

7.4: Substitution: Integrands Containing $ax^2 + bx + c$

Skill Building

1. We complete the square: $x^2 + 4x + 5 = (x + 2)^2 + 1$. Then we let $u = x + 2$, so $du = dx$, and we obtain

$$\begin{aligned}\int \frac{dx}{x^2 + 4x + 5} &= \int \frac{dx}{(x + 2)^2 + 1} \\ &= \int \frac{du}{u^2 + 1} \\ &= \tan^{-1} u + C \\ &= \boxed{\tan^{-1}(x + 2) + C}.\end{aligned}$$

2. We complete the square: $x^2 + 2x + 5 = (x + 1)^2 + 4$. Then we let $u = x + 1$, so $du = dx$, and we obtain

$$\begin{aligned}\int \frac{dx}{x^2 + 2x + 5} &= \int \frac{dx}{(x + 1)^2 + 4} \\ &= \int \frac{du}{u^2 + 2^2} \\ &= \frac{1}{2} \tan^{-1} \frac{u}{2} + C \\ &= \boxed{\frac{1}{2} \tan^{-1} \left(\frac{x+1}{2} \right) + C}.\end{aligned}$$

3. We complete the square: $x^2 + 4x + 8 = (x + 2)^2 + 4$. Then we let $u = x + 2$, so $du = dx$, and we obtain

$$\begin{aligned}\int \frac{dx}{x^2 + 4x + 8} &= \int \frac{dx}{(x + 2)^2 + 4} \\ &= \int \frac{du}{u^2 + 2^2} \\ &= \frac{1}{2} \tan^{-1} \frac{u}{2} + C \\ &= \boxed{\frac{1}{2} \tan^{-1} \left(\frac{x+2}{2} \right) + C}.\end{aligned}$$

4. We complete the square: $x^2 - 6x + 10 = (x - 3)^2 + 1$. Then we let $u = x - 3$, so $du = dx$, and we obtain

$$\begin{aligned}\int \frac{dx}{x^2 - 6x + 10} &= \int \frac{dx}{(x - 3)^2 + 1} \\ &= \int \frac{du}{u^2 + 1} \\ &= \tan^{-1} u + C \\ &= \boxed{\tan^{-1}(x - 3) + C}.\end{aligned}$$

5. We complete the square: $3 + 2x + 2x^2 = 2\left(x + \frac{1}{2}\right)^2 + \frac{5}{2}$. Then we let $u = x + \frac{1}{2}$ to obtain

$$\begin{aligned}
 \int \frac{2 \, dx}{3 + 2x + 2x^2} &= \int \frac{2 \, dx}{2\left(x + \frac{1}{2}\right)^2 + \frac{5}{2}} \\
 &= 2 \int \frac{du}{2u^2 + \frac{5}{2}} \\
 &= \int \frac{du}{u^2 + \left(\frac{\sqrt{5}}{2}\right)^2} \\
 &= \frac{2}{\sqrt{5}} \tan^{-1} \left(\frac{u}{\sqrt{5}/2} \right) + C \\
 &= \frac{2\sqrt{5}}{5} \tan^{-1} \left(\frac{2\left(x + \frac{1}{2}\right)}{\sqrt{5}} \right) + C \\
 &= \boxed{\frac{2\sqrt{5}}{5} \tan^{-1} \left(\frac{2x+1}{\sqrt{5}} \right) + C}.
 \end{aligned}$$

6. We complete the square: $x^2 + 6x + 10 = (x + 3)^2 + 1$. Then we let $u = x + 3$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{3 \, dx}{x^2 + 6x + 10} &= 3 \int \frac{dx}{(x + 3)^2 + 1} \\
 &= 3 \int \frac{du}{u^2 + 1} \\
 &= 3 \tan^{-1} u + C \\
 &= \boxed{3 \tan^{-1} (x + 3) + C}.
 \end{aligned}$$

7. We force the the derivative of the denominator to appear in the numerator. We then complete the square with $2x^2 + 2x + 3 = 2\left(x + \frac{1}{2}\right)^2 + \frac{5}{2}$, and let $u = x + \frac{1}{2}$, so $du = dx$. We obtain

$$\begin{aligned}
 \int \frac{x \, dx}{2x^2 + 2x + 3} &= \int \frac{\frac{1}{4}(4x + 2) - \frac{1}{2}}{2x^2 + 2x + 3} \, dx \\
 &= \frac{1}{4} \int \frac{4x + 2}{2x^2 + 2x + 3} \, dx - \frac{1}{2} \int \frac{dx}{2x^2 + 2x + 3} \\
 &= \frac{1}{4} \ln |2x^2 + 2x + 3| - \frac{1}{2} \int \frac{dx}{2x^2 + 2x + 3} \\
 &= \frac{1}{4} \ln (2x^2 + 2x + 3) - \frac{1}{2} \int \frac{dx}{2\left(x + \frac{1}{2}\right)^2 + \frac{5}{2}} \\
 &= \frac{1}{4} \ln (2x^2 + 2x + 3) - \frac{1}{4} \int \frac{du}{u^2 + \left(\frac{\sqrt{5}}{2}\right)^2} \\
 &= \frac{1}{4} \ln (2x^2 + 2x + 3) - \frac{1}{4} \frac{2}{\sqrt{5}} \tan^{-1} \left(\frac{u}{\sqrt{5}/2} \right) + C \\
 &= \frac{1}{4} \ln (2x^2 + 2x + 3) - \frac{\sqrt{5}}{10} \tan^{-1} \left(\frac{2\left(x + \frac{1}{2}\right)}{\sqrt{5}} \right) + C \\
 &= \boxed{\frac{1}{4} \ln (2x^2 + 2x + 3) - \frac{\sqrt{5}}{10} \tan^{-1} \left(\frac{2x+1}{\sqrt{5}} \right) + C}.
 \end{aligned}$$

8. We force the the derivative of the denominator to appear in the numerator. We then complete the square with $x^2 + 6x + 10 = (x + 3)^2 + 1$, and let $u = x + 3$, so $du = dx$. We obtain

$$\begin{aligned}
 \int \frac{3x \, dx}{x^2 + 6x + 10} &= \int \frac{\frac{3}{2}(2x + 6) - 9}{x^2 + 6x + 10} \, dx \\
 &= \frac{3}{2} \int \frac{(2x + 6)}{x^2 + 6x + 10} \, dx - 9 \int \frac{dx}{x^2 + 6x + 10} \\
 &= \frac{3}{2} \ln |x^2 + 6x + 10| - 9 \int \frac{dx}{(x + 3)^2 + 1} \\
 &= \frac{3}{2} \ln (x^2 + 6x + 10) - 9 \int \frac{du}{u^2 + 1} \\
 &= \frac{3}{2} \ln (x^2 + 6x + 10) - 9 \tan^{-1} u + C \\
 &= \boxed{\frac{3}{2} \ln (x^2 + 6x + 10) - 9 \tan^{-1} (x + 3) + C}.
 \end{aligned}$$

9. We complete the square: $8 + 2x - x^2 = 9 - (x - 1)^2$. Then we let $u = x - 1$ to obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{8 + 2x - x^2}} &= \int \frac{dx}{\sqrt{9 - (x - 1)^2}} \\
 &= \int \frac{du}{\sqrt{3^2 - u^2}} \\
 &= \sin^{-1} \left(\frac{u}{3} \right) + C \\
 &= \boxed{\sin^{-1} \left(\frac{x-1}{3} \right) + C}.
 \end{aligned}$$

10. We complete the square: $5 - 4x - 2x^2 = 7 - 2(x + 1)^2$. Then we let $u = x + 1$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{5 - 4x - 2x^2}} &= \int \frac{dx}{\sqrt{7 - 2(x + 1)^2}} \\
 &= \int \frac{du}{\sqrt{7 - 2u^2}} \\
 &= \frac{1}{\sqrt{2}} \int \frac{du}{\sqrt{\left(\frac{\sqrt{14}}{2}\right)^2 - u^2}} \\
 &= \frac{\sqrt{2}}{2} \sin^{-1} \left(\frac{u}{\sqrt{14}/2} \right) + C \\
 &= \boxed{\frac{\sqrt{2}}{2} \sin^{-1} \left(\frac{\sqrt{14}(x+1)}{7} \right) + C}.
 \end{aligned}$$

11. We complete the square: $4x - x^2 = 4 - (x - 2)^2$. Then we let $u = x - 2$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{4x - x^2}} &= \int \frac{dx}{\sqrt{4 - (x - 2)^2}} \\
 &= \int \frac{du}{\sqrt{2^2 - u^2}} \\
 &= \sin^{-1} \left(\frac{u}{2} \right) + C \\
 &= \boxed{\sin^{-1} \left(\frac{x-2}{2} \right) + C}.
 \end{aligned}$$

12. We complete the square: $x^2 - 6x - 10 = (x - 3)^2 - 19$. Then we let $u = x - 3$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 - 6x - 10}} &= \int \frac{dx}{\sqrt{(x - 3)^2 - 19}} \\
 &= \int \frac{du}{\sqrt{u^2 - (\sqrt{19})^2}} \\
 &= \ln \left| u + \sqrt{u^2 - 19} \right| + C \quad (\text{from Exercise 89, Section 7.3}) \\
 &= \ln \left| (x - 3) + \sqrt{(x - 3)^2 - 19} \right| + C \\
 &= \boxed{\ln \left| x - 3 + \sqrt{x^2 - 6x - 10} \right| + C}.
 \end{aligned}$$

13. We complete the square: $x^2 + 2x + 2 = (x + 1)^2 + 1$. Then we let $u = x + 1$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{dx}{(x + 1)\sqrt{x^2 + 2x + 2}} &= \int \frac{dx}{(x + 1)\sqrt{(x + 1)^2 + 1}} \\
 &= \int \frac{du}{u\sqrt{u^2 + 1^2}} \\
 &= \ln \left| \frac{\sqrt{u^2 + 1} - 1}{u} \right| + C \\
 &= \ln \left| \frac{\sqrt{(x + 1)^2 + 1} - 1}{x + 1} \right| + C \\
 &= \boxed{\ln \left| \frac{\sqrt{x^2 + 2x + 2} - 1}{x + 1} \right| + C}.
 \end{aligned}$$

14. We complete the square: $x^2 - 8x + 17 = (x - 4)^2 + 1$. Then we let $u = x - 4$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{dx}{(x-4)\sqrt{x^2-8x+17}} &= \int \frac{dx}{(x-4)\sqrt{(x-4)^2+1}} \\
 &= \int \frac{du}{u\sqrt{u^2+1^2}} \\
 &= \ln \left| \frac{\sqrt{u^2+1}-1}{u} \right| + C \\
 &= \ln \left| \frac{\sqrt{(x-4)^2+1}-1}{x-4} \right| + C \\
 &= \boxed{\ln \left| \frac{\sqrt{x^2-8x+17}-1}{x-4} \right| + C}.
 \end{aligned}$$

15. We complete the square: $24 - 2x - x^2 = 25 - (x + 1)^2$. Then we let $u = x + 1$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{24-2x-x^2}} &= \int \frac{dx}{\sqrt{25-(x+1)^2}} \\
 &= \int \frac{du}{\sqrt{5^2-u^2}} \\
 &= \sin^{-1} \left(\frac{u}{5} \right) + C \\
 &= \boxed{\sin^{-1} \left(\frac{x+1}{5} \right) + C}.
 \end{aligned}$$

16. We complete the square: $9x^2 + 6x + 10 = 9\left(x + \frac{1}{3}\right)^2 + 9$. Then we let $u = x + \frac{1}{3}$ to obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{9x^2+6x+10}} &= \int \frac{dx}{\sqrt{9\left(x+\frac{1}{3}\right)^2+9}} \\
 &= \frac{1}{3} \int \frac{du}{\sqrt{u^2+1^2}} \\
 &= \frac{1}{3} \ln \left(u + \sqrt{u^2+1} \right) + C \\
 &= \frac{1}{3} \ln \left(x + \frac{1}{3} + \sqrt{\left(x + \frac{1}{3}\right)^2 + 1} \right) + C \\
 &= \frac{1}{3} \ln \left(x + \frac{1}{3} + \sqrt{x^2 + \frac{2}{3}x + \frac{10}{9}} \right) + C \\
 &= \boxed{\frac{1}{3} \ln \left(3x + 1 + \sqrt{9x^2 + 6x + 10} \right) + C}.
 \end{aligned}$$

17. We force the the derivative of the denominator to appear in the numerator, and obtain two integrals.

$$\begin{aligned}\int \frac{x-5}{\sqrt{x^2-2x+5}} dx &= \int \frac{\frac{1}{2}(2x-2)-4}{\sqrt{x^2-2x+5}} dx \\ &= \frac{1}{2} \int \frac{(2x-2)}{\sqrt{x^2-2x+5}} dx - 4 \int \frac{dx}{\sqrt{(x-1)^2+4}}.\end{aligned}$$

Now for the first integral let $w = x^2 - 2x + 5$, so $dw = (2x - 2) dx$. In the second integral, complete the square with $x^2 - 2x + 5 = (x - 1)^2 + 4$. ; and let $u = x - 1$, so $du = dx$. We obtain

$$\begin{aligned}&= \frac{1}{2} \int w^{-1/2} dw - 4 \int \frac{du}{\sqrt{u^2+2^2}} \\ &= \frac{1}{2} (2\sqrt{w}) - 4 \ln(u + \sqrt{u^2+4}) + C \\ &= \sqrt{x^2-2x+5} - 4 \ln(x-1 + \sqrt{(x-1)^2+4}) + C \\ &= \boxed{\sqrt{x^2-2x+5} - 4 \ln(x-1 + \sqrt{x^2-2x+5}) + C}.\end{aligned}$$

18. We force the the derivative of the denominator to appear in the numerator. We then complete the square with $x^2 - 4x + 3 = (x - 2)^2 - 1$, and let $u = x - 2$, so $du = dx$. We obtain

$$\begin{aligned}\int \frac{x+1}{x^2-4x+3} dx &= \int \frac{\frac{1}{2}(2x-4)+3}{x^2-4x+3} dx \\ &= \frac{1}{2} \int \frac{(2x-4)}{x^2-4x+3} dx + 3 \int \frac{dx}{(x-2)^2-1} \\ &= \frac{1}{2} \ln|x^2-4x+3| + 3 \int \frac{du}{u^2-1} \\ &= \frac{1}{2} \ln|x^2-4x+3| + 3 \left(\frac{1}{2} \ln|u-1| - \frac{1}{2} \ln|u+1| \right) + C \\ &= \frac{1}{2} \ln|x^2-4x+3| + 3 \left(\frac{1}{2} \ln|(x-2)-1| - \frac{1}{2} \ln|(x-2)+1| \right) + C \\ &= \boxed{\frac{1}{2} \ln|x^2-4x+3| + \frac{3}{2} \ln|x-3| - \frac{3}{2} \ln|x-1| + C}.\end{aligned}$$

19. We complete the square: $x^2 - 2x + 5 = (x - 1)^2 + 4$, and let $u = x - 1$ to obtain

$$\begin{aligned}\int_1^3 \frac{dx}{\sqrt{x^2-2x+5}} &= \int_1^3 \frac{dx}{\sqrt{(x-1)^2+4}} \\ &= \int_0^2 \frac{du}{\sqrt{u^2+2^2}} \\ &= \left[\ln(u + \sqrt{u^2+4}) \right]_{u=0}^{u=2} \\ &= \ln(2 + \sqrt{2^2+4}) - \ln(0 + \sqrt{0^2+4}) \\ &= \ln(2\sqrt{2}+2) - \ln 2 \\ &= \boxed{\ln(\sqrt{2}+1)}.\end{aligned}$$

20. We complete the square: $2x - x^2 = 1 - (x - 1)^2$. Then we let $u = x - 1$ to obtain

$$\begin{aligned}
 \int_{1/2}^1 \frac{x^2 dx}{\sqrt{2x - x^2}} &= \int_{1/2}^1 \frac{x^2 dx}{\sqrt{1 - (x - 1)^2}} \\
 &= \int_{-1/2}^0 \frac{(u + 1)^2}{\sqrt{1 - u^2}} du \\
 &= \int_{-1/2}^0 \frac{u^2 + 2u + 1}{\sqrt{1 - u^2}} du \\
 &= \int_{-1/2}^0 \frac{u^2}{\sqrt{1 - u^2}} du + \int_{-1/2}^0 \frac{2u}{\sqrt{1 - u^2}} du + \int_{-1/2}^0 \frac{1}{\sqrt{1 - u^2}} du \\
 &= \int_{-1/2}^0 \frac{u^2}{\sqrt{1 - u^2}} du + \int_{-1/2}^0 \frac{2u}{\sqrt{1 - u^2}} du + [\sin^{-1} u]_{-1/2}^0 \\
 &= \int_{-1/2}^0 \frac{u^2}{\sqrt{1 - u^2}} du + \int_{-1/2}^0 \frac{2u}{\sqrt{1 - u^2}} du + \frac{\pi}{6}.
 \end{aligned}$$

For the first integral we let $u = \sin \theta$, then we have

$$\begin{aligned}
 \int_{-1/2}^0 \frac{u^2}{\sqrt{1 - u^2}} du &= \int_{-\pi/6}^0 \frac{\sin^2 \theta}{\cos \theta} \cos \theta d\theta \\
 &= \frac{1}{2} \int_{-\pi/6}^0 (1 - \cos(2\theta)) d\theta \\
 &= \frac{1}{2} \left[\theta - \frac{1}{2} \sin 2\theta \right]_{-\pi/6}^0 \\
 &= \frac{1}{12} \pi - \frac{1}{8} \sqrt{3}.
 \end{aligned}$$

And for the second integral we let $w = 1 - u^2$ to obtain

$$\begin{aligned}
 \int_{-1/2}^0 \frac{2u}{\sqrt{1 - u^2}} du &= \int_{3/4}^1 w^{-1/2} (-dw) \\
 &= [-2\sqrt{w}]_{3/4}^1 \\
 &= \sqrt{3} - 2.
 \end{aligned}$$

And so we obtain

$$\begin{aligned}
 \int_{1/2}^1 \frac{x^2 dx}{\sqrt{2x - x^2}} &= \left(\frac{1}{12} \pi - \frac{1}{8} \sqrt{3} \right) + (\sqrt{3} - 2) + \frac{\pi}{6} \\
 &= \boxed{\frac{1}{4} \pi + \frac{7}{8} \sqrt{3} - 2}.
 \end{aligned}$$

21. We complete the square: $e^{2x} + e^x + 1 = \left(e^x + \frac{1}{2}\right)^2 + \frac{3}{4}$. Then we let $u = e^x + \frac{1}{2}$ to obtain

$$\begin{aligned}
 \int \frac{e^x dx}{\sqrt{e^{2x} + e^x + 1}} &= \int \frac{e^x dx}{\sqrt{\left(e^x + \frac{1}{2}\right)^2 + \frac{3}{4}}} \\
 &= \int \frac{du}{\sqrt{u^2 + \left(\frac{\sqrt{3}}{2}\right)^2}} \\
 &= \ln \left(u + \sqrt{u^2 + \frac{3}{4}} \right) + C \\
 &= \ln \left(e^x + \frac{1}{2} + \sqrt{\left(e^x + \frac{1}{2}\right)^2 + \frac{3}{4}} \right) + C \\
 &= \boxed{\ln \left(e^x + \frac{1}{2} + \sqrt{e^{2x} + e^x + 1} \right) + C}.
 \end{aligned}$$

22. We complete the square: $\sin^2 x + 4 \sin x + 3 = (\sin x + 2)^2 - 1$. Then we let $u = \sin x + 2$ to obtain

$$\begin{aligned}
 \int \frac{\cos x dx}{\sqrt{\sin^2 x + 4 \sin x + 3}} &= \int \frac{\cos x dx}{\sqrt{(\sin x + 2)^2 - 1}} \\
 &= \int \frac{du}{\sqrt{u^2 - 1}} \\
 &= \ln |u + \sqrt{u^2 - 1}| + C \\
 &= \ln \left(\sin x + 2 + \sqrt{(\sin x + 2)^2 - 1} \right) + C \\
 &= \boxed{\ln \left(\sin x + 2 + \sqrt{\sin^2 x + 4 \sin x + 3} \right) + C}.
 \end{aligned}$$

23. We force the the derivative of the quadratic to appear in the numerator.

$$\begin{aligned}
 \int \frac{2x - 3}{\sqrt{4x - x^2 - 3}} dx &= \int \frac{-(4 - 2x) + 1}{\sqrt{4x - x^2 - 3}} dx \\
 &= - \int \frac{4 - 2x}{\sqrt{4x - x^2 - 3}} dx + \int \frac{1}{\sqrt{1 - (x - 2)^2}} dx.
 \end{aligned}$$

For the first integral let $w = 4x - x^2 - 3$ so $dw = (4 - 2x) dx$. In the second integral, complete the square with $4x - x^2 - 3 = 1 - (x - 2)^2$, and let $u = x - 2$, so $du = dx$. We obtain

$$\begin{aligned}
 \int \frac{2x - 3}{\sqrt{4x - x^2 - 3}} dx &= - \int w^{-1/2} dw + \int \frac{du}{\sqrt{1 - u^2}} \\
 &= -(2\sqrt{w}) + \sin^{-1} u + C \\
 &= \boxed{-2\sqrt{4x - x^2 - 3} + \sin^{-1} (x - 2) + C}.
 \end{aligned}$$

24. We force the the derivative of the quadratic to appear in the numerator.

$$\begin{aligned}\int \frac{x+3}{\sqrt{x^2+2x+2}} dx &= \int \frac{\frac{1}{2}(2x+2)+2}{\sqrt{x^2+2x+2}} dx \\ &= \frac{1}{2} \int \frac{2x+2}{\sqrt{x^2+2x+2}} dx + 2 \int \frac{dx}{\sqrt{(x+1)^2+1}}.\end{aligned}$$

For the first integral we let $w = x^2 + 2x + 2$ so $dw = (2x + 2) dx$. In the second integral, we complete the square with $x^2 + 2x + 2 = (x + 1)^2 + 1$, and let $u = x + 1$, so $du = dx$. We obtain

$$\begin{aligned}\int \frac{x+3}{\sqrt{x^2+2x+2}} dx &= \frac{1}{2} \int w^{-1/2} dw + 2 \int \frac{du}{\sqrt{u^2+1}} \\ &= \frac{1}{2} (2\sqrt{w}) + 2 \ln(u + \sqrt{u^2+1}) + C \\ &= \sqrt{x^2+2x+2} + 2 \ln(x+1 + \sqrt{(x+1)^2+1}) + C \\ &= \boxed{\sqrt{x^2+2x+2} + 2 \ln(x+1 + \sqrt{x^2+2x+2}) + C}.\end{aligned}$$

25. We complete the square: $x^2 - 2x + 10 = (x - 1)^2 + 9$. Then we let $u = x - 1$, so $du = dx$, and obtain

$$\begin{aligned}\int \frac{dx}{(x^2 - 2x + 10)^{3/2}} &= \int \frac{dx}{((x - 1)^2 + 9)^{3/2}} \\ &= \int \frac{du}{(u^2 + 9)^{3/2}}.\end{aligned}$$

Let $u = 3 \tan \theta$, then $du = 3 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned}\int \frac{dx}{(x^2 - 2x + 10)^{3/2}} &= \int \frac{3 \sec^2 \theta}{((3 \tan \theta)^2 + 9)^{3/2}} d\theta \\ &= 3 \int \frac{\sec^2 \theta}{(9 \tan^2 \theta + 9)^{3/2}} d\theta \\ &= \frac{1}{9} \int \frac{\sec^2 \theta}{\sec^3 \theta} d\theta \\ &= \frac{1}{9} \int \cos \theta d\theta \\ &= \frac{1}{9} \sin \theta + C.\end{aligned}$$

We have $\tan \theta = \frac{u}{3}$, so $\cot \theta = \frac{3}{u}$, and $\csc \theta = \sqrt{1 + \cot^2 \theta} = \sqrt{1 + \left(\frac{3}{u}\right)^2} = \frac{1}{u} \sqrt{u^2 + 9}$. So $\sin \theta = \frac{u}{\sqrt{u^2+9}}$ and we obtain

$$\begin{aligned}\int \frac{dx}{(x^2 - 2x + 10)^{3/2}} &= \frac{1}{9} \frac{u}{\sqrt{u^2+9}} + C \\ &= \frac{x-1}{9\sqrt{(x-1)^2+9}} + C \\ &= \boxed{\frac{x-1}{9\sqrt{x^2-2x+10}} + C}.\end{aligned}$$

26. We complete the square: $x^2 - 2x + 10 = (x - 1)^2 + 9$. Then we let $u = x - 1$ to obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 - 2x + 10}} &= \int \frac{dx}{\sqrt{(x - 1)^2 + 9}} \\
 &= \int \frac{du}{\sqrt{u^2 + 3^2}} \\
 &= \ln \left(u + \sqrt{u^2 + 9} \right) + C \\
 &= \ln \left(x - 1 + \sqrt{(x - 1)^2 + 9} \right) + C \\
 &= \boxed{\ln \left(x - 1 + \sqrt{x^2 - 2x + 10} \right) + C}.
 \end{aligned}$$

27. We complete the square: $x^2 + 2x - 3 = (x + 1)^2 - 4$. Then we let $u = x + 1$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x^2 + 2x - 3}} &= \int \frac{dx}{\sqrt{(x + 1)^2 - 4}} \\
 &= \int \frac{du}{\sqrt{u^2 - 4}} \\
 &= \ln \left| u + \sqrt{u^2 - 4} \right| + C \\
 &= \ln \left| x + 1 + \sqrt{(x + 1)^2 - 4} \right| + C \\
 &= \boxed{\ln \left| x + 1 + \sqrt{x^2 + 2x - 3} \right| + C}.
 \end{aligned}$$

28. We complete the square: $x^2 - 4x - 1 = (x - 2)^2 - 5$. Then we let $u = x - 2$, so $du = dx$, so we obtain

$$\begin{aligned}
 \int x \sqrt{x^2 - 4x - 1} \, dx &= \int x \sqrt{(x - 2)^2 - 5} \, dx \\
 &= \int (u + 2) \sqrt{u^2 - 5} \, du \\
 &= \int u \sqrt{u^2 - 5} \, du + 2 \int \sqrt{u^2 - 5} \, du.
 \end{aligned}$$

With the first integral, let $w = u^2 - 5$, so $dw = 2 \, du$, and we obtain

$$\begin{aligned}
 \int u \sqrt{u^2 - 5} \, du &= \frac{1}{2} \int \sqrt{w} \, dw \\
 &= \frac{1}{2} \left(\frac{2}{3} \right) w^{\frac{3}{2}} + C \\
 &= \frac{1}{3} (u^2 - 5)^{\frac{3}{2}} + C.
 \end{aligned}$$

And for the second integral, let $u = \sqrt{5} \sec \theta$, so $du = \sqrt{5} \sec \theta \tan \theta d\theta$, and we obtain

$$\begin{aligned}
 \int \sqrt{u^2 - 5} du &= \int \sqrt{5 \sec^2 \theta - 5} \sqrt{5} \sec \theta \tan \theta d\theta \\
 &= 5 \int \sec \theta \tan^2 \theta d\theta \\
 &= 5 \int (\sec^3 \theta - \sec \theta) d\theta \\
 &= 5 \left(\frac{1}{2} \sec \theta \tan \theta - \frac{1}{2} \ln |\sec \theta + \tan \theta| \right) + C \\
 &= 5 \left(\frac{1}{2} \left(\frac{u}{\sqrt{5}} \right) \sqrt{\frac{u^2}{5} - 1} - \frac{1}{2} \ln \left| \frac{u}{\sqrt{5}} + \sqrt{\frac{u^2}{5} - 1} \right| \right) + C \\
 &= \frac{1}{2} u \sqrt{u^2 - 5} - \frac{5}{2} \ln |\sqrt{u^2 - 5} + u| + C.
 \end{aligned}$$

So we obtain

$$\begin{aligned}
 \int x \sqrt{x^2 - 4x - 1} dx &= \frac{1}{3} (u^2 - 5)^{\frac{3}{2}} + 2 \left(\frac{1}{2} u \sqrt{u^2 - 5} - \frac{5}{2} \ln |\sqrt{u^2 - 5} + u| \right) + C \\
 &= \frac{\left((x-2)^2 - 5 \right)^{\frac{3}{2}}}{3} + (x-2) \sqrt{(x-2)^2 - 5} \\
 &\quad - 5 \ln |x-2 + \sqrt{(x-2)^2 - 5}| + C \\
 &= \boxed{\frac{(x^2 - 4x - 1)^{\frac{3}{2}}}{3} + (x-2) \sqrt{x^2 - 4x - 1} - 5 \ln |x-2 + \sqrt{x^2 - 4x - 1}| + C}.
 \end{aligned}$$

29. We complete the square: $5 + 4x - x^2 = 9 - (x-2)^2$. Then we let $u = x-2$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{\sqrt{5 + 4x - x^2}}{x-2} dx &= \int \frac{\sqrt{9 - (x-2)^2}}{x-2} dx \\
 &= \int \frac{\sqrt{9 - u^2}}{u} du.
 \end{aligned}$$

Let $u = 3 \sin \theta$, so $du = 3 \cos \theta$, and we have

$$\begin{aligned}
\int \frac{\sqrt{5+4x-x^2}}{x-2} dx &= \int \frac{\sqrt{9-(3\sin\theta)^2}}{3\sin\theta} (3\cos\theta) d\theta \\
&= 3 \int \frac{\cos^2\theta}{\sin\theta} d\theta \\
&= 3 \int \frac{1-\sin^2\theta}{\sin\theta} d\theta \\
&= 3 \int (\csc\theta - \sin\theta) d\theta \\
&= 3(-\ln|\csc\theta + \cot\theta| + \cos\theta) + C \\
&= 3\left(-\ln\left|\frac{3}{u} + \frac{\sqrt{9-u^2}}{u}\right| + \frac{1}{3}\sqrt{9-u^2}\right) + C \\
&= -3\ln\left|\frac{3}{x-2} + \frac{\sqrt{9-(x-2)^2}}{x-2}\right| + \sqrt{9-(x-2)^2} + C \\
&= \boxed{3\ln|x-2| - 3\ln|3 + \sqrt{5+4x-x^2}| + \sqrt{5+4x-x^2} + C}.
\end{aligned}$$

30. We complete the square: $5+4x-x^2 = 9-(x-2)^2$. Then we let $u = x-2$, so $du = dx$, and we obtain

$$\begin{aligned}
\int \sqrt{5+4x-x^2} dx &= \int \sqrt{9-(x-2)^2} dx \\
&= \int \sqrt{9-u^2} du.
\end{aligned}$$

Let $u = 3\sin\theta$, so $du = 3\cos\theta$, and we obtain

$$\begin{aligned}
\int \sqrt{5+4x-x^2} dx &= \int \sqrt{9-(3\sin\theta)^2} (3\cos\theta) d\theta \\
&= 9 \int \cos^2\theta d\theta \\
&= \frac{9}{2} \int (1 + \cos(2\theta)) d\theta \\
&= \frac{9}{2} \left(\theta + \frac{1}{2}\sin 2\theta\right) + C \\
&= \frac{9}{2}(\theta + \sin\theta \cos\theta) + C \\
&= \frac{9}{2} \left(\sin^{-1}\left(\frac{u}{3}\right) + \frac{u}{3} \left(\frac{\sqrt{9-u^2}}{3}\right)\right) + C \\
&= \frac{9}{2} \sin^{-1}\left(\frac{u}{3}\right) + \frac{1}{2}u\sqrt{9-u^2} + C \\
&= \frac{9}{2} \sin^{-1}\left(\frac{x-2}{3}\right) + \frac{1}{2}(x-2)\sqrt{9-(x-2)^2} + C \\
&= \boxed{\frac{9}{2} \sin^{-1}\left(\frac{x-2}{3}\right) + \frac{1}{2}(x-2)\sqrt{5+4x-x^2} + C}.
\end{aligned}$$

31. We force the the derivative of the quadratic to appear in the numerator.

$$\begin{aligned}\int \frac{x \, dx}{\sqrt{x^2 + 2x - 3}} &= \int \frac{\frac{1}{2}(2x + 2) - 1}{\sqrt{x^2 + 2x - 3}} \, dx \\ &= \frac{1}{2} \int \frac{2x + 2}{\sqrt{x^2 + 2x - 3}} \, dx - \int \frac{dx}{\sqrt{(x + 1)^2 - 4}}.\end{aligned}$$

In the first integral, let $w = x^2 + 2x - 3$, so $dw = (2x + 2) \, dx$. In the second integral, complete the square with $x^2 + 2x - 3 = (x + 1)^2 - 4$, and let $u = x + 1$, so $du = dx$. We obtain

$$\begin{aligned}\int \frac{x \, dx}{\sqrt{x^2 + 2x - 3}} &= \frac{1}{2} \int w^{-1/2} \, dw - \int \frac{du}{\sqrt{u^2 - 4}} \\ &= \frac{1}{2} (2\sqrt{w}) - \ln |u + \sqrt{u^2 - 4}| + C \\ &= \sqrt{x^2 + 2x - 3} - \ln |x + 1 + \sqrt{(x + 1)^2 - 4}| + C \\ &= \boxed{\sqrt{x^2 + 2x - 3} - \ln |x + 1 + \sqrt{x^2 + 2x - 3}| + C}.\end{aligned}$$

32. We force the the derivative of the quadratic to appear in the numerator.

$$\begin{aligned}\int \frac{x \, dx}{\sqrt{x^2 - 4x + 3}} &= \int \frac{\frac{1}{2}(2x - 4) + 2}{\sqrt{x^2 - 4x + 3}} \, dx \\ &= \frac{1}{2} \int \frac{2x - 4}{\sqrt{x^2 - 4x + 3}} \, dx + 2 \int \frac{dx}{\sqrt{(x - 2)^2 - 1}}.\end{aligned}$$

In the first integral let $w = x^2 - 4x + 3$, so $dw = (2x - 4) \, dx$. In the second integral, complete the square with $x^2 - 4x + 3 = (x - 2)^2 - 1$, and let $u = x - 2$, so $du = dx$. We obtain

$$\begin{aligned}\int \frac{x \, dx}{\sqrt{x^2 - 4x + 3}} &= \frac{1}{2} \int w^{-1/2} \, dw + 2 \int \frac{du}{\sqrt{u^2 - 1}} \\ &= \frac{1}{2} (2\sqrt{w}) + 2 \ln |u + \sqrt{u^2 - 1}| + C \\ &= \sqrt{x^2 - 4x + 3} + 2 \ln |x - 2 + \sqrt{(x - 2)^2 - 1}| + C \\ &= \boxed{\sqrt{x^2 - 4x + 3} + 2 \ln |x - 2 + \sqrt{x^2 - 4x + 3}| + C}.\end{aligned}$$

Applications and Extensions

33. Let $u = x + h$, then

$$\int \frac{dx}{\sqrt{(x + h)^2 + k}} = \int \frac{du}{\sqrt{u^2 + k}}.$$

We then apply the result of exercise 97, section 7.3, to obtain

$$\begin{aligned}\int \frac{dx}{\sqrt{(x + h)^2 + k}} &= \ln [u + \sqrt{u^2 + k}] + C \\ &= \boxed{\ln [\sqrt{(x + h)^2 + k} + x + h] + C}.\end{aligned}$$

34. We complete the square: $ax^2 + bx + c = a\left(x + \frac{b}{2a}\right)^2 + c - \frac{b^2}{4a} = a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2 - 4ac}{4a}$. Then let $u = x + \frac{b}{2a}$, so $du = dx$, and we obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{ax^2 + bx + c}} &= \int \frac{dx}{\sqrt{a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2 - 4ac}{4a}}} \\
 &= \int \frac{du}{\sqrt{au^2 - \frac{b^2 - 4ac}{4a}}} \\
 &= \int \frac{du}{\sqrt{a\left(u^2 - \frac{b^2 - 4ac}{4a^2}\right)}} \\
 &= \frac{1}{\sqrt{a}} \int \frac{du}{\sqrt{u^2 - \left(\frac{\sqrt{b^2 - 4ac}}{2a}\right)^2}} \quad (\text{using } a > 0 \text{ and } b^2 - 4ac > 0) \\
 &= \frac{1}{\sqrt{a}} \ln \left| u + \sqrt{u^2 - \left(\frac{\sqrt{b^2 - 4ac}}{2a}\right)^2} \right| + C \\
 &= \frac{1}{\sqrt{a}} \ln \left| x + \frac{b}{2a} + \sqrt{\left(x + \frac{b}{2a}\right)^2 - \frac{b^2 - 4ac}{4a^2}} \right| + C.
 \end{aligned}$$

And then we rewrite this and obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{ax^2 + bx + c}} &= \frac{1}{\sqrt{a}} \ln \left| x + \frac{b}{2a} + \sqrt{x^2 + \frac{b}{a}x + \frac{c}{a}} \right| + C \\
 &= \frac{1}{\sqrt{a}} \ln \left| x + \frac{b}{2a} + \frac{1}{\sqrt{a}} \sqrt{ax^2 + bx + c} \right| + C \\
 &= \frac{1}{\sqrt{a}} \ln \left| \frac{\sqrt{ax^2 + bx + c} + \frac{b}{2\sqrt{a}}}{\sqrt{a}} \right| + C \\
 &= \frac{1}{\sqrt{a}} \ln \left| \sqrt{ax^2 + bx + c} + \frac{b}{2\sqrt{a}} \right| - \frac{1}{\sqrt{a}} \ln \sqrt{a} + C \\
 &= \boxed{\frac{1}{\sqrt{a}} \ln \left| \sqrt{ax^2 + bx + c} + \sqrt{ax^2 + bx + c} + \frac{b}{2\sqrt{a}} \right| + C}.
 \end{aligned}$$

Challenge Problems

35. We rewrite

$$\sqrt{\frac{a+x}{a-x}} = \sqrt{\frac{(a+x)(a+x)}{(a-x)(a+x)}} = \sqrt{\frac{(a+x)^2}{a^2 - x^2}} = \frac{\sqrt{(a+x)^2}}{\sqrt{a^2 - x^2}} = \frac{a+x}{\sqrt{a^2 - x^2}}.$$

Then we obtain

$$\begin{aligned}
 \int \sqrt{\frac{a+x}{a-x}} dx &= \int \frac{a+x}{\sqrt{a^2 - x^2}} dx \\
 &= \int \frac{a}{\sqrt{a^2 - x^2}} dx + \int \frac{x}{\sqrt{a^2 - x^2}} dx.
 \end{aligned}$$

Let $u = a^2 - x^2$, so $du = -2x \, dx$. Then we have

$$\begin{aligned}\int \sqrt{\frac{a+x}{a-x}} \, dx &= a \sin^{-1} \frac{x}{a} + \int \frac{-\frac{1}{2} du}{\sqrt{u}} \\ &= a \sin^{-1} \frac{x}{a} - \sqrt{u} + C \\ &= \boxed{a \sin^{-1} \frac{x}{a} - \sqrt{a^2 - x^2} + C}.\end{aligned}$$

7.5: Integration of Rational Functions Using Partial Fractions

Concepts and Vocabulary

1. (a) less than
2. True
3. True
4. False, the term $\frac{D}{(x+1)^4}$ is also needed

Skill Building

5. We use long division to obtain

$$\begin{aligned}\int \frac{x^2+1}{x+1} dx &= \int \left(x-1 + \frac{2}{x+1} \right) dx \\ &= \boxed{\frac{1}{2}x^2 - x + 2 \ln |x+1| + C}.\end{aligned}$$

6. We use long division to obtain

$$\begin{aligned}\int \frac{x^2+4}{x-2} dx &= \int \left(x+2 + \frac{8}{x-2} \right) dx \\ &= \boxed{\frac{1}{2}x^2 + 2x + 8 \ln |x-2| + C}.\end{aligned}$$

7. We use long division to obtain

$$\begin{aligned}\int \frac{x^3+3x-4}{x-2} dx &= \int \left(x^2+2x+7 + \frac{10}{x-2} \right) dx \\ &= \boxed{\frac{1}{3}x^3 + x^2 + 7x + 10 \ln |x-2| + C}.\end{aligned}$$

8. We use long division to obtain

$$\begin{aligned}\int \frac{x^3-3x^2+4}{x+3} dx &= \int \left(x^2-6x+18 - \frac{50}{x+3} \right) dx \\ &= \boxed{\frac{1}{3}x^3 - 3x^2 + 18x - 50 \ln |x+3| + C}.\end{aligned}$$

9. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{(x-2)(x+1)} &= \frac{A}{x-2} + \frac{B}{x+1} \\ 1 &= A(x+1) + B(x-2)\end{aligned}$$

When $x = -1$ we obtain $B = -\frac{1}{3}$, and when $x = 2$ we have $A = \frac{1}{3}$. So we obtain

$$\begin{aligned}\int \frac{1}{(x-2)(x+1)} dx &= \int \left(\frac{1/3}{x-2} - \frac{1/3}{x+1} \right) dx \\ &= \boxed{\frac{1}{3} \ln |x-2| - \frac{1}{3} \ln |x+1| + C}.\end{aligned}$$

10. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{(x+4)(x-1)} &= \frac{A}{x+4} + \frac{B}{x-1} \\ 1 &= A(x-1) + B(x+4)\end{aligned}$$

When $x = 1$ we obtain $B = \frac{1}{5}$, and when $x = -4$ we have $A = -\frac{1}{5}$. So we obtain

$$\begin{aligned}\int \frac{1}{(x+4)(x-1)} dx &= \int \left(\frac{-1/5}{x+4} + \frac{1/5}{x-1} \right) dx \\ &= \boxed{-\frac{1}{5} \ln |x+4| + \frac{1}{5} \ln |x-1| + C}.\end{aligned}$$

11. We use partial fractions to obtain

$$\begin{aligned}\frac{x}{(x-1)(x-2)} &= \frac{A}{x-1} + \frac{B}{x-2} \\ x &= A(x-2) + B(x-1)\end{aligned}$$

When $x = 2$ we obtain $B = 2$, and when $x = 1$ we have $A = -1$. So we obtain

$$\begin{aligned}\int \frac{x dx}{(x-1)(x-2)} &= \int \left(-\frac{1}{x-1} + \frac{2}{x-2} \right) dx \\ &= \boxed{-\ln |x-1| + 2 \ln |x-2| + C}.\end{aligned}$$

12. We use partial fractions to obtain

$$\begin{aligned}\frac{3x}{(x+2)(x-4)} &= \frac{A}{x+2} + \frac{B}{x-4} \\ 3x &= A(x-4) + B(x+2)\end{aligned}$$

When $x = 4$ we obtain $B = 2$, and when $x = -2$ we have $A = 1$. So we obtain

$$\begin{aligned}\int \frac{3x dx}{(x+2)(x-4)} &= \int \left(\frac{1}{x+2} + \frac{2}{x-4} \right) dx \\ &= \boxed{\ln |x+2| + 2 \ln |x-4| + C}.\end{aligned}$$

13. We use partial fractions to obtain

$$\begin{aligned}\frac{x}{(3x-2)(2x+1)} &= \frac{A}{3x-2} + \frac{B}{2x+1} \\ x &= A(2x+1) + B(3x-2)\end{aligned}$$

When $x = -\frac{1}{2}$ we obtain $B = \frac{1}{7}$, and when $x = \frac{2}{3}$ we have $A = \frac{2}{7}$. So we obtain

$$\begin{aligned}\int \frac{x dx}{(3x-2)(2x+1)} &= \int \left(\frac{2/7}{3x-2} + \frac{1/7}{2x+1} \right) dx \\ &= \boxed{\frac{2}{21} \ln |3x-2| + \frac{1}{14} \ln |2x+1| + C}.\end{aligned}$$

14. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{(2x+3)(4x-1)} &= \frac{A}{2x+3} + \frac{B}{4x-1} \\ 1 &= A(4x-1) + B(2x+3)\end{aligned}$$

When $x = \frac{1}{4}$ we obtain $B = \frac{2}{7}$, and when $x = -\frac{3}{2}$ we have $A = -\frac{1}{7}$. So we obtain

$$\begin{aligned}\int \frac{dx}{(2x+3)(4x-1)} &= \int \left(\frac{-1/7}{2x+3} + \frac{2/7}{4x-1} \right) dx \\ &= \boxed{-\frac{1}{14} \ln |2x+3| + \frac{1}{14} \ln |4x-1| + C}.\end{aligned}$$

15. We use partial fractions to obtain

$$\begin{aligned}\frac{x-3}{(x+2)(x+1)^2} &= \frac{A}{x+2} + \frac{B}{x+1} + \frac{C}{(x+1)^2} \\ x-3 &= A(x+1)^2 + B(x+1)(x+2) + C(x+2)\end{aligned}$$

When $x = -1$ we obtain $C = -4$, and when $x = -2$ we have $A = -5$. When $x = 0$ we obtain $B = 5$. So we obtain

$$\begin{aligned}\int \frac{x-3}{(x+2)(x+1)^2} dx &= \int \left(\frac{-5}{x+2} + \frac{5}{x+1} + \frac{-4}{(x+1)^2} \right) dx \\ &= \int \frac{-5}{x+2} dx + \int \frac{5}{x+1} dx + \int \frac{-4}{(x+1)^2} dx \\ &= \boxed{-5 \ln |x+2| + 5 \ln |x+1| + \frac{4}{x+1} + C}.\end{aligned}$$

16. We use partial fractions to obtain

$$\begin{aligned}\frac{x+1}{x^2(x-2)} &= \frac{A}{x-2} + \frac{B}{x} + \frac{C}{x^2} \\ x+1 &= Ax^2 + Bx(x-2) + C(x-2)\end{aligned}$$

When $x = 0$ we obtain $C = -1/2$, and when $x = 2$ we have $A = 3/4$. When $x = 1$ we obtain $B = -3/4$. So we obtain

$$\begin{aligned}\int \frac{x+1}{x^2(x-2)} dx &= \int \left(\frac{3/4}{x-2} + \frac{-3/4}{x} + \frac{-1/2}{x^2} \right) dx \\ &= \int \frac{3/4}{x-2} dx + \int \frac{-3/4}{x} dx + \int \frac{-1/2}{x^2} dx \\ &= \boxed{\frac{3}{4} \ln |x-2| - \frac{3}{4} \ln |x| + \frac{1}{2x} + C}.\end{aligned}$$

17. We use partial fractions to obtain

$$\begin{aligned}\frac{x^2}{(x-1)^2(x+1)} &= \frac{A}{x+1} + \frac{B}{x-1} + \frac{C}{(x-1)^2} \\ x^2 &= A(x-1)^2 + B(x-1)(x+1) + C(x+1)\end{aligned}$$

When $x = 1$ we obtain $C = 1/2$, and when $x = -1$ we have $A = 1/4$. When $x = 0$ we obtain $B = 3/4$. So we obtain

$$\begin{aligned}\int \frac{x^2}{(x-1)^2(x+1)} dx &= \int \left(\frac{1/4}{x+1} + \frac{3/4}{x-1} + \frac{1/2}{(x-1)^2} \right) dx \\ &= \int \frac{1/4}{x+1} dx + \int \frac{3/4}{x-1} dx + \int \frac{1/2}{(x-1)^2} dx \\ &= \boxed{\frac{1}{4} \ln |x+1| + \frac{3}{4} \ln |x-1| - \frac{1}{2(x-1)} + C}.\end{aligned}$$

18. We use partial fractions to obtain

$$\begin{aligned}\frac{x^2 + x}{(x+2)(x-1)^2} &= \frac{A}{x+2} + \frac{B}{x-1} + \frac{C}{(x-1)^2} \\ x^2 + x &= A(x-1)^2 + B(x-1)(x+2) + C(x+2)\end{aligned}$$

When $x = 1$ we obtain $C = 2/3$, and when $x = -2$ we have $A = 2/9$. When $x = 0$ we obtain $B = 7/9$. So we obtain

$$\begin{aligned}\int \frac{x^2 + x}{(x+2)(x-1)^2} dx &= \int \left(\frac{2/9}{x+2} + \frac{7/9}{x-1} + \frac{2/3}{(x-1)^2} \right) dx \\ &= \int \frac{2/9}{x+2} dx + \int \frac{7/9}{x-1} dx + \int \frac{2/3}{(x-1)^2} dx \\ &= \boxed{\frac{2}{9} \ln |x+2| + \frac{7}{9} \ln |x-1| - \frac{2}{3(x-1)} + C}.\end{aligned}$$

19. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{x(x^2+1)} &= \frac{A}{x} + \frac{Bx+C}{x^2+1} \\ 1 &= A(x^2+1) + (Bx+C)x\end{aligned}$$

When $x = 0$ we obtain $A = 1$. So

$$\begin{aligned}1 &= (1)(x^2+1) + (Bx+C)x \\ 1 &= (B+1)x^2 + Cx + 1\end{aligned}$$

Equating coefficients, we obtain $B = -1$ and $C = 0$. We now have

$$\begin{aligned}\int \frac{dx}{x(x^2+1)} &= \int \left(\frac{1}{x} + \frac{-x}{x^2+1} \right) dx \\ &= \int \frac{1}{x} dx + \int \frac{-x}{x^2+1} dx \\ &= \boxed{\ln |x| - \frac{1}{2} \ln (x^2+1) + C}.\end{aligned}$$

20. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{(x+1)(x^2+4)} &= \frac{A}{x+1} + \frac{Bx+C}{x^2+4} \\ 1 &= A(x^2+4) + (Bx+C)(x+1)\end{aligned}$$

When $x = -1$ we obtain $A = 1/5$. So

$$\begin{aligned}1 &= (1/5)(x^2+4) + (Bx+C)(x+1) \\ 1 &= \left(B + \frac{1}{5}\right)x^2 + (B+C)x + \left(C + \frac{4}{5}\right)\end{aligned}$$

Equating coefficients, we obtain $B = -1/5$ and $C = 1/5$. We now have

$$\begin{aligned}\int \frac{dx}{(x+1)(x^2+4)} &= \int \left(\frac{1/5}{x+1} + \frac{-(1/5)x + 1/5}{x^2+4} \right) dx \\ &= \int \frac{1/5}{x+1} dx + \int \frac{-(1/5)x}{x^2+4} dx + \int \frac{1/5}{x^2+4} dx \\ &= \boxed{\frac{1}{5} \ln |x+1| - \frac{1}{10} \ln (x^2+4) + \frac{1}{10} \tan^{-1} \left(\frac{x}{2} \right) + C}.\end{aligned}$$

21. We use partial fractions to obtain

$$\begin{aligned}\frac{x^2 + 2x + 3}{(x+1)(x^2 + 2x + 4)} &= \frac{A}{x+1} + \frac{Bx+C}{x^2 + 2x + 4} \\ x^2 + 2x + 3 &= A(x^2 + 2x + 4) + (Bx+C)(x+1)\end{aligned}$$

When $x = -1$ we obtain $A = 2/3$. So

$$\begin{aligned}x^2 + 2x + 3 &= A(x^2 + 2x + 4) + (Bx+C)(x+1) \\ x^2 + 2x + 3 &= \left(B + \frac{2}{3}\right)x^2 + \left(B + C + \frac{4}{3}\right)x + \left(C + \frac{8}{3}\right)\end{aligned}$$

Equating coefficients, we obtain $B = 1/3$ and $C = 1/3$. We now have

$$\begin{aligned}\int \frac{x^2 + 2x + 3}{(x+1)(x^2 + 2x + 4)} dx &= \int \left(\frac{2/3}{x+1} + \frac{(1/3)x + 1/3}{x^2 + 2x + 4} \right) dx \\ &= \int \frac{2/3}{x+1} dx + \frac{1}{6} \int \frac{2x+2}{x^2 + 2x + 4} dx \\ &= \boxed{\frac{2}{3} \ln|x+1| + \frac{1}{6} \ln(x^2 + 2x + 4) + C}.\end{aligned}$$

22. We use partial fractions to obtain

$$\begin{aligned}\frac{x^2 - 11x - 18}{x(x^2 + 3x + 3)} &= \frac{A}{x} + \frac{Bx+C}{x^2 + 3x + 3} \\ x^2 - 11x - 18 &= A(x^2 + 3x + 3) + (Bx+C)x\end{aligned}$$

When $x = 0$ we obtain $A = -6$. So

$$\begin{aligned}x^2 - 11x - 18 &= A(x^2 + 3x + 3) + (Bx+C)x \\ x^2 - 11x - 18 &= (B-6)x^2 + (C-18)x - 18\end{aligned}$$

Equating coefficients, we obtain $B = 7$ and $C = 7$. We now have

$$\begin{aligned}\int \frac{x^2 - 11x - 18}{x(x^2 + 3x + 3)} dx &= \int \left(\frac{-6}{x} + \frac{7x+7}{x^2 + 3x + 3} \right) dx \\ &= \int \frac{-6}{x} dx + \int \frac{\frac{7}{2}(2x+3) - \frac{7}{2}}{x^2 + 3x + 3} dx \\ &= \int \frac{-6}{x} dx + \frac{7}{2} \int \frac{2x+3}{x^2 + 3x + 3} dx - \frac{7}{2} \int \frac{1}{\left(x + \frac{3}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2} dx \\ &= -6 \ln|x| + \frac{7}{2} \ln(x^2 + 3x + 3) - \frac{7}{2} \frac{1}{\frac{\sqrt{3}}{2}} \tan^{-1} \left(\frac{x + \frac{3}{2}}{\frac{\sqrt{3}}{2}} \right) + C \\ &= \boxed{-6 \ln|x| + \frac{7}{2} \ln(x^2 + 3x + 3) - \frac{7\sqrt{3}}{3} \tan^{-1} \left(\frac{\sqrt{3}(2x+3)}{3} \right) + C}.\end{aligned}$$

23. We expand to obtain

$$\begin{aligned}\int \frac{2x+1}{(x^2+16)^2} dx &= \int \frac{2x}{(x^2+16)^2} dx + \int \frac{1}{(x^2+16)^2} dx \\ &= -\frac{1}{x^2+16} + \int \frac{1}{(x^2+16)^2} dx.\end{aligned}$$

Let $x = 4 \tan \theta$ to obtain

$$\begin{aligned}
 \int \frac{2x+1}{(x^2+16)^2} dx &= -\frac{1}{x^2+16} + \int \frac{4 \sec^2 \theta}{256 \sec^4 \theta} d\theta \\
 &= -\frac{1}{x^2+16} + \frac{1}{64} \int \cos^2 \theta d\theta \\
 &= -\frac{1}{x^2+16} + \frac{1}{128} \int (1 + \cos 2\theta) d\theta \\
 &= -\frac{1}{x^2+16} + \frac{1}{128} \left(\theta + \frac{1}{2} \sin 2\theta \right) + C \\
 &= -\frac{1}{x^2+16} + \frac{1}{128} \theta + \frac{1}{128} \cos \theta \sin \theta + C \\
 &= -\frac{1}{x^2+16} + \frac{1}{128} \tan^{-1} \left(\frac{x}{4} \right) + \frac{1}{128} \frac{4}{\sqrt{x^2+16}} \frac{x}{\sqrt{x^2+16}} + C \\
 &= \boxed{-\frac{1}{x^2+16} + \frac{1}{128} \tan^{-1} \left(\frac{x}{4} \right) + \frac{x}{32(x^2+16)} + C}.
 \end{aligned}$$

24. We use partial fractions to obtain

$$\begin{aligned}
 \frac{x^2+2x+3}{(x^2+4)^2} &= \frac{Ax+B}{x^2+4} + \frac{Cx+D}{(x^2+4)^2} \\
 x^2+2x+3 &= (Ax+B)(x^2+4) + (Cx+D) \\
 x^2+2x+3 &= Ax^3+Bx^2+(4A+C)x+(4B+D).
 \end{aligned}$$

Equating coefficients, we obtain $A = 0$, $B = 1$, $C = 2$, and $D = -1$, so

$$\begin{aligned}
 \int \frac{x^2+2x+3}{(x^2+4)^2} dx &= \int \left(\frac{1}{x^2+4} + \frac{2x-1}{(x^2+4)^2} \right) dx \\
 &= \int \frac{1}{x^2+4} dx + \int \frac{2x}{(x^2+4)^2} dx - \int \frac{1}{(x^2+4)^2} dx \\
 &= \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{x^2+4} - \int \frac{1}{(x^2+4)^2} dx.
 \end{aligned}$$

Let $x = 2 \tan \theta$ to obtain

$$\begin{aligned}
 \int \frac{x^2+2x+3}{(x^2+4)^2} dx &= \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{x^2+4} - \int \frac{2 \sec^2 \theta}{16 \sec^4 \theta} d\theta \\
 &= \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{x^2+4} - \frac{1}{8} \int \cos^2 \theta d\theta \\
 &= \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{x^2+4} - \frac{1}{16} \int (1 + \cos 2\theta) d\theta \\
 &= \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{x^2+4} - \frac{1}{16} \left(\theta + \frac{1}{2} \sin 2\theta \right) + C \\
 &= \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{x^2+4} - \frac{1}{16} \theta - \frac{1}{16} \cos \theta \sin \theta + C \\
 &= \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{x^2+4} - \frac{1}{16} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{16} \frac{2}{\sqrt{x^2+4}} \frac{x}{\sqrt{x^2+4}} + C \\
 &= \boxed{\frac{7}{16} \tan^{-1} \left(\frac{x}{2} \right) - \frac{1}{x^2+4} - \frac{x}{8(x^2+4)} + C}.
 \end{aligned}$$

25. We use partial fractions to obtain

$$\begin{aligned}
 \frac{x^3}{(x^2 + 16)^3} &= \frac{Ax + B}{x^2 + 16} + \frac{Cx + D}{(x^2 + 16)^2} + \frac{Ex + F}{(x^2 + 16)^3} \\
 x^3 &= (Ax + B)(x^2 + 16)^2 + (Cx + D)(x^2 + 16) + Ex + F \\
 x^3 &= Ax^5 + Bx^4 + (32A + C)x^3 + (32B + D)x^2 \\
 &\quad + (256A + 16C + E)x + (256B + F + 16D).
 \end{aligned}$$

Equating coefficients, we obtain $A = 0$, $B = 0$, $C = 1$, $D = 0$, $E = -16$, and $F = 0$. So

$$\begin{aligned}
 \int \frac{x^3 dx}{(x^2 + 16)^3} &= \int \left(\frac{x}{(x^2 + 16)^2} + \frac{(-16)x}{(x^2 + 16)^3} \right) dx \\
 &= \int \frac{x}{(x^2 + 16)^2} dx - 16 \int \frac{x}{(x^2 + 16)^3} dx \\
 &= \boxed{-\frac{1}{2(x^2 + 16)} + \frac{4}{(x^2 + 16)^2} + C}.
 \end{aligned}$$

26. We use partial fractions to obtain

$$\begin{aligned}
 \frac{x^2}{(x^2 + 4)^3} &= \frac{Ax + B}{x^2 + 4} + \frac{Cx + D}{(x^2 + 4)^2} + \frac{Ex + F}{(x^2 + 4)^3} \\
 x^2 &= (Ax + B)(x^2 + 4)^2 + (Cx + D)(x^2 + 4) + Ex + F \\
 x^2 &= Ax^5 + Bx^4 + (8A + C)x^3 + (8B + D)x^2 + (16A + 4C + E)x + (16B + F + 4D).
 \end{aligned}$$

Equating coefficients, we obtain $A = 0$, $B = 0$, $C = 0$, $D = 1$, $E = 0$, and $F = -4$. So

$$\int \frac{x^2 dx}{(x^2 + 4)^3} = \int \left(\frac{1}{(x^2 + 4)^2} + \frac{-4}{(x^2 + 4)^3} \right) dx.$$

Let $x = 2 \tan \theta$ to obtain

$$\begin{aligned}
 \int \frac{x^2 dx}{(x^2 + 4)^3} &= \int \left(\frac{1}{(4 \tan^2 \theta + 4)^2} + \frac{-4}{(4 \tan^2 \theta + 4)^3} \right) (2 \sec^2 \theta) d\theta \\
 &= \int \left(\frac{1}{16 \sec^4 \theta} + \frac{-4}{64 \sec^6 \theta} \right) (2 \sec^2 \theta) d\theta \\
 &= \frac{1}{8} \int \left(\frac{1}{\sec^4 \theta} - \frac{1}{\sec^6 \theta} \right) (\sec^2 \theta) d\theta \\
 &= \frac{1}{8} \int (\cos^2 \theta - \cos^4 \theta) d\theta \\
 &= \frac{1}{8} \int \left[\frac{1 + \cos(2\theta)}{2} - \left(\frac{1 + \cos(2\theta)}{2} \right)^2 \right] d\theta \\
 &= \frac{1}{8} \int \left(\frac{1 + \cos(2\theta)}{2} - \frac{1 + 2 \cos(2\theta) + \cos^2(2\theta)}{4} \right) d\theta \\
 &= \frac{1}{8} \int \left(\frac{1}{4} - \frac{\cos^2(2\theta)}{4} \right) d\theta \\
 &= \frac{1}{32} \int \left(1 - \frac{1 + \cos(4\theta)}{2} \right) d\theta \\
 &= \frac{1}{64} \int (1 - \cos(4\theta)) d\theta \\
 &= \frac{1}{64} \left(\theta - \frac{1}{4} \sin(4\theta) \right) + C \\
 &= \frac{1}{64} \left(\theta - \frac{1}{2} \sin(2\theta) \cos(2\theta) \right) + C \\
 &= \frac{1}{64} (\theta - \sin \theta \cos \theta (2 \cos^2 \theta - 1)) + C \\
 &= \frac{1}{64} \left(\tan^{-1} \left(\frac{x}{2} \right) - \frac{x}{\sqrt{x^2 + 4}} \frac{2}{\sqrt{x^2 + 4}} \left(2 \left(\frac{2}{\sqrt{x^2 + 4}} \right)^2 - 1 \right) \right) + C \\
 &= \boxed{\frac{1}{64} \tan^{-1} \left(\frac{x}{2} \right) + \frac{x(x^2 - 4)}{32(x^2 + 4)^2} + C}.
 \end{aligned}$$

27. We use partial fractions to obtain

$$\begin{aligned}
 \frac{x}{x^2 + 2x - 3} &= \frac{x}{(x + 3)(x - 1)} = \frac{A}{x + 3} + \frac{B}{x - 1} \\
 x &= A(x - 1) + B(x + 3)
 \end{aligned}$$

When $x = 1$ we obtain $B = 1/4$, and when $x = -3$ we have $A = 3/4$. So we obtain

$$\begin{aligned}
 \int \frac{x dx}{x^2 + 2x - 3} &= \int \left(\frac{3/4}{x + 3} + \frac{1/4}{x - 1} \right) dx \\
 &= \boxed{\frac{3}{4} \ln |x + 3| + \frac{1}{4} \ln |x - 1| + C}.
 \end{aligned}$$

28. We use partial fractions to obtain

$$\begin{aligned}
 \frac{x^2 - x - 8}{(x + 1)(x^2 + 5x + 6)} &= \frac{x^2 - x - 8}{(x + 1)(x + 2)(x + 3)} = \frac{A}{x + 1} + \frac{B}{x + 2} + \frac{C}{x + 3} \\
 x^2 - x - 8 &= A(x + 2)(x + 3) + B(x + 1)(x + 3) + C(x + 1)(x + 2)
 \end{aligned}$$

When $x = -3$ we obtain $C = 2$, when $x = -2$ we have $B = 2$, and when $x = -1$ we have $A = -3$. So we obtain

$$\begin{aligned}\int \frac{x^2 - x - 8}{(x+1)(x^2+5x+6)} dx &= \int \left(\frac{-3}{x+1} + \frac{2}{x+2} + \frac{2}{x+3} \right) dx \\ &= \boxed{-3 \ln |x+1| + 2 \ln |x+2| + 2 \ln |x+3| + C}.\end{aligned}$$

29. We use partial fractions to obtain

$$\begin{aligned}\frac{10x^2 + 2x}{(x-1)^2(x^2+2)} &= \frac{A}{x-1} + \frac{B}{(x-1)^2} + \frac{Cx+D}{x^2+2} \\ 10x^2 + 2x &= A(x-1)(x^2+2) + B(x^2+2) + (Cx+D)(x-1)^2\end{aligned}$$

When $x = 1$ we obtain $B = 4$. We expand and obtain

$$\begin{aligned}10x^2 + 2x &= A(x-1)(x^2+2) + 4(x^2+2) + (Cx+D)(x-1)^2 \\ 10x^2 + 2x &= (A+C)x^3 + (-A-2C+D+4)x^2 + (2A+C-2D)x + (-2A+D+8)\end{aligned}$$

Equating coefficients, we have

$$\begin{aligned}0 &= A+C \\ 10 &= -A-2C+D+4 \\ 2 &= 2A+C-2D \\ 0 &= -2A+D+8\end{aligned}$$

We obtain $A = -C$, so $10 = -(-C) - 2C + D + 4 = D - C + 4$ and $D = 6 + C$. Then $0 = -2A + D + 8 = -2(-C) + (6 + C) + 8 = 3C + 14$, and $C = -14/3$. We now obtain $A = 14/3$, and $D = 4/3$. So

$$\begin{aligned}\int \frac{10x^2 + 2x}{(x-1)^2(x^2+2)} dx &= \int \left(\frac{14/3}{x-1} + \frac{4}{(x-1)^2} + \frac{(-14/3)x + 4/3}{x^2+2} \right) dx \\ &= \int \frac{14/3}{x-1} dx + \int \frac{4}{(x-1)^2} dx - \frac{14}{3} \int \frac{x}{x^2+2} dx + \frac{4}{3} \int \frac{dx}{x^2+2} \\ &= \boxed{\frac{14}{3} \ln |x-1| - \frac{4}{x-1} - \frac{7}{3} \ln (x^2+2) + \frac{2\sqrt{2}}{3} \tan^{-1} \left(\frac{\sqrt{2}x}{2} \right) + C}.\end{aligned}$$

30. We use partial fractions to obtain

$$\begin{aligned}\frac{x+4}{x^2(x^2+4)} &= \frac{A}{x} + \frac{B}{x^2} + \frac{Cx+D}{x^2+4} \\ x+4 &= Ax(x^2+4) + B(x^2+4) + (Cx+D)x^2\end{aligned}$$

When $x = 0$ we obtain $B = 1$. We expand and obtain

$$\begin{aligned}x+4 &= Ax(x^2+4) + 1(x^2+4) + (Cx+D)x^2 \\ x+4 &= (A+C)x^3 + (D+1)x^2 + 4Ax + 4\end{aligned}$$

Equating coefficients, we have

$$\begin{aligned}0 &= A+C \\ 0 &= D+1 \\ 1 &= 4A\end{aligned}$$

We obtain $A = 1/4$, $C = -1/4$, and $D = -1$. So

$$\begin{aligned}\int \frac{x+4}{x^2(x^2+4)} dx &= \int \left(\frac{1/4}{x} + \frac{1}{x^2} + \frac{(-1/4)x-1}{x^2+4} \right) dx \\ &= \int \frac{1/4}{x} dx + \int \frac{1}{x^2} dx - \frac{1}{4} \int \frac{x}{x^2+4} dx - \int \frac{dx}{x^2+4} \\ &= \boxed{\frac{1}{4} \ln |x| - \frac{1}{x} - \frac{1}{8} \ln (x^2+4) - \frac{1}{2} \tan^{-1} \left(\frac{x}{2} \right) + C}.\end{aligned}$$

31. We use partial fractions to obtain

$$\begin{aligned}\frac{7x+3}{x^3-2x^2-3x} &= \frac{7x+3}{x(x+1)(x-3)} = \frac{A}{x} + \frac{B}{x+1} + \frac{C}{x-3} \\ 7x+3 &= A(x+1)(x-3) + Bx(x-3) + Cx(x+1)\end{aligned}$$

When $x = 3$ we obtain $C = 2$, when $x = -1$, we get $B = -1$, and when $x = 0$, we have $A = -1$. So

$$\begin{aligned}\int \frac{7x+3}{x^3-2x^2-3x} dx &= \int \left(\frac{-1}{x} + \frac{-1}{x+1} + \frac{2}{x-3} \right) dx \\ &= \int \frac{-1}{x} dx + \int \frac{-1}{x+1} dx + \int \frac{2}{x-3} dx \\ &= \boxed{-\ln |x| - \ln |x+1| + 2 \ln |x-3| + C}.\end{aligned}$$

32. We use partial fractions to obtain

$$\begin{aligned}\frac{x^5+1}{x^6-x^4} &= \frac{(x+1)(x^4-x^3+x^2-x+1)}{x^4(x-1)(x+1)} \\ \frac{x^4-x^3+x^2-x+1}{x^4(x-1)} &= \frac{A}{x} + \frac{B}{x^2} + \frac{C}{x^3} + \frac{D}{x^4} + \frac{E}{x-1} \\ x^4-x^3+x^2-x+1 &= Ax^3(x-1) + Bx^2(x-1) + Cx(x-1) + D(x-1) + Ex^4\end{aligned}$$

When $x = 1$ we obtain $E = 1$, and when $x = 0$, we have $D = -1$. So

$$\begin{aligned}x^4-x^3+x^2-x+1 &= Ax^3(x-1) + Bx^2(x-1) + Cx(x-1) + (-1)(x-1) + (1)x^4 \\ x^4-x^3+x^2-x+1 &= (A+1)x^4 + (B-A)x^3 + (C-B)x^2 + (-C-1)x + 1.\end{aligned}$$

Equating coefficients, we obtain $A = 0$, $B = -1$, and $C = 0$. We now integrate

$$\begin{aligned}\int \frac{x^5+1}{x^6-x^4} dx &= \int \left(\frac{-1}{x^2} + \frac{-1}{x^4} + \frac{1}{x-1} \right) dx \\ &= \int \frac{-1}{x^2} dx + \int \frac{-1}{x^4} dx + \int \frac{1}{x-1} dx \\ &= \boxed{\frac{1}{x} + \frac{1}{3x^3} + \ln |x-1| + C}.\end{aligned}$$

33. We use partial fractions to obtain

$$\begin{aligned}\frac{x^2}{(x-2)(x-1)^2} &= \frac{A}{x-2} + \frac{B}{x-1} + \frac{C}{(x-1)^2} \\ x^2 &= A(x-1)^2 + B(x-2)(x-1) + C(x-2).\end{aligned}$$

When $x = 1$ we obtain $C = -1$, and when $x = 2$, we have $A = 4$. So

$$\begin{aligned}x^2 &= 4(x-1)^2 + B(x-2)(x-1) + (-1)(x-2) \\x^2 &= (B+4)x^2 + (-3B-9)x + (2B+6).\end{aligned}$$

Equating coefficients, we obtain $B = -3$. We now obtain

$$\begin{aligned}\int \frac{x^2}{(x-2)(x-1)^2} dx &= \int \left(\frac{4}{x-2} + \frac{-3}{x-1} + \frac{-1}{(x-1)^2} \right) dx \\&= \int \frac{4}{x-2} dx + \int \frac{-3}{x-1} dx + \int \frac{-1}{(x-1)^2} dx \\&= \boxed{4 \ln |x-2| - 3 \ln |x-1| + \frac{1}{x-1} + C}.\end{aligned}$$

34. We use partial fractions to obtain

$$\begin{aligned}\frac{x^2+1}{(x+3)(x-1)^2} &= \frac{A}{x+3} + \frac{B}{x-1} + \frac{C}{(x-1)^2} \\x^2+1 &= A(x-1)^2 + B(x+3)(x-1) + C(x+3).\end{aligned}$$

When $x = 1$ we obtain $C = 1/2$, and when $x = -3$, we have $A = 5/8$. So

$$\begin{aligned}x^2+1 &= (5/8)(x-1)^2 + B(x+3)(x-1) + (1/2)(x+3) \\x^2+1 &= \left(B + \frac{5}{8}\right)x^2 + \left(2B - \frac{3}{4}\right)x + \left(\frac{17}{8} - 3B\right).\end{aligned}$$

Equating coefficients, we obtain $B = 3/8$. We now obtain

$$\begin{aligned}\int \frac{x^2+1}{(x+3)(x-1)^2} dx &= \int \left(\frac{5/8}{x+3} + \frac{3/8}{x-1} + \frac{1/2}{(x-1)^2} \right) dx \\&= \int \frac{5/8}{x+3} dx + \int \frac{3/8}{x-1} dx + \int \frac{1/2}{(x-1)^2} dx \\&= \boxed{\frac{5}{8} \ln |x+3| + \frac{3}{8} \ln |x-1| - \frac{1}{2(x-1)} + C}.\end{aligned}$$

35. We use partial fractions to obtain

$$\begin{aligned}\frac{2x+1}{x^3-1} &= \frac{2x+1}{(x-1)(x^2+x+1)} = \frac{A}{x-1} + \frac{Bx+C}{x^2+x+1} \\2x+1 &= A(x^2+x+1) + (Bx+C)(x-1).\end{aligned}$$

When $x = 1$ we obtain $A = 1$. So

$$\begin{aligned}2x+1 &= (1)(x^2+x+1) + (Bx+C)(x-1) \\2x+1 &= (B+1)x^2 + (C-B+1)x + (1-C).\end{aligned}$$

Equating coefficients, we obtain $B = -1$, and $C = 0$. We now obtain

$$\begin{aligned}
 \int \frac{2x+1}{x^3-1} dx &= \int \left(\frac{1}{x-1} + \frac{-x}{x^2+x+1} \right) dx \\
 &= \int \frac{1}{x-1} dx + \int \frac{-\frac{1}{2}(2x+1) + \frac{1}{2}}{x^2+x+1} dx \\
 &= \int \frac{1}{x-1} dx - \frac{1}{2} \int \frac{2x+1}{x^2+x+1} dx + \frac{1}{2} \int \frac{1}{\left(x+\frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2} dx \\
 &= \boxed{\ln|x-1| - \frac{1}{2} \ln(x^2+x+1) + \frac{\sqrt{3}}{3} \tan^{-1} \left(\frac{\sqrt{3}(2x+1)}{3} \right) + C}.
 \end{aligned}$$

36. We use partial fractions to obtain

$$\begin{aligned}
 \frac{1}{x^3-8} &= \frac{1}{(x-2)(x^2+2x+4)} = \frac{A}{x-2} + \frac{Bx+C}{x^2+2x+4} \\
 1 &= A(x^2+2x+4) + (Bx+C)(x-2).
 \end{aligned}$$

When $x = 2$ we obtain $A = \frac{1}{12}$. So

$$\begin{aligned}
 1 &= \left(\frac{1}{12} \right) (x^2+2x+4) + (Bx+C)(x-2) \\
 1 &= \left(B + \frac{1}{12} \right) x^2 + \left(C - 2B + \frac{1}{6} \right) x + \left(\frac{1}{3} - 2C \right).
 \end{aligned}$$

Equating coefficients, we obtain $B = -\frac{1}{12}$, and $C = -\frac{1}{3}$. We now obtain

$$\begin{aligned}
 \int \frac{dx}{x^3-8} &= \int \left(\frac{\frac{1}{12}}{x-2} + \frac{-\frac{1}{12}x - \frac{1}{3}}{x^2+2x+4} \right) dx \\
 &= \int \frac{\frac{1}{12}}{x-2} dx + \int \frac{\frac{-1}{24}(2x+2) - \frac{1}{4}}{x^2+2x+4} dx \\
 &= \int \frac{\frac{1}{12}}{x-2} dx - \frac{1}{24} \int \frac{2x+2}{x^2+2x+4} dx - \frac{1}{4} \int \frac{1}{(x+1)^2 + (\sqrt{3})^2} dx \\
 &= \boxed{\frac{1}{12} \ln|x-2| - \frac{1}{24} \ln(x^2+2x+4) - \frac{\sqrt{3}}{12} \tan^{-1} \left(\frac{\sqrt{3}(x+1)}{3} \right) + C}.
 \end{aligned}$$

37. We use partial fractions to obtain

$$\begin{aligned}
 \frac{1}{x^2-9} &= \frac{1}{(x-3)(x+3)} = \frac{A}{x-3} + \frac{B}{x+3} \\
 1 &= A(x+3) + B(x-3).
 \end{aligned}$$

When $x = -3$ we obtain $B = -\frac{1}{6}$, and when $x = 3$ we have $A = \frac{1}{6}$. So we obtain

$$\begin{aligned}
 \int_0^1 \frac{dx}{x^2-9} &= \int_0^1 \left(\frac{1/6}{x-3} + \frac{-1/6}{x+3} \right) dx \\
 &= \left[\frac{1}{6} \ln|x-3| - \frac{1}{6} \ln|x+3| \right]_0^1 \\
 &= \frac{1}{6} \ln|1-3| - \frac{1}{6} \ln|1+3| - \left(\frac{1}{6} \ln|0-3| - \frac{1}{6} \ln|0+3| \right) \\
 &= \boxed{-\frac{1}{6} \ln 2}.
 \end{aligned}$$

38. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{x^2 - 25} &= \frac{1}{(x-5)(x+5)} = \frac{A}{x-5} + \frac{B}{x+5} \\ 1 &= A(x+5) + B(x-5).\end{aligned}$$

When $x = -5$ we obtain $B = \frac{-1}{10}$, and when $x = 5$ we have $A = \frac{1}{10}$. So we obtain

$$\begin{aligned}\int_2^4 \frac{dx}{x^2 - 25} &= \int_2^4 \left(\frac{\frac{1}{10}}{x-5} + \frac{\frac{-1}{10}}{x+5} \right) dx \\ &= \left[\frac{1}{10} \ln |x-5| - \frac{1}{10} \ln |x+5| \right]_2^4 \\ &= \frac{1}{10} \ln |4-5| - \frac{1}{10} \ln |4+5| - \left(\frac{1}{10} \ln |2-5| - \frac{1}{10} \ln |2+5| \right) \\ &= \boxed{\frac{1}{10} \ln 7 - \frac{3}{10} \ln 3}.\end{aligned}$$

39. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{16 - x^2} &= \frac{-1}{(x-4)(x+4)} = \frac{A}{x-4} + \frac{B}{x+4} \\ -1 &= A(x+4) + B(x-4).\end{aligned}$$

When $x = -4$ we obtain $B = \frac{1}{8}$, and when $x = 4$ we have $A = \frac{-1}{8}$. So we obtain

$$\begin{aligned}\int_{-2}^3 \frac{dx}{16 - x^2} &= \int_{-2}^3 \left(\frac{-1/8}{x-4} + \frac{1/8}{x+4} \right) dx \\ &= \left[\frac{-1}{8} \ln |x-4| + \frac{1}{8} \ln |x+4| \right]_{-2}^3 \\ &= \frac{-1}{8} \ln |3-4| + \frac{1}{8} \ln |3+4| - \left(\frac{-1}{8} \ln |-2-4| + \frac{1}{8} \ln |-2+4| \right) \\ &= \frac{1}{8} \ln 7 - \frac{1}{8} \ln 2 + \frac{1}{8} \ln 6 = \boxed{\frac{1}{8} \ln 21}.\end{aligned}$$

40. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{9 - x^2} &= \frac{-1}{(x-3)(x+3)} = \frac{A}{x-3} + \frac{B}{x+3} \\ -1 &= A(x+3) + B(x-3).\end{aligned}$$

When $x = -3$ we obtain $B = \frac{1}{6}$, and when $x = 3$ we have $A = \frac{-1}{6}$. So we obtain

$$\begin{aligned}\int_1^2 \frac{dx}{9 - x^2} &= \int_1^2 \left(\frac{-1/6}{x-3} + \frac{1/6}{x+3} \right) dx \\ &= \left[\frac{-1}{6} \ln |x-3| + \frac{1}{6} \ln |x+3| \right]_1^2 \\ &= \frac{-1}{6} \ln |2-3| + \frac{1}{6} \ln |2+3| - \left(\frac{-1}{6} \ln |1-3| + \frac{1}{6} \ln |1+3| \right) \\ &= \boxed{\frac{1}{6} \ln 5 - \frac{1}{6} \ln 2}.\end{aligned}$$

41. Let $x = \sin \theta$, and substitute to obtain

$$\int \frac{\cos \theta}{\sin^2 \theta + \sin \theta - 6} d\theta = \int \frac{dx}{x^2 + x - 6} = \int \frac{dx}{(x-2)(x+3)}.$$

We use partial fractions to obtain

$$\begin{aligned} \frac{1}{(x-2)(x+3)} &= \frac{A}{x-2} + \frac{B}{x+3} \\ 1 &= A(x+3) + B(x-2) \end{aligned}$$

When $x = -3$ we obtain $B = -\frac{1}{5}$, and when $x = 2$ we have $A = \frac{1}{5}$. So we obtain

$$\begin{aligned} \int \frac{\cos \theta}{\sin^2 \theta + \sin \theta - 6} d\theta &= \int \left(\frac{1/5}{x-2} + \frac{-1/5}{x+3} \right) dx \\ &= \frac{1}{5} \ln |x-2| - \frac{1}{5} \ln |x+3| + C \\ &= \boxed{\frac{1}{5} \ln (2 - \sin \theta) - \frac{1}{5} \ln (\sin \theta + 3) + C}. \end{aligned}$$

42. Let $u = \cos x$, and substitute to obtain

$$\int \frac{\sin x}{\cos^2 x - 2 \cos x - 8} dx = \int \frac{-du}{u^2 - 2u - 8} = \int \frac{-du}{(u-4)(u+2)}.$$

We use partial fractions to obtain

$$\begin{aligned} \frac{-1}{(u-4)(u+2)} &= \frac{A}{u-4} + \frac{B}{u+2} \\ -1 &= A(u+2) + B(u-4) \end{aligned}$$

When $u = -2$ we obtain $B = \frac{1}{6}$, and when $u = 4$ we have $A = -\frac{1}{6}$. So we obtain

$$\begin{aligned} \int \frac{\sin x}{\cos^2 x - 2 \cos x - 8} dx &= \int \left(\frac{-1/6}{u-4} + \frac{1/6}{u+2} \right) du \\ &= -\frac{1}{6} \ln |u-4| + \frac{1}{6} \ln |u+2| + C \\ &= \boxed{-\frac{1}{6} \ln (4 - \cos x) + \frac{1}{6} \ln (\cos x + 2) + C}. \end{aligned}$$

43. Let $x = \cos \theta$, and substitute to obtain

$$\int \frac{\sin \theta}{\cos^3 \theta + \cos \theta} d\theta = \int \frac{-dx}{x^3 + x} = \int \frac{-dx}{x(x^2 + 1)}.$$

We use partial fractions to obtain

$$\begin{aligned} \frac{-1}{x(x^2 + 1)} &= \frac{A}{x} + \frac{Bx + C}{x^2 + 1} \\ -1 &= A(x^2 + 1) + (Bx + C)x \end{aligned}$$

When $x = 0$ we obtain $A = -1$. So

$$\begin{aligned} -1 &= (-1)(x^2 + 1) + (Bx + C)x \\ -1 &= (B-1)x^2 + Cx - 1 \end{aligned}$$

Equating coefficients, we obtain $B = 1$ and $C = 0$. We now have

$$\begin{aligned}
 \int \frac{\sin \theta}{\cos^3 \theta + \cos \theta} d\theta &= \int \left(\frac{-1}{x} + \frac{x}{x^2 + 1} \right) dx \\
 &= \int \frac{-1}{x} dx + \int \frac{x}{x^2 + 1} dx \\
 &= -\ln |x| + \frac{1}{2} \ln (x^2 + 1) + C \\
 &= \boxed{-\ln |\cos \theta| + \frac{1}{2} \ln (\cos^2 \theta + 1) + C}.
 \end{aligned}$$

44. Let $x = \sin \theta$, and substitute to obtain

$$\int \frac{4 \cos \theta}{\sin^3 \theta + 2 \sin \theta} d\theta = \int \frac{4 dx}{x^3 + 2x} = \int \frac{4 dx}{x(x^2 + 2)}.$$

We use partial fractions to obtain

$$\begin{aligned}
 \frac{4}{x(x^2 + 2)} &= \frac{A}{x} + \frac{Bx + C}{x^2 + 2} \\
 4 &= A(x^2 + 2) + (Bx + C)x
 \end{aligned}$$

When $x = 0$ we obtain $A = 2$. So

$$\begin{aligned}
 4 &= 2(x^2 + 2) + (Bx + C)x \\
 4 &= (B + 2)x^2 + Cx + 4
 \end{aligned}$$

Equating coefficients, we obtain $B = -2$ and $C = 0$. We now have

$$\begin{aligned}
 \int \frac{4 \cos \theta}{\cos^3 \theta + \cos \theta} d\theta &= \int \left(\frac{2}{x} + \frac{-2x}{x^2 + 2} \right) dx \\
 &= 2 \int \frac{1}{x} dx - \int \frac{2x}{x^2 + 2} dx \\
 &= 2 \ln |x| - \ln (x^2 + 2) + C \\
 &= \boxed{2 \ln |\sin \theta| - \ln (\sin^2 \theta + 2) + C}.
 \end{aligned}$$

45. Let $x = e^t$, and substitute to obtain

$$\int \frac{e^t}{e^{2t} + e^t - 2} dt = \int \frac{dx}{x^2 + x - 2} = \int \frac{dx}{(x - 1)(x + 2)}.$$

We use partial fractions to obtain

$$\begin{aligned}
 \frac{1}{(x - 1)(x + 2)} &= \frac{A}{x - 1} + \frac{B}{x + 2} \\
 1 &= A(x + 2) + B(x - 1)
 \end{aligned}$$

When $x = -2$ we obtain $B = -\frac{1}{3}$, and when $x = 1$ we have $A = \frac{1}{3}$. So we obtain

$$\begin{aligned}
 \int \frac{e^t}{e^{2t} + e^t - 2} dt &= \int \left(\frac{1/3}{x - 1} + \frac{-1/3}{x + 2} \right) dx \\
 &= \int \frac{1/3}{x - 1} dx + \int \frac{-1/3}{x + 2} dx \\
 &= \frac{1}{3} \ln |x - 1| - \frac{1}{3} \ln |x + 2| + C \\
 &= \boxed{\frac{1}{3} \ln |e^t - 1| - \frac{1}{3} \ln (e^t + 2) + C}.
 \end{aligned}$$

46. Let $y = e^x$, and substitute to obtain

$$\int \frac{e^x}{e^{2x} + e^x - 6} dx = \int \frac{dy}{y^2 + y - 6} = \int \frac{dy}{(y-2)(y+3)}.$$

We use partial fractions to obtain

$$\begin{aligned} \frac{1}{(y-2)(y+3)} &= \frac{A}{y-2} + \frac{B}{y+3} \\ 1 &= A(y+3) + B(y-2) \end{aligned}$$

When $y = -3$ we obtain $B = -\frac{1}{5}$, and when $y = 2$ we have $A = \frac{1}{5}$. So we obtain

$$\begin{aligned} \int \frac{e^x}{e^{2x} + e^x - 6} dx &= \int \left(\frac{1/5}{y-2} + \frac{-1/5}{y+3} \right) dy \\ &= \int \frac{1/5}{y-2} dy + \int \frac{-1/5}{y+3} dy \\ &= \frac{1}{5} \ln |y-2| - \frac{1}{5} \ln |y+3| + C \\ &= \boxed{\frac{1}{5} \ln |e^x - 2| - \frac{1}{5} \ln (e^x + 3) + C}. \end{aligned}$$

47. Let $y = e^x$, and substitute to obtain

$$\int \frac{e^x}{e^{2x} - 1} dx = \int \frac{dy}{y^2 - 1} = \int \frac{dy}{(y-1)(y+1)}.$$

We use partial fractions to obtain

$$\begin{aligned} \frac{1}{(y-1)(y+1)} &= \frac{A}{y-1} + \frac{B}{y+1} \\ 1 &= A(y+1) + B(y-1) \end{aligned}$$

When $y = -1$ we obtain $B = -\frac{1}{2}$, and when $y = 1$ we have $A = \frac{1}{2}$. So we obtain

$$\begin{aligned} \int \frac{e^x}{e^{2x} - 1} dx &= \int \left(\frac{1/2}{y-1} + \frac{-1/2}{y+1} \right) dy \\ &= \int \frac{1/2}{y-1} dy + \int \frac{-1/2}{y+1} dy \\ &= \frac{1}{2} \ln |y-1| - \frac{1}{2} \ln |y+1| + C \\ &= \boxed{\frac{1}{2} \ln |e^x - 1| - \frac{1}{2} \ln (e^x + 1) + C}. \end{aligned}$$

48. We rewrite the integral as

$$\int \frac{dx}{e^x - e^{-x}} = \int \frac{e^x}{e^{2x} - 1} dx.$$

Let $y = e^x$, and substitute to obtain

$$\int \frac{dx}{e^x - e^{-x}} = \int \frac{dy}{y^2 - 1} = \int \frac{dy}{(y-1)(y+1)}.$$

We use partial fractions to obtain

$$\begin{aligned}\frac{1}{(y-1)(y+1)} &= \frac{A}{y-1} + \frac{B}{y+1} \\ 1 &= A(y+1) + B(y-1)\end{aligned}$$

When $y = -1$ we obtain $B = -\frac{1}{2}$, and when $y = 1$ we have $A = \frac{1}{2}$. So we obtain

$$\begin{aligned}\int \frac{dx}{e^x - e^{-x}} &= \int \left(\frac{1/2}{y-1} + \frac{-1/2}{y+1} \right) dy \\ &= \int \frac{1/2}{y-1} dy + \int \frac{-1/2}{y+1} dy \\ &= \frac{1}{2} \ln |y-1| - \frac{1}{2} \ln |y+1| + C \\ &= \boxed{\frac{1}{2} \ln |e^x - 1| - \frac{1}{2} \ln (e^x + 1) + C}.\end{aligned}$$

49. We rewrite the integral as

$$\int \frac{dt}{e^{2t} + 1} = \int \frac{e^t}{e^t(e^{2t} + 1)} dt.$$

Let $x = e^t$, and substitute to obtain

$$\int \frac{dt}{e^{2t} + 1} = \int \frac{dx}{x(x^2 + 1)}.$$

We use partial fractions to obtain

$$\begin{aligned}\frac{1}{x(x^2 + 1)} &= \frac{A}{x} + \frac{Bx + C}{x^2 + 1} \\ 1 &= A(x^2 + 1) + (Bx + C)x\end{aligned}$$

When $x = 0$ we obtain $A = 1$. So

$$\begin{aligned}1 &= (1)(x^2 + 1) + (Bx + C)x \\ 1 &= (B + 1)x^2 + Cx + 1\end{aligned}$$

Equating coefficients, we obtain $B = -1$ and $C = 0$. We now have

$$\begin{aligned}\int \frac{dt}{e^{2t} + 1} &= \int \left(\frac{1}{x} + \frac{-x}{x^2 + 1} \right) dx \\ &= \int \frac{1}{x} dx + \int \frac{-x}{x^2 + 1} dx \\ &= \ln |x| - \frac{1}{2} \ln (x^2 + 1) + C \\ &= \ln (e^t) - \frac{1}{2} \ln (e^{2t} + 1) + C \\ &= \boxed{t - \frac{1}{2} \ln (e^{2t} + 1) + C}.\end{aligned}$$

50. We rewrite the integral as

$$\int \frac{dt}{e^{3t} + e^t} = \int \frac{e^t}{e^{2t}(e^{2t} + 1)} dt.$$

Let $x = e^t$, and substitute to obtain

$$\int \frac{dt}{e^{3t} + e^t} = \int \frac{dx}{x^2(x^2 + 1)}.$$

We use partial fractions to obtain

$$\begin{aligned} \frac{1}{x^2(x^2 + 1)} &= \frac{A}{x} + \frac{B}{x^2} + \frac{Cx + D}{x^2 + 1} \\ 1 &= Ax(x^2 + 1) + B(x^2 + 1) + (Cx + D)x^2 \end{aligned}$$

When $x = 0$ we obtain $B = 1$. We expand and obtain

$$\begin{aligned} 1 &= Ax(x^2 + 1) + (1)(x^2 + 1) + (Cx + D)x^2 \\ 1 &= (A + C)x^3 + (D + 1)x^2 + Ax + 1 \end{aligned}$$

Equating coefficients, we obtain $A = 0$, $C = 0$, and $D = -1$. So

$$\begin{aligned} \int \frac{dt}{e^{3t} + e^t} &= \int \left(\frac{1}{x^2} + \frac{-1}{x^2 + 1} \right) dx \\ &= \int \frac{1}{x^2} dx - \int \frac{dx}{x^2 + 1} \\ &= -\frac{1}{x} - \tan^{-1} x + C \\ &= \boxed{-e^{-t} - \tan^{-1}(e^t) + C}. \end{aligned}$$

51. Let $u = \sin x - 1$, and substitute to obtain

$$\begin{aligned} \int \frac{\sin x \cos x}{(\sin x - 1)^2} dx &= \int \frac{u + 1}{u^2} du \\ &= \int \left(\frac{1}{u} + u^{-2} \right) du \\ &= \ln |u| - \frac{1}{u} + C \\ &= \boxed{\ln |\sin x - 1| - \frac{1}{\sin x - 1} + C}. \end{aligned}$$

52. Let $u = \cos x - 2$, and substitute to obtain

$$\begin{aligned} \int \frac{\cos x \sin x}{(\cos x - 2)^2} dx &= \int \frac{-(u + 2)}{u^2} du \\ &= \int \left(-\frac{1}{u} - 2u^{-2} \right) du \\ &= -\ln |u| + \frac{2}{u} + C \\ &= \boxed{-\ln (2 - \cos x) + \frac{2}{\cos x - 2} + C}. \end{aligned}$$

53. Let $u = \sin x$, and substitute to obtain

$$\int \frac{\cos x}{(\sin^2 x + 9)^2} dx = \int \frac{du}{(u^2 + 9)^2}.$$

Let $u = 3 \tan \theta$, and substitute to obtain

$$\begin{aligned}
 \int \frac{\cos x}{(\sin^2 x + 9)^2} dx &= \int \frac{3 \sec^2 \theta d\theta}{\left((3 \tan \theta)^2 + 9\right)^2} \\
 &= \frac{1}{27} \int \cos^2 \theta d\theta \\
 &= \frac{1}{27} \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{1}{54} \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\
 &= \frac{1}{54} \tan^{-1} \frac{u}{3} + \frac{1}{54} \sin \theta \cos \theta + C \\
 &= \frac{1}{54} \tan^{-1} \frac{u}{3} + \frac{1}{54} \frac{\tan \theta}{\sec^2 \theta} + C.
 \end{aligned}$$

Since $\tan \theta = \frac{u}{3}$, $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{\left(\frac{u}{3}\right)^2 + 1} = \frac{1}{3} \sqrt{u^2 + 9}$, and we have

$$\begin{aligned}
 \int \frac{\cos x}{(\sin^2 x + 9)^2} dx &= \frac{1}{54} \tan^{-1} \frac{u}{3} + \frac{1}{54} \frac{\frac{u}{3}}{\left(\frac{1}{3} \sqrt{u^2 + 9}\right)^2} + C \\
 &= \frac{1}{54} \tan^{-1} \frac{u}{3} + \frac{1}{18} \frac{u}{u^2 + 9} + C \\
 &= \boxed{\frac{1}{54} \tan^{-1} \frac{\sin x}{3} + \frac{1}{18} \frac{\sin x}{\sin^2 x + 9} + C}.
 \end{aligned}$$

54. Let $u = \cos x$, and substitute to obtain

$$\int \frac{\sin x}{(\cos^2 x + 4)^2} dx = \int \frac{-du}{(u^2 + 4)^2}.$$

Let $u = 2 \tan \theta$, and substitute to obtain

$$\begin{aligned}
 \int \frac{\sin x}{(\cos^2 x + 4)^2} dx &= \int \frac{-2 \sec^2 \theta d\theta}{\left((2 \tan \theta)^2 + 4\right)^2} \\
 &= \frac{-1}{8} \int \cos^2 \theta d\theta \\
 &= \frac{-1}{8} \int \frac{1 + \cos(2\theta)}{2} d\theta \\
 &= \frac{-1}{16} \left(\theta + \frac{1}{2} \sin(2\theta) \right) + C \\
 &= \frac{-1}{16} \tan^{-1} \frac{u}{2} + \frac{-1}{16} \sin \theta \cos \theta + C \\
 &= \frac{-1}{16} \tan^{-1} \frac{u}{2} + \frac{-1}{16} \frac{\tan \theta}{\sec^2 \theta} + C.
 \end{aligned}$$

Since $\tan \theta = \frac{u}{2}$, $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{\left(\frac{u}{2}\right)^2 + 1} = \frac{1}{2}\sqrt{u^2 + 4}$, and we have

$$\begin{aligned} \int \frac{\sin x}{(\cos^2 x + 4)^2} dx &= \frac{-1}{16} \tan^{-1} \frac{u}{2} + \frac{-1}{16} \frac{\frac{u}{2}}{\left(\frac{1}{2}\sqrt{u^2 + 4}\right)^2} + C \\ &= \frac{-1}{16} \tan^{-1} \frac{u}{2} - \frac{1}{8} \frac{u}{u^2 + 4} + C \\ &= \boxed{\frac{-1}{16} \tan^{-1} \frac{\cos x}{2} - \frac{1}{8} \frac{\cos x}{\cos^2 x + 4} + C}. \end{aligned}$$

55. The area under the graph is given by

$$A = \int_3^5 \frac{4}{x^2 - 4} dx = \int_3^5 \frac{4}{(x+2)(x-2)} dx.$$

We use partial fractions to obtain

$$\begin{aligned} \frac{4}{(x+2)(x-2)} &= \frac{A}{x+2} + \frac{B}{x-2} \\ 4 &= A(x-2) + B(x+2) \end{aligned}$$

When $x = 2$ we obtain $B = 1$, and when $x = -2$ we have $A = -1$. So we obtain

$$\begin{aligned} A &= \int_3^5 \left(\frac{-1}{x+2} + \frac{1}{x-2} \right) dx \\ &= [-\ln(x+2) + \ln(x-2)]_3^5 \\ &= -\ln(5+2) + \ln(5-2) - (-\ln(3+2) + \ln(3-2)) \\ &= \ln 3 + \ln 5 - \ln 7 = \boxed{\ln \frac{15}{7}}. \end{aligned}$$

56. The area under the graph is given by

$$A = \int_4^6 \frac{x-4}{(x+3)^2} dx.$$

Let $u = x + 3$ to obtain

$$\begin{aligned} A &= \int_7^9 \frac{(u-3)-4}{u^2} du \\ &= \int_7^9 \left(\frac{1}{u} - \frac{7}{u^2} \right) du \\ &= \left[\ln u + \frac{7}{u} \right]_7^9 \\ &= \ln 9 + \frac{7}{9} - \left(\ln 7 + \frac{7}{7} \right) \\ &= \boxed{\ln 9 - \ln 7 - \frac{2}{9}}. \end{aligned}$$

57. The area under the graph is given by

$$A = \int_0^2 \frac{8}{x^3 + 1} dx = \int_0^2 \frac{8}{(x+1)(x^2 - x + 1)} dx.$$

We use partial fractions to obtain

$$\begin{aligned}\frac{8}{(x+1)(x^2-x+1)} &= \frac{A}{x+1} + \frac{Bx+C}{x^2-x+1} \\ 8 &= A(x^2-x+1) + (Bx+C)(x+1).\end{aligned}$$

When $x = -1$ we obtain $A = 8/3$. We expand and obtain

$$\begin{aligned}8 &= (8/3)(x^2-x+1) + (Bx+C)(x+1) \\ 8 &= \left(B + \frac{8}{3}\right)x^2 + \left(B + C - \frac{8}{3}\right)x + \left(C + \frac{8}{3}\right).\end{aligned}$$

Equating coefficients, we have $B = -8/3$ and $C = 16/3$. We now have

$$\begin{aligned}A &= \int_0^2 \left(\frac{8/3}{x+1} + \frac{(-8/3)x + 16/3}{x^2-x+1} \right) dx \\ &= \left[\frac{8}{3} \ln(x+1) \right]_0^2 + \int_0^2 \frac{(-4/3)(2x-1)x + 4}{x^2-x+1} dx \\ &= \frac{8}{3} \ln(2+1) - \frac{8}{3} \ln(0+1) - \frac{4}{3} \int_0^2 \frac{2x-1}{x^2-x+1} dx + 4 \int_0^2 \frac{dx}{\left(x - \frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2} \\ &= \frac{8}{3} \ln 3 - \frac{4}{3} [\ln(x^2-x+1)]_0^2 + 4 \left[\frac{2\sqrt{3}}{3} \tan^{-1} \left(\frac{\sqrt{3}(2x-1)}{3} \right) \right]_0^2 \\ &= \frac{8}{3} \ln 3 - \frac{4}{3} (\ln(2^2-2+1) - \ln(0^2-0+1)) \\ &\quad + 4 \left[\frac{2\sqrt{3}}{3} \tan^{-1} \left(\frac{\sqrt{3}(2(2)-1)}{3} \right) - \frac{2\sqrt{3}}{3} \tan^{-1} \left(\frac{\sqrt{3}(2(0)-1)}{3} \right) \right] \\ &= \boxed{\frac{4}{3} \ln 3 + \frac{4\sqrt{3}}{3} \pi}.\end{aligned}$$

58. The volume is given by

$$V = \int_3^5 \pi \left(\frac{4}{x^2-4} \right)^2 dx = \pi \int_3^5 \frac{16}{(x-2)^2(x+2)^2} dx.$$

We use partial fractions to obtain

$$\begin{aligned}\frac{16}{(x-2)^2(x+2)^2} &= \frac{A}{x-2} + \frac{B}{(x-2)^2} + \frac{C}{x+2} + \frac{D}{(x+2)^2} \\ 16 &= A(x-2)(x+2)^2 + B(x+2)^2 + C(x-2)^2(x+2) + D(x-2)^2.\end{aligned}$$

When $x = -2$ we obtain $D = 1$, and when $x = 2$ we have $B = 1$. We expand and obtain

$$\begin{aligned}16 &= A(x-2)(x+2)^2 + (1)(x+2)^2 + C(x-2)^2(x+2) + (1)(x-2)^2 \\ 16 &= (A+C)x^3 + (2A-2C+2)x^2 + (-4A-4C)x + (8C-8A+8).\end{aligned}$$

Equating coefficients, we have $A + C = 0$ and $2A - 2C + 2 = 0$. So $C = -A$, and

$2A - 2(-A) + 2 = 4A + 2 = 0$. We obtain $A = -1/2$ and $C = 1/2$. We now have

$$\begin{aligned}
 V &= \pi \int_3^5 \left(\frac{-1/2}{x-2} + \frac{1}{(x-2)^2} + \frac{1/2}{x+2} + \frac{1}{(x+2)^2} \right) dx \\
 &= \pi \left(\int_3^5 \frac{-1/2}{x-2} dx + \int_3^5 \frac{1}{(x-2)^2} dx + \int_3^5 \frac{1/2}{x+2} dx + \int_3^5 \frac{1}{(x+2)^2} dx \right) \\
 &= \pi \left(\left[-\frac{1}{2} \ln(x-2) \right]_3^5 + \left[-\frac{1}{x-2} \right]_3^5 + \left[\frac{1}{2} \ln(x+2) \right]_3^5 + \left[-\frac{1}{x+2} \right]_3^5 \right) \\
 &= \pi \left[-\frac{1}{2} \ln(5-2) - \left(-\frac{1}{2} \ln(3-2) \right) + \left(-\frac{1}{5-2} \right) - \left(-\frac{1}{3-2} \right) \right. \\
 &\quad \left. + \frac{1}{2} \ln(5+2) - \frac{1}{2} \ln(3+2) + \left(-\frac{1}{5+2} \right) - \left(-\frac{1}{3+2} \right) \right] \\
 &= \boxed{\pi \left(\frac{1}{2} \ln 7 - \frac{1}{2} \ln 5 - \frac{1}{2} \ln 3 + \frac{76}{105} \right)}.
 \end{aligned}$$

59. (a) We test possible rational roots, and obtain that the zeros of q are $\boxed{-4, -2, \text{ and } 3}$.

(b) From part (a), we obtain $q(x) = (x+4)(x+2)(x-3)$.

(c) We use partial fractions to obtain

$$\begin{aligned}
 \frac{3x-7}{x^3+3x^2-10x-24} &= \frac{A}{x+2} + \frac{B}{x-3} + \frac{C}{x+4} \\
 3x-7 &= A(x-3)(x+4) + B(x+2)(x+4) + C(x+2)(x-3).
 \end{aligned}$$

When $x = -4$ we obtain $C = -19/14$. When $x = 3$ we get $B = \frac{2}{35}$. And when $x = -2$, we have $A = \frac{13}{10}$. We now obtain

$$\begin{aligned}
 \int \frac{3x-7}{x^3+3x^2-10x-24} dx &= \int \left(\frac{13/10}{x+2} + \frac{2/35}{x-3} + \frac{-19/14}{x+4} \right) dx \\
 &= \int \frac{13/10}{x+2} dx + \int \frac{2/35}{x-3} dx + \int \frac{-19/14}{x+4} dx \\
 &= \boxed{\frac{13}{10} \ln|x+2| + \frac{2}{35} \ln|x-3| - \frac{19}{14} \ln|x+4| + C}.
 \end{aligned}$$

Challenge Problems

60. Let $u = \sqrt{x}$, $du = \frac{1}{2\sqrt{x}} dx$, so $dx = 2u du$. We obtain

$$\begin{aligned}
 \int \frac{x dx}{3 + \sqrt{x}} &= \int \frac{u^2}{3 + u} (2u) du \\
 &= 2 \int \frac{u^3}{u+3} du.
 \end{aligned}$$

Let $y = u + 3$, then we have

$$\begin{aligned}
 \int \frac{x \, dx}{3 + \sqrt{x}} &= 2 \int \frac{(y-3)^3}{y} \, dy \\
 &= 2 \int \frac{y^3 - 9y^2 + 27y - 27}{y} \, dy \\
 &= 2 \int \left(y^2 - 9y + 27 - \frac{27}{y} \right) \, dy \\
 &= 2 \left(\frac{1}{3} y^3 - \frac{9}{2} y^2 + 27y - 27 \ln |y| \right) + C \\
 &= \frac{2}{3} (u+3)^3 - 9(u+3)^2 + 54(u+3) - 54 \ln |u+3| + C \\
 &= \boxed{\frac{2}{3} (\sqrt{x}+3)^3 - 9(\sqrt{x}+3)^2 + 54(\sqrt{x}+3) - 54 \ln (\sqrt{x}+3) + C}.
 \end{aligned}$$

61. Let $u = \sqrt{x}$, $du = \frac{1}{2\sqrt{x}} dx$, so $dx = 2u \, du$. We obtain

$$\int \frac{dx}{\sqrt{x}+2} = \int \frac{2u}{u+2} \, du.$$

Let $y = u + 2$, then we have

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x}+2} &= 2 \int \frac{y-2}{y} \, du \\
 &= 2 \int \left(1 - \frac{2}{y} \right) \, dy \\
 &= 2(y - 2 \ln |y|) + C \\
 &= 2(u+2) - 4 \ln |u+2| + C \\
 &= \boxed{2\sqrt{x} - 4 \ln (\sqrt{x}+2) + C}.
 \end{aligned}$$

62. Let $u = \sqrt[3]{x}$, $du = \frac{1}{3x^{2/3}} dx$, so $dx = 3u^2 \, du$. We obtain

$$\begin{aligned}
 \int \frac{dx}{x - \sqrt[3]{x}} &= \int \frac{3u^2}{u^3 - u} \, du \\
 &= \int \frac{3u}{u^2 - 1} \, du \\
 &= \int \frac{3u}{(u-1)(u+1)} \, du.
 \end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned}
 \frac{3u}{(u-1)(u+1)} &= \frac{A}{u-1} + \frac{B}{u+1} \\
 3u &= A(u+1) + B(u-1).
 \end{aligned}$$

When $u = -1$ we obtain $B = 3/2$, and when $u = 1$ we have $A = 3/2$. We now obtain

$$\begin{aligned}
 \int \frac{dx}{x - \sqrt[3]{x}} &= \int \left(\frac{3/2}{u-1} + \frac{3/2}{u+1} \right) \, du \\
 &= \frac{3}{2} \ln |u-1| + \frac{3}{2} \ln |u+1| + C \\
 &= \boxed{\frac{3}{2} \ln |\sqrt[3]{x}-1| + \frac{3}{2} \ln |\sqrt[3]{x}+1| + C}.
 \end{aligned}$$

63. Let $u = \sqrt[3]{x}$, $du = \frac{1}{3x^{2/3}} dx$, so $dx = 3u^2 du$. We obtain

$$\begin{aligned}\int \frac{x dx}{\sqrt[3]{x} - 1} &= \int \frac{u^3}{u - 1} (3u^2) du \\ &= 3 \int \frac{u^5}{u - 1} du.\end{aligned}$$

Let $y = u - 1$, then we have

$$\begin{aligned}\int \frac{x dx}{\sqrt[3]{x} - 1} &= 3 \int \frac{(y+1)^5}{y} dy \\ &= 3 \int \frac{y^5 + 5y^4 + 10y^3 + 10y^2 + 5y + 1}{y} dy \\ &= 3 \int \left(y^4 + 5y^3 + 10y^2 + 10y + 5 + \frac{1}{y} \right) dy \\ &= 3 \left(\frac{1}{5}y^5 + \frac{5}{4}y^4 + \frac{10}{3}y^3 + 5y^2 + 5y + \ln|y| \right) + C \\ &= \frac{3}{5}(u-1)^5 + \frac{15}{4}(u-1)^4 + 10(u-1)^3 + 15(u-1)^2 + 15(u-1) + 3\ln|u-1| + C \\ &= \frac{3}{5}u^5 + \frac{3}{4}u^4 + u^3 + \frac{3}{2}u^2 + 3u + 3\ln|u-1| + C \\ &= \boxed{\frac{3}{5}x^{5/3} + \frac{3}{4}x^{4/3} + x + \frac{3}{2}x^{2/3} + 3x^{1/3} + 3\ln|x^{1/3} - 1| + C}.\end{aligned}$$

64. Let $u = x^{1/6}$, $du = \frac{1}{6x^{5/6}} dx$, so $dx = 6u^5 du$. We obtain

$$\begin{aligned}\int \frac{dx}{\sqrt{x} + \sqrt[3]{x}} &= \int \frac{6u^5}{u^3 + u^2} du \\ &= \int \frac{6u^3}{u + 1} du.\end{aligned}$$

Let $y = u + 1$, and substitute to obtain

$$\begin{aligned}\int \frac{dx}{\sqrt{x} + \sqrt[3]{x}} &= \int \frac{6(y-1)^3}{y} dy \\ &= \int \frac{6y^3 - 18y^2 + 18y - 6}{y} dy \\ &= \int \left(6y^2 - 18y + 18 - \frac{6}{y} \right) dy \\ &= 2y^3 - 9y^2 + 18y - 6\ln|y| + C \\ &= 2(u+1)^3 - 9(u+1)^2 + 18(u+1) - 6\ln|u+1| + C \\ &= 2u^3 - 3u^2 + 6u - 6\ln|u+1| + C \\ &= \boxed{2\sqrt{x} - 3\sqrt[3]{x} + 6x^{1/6} - 6\ln|x^{1/6} + 1| + C}.\end{aligned}$$

65. Let $u = x^{1/6}$, $du = \frac{1}{6x^{5/6}} dx$, so $dx = 6u^5 du$. We obtain

$$\begin{aligned}\int \frac{dx}{3\sqrt{x} - \sqrt[3]{x}} &= \int \frac{6u^5}{3u^3 - u^2} du \\ &= \int \frac{6u^3}{3u - 1} du.\end{aligned}$$

Let $y = 3u - 1$, and substitute to obtain

$$\begin{aligned}
 \int \frac{dx}{3\sqrt{x} - \sqrt[3]{x}} &= \int \frac{6\left(\frac{y+1}{3}\right)^3 \frac{1}{3} dy}{y} \\
 &= \int \frac{\frac{2}{9}y^3 + \frac{2}{3}y^2 + \frac{2}{3}y + \frac{2}{9}}{3y} dy \\
 &= \int \left(\frac{2}{27}y^2 + \frac{2}{9}y + \frac{2}{9} + \frac{2}{27y} \right) dy \\
 &= \frac{2}{81}y^3 + \frac{1}{9}y^2 + \frac{2}{9}y + \frac{2}{27} \ln|y| + C \\
 &= \frac{2}{81}(3u-1)^3 + \frac{1}{9}(3u-1)^2 + \frac{2}{9}(3u-1) + \frac{2}{27} \ln|3u-1| + C \\
 &= \frac{2}{3}u^3 + \frac{1}{3}u^2 + \frac{2}{9}u + \frac{2}{27} \ln|3u-1| + C \\
 &= \boxed{\frac{2}{3}x^{1/2} + \frac{1}{3}x^{1/3} + \frac{2}{9}x^{1/6} + \frac{2}{27} \ln|3x^{1/6} - 1| + C}.
 \end{aligned}$$

66. Let $u = 2 + 3x$, and substitute to obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt[3]{2+3x}} &= \int \frac{\frac{1}{3} du}{\sqrt[3]{u}} \\
 &= \frac{1}{3} \int u^{-1/3} du \\
 &= \frac{1}{3} \left(\frac{3}{2} u^{2/3} \right) + C \\
 &= \boxed{\frac{1}{2}(2+3x)^{2/3} + C}.
 \end{aligned}$$

67. Let $u = 1 + 2x$, and substitute to obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt[4]{1+2x}} &= \int \frac{\frac{1}{2} du}{\sqrt[4]{u}} \\
 &= \frac{1}{2} \int u^{-1/4} du \\
 &= \frac{1}{2} \left(\frac{4}{3} u^{3/4} \right) + C \\
 &= \boxed{\frac{2}{3}(1+2x)^{3/4} + C}.
 \end{aligned}$$

68. Let $u = 1 + x$, and substitute to obtain

$$\begin{aligned}
 \int \frac{x dx}{(1+x)^{3/4}} &= \int \frac{(u-1) du}{u^{3/4}} \\
 &= \int \left(u^{1/4} - u^{-3/4} \right) du \\
 &= \frac{4}{5} u^{5/4} - 4u^{1/4} + C \\
 &= \boxed{\frac{4}{5}(1+x)^{5/4} - 4(1+x)^{1/4} + C}.
 \end{aligned}$$

69. Let $u = 1 + x$, and substitute to obtain

$$\begin{aligned}\int \frac{dx}{(1+x)^{2/3}} &= \int \frac{du}{u^{2/3}} \\ &= \int u^{-2/3} du \\ &= 3u^{1/3} + C \\ &= \boxed{3(1+x)^{1/3} + C}.\end{aligned}$$

70. Let $u = \sqrt[3]{x}$, $du = \frac{1}{3x^{2/3}} dx$, so $dx = 3u^2 du$. We obtain

$$\int \frac{\sqrt[3]{x} + 1}{\sqrt[3]{x} - 1} dx = \int \frac{u + 1}{u - 1} 3u^2 du.$$

Let $y = u - 1$, then we have

$$\begin{aligned}\int \frac{\sqrt[3]{x} + 1}{\sqrt[3]{x} - 1} dx &= 3 \int \frac{(y+1)+1}{y} (y+1)^2 dy \\ &= 3 \int \frac{(y+2)(y+1)^2}{y} dy \\ &= 3 \int \frac{y^3 + 4y^2 + 5y + 2}{y} dy \\ &= 3 \int \left(y^2 + 4y + 5 + \frac{2}{y} \right) dy \\ &= 3 \left(\frac{1}{3} y^3 + 4 \left(\frac{1}{2} \right) y^2 + 5y + 2 \ln |y| \right) + C \\ &= 3 \left(\frac{1}{3} (u-1)^3 + 4 \left(\frac{1}{2} \right) (u-1)^2 + 5(u-1) + 2 \ln |u-1| \right) + C \\ &= u^3 + 3u^2 + 6u + 6 \ln |u-1| + C \\ &= \boxed{x + 3x^{2/3} + 6\sqrt[3]{x} + 6 \ln |\sqrt[3]{x} - 1| + C}.\end{aligned}$$

71. Let $u = x^{1/6}$, $du = \frac{1}{6x^{5/6}} dx$, so $dx = 6u^5 du$. We obtain

$$\begin{aligned}\int \frac{dx}{\sqrt{x}(1+\sqrt[3]{x})^2} &= \int \frac{6u^5}{u^3(1+u^2)^2} du \\ &= 6 \int \frac{(1+u^2) - 1}{(1+u^2)^2} du \\ &= 6 \int \left(\frac{1}{1+u^2} - \frac{1}{(1+u^2)^2} \right) du \\ &= 6 \tan^{-1} u - 6 \int \frac{1}{(1+u^2)^2} du.\end{aligned}$$

In the last integral, let $u = \tan \theta$, and substitute to obtain

$$\begin{aligned}
 \int \frac{1}{(1+u^2)^2} du &= \int \frac{\sec^2 \theta}{\sec^4 \theta} d\theta \\
 &= \int \cos^2 \theta d\theta \\
 &= \frac{1}{2} \int (1 + \cos(2\theta)) d\theta \\
 &= \frac{1}{2} \left(\theta + \frac{1}{2} \sin 2\theta \right) + C \\
 &= \frac{1}{2} \theta + \frac{1}{2} \sin \theta \cos \theta + C \\
 &= \frac{1}{2} \tan^{-1} u + \frac{1}{2} \frac{u}{\sqrt{1+u^2}} \frac{1}{\sqrt{1+u^2}} + C \\
 &= \frac{1}{2} \tan^{-1} u + \frac{u}{2(u^2+1)} + C.
 \end{aligned}$$

We now obtain

$$\begin{aligned}
 \int \frac{dx}{\sqrt{x}(1+\sqrt[3]{x})^2} &= 6 \tan^{-1} u - 6 \left(\frac{1}{2} \tan^{-1} u + \frac{u}{2(u^2+1)} \right) + C \\
 &= 3 \tan^{-1} u - \frac{3u}{u^2+1} + C \\
 &= \boxed{3 \tan^{-1} (x^{1/6}) - 3 \frac{x^{1/6}}{x^{1/3}+1} + C}.
 \end{aligned}$$

72. With the substitution $z = \tan \frac{x}{2}$, $\sin x = \frac{2z}{1+z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned}
 \int \frac{dx}{1-\sin x} &= \int \frac{1}{1-\frac{2z}{1+z^2}} \frac{2dz}{1+z^2} \\
 &= 2 \int \frac{dz}{1-2z+z^2} \\
 &= 2 \int (1-z)^{-2} dz \\
 &= 2(1-z)^{-1} + C \\
 &= \boxed{\frac{2}{1-\tan \frac{x}{2}} + C}.
 \end{aligned}$$

73. With the substitution $z = \tan \frac{x}{2}$, $\sin x = \frac{2z}{1+z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned}
 \int \frac{dx}{1+\sin x} &= \int \frac{1}{1+\frac{2z}{1+z^2}} \frac{2dz}{1+z^2} \\
 &= 2 \int \frac{dz}{1+2z+z^2} \\
 &= 2 \int (1+z)^{-2} dz \\
 &= -2(1+z)^{-1} + C \\
 &= \boxed{-\frac{2}{1+\tan \frac{x}{2}} + C}.
 \end{aligned}$$

74. With the substitution $z = \tan \frac{x}{2}$, $\cos x = \frac{1-z^2}{1+z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned} \int \frac{dx}{1 - \cos x} &= \int \frac{1}{1 - \frac{1-z^2}{1+z^2}} \frac{2dz}{1+z^2} \\ &= \int \frac{dz}{z^2} \\ &= -\frac{1}{z} + C \\ &= -\frac{1}{\tan \frac{x}{2}} + C \\ &= \boxed{-\cot \frac{x}{2} + C}. \end{aligned}$$

75. With the substitution $z = \tan \frac{x}{2}$, $\cos x = \frac{1-z^2}{1+z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned} \int \frac{dx}{3 + 2 \cos x} &= \int \frac{1}{3 + 2 \frac{1-z^2}{1+z^2}} \frac{2dz}{1+z^2} \\ &= 2 \int \frac{dz}{z^2 + (\sqrt{5})^2} \\ &= \frac{2\sqrt{5}}{5} \tan^{-1} \left(\frac{\sqrt{5}}{5} z \right) + C \\ &= \boxed{\frac{2\sqrt{5}}{5} \tan^{-1} \left(\frac{\sqrt{5}}{5} \tan \frac{x}{2} \right) + C}. \end{aligned}$$

76. With the substitution $z = \tan \frac{x}{2}$, $\sin x = \frac{2z}{1+z^2}$, $\cos x = \frac{1-z^2}{1+z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned} \int \frac{dx}{\sin x + \cos x} &= \int \frac{1}{\frac{2z}{1+z^2} + \frac{1-z^2}{1+z^2}} \frac{2dz}{1+z^2} \\ &= \int \frac{2dz}{-z^2 + 2z + 1} \\ &= \int \frac{-2dz}{z^2 - 2z - 1} \\ &= \int \frac{-2dz}{(z - (1 + \sqrt{2}))(z - (1 - \sqrt{2}))} \end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned} \frac{-2}{(z - (1 + \sqrt{2}))(z - (1 - \sqrt{2}))} &= \frac{A}{z - (1 + \sqrt{2})} + \frac{B}{z - (1 - \sqrt{2})} \\ -2 &= A(z - (1 - \sqrt{2})) + B(z - (1 + \sqrt{2})) \end{aligned}$$

When $z = 1 - \sqrt{2}$ we obtain $B = \sqrt{2}/2$, and when $z = 1 + \sqrt{2}$ we have $A = -\sqrt{2}/2$. So we obtain

$$\begin{aligned} \int \frac{dx}{\sin x + \cos x} &= \int \left(\frac{-\sqrt{2}/2}{z - (1 + \sqrt{2})} + \frac{\sqrt{2}/2}{z - (1 - \sqrt{2})} \right) dx \\ &= -\frac{\sqrt{2}}{2} \ln |z - 1 - \sqrt{2}| + \frac{\sqrt{2}}{2} \ln |z - 1 + \sqrt{2}| + C \\ &= \boxed{-\frac{\sqrt{2}}{2} \ln |\tan \frac{x}{2} - 1 - \sqrt{2}| + \frac{\sqrt{2}}{2} \ln |\tan \frac{x}{2} - 1 + \sqrt{2}| + C}. \end{aligned}$$

77. With the substitution $z = \tan \frac{x}{2}$, $\sin x = \frac{2z}{1+z^2}$, $\cos x = \frac{1-z^2}{1+z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned} \int \frac{dx}{1 - \sin x + \cos x} &= \int \frac{1}{1 - \frac{2z}{1+z^2} + \frac{1-z^2}{1+z^2}} \frac{2dz}{1+z^2} \\ &= \int \frac{dz}{1-z} \\ &= -\ln|1-z| \\ &= \boxed{-\ln\left|1 - \tan \frac{x}{2}\right| + C} \end{aligned}$$

78. Let $u = 3 + \cos x$, substitute to obtain

$$\begin{aligned} \int \frac{\sin x dx}{3 + \cos x} &= \int \frac{-du}{u} \\ &= -\ln|u| + C \\ &= -\ln(3 + \cos x) + C. \end{aligned}$$

79. With the substitution $z = \tan \frac{x}{2}$, $\tan x = \frac{2z}{1-z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned} \int \frac{dx}{\tan x - 1} &= \int \frac{\frac{2}{1+z^2}}{\frac{2z}{1-z^2} - 1} dz \\ &= \int \frac{2(1-z^2)}{(1+z^2)(2z - (1-z^2))} dz \\ &= \int \frac{2(1-z^2)}{(z^2+1)(z^2+2z-1)} dz. \end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned} \frac{2(1-z^2)}{(z^2+1)(z^2+2z-1)} &= \frac{Az+B}{z^2+1} + \frac{Cz+D}{z^2+2z-1} \\ -2z^2+2 &= (Az+B)(z^2+2z-1) + (Cz+D)(z^2+1) \\ -2z^2+2 &= (A+C)z^3 + (2A+B+D)z^2 + (2B-A+C)z + (D-B). \end{aligned}$$

Equating coefficients, we have

$$\begin{aligned} A+C &= 0 \\ 2A+B+D &= -2 \\ 2B-A+C &= 0 \\ D-B &= 2 \end{aligned}$$

We solve this system and obtain $A = -1$, $B = -1$, $C = 1$, and $D = 1$. So

$$\begin{aligned} \int \frac{dx}{\tan x - 1} &= \int \left(\frac{z+1}{z^2+2z-1} - \frac{z+1}{z^2+1} \right) dz \\ &= \frac{1}{2} \int \frac{2(z+1)}{z^2+2z-1} - \frac{1}{2} \int \frac{2z}{z^2+1} dz - \int \frac{1}{z^2+1} dz \\ &= \frac{1}{2} \ln|z^2+2z-1| - \frac{1}{2} \ln(z^2+1) - \tan^{-1} z + C \\ &= \boxed{\frac{1}{2} \ln\left|\tan^2\left(\frac{x}{2}\right) + 2\tan\frac{x}{2} - 1\right| - \frac{1}{2} \ln\left(\tan^2\left(\frac{x}{2}\right) + 1\right) - \frac{x}{2} + C} \end{aligned}$$

80. With the substitution $z = \tan \frac{x}{2}$, $\sin x = \frac{2z}{1+z^2}$, $\tan x = \frac{2z}{1-z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned}
 \int \frac{dx}{\tan x - \sin x} &= \int \frac{\frac{2}{1+z^2}}{\frac{2z}{1-z^2} - \frac{2z}{1+z^2}} dz \\
 &= \int \frac{2(1-z^2)}{2z((1+z^2) - (1-z^2))} dz \\
 &= \int \frac{2(1-z^2)}{4z^3} dz \\
 &= \frac{1}{2} \int \left(z^{-3} - \frac{1}{z} \right) dz \\
 &= \frac{1}{2} \left(-\frac{1}{2} z^{-2} - \ln |z| \right) + C \\
 &= \boxed{-\frac{1}{4} \cot^2 \left(\frac{x}{2} \right) - \frac{1}{2} \ln \left| \tan \frac{x}{2} \right| + C}.
 \end{aligned}$$

81. With the substitution $z = \tan \frac{x}{2}$, $\sec x = \frac{1+z^2}{1-z^2}$, $\tan x = \frac{2z}{1-z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned}
 \int \frac{\sec x dx}{\tan x - 2} &= \int \frac{\frac{1+z^2}{1-z^2} \frac{2}{1+z^2}}{\frac{2z}{1-z^2} - 2} dz \\
 &= \int \frac{1}{z - (1-z^2)} dz \\
 &= \int \frac{1}{z^2 + z - 1} dz \\
 &= \int \frac{1}{\left(z - \left(\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)\right)\left(z - \left(-\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)\right)} dz.
 \end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned}
 \frac{1}{\left(z - \left(\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)\right)\left(z - \left(-\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)\right)} &= \frac{A}{z - \left(\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)} + \frac{B}{z - \left(-\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)} \\
 1 &= A\left(z - \left(-\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)\right) + B\left(z - \left(\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)\right).
 \end{aligned}$$

When $z = -\frac{1}{2}\sqrt{5} - \frac{1}{2}$ we obtain $B = -\sqrt{5}/5$, and when $z = \frac{1}{2}\sqrt{5} - \frac{1}{2}$ we have $A = \sqrt{5}/5$. So we obtain

$$\begin{aligned}
 \int \frac{\sec x dx}{\tan x - 2} &= \int \left(\frac{\sqrt{5}/5}{z - \left(\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)} + \frac{-\sqrt{5}/5}{z - \left(-\frac{1}{2}\sqrt{5} - \frac{1}{2}\right)} \right) dz \\
 &= \frac{\sqrt{5}}{5} \ln \left| z - \left(\frac{1}{2}\sqrt{5} - \frac{1}{2}\right) \right| - \frac{\sqrt{5}}{5} \ln \left| z - \left(-\frac{1}{2}\sqrt{5} - \frac{1}{2}\right) \right| + C \\
 &= \boxed{\frac{\sqrt{5}}{5} \ln \left| \tan \frac{x}{2} - \frac{1}{2}\sqrt{5} + \frac{1}{2} \right| - \frac{\sqrt{5}}{5} \ln \left| \tan \frac{x}{2} + \frac{1}{2}\sqrt{5} + \frac{1}{2} \right| + C}.
 \end{aligned}$$

82. With the substitution $z = \tan \frac{x}{2}$, $\sin x = \frac{2z}{1+z^2}$, $\cot x = \frac{1-z^2}{2z}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned} \int \frac{\cot x \, dx}{1 + \sin x} &= \int \frac{\frac{1-z^2}{2z}}{1 + \frac{2z}{1+z^2}} \left(\frac{2}{1+z^2} \right) dz \\ &= \int \frac{\frac{1-z^2}{z}}{1 + z^2 + 2z} dz \\ &= \int \frac{(1-z)(1+z)}{z(1+z)^2} dz \\ &= \int \frac{1-z}{z(1+z)} dz. \end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned} \frac{1-z}{z(1+z)} &= \frac{A}{z} + \frac{B}{1+z} \\ 1-z &= A(1+z) + Bz. \end{aligned}$$

When $z = -1$, we have $B = -2$, and when $z = 0$, $A = 1$. We now obtain

$$\begin{aligned} \int \frac{\cot x \, dx}{1 + \sin x} &= \int \left(\frac{1}{z} + \frac{-2}{1+z} \right) dz \\ &= \ln |z| - 2 \ln |1+z| + C \\ &= \boxed{\ln \left| \tan \frac{x}{2} \right| - 2 \ln \left| 1 + \tan \frac{x}{2} \right| + C}. \end{aligned}$$

83. With the substitution $z = \tan \frac{x}{2}$, $\sin x = \frac{2z}{1+z^2}$, $\sec x = \frac{1+z^2}{1-z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned} \int \frac{\sec x \, dx}{1 + \sin x} &= \int \frac{\frac{1+z^2}{1-z^2} \frac{2}{1+z^2}}{1 + \frac{2z}{1+z^2}} dz \\ &= \int \frac{-2(1+z^2)}{(z-1)(z+1)^3} dz \end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned} \frac{-2(1+z^2)}{(z-1)(z+1)^3} &= \frac{A}{z-1} + \frac{B}{z+1} + \frac{C}{(z+1)^2} + \frac{D}{(z+1)^3} \\ -2(1+z^2) &= A(z+1)^3 + B(z-1)(z+1)^2 + C(z-1)(z+1) + D(z-1). \end{aligned}$$

When $z = -1$, we have $D = 2$, and when $z = 1$, $A = -1/2$. We now obtain

$$\begin{aligned} -2z^2 - 2 &= (-1/2)(z+1)^3 + B(z-1)(z+1)^2 + C(z-1)(z+1) + 2(z-1) \\ -2z^2 - 2 &= \left(B - \frac{1}{2} \right) z^3 + \left(B + C - \frac{3}{2} \right) z^2 + \left(\frac{1}{2} - B \right) z - \left(B + C + \frac{5}{2} \right). \end{aligned}$$

Equating coefficients, we obtain $B = 1/2$ and $C = -1$. We now have

$$\begin{aligned}
\int \frac{\sec x \, dx}{1 + \sin x} &= \int \left(\frac{-1/2}{z-1} + \frac{1/2}{z+1} + \frac{-1}{(z+1)^2} + \frac{2}{(z+1)^3} \right) dz \\
&= \int \frac{-1/2}{z-1} dz + \int \frac{1/2}{z+1} dz + \int \frac{-1}{(z+1)^2} dz + \int \frac{2}{(z+1)^3} dz \\
&= -\frac{1}{2} \ln |z-1| + \frac{1}{2} \ln |z+1| + \frac{1}{z+1} - \frac{1}{(z+1)^2} + C \\
&= \boxed{-\frac{1}{2} \ln \left| \tan \frac{x}{2} - 1 \right| + \frac{1}{2} \ln \left| \tan \frac{x}{2} + 1 \right| + \frac{1}{\tan \frac{x}{2} + 1} - \frac{1}{(\tan \frac{x}{2} + 1)^2} + C}.
\end{aligned}$$

84. With the substitution $z = \tan \frac{x}{2}$, $\sin x = \frac{2z}{1+z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned}
\int_0^{\pi/2} \frac{dx}{\sin x + 1} &= \int_0^1 \frac{1}{\frac{2z}{1+z^2} + 1} \frac{2dz}{1+z^2} \\
&= 2 \int_0^1 \frac{dz}{1+2z+z^2} \\
&= 2 \int_0^1 (1+z)^{-2} dz \\
&= \left[-2(1+z)^{-1} \right]_0^1 \\
&= -2(1+1)^{-1} - \left(-2(1+0)^{-1} \right) \\
&= \boxed{1}.
\end{aligned}$$

85. With the substitution $z = \tan \frac{x}{2}$, $\csc x = \frac{1+z^2}{2z}$, $\tan x = \frac{2z}{1-z^2}$, and $dx = \frac{2dz}{1+z^2}$, we obtain

$$\begin{aligned}
\int_{\pi/4}^{\pi/3} \frac{\csc x}{3+4\tan x} dx &= \int_{\tan(\pi/8)}^{\sqrt{3}/3} \frac{\frac{1+z^2}{2z} \frac{2}{1+z^2}}{3+4\frac{2z}{1-z^2}} dz \\
&= \int_{\tan(\pi/8)}^{\sqrt{3}/3} \frac{\frac{1}{z}(1-z^2)}{3(1-z^2)+8z} dz \\
&= \int_{\tan(\pi/8)}^{\sqrt{3}/3} \frac{z^2-1}{z(3z+1)(z-3)} dz.
\end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned}
\frac{z^2-1}{z(3z+1)(z-3)} &= \frac{A}{z} + \frac{B}{3z+1} + \frac{C}{z-3} \\
z^2-1 &= A(3z+1)(z-3) + Bz(z-3) + Cz(3z+1).
\end{aligned}$$

When $z = 0$, we have $A = 1/3$, when $z = -1/3$, $B = -4/5$, and when $z = 3$, $C = 4/15$.

We now obtain

$$\begin{aligned}
\int_{\pi/4}^{\pi/3} \frac{\csc x}{3 + 4 \tan x} dx &= \int_{\tan(\pi/8)}^{\sqrt{3}/3} \left(\frac{1/3}{z} + \frac{-4/5}{3z+1} + \frac{4/15}{z-3} \right) dz \\
&= \left[\frac{1}{3} \ln z - \frac{4}{15} \ln(3z+1) + \frac{4}{15} \ln(3-z) \right]_{\tan(\pi/8)}^{\sqrt{3}/3} \\
&= \frac{1}{3} \ln \frac{\sqrt{3}}{3} - \frac{4}{15} \ln \left(3 \frac{\sqrt{3}}{3} + 1 \right) + \frac{4}{15} \ln \left(3 - \frac{\sqrt{3}}{3} \right) \\
&\quad - \left(\frac{1}{3} \ln \left(\tan \frac{\pi}{8} \right) - \frac{4}{15} \ln \left(3 \tan \frac{\pi}{8} + 1 \right) + \frac{4}{15} \ln \left(3 - \tan \frac{\pi}{8} \right) \right) \\
&= \boxed{\frac{1}{3} \ln \frac{\sqrt{3}}{3} - \frac{1}{3} \ln(\sqrt{2}-1) - \frac{4}{15} \ln(\sqrt{3}+1) - \frac{4}{15} \ln(4-\sqrt{2}) + \frac{4}{15} \ln(3\sqrt{2}-2) + \frac{4}{15} \ln \left(3 - \frac{\sqrt{3}}{3} \right)}.
\end{aligned}$$

86. With the substitution $z = \tan \frac{x}{2}$, $\cos x = \frac{1-z^2}{1+z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned}
\int_0^{\pi/2} \frac{\cos x dx}{2 - \cos x} &= \int_0^1 \frac{\frac{1-z^2}{1+z^2} \frac{2}{1+z^2}}{2 - \frac{1-z^2}{1+z^2}} dz \\
&= \int_0^1 \frac{2(1-z^2)}{(1+z^2)(2(1+z^2) - (1-z^2))} dz \\
&= \int_0^1 \frac{2(1-z^2)}{(z^2+1)(3z^2+1)} dz.
\end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned}
\frac{2(1-z^2)}{(z^2+1)(3z^2+1)} &= \frac{Az+B}{z^2+1} + \frac{Cz+D}{3z^2+1} \\
2(1-z^2) &= (Az+B)(3z^2+1) + (Cz+D)(z^2+1) \\
2-2z^2 &= (3A+C)z^3 + (3B+D)z^2 + (A+D)z + (B+D).
\end{aligned}$$

Equating coefficients, we obtain

$$\begin{aligned}
3A+C &= 0 \\
3B+D &= -2 \\
A+D &= 0 \\
B+D &= 2
\end{aligned}$$

We solve this system, and obtain $A=0$, $B=-2$, $C=0$, and $D=4$. So

$$\begin{aligned}
\int_0^{\pi/2} \frac{\cos x dx}{2 - \cos x} &= \int_0^1 \left(-\frac{2}{z^2+1} + \frac{4}{3z^2+1} \right) dz \\
&= -2 \int_0^1 \frac{1}{z^2+1} dz + \frac{4}{3} \int_0^1 \frac{1}{z^2 + \left(\frac{\sqrt{3}}{3}\right)^2} dz \\
&= [-2 \tan^{-1} z]_0^1 + \left[\frac{4\sqrt{3}}{3} \tan^{-1} \left(\sqrt{3}z \right) \right]_0^1 \\
&= -2 \tan^{-1} 1 - (-2 \tan^{-1} 0) + \frac{4\sqrt{3}}{3} \tan^{-1} (\sqrt{3}(1)) - \frac{4\sqrt{3}}{3} \tan^{-1} (\sqrt{3}(0)) \\
&= \boxed{\frac{4\sqrt{3}}{9} \pi - \frac{1}{2} \pi}.
\end{aligned}$$

87. With the substitution $z = \tan \frac{x}{2}$, $\tan x = \frac{2z}{1-z^2}$, and $dx = \frac{2dz}{1+z^2}$ we obtain

$$\begin{aligned} \int_0^{\pi/4} \frac{4dx}{\tan x + 1} &= \int_0^{\tan(\pi/8)} \frac{4 \frac{2}{1+z^2}}{\frac{2z}{1-z^2} + 1} dz \\ &= \int_0^{\tan(\pi/8)} \frac{8(1-z^2)}{(1+z^2)(2z+(1-z^2))} dz \\ &= \int_0^{\tan(\pi/8)} \frac{8(z^2-1)}{(z^2+1)(z^2-2z-1)} dz. \end{aligned}$$

We use partial fractions to obtain

$$\begin{aligned} \frac{8(z^2-1)}{(z^2+1)(z^2-2z-1)} &= \frac{Az+B}{z^2+1} + \frac{Cz+D}{z^2-2z-1} \\ 8(z^2-1) &= (Az+B)(z^2-2z-1) + (Cz+D)(z^2+1) \\ 8z^2-8 &= (A+C)z^3 + (B-2A+D)z^2 + (C-2B-A)z + (D-B). \end{aligned}$$

Equating coefficients, we obtain

$$\begin{aligned} A+C &= 0 \\ B-2A+D &= 8 \\ -A-2B+C &= 0 \\ -B+D &= -8 \end{aligned}$$

We solve this system, and obtain $A = -4$, $B = 4$, $C = 4$, and $D = -4$. We now have

$$\begin{aligned} \int_0^{\pi/2} \frac{4dx}{\tan x + 1} &= \int_0^{\tan(\pi/8)} \left(\frac{-4z+4}{z^2+1} + \frac{4z-4}{z^2-2z-1} \right) dz \\ &= -2 \int_0^{\tan(\pi/8)} \frac{2z}{z^2+1} dz + 4 \int_0^{\tan(\pi/8)} \frac{1}{z^2+1} dz + 2 \int_0^{\tan(\pi/8)} \frac{2z-2}{z^2-2z-1} dz \\ &= -2 [\ln(z^2+1)]_0^{\tan(\pi/8)} + 4 [\tan^{-1} z]_0^{\tan(\pi/8)} + 2 [\ln(1+2z-z^2)]_0^{\tan(\pi/8)} \\ &= -2 \ln(\tan^2(\pi/8)+1) - (-2) \ln(0^2+1) + 4 \tan^{-1}(\tan(\pi/8)) - 4 \tan^{-1} 0 \\ &\quad + 2 \ln(1+2 \tan(\pi/8) - \tan^2(\pi/8)) - 2 \ln(1+2(0) - (0)^2) \\ &= -2 \ln\left(\left(\sqrt{2}-1\right)^2+1\right) + 4\left(\frac{1}{8}\pi\right) + 2 \ln\left(1+2\left(\sqrt{2}-1\right) - \left(\sqrt{2}-1\right)^2\right) \\ &= 2 \ln\left(\frac{2\sqrt{2}-2}{2-\sqrt{2}}\right) + \frac{1}{2}\pi \\ &= 2 \ln(\sqrt{2}) + \frac{1}{2}\pi \\ &= \boxed{\ln 2 + \frac{\pi}{2}}. \end{aligned}$$

88. With the substitution $z = \tan \frac{x}{2}$, $\csc x = \frac{1+z^2}{2z}$, and $dx = \frac{2dz}{1+z^2}$, we obtain

$$\begin{aligned}
 \int \csc x \, dx &= \int \frac{1+z^2}{2z} \frac{2}{1+z^2} dz \\
 &= \int \frac{1}{z} dz \\
 &= \ln |z| + C \\
 &= \ln \left| \tan \frac{x}{2} \right| + C \\
 &= \ln \frac{\left| \sin \frac{x}{2} \right|}{\left| \cos \frac{x}{2} \right|} + C \\
 &= \ln \frac{\sqrt{\frac{1-\cos x}{2}}}{\sqrt{\frac{1+\cos x}{2}}} + C \\
 &= \boxed{\ln \sqrt{\frac{1-\cos x}{1+\cos x}} + C}.
 \end{aligned}$$

89. We simplify as follows

$$\begin{aligned}
 \ln \sqrt{\frac{1-\cos x}{1+\cos x}} &= \ln \sqrt{\frac{(1-\cos x)^2}{(1+\cos x)(1-\cos x)}} \\
 &= \ln \frac{1-\cos x}{\sqrt{1-\cos^2 x}} \\
 &= \ln \frac{1-\cos x}{\sqrt{\sin^2 x}} \\
 &= \ln \frac{1-\cos x}{|\sin x|} \\
 &= \ln \left| \frac{1-\cos x}{\sin x} \right| \\
 &= \ln \left| \frac{1}{\sin x} - \frac{\cos x}{\sin x} \right| \\
 &= \ln |\csc x - \cot x|.
 \end{aligned}$$

90. The domain of the function given by $\tanh^{-1}(x)$ is the interval $(-1, 1)$, so the function given by $\tanh^{-1}(x)$ is not an antiderivative of $\frac{1}{1-x^2}$ on the interval $[2, 3]$. We use partial fractions to obtain

$$\begin{aligned}
 \frac{1}{1-x^2} &= \frac{-1}{x^2-1} = \frac{A}{x-1} + \frac{B}{x+1} \\
 -1 &= A(x+1) + B(x-1).
 \end{aligned}$$

When $x = -1$ we obtain $B = \frac{1}{2}$, and when $x = 1$ we have $A = -\frac{1}{2}$. So we obtain

$$\begin{aligned}
 \int_2^3 \frac{1}{1-x^2} dx &= \int_2^3 \left(\frac{-1/2}{x-1} + \frac{1/2}{x+1} \right) dx \\
 &= \left[-\frac{1}{2} \ln |x-1| + \frac{1}{2} \ln |x+1| \right]_2^3 \\
 &= -\frac{1}{2} \ln |3-1| + \frac{1}{2} \ln |3+1| - \left(-\frac{1}{2} \ln |2-1| + \frac{1}{2} \ln |2+1| \right) \\
 &= \boxed{\frac{\ln 2 - \ln 3}{2}}.
 \end{aligned}$$

91. We simplify as follows

$$\begin{aligned}
 \ln \left| \frac{1 + \tan \frac{x}{2}}{1 - \tan \frac{x}{2}} \right| &= \ln \left| \frac{1 + \frac{\sin \frac{x}{2}}{\cos \frac{x}{2}}}{1 - \frac{\sin \frac{x}{2}}{\cos \frac{x}{2}}} \right| \\
 &= \ln \left| \frac{1 + \frac{\sin^2 \frac{x}{2}}{\sin \frac{x}{2} \cos \frac{x}{2}}}{1 - \frac{\sin^2 \frac{x}{2}}{\sin \frac{x}{2} \cos \frac{x}{2}}} \right| \\
 &= \ln \left| \frac{1 + \frac{\frac{1-\cos x}{2}}{\frac{\sin x}{2}}}{1 - \frac{\frac{1-\cos x}{2}}{\frac{\sin x}{2}}} \right| \\
 &= \ln \left| \frac{1 + \frac{1-\cos x}{\sin x}}{1 - \frac{1-\cos x}{\sin x}} \right| \\
 &= \ln \left| \frac{\sin x + 1 - \cos x}{\sin x - 1 + \cos x} \right| \\
 &= \ln \left| \frac{\tan x + \sec x - 1}{\tan x - \sec x + 1} \frac{\sec x + \tan x}{\sec x + \tan x} \right| \\
 &= \ln \left| \frac{(\tan x + \sec x - 1)(\sec x + \tan x)}{(\tan x - \sec x + 1)(\sec x + \tan x)} \right| \\
 &= \ln \left| \frac{(\tan x + \sec x - 1)(\sec x + \tan x)}{\tan x \sec x + \tan^2 x - \sec^2 x - \sec x \tan x + \sec x + \tan x} \right| \\
 &= \ln \left| \frac{(\tan x + \sec x - 1)(\sec x + \tan x)}{-1 + \sec x + \tan x} \right| \\
 &= \ln |\sec x + \tan x|.
 \end{aligned}$$

92. We factor $1 + x^4 = (x^2 + \sqrt{2}x + 1)(x^2 - \sqrt{2}x + 1)$, and use partial fractions to obtain

$$\begin{aligned}
 \frac{1}{1+x^4} &= \frac{Ax+B}{x^2+\sqrt{2}x+1} + \frac{Cx+D}{x^2-\sqrt{2}x+1} \\
 1 &= (Ax+B)(x^2-\sqrt{2}x+1) + (Cx+D)(x^2+\sqrt{2}x+1) \\
 1 &= (A+C)x^3 + (B+D-\sqrt{2}A+\sqrt{2}C)x^2 + (A+C-\sqrt{2}B+\sqrt{2}D)x + (B+D).
 \end{aligned}$$

We solve the system

$$\begin{aligned} A + C &= 0 \\ B + D - \sqrt{2}A + \sqrt{2}C &= 0 \\ A + C - \sqrt{2}B + \sqrt{2}D &= 0 \\ B + D &= 1 \end{aligned}$$

and obtain $A = \sqrt{2}/4$, $B = 1/2$, $C = -\sqrt{2}/4$, and $D = 1/2$. We now obtain

$$\begin{aligned} \int \frac{1}{1+x^4} dx &= \int \left(\frac{(\sqrt{2}/4)x + 1/2}{x^2 + \sqrt{2}x + 1} + \frac{(-\sqrt{2}/4)x + 1/2}{x^2 - \sqrt{2}x + 1} \right) dx \\ &= \int \left(\frac{(\sqrt{2}/8)(2x + \sqrt{2}) + \frac{1}{4}}{x^2 + \sqrt{2}x + 1} + \frac{\left(-\frac{\sqrt{2}}{8}\right)(2x - \sqrt{2}) + \frac{1}{4}}{x^2 - \sqrt{2}x + 1} \right) dx \\ &= \frac{\sqrt{2}}{8} \int \frac{2x + \sqrt{2}}{x^2 + \sqrt{2}x + 1} dx + \frac{1}{4} \int \frac{dx}{\left(x + \frac{\sqrt{2}}{2}\right)^2 + \left(\frac{\sqrt{2}}{2}\right)^2} \\ &\quad - \frac{\sqrt{2}}{8} \int \frac{2x - \sqrt{2}}{x^2 - \sqrt{2}x + 1} dx + \frac{1}{4} \int \frac{dx}{\left(x - \frac{\sqrt{2}}{2}\right)^2 + \left(\frac{\sqrt{2}}{2}\right)^2} \\ &= \boxed{\frac{\sqrt{2}}{8} \ln(x^2 + \sqrt{2}x + 1) + \frac{\sqrt{2}}{4} \tan^{-1}(\sqrt{2}x + 1) - \frac{\sqrt{2}}{8} \ln(x^2 - \sqrt{2}x + 1) + \frac{\sqrt{2}}{4} \tan^{-1}(\sqrt{2}x - 1) + C}. \end{aligned}$$

Skill Building

3. When $n = 3$ we have $\Delta x = \frac{6-0}{3} = 2$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_0^6 f(x) dx &\approx \frac{\Delta x}{2} [f(0) + 2f(2) + 2f(4) + f(6)] \\ &= \frac{2}{2}(6 + 2(3) + 2(3) + 4) \\ &= \boxed{22}.\end{aligned}$$

When $n = 6$ we have $\Delta x = \frac{6-0}{6} = 1$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_0^6 f(x) dx &\approx \frac{\Delta x}{2} [f(0) + 2f(1) + 2f(2) + 2f(3) + 2f(4) + 2f(5) + f(6)] \\ &= \frac{1}{2}(6 + 2(3) + 2(3) + 2(4) + 2(3) + 2(2) + 4) \\ &= \boxed{20}.\end{aligned}$$

4. When $n = 2$ we have $\Delta x = \frac{5-1}{2} = 2$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_1^5 f(x) dx &\approx \frac{\Delta x}{2} [f(1) + 2f(3) + f(5)] \\ &= \frac{2}{2}(0 + 2(3) + 6) \\ &= \boxed{12}.\end{aligned}$$

When $n = 4$ we have $\Delta x = \frac{5-1}{4} = 1$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_1^5 f(x) dx &\approx \frac{\Delta x}{2} [f(1) + 2f(2) + 2f(3) + 2f(4) + f(5)] \\ &= \frac{1}{2}(0 + 2(2.5) + 2(3) + 2(6) + 6) \\ &= \boxed{\frac{29}{2} = 14.5}.\end{aligned}$$

5. When $n = 2$ we have $\Delta x = \frac{6-0}{2} = 3$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_0^6 f(x) dx &\approx \frac{\Delta x}{3} [f(0) + 4f(3) + f(6)] \\ &= \frac{3}{3}(6 + 4(4) + 4) \\ &= \boxed{26}.\end{aligned}$$

When $n = 6$ we have $\Delta x = \frac{6-0}{6} = 1$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_0^6 f(x) dx &\approx \frac{\Delta x}{3} [f(0) + 4f(1) + 2f(2) + 4f(3) + 2f(4) + 4f(5) + f(6)] \\ &= \frac{1}{3} (6 + 4(3) + 2(3) + 4(4) + 2(3) + 4(2) + 4) \\ &= \boxed{\frac{58}{3}}.\end{aligned}$$

6. When $n = 2$ we have $\Delta x = \frac{5-1}{2} = 2$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_1^5 f(x) dx &\approx \frac{\Delta x}{3} [f(1) + 4f(3) + f(5)] \\ &= \frac{2}{3} (0 + 4(3) + 6) \\ &= \boxed{12}.\end{aligned}$$

When $n = 4$ we have $\Delta x = \frac{5-1}{4} = 1$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_1^5 f(x) dx &\approx \frac{\Delta x}{3} [f(1) + 4f(2) + 2f(3) + 4f(4) + f(5)] \\ &= \frac{1}{3} (0 + 4(2.5) + 2(3) + 4(6) + 6) \\ &= \boxed{\frac{46}{3}}.\end{aligned}$$

7. (a) With $n = 3$ we have $\Delta x = \frac{\pi - \pi/2}{3} = \pi/6$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_{\pi/2}^{\pi} \frac{\sin x}{x} dx &\approx \frac{\Delta x}{2} \left[f\left(\frac{\pi}{2}\right) + 2f\left(\frac{2\pi}{3}\right) + 2f\left(\frac{5\pi}{6}\right) + f(\pi) \right] \\ &= \frac{\pi/6}{2} \left[\frac{\sin \frac{\pi}{2}}{\frac{\pi}{2}} + 2 \frac{\sin \frac{2\pi}{3}}{\frac{2\pi}{3}} + 2 \frac{\sin \frac{5\pi}{6}}{\frac{5\pi}{6}} + \frac{\sin \pi}{\pi} \right] \\ &= \frac{\pi}{12} \left[\frac{2}{\pi} + \frac{3}{2} \frac{\sqrt{3}}{\pi} + \frac{6}{5\pi} + 0 \right] \\ &\approx \boxed{0.483}.\end{aligned}$$

(b) We have $\frac{d}{dx} \left(\frac{\sin x}{x} \right) = -\frac{1}{x^2} (\sin x - x \cos x)$, and $\frac{d^2}{dx^2} \left(\frac{\sin x}{x} \right) = -\frac{1}{x^3} (x^2 \sin x - 2 \sin x + 2x \cos x)$. The graph of $|f''(x)| = \left| -\frac{1}{x^3} (x^2 \sin x - 2 \sin x + 2x \cos x) \right|$ shows that the maximum occurs at $x = \pi$, and so $M = \left| -\frac{1}{\pi^3} (\pi^2 \sin \pi - 2 \sin \pi + 2\pi \cos \pi) \right| = \frac{2}{\pi^2}$. We obtain

$$\text{Error} \leq \frac{(\pi - \pi/2)^3 \left(\frac{2}{\pi^2} \right)}{12(3)^2} \approx 0.007$$

(c) We require

$$\begin{aligned} \text{Error} &\leq \frac{(\pi - \pi/2)^3 \left(\frac{2}{\pi^2}\right)}{12(n)^2} = \frac{\pi}{48n^2} < 0.0001 \\ \frac{\pi}{48(0.0001)} &< n^2 \\ \sqrt{\frac{\pi}{48(0.0001)}} &< n \\ 25.58 &< n \end{aligned}$$

So we need $n = \boxed{26}$.

8. (a) With $n = 3$ we have $\Delta x = \frac{2\pi - 3\pi/2}{3} = \pi/6$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned} \int_{3\pi/2}^{2\pi} \frac{\cos x}{x} dx &\approx \frac{\Delta x}{2} \left[f\left(\frac{3\pi}{2}\right) + 2f\left(\frac{5\pi}{3}\right) + 2f\left(\frac{11\pi}{6}\right) + f(2\pi) \right] \\ &= \frac{\pi/6}{2} \left[\frac{\cos \frac{3\pi}{2}}{\frac{3\pi}{2}} + 2\frac{\cos \frac{5\pi}{3}}{\frac{5\pi}{3}} + 2\frac{\cos \frac{11\pi}{6}}{\frac{11\pi}{6}} + \frac{\cos(2\pi)}{2\pi} \right] \\ &= \frac{\pi}{12} \left[0 + \frac{3}{5\pi} + \frac{6}{11} \frac{\sqrt{3}}{\pi} + \frac{1}{2\pi} \right] \\ &\approx \boxed{0.1704}. \end{aligned}$$

- (b) We have $\frac{d}{dx}\left(\frac{\cos x}{x}\right) = -\frac{1}{x^2}(\cos x + x \sin x)$, and $\frac{d^2}{dx^2}\left(\frac{\cos x}{x}\right) = \frac{1}{x^3}(2 \cos x - x^2 \cos x + 2x \sin x)$. The graph of $|f''(x)| = \left|\frac{1}{x^3}(2 \cos x - x^2 \cos x + 2x \sin x)\right|$ shows that the maximum $M < 0.2$. We obtain

$$\text{Error} \leq \frac{(2\pi - 3\pi/2)^3 (0.2)}{12(3)^2} \approx 0.0072$$

(c) We require

$$\begin{aligned}\text{Error} &\leq \frac{(2\pi - 3\pi/2)^3(0.2)}{12(n)^2} = \frac{\pi^3}{480n^2} < 0.0001 \\ \frac{\pi^3}{0.0001(480)} &< n^2 \\ \sqrt{\frac{\pi^3}{0.0001(480)}} &< n \\ 25.42 &< n\end{aligned}$$

So we need $n = \boxed{26}$.

9. (a) With $n = 4$ we have $\Delta x = \frac{1-0}{4} = \frac{1}{4}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_0^1 e^{-x^2} dx &\approx \frac{\Delta x}{2} \left[f(0) + 2f\left(\frac{1}{4}\right) + 2f\left(\frac{1}{2}\right) + 2f\left(\frac{3}{4}\right) + f(1) \right] \\ &= \frac{1/4}{2} \left[e^{-(0)^2} + 2e^{-(\frac{1}{4})^2} + 2e^{-(\frac{1}{2})^2} + 2e^{-(\frac{3}{4})^2} + e^{-(1)^2} \right] \\ &= \frac{1}{8} \left[1 + 2e^{-\frac{1}{16}} + 2e^{-\frac{1}{4}} + 2e^{-\frac{9}{16}} + e^{-1} \right] \\ &\approx \boxed{0.743}.\end{aligned}$$

- (b) We have $\frac{d}{dx}(e^{-x^2}) = -2xe^{-x^2}$, and $\frac{d^2}{dx^2}(e^{-x^2}) = 4x^2e^{-x^2} - 2e^{-x^2}$. The graph of $|f''(x)| = |4x^2e^{-x^2} - 2e^{-x^2}|$ shows that the maximum $M = 2$. We obtain

$$\text{Error} \leq \frac{(1-0)^3(2)}{12(4)^2} = \frac{1}{96}$$

(c) We require

$$\begin{aligned}\text{Error} &\leq \frac{(1-0)^3(2)}{12(n)^2} = \frac{1}{6n^2} < 0.0001 \\ \frac{1}{6(0.0001)} &< n^2 \\ \sqrt{\frac{1}{6(0.0001)}} &< n \\ 40.82 &< n\end{aligned}$$

So we need $n = \boxed{41}$.

10. (a) With $n = 4$ we have $\Delta x = \frac{1-0}{4} = \frac{1}{4}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_0^1 e^{x^2} dx &\approx \frac{\Delta x}{2} \left[f(0) + 2f\left(\frac{1}{4}\right) + 2f\left(\frac{1}{2}\right) + 2f\left(\frac{3}{4}\right) + f(1) \right] \\ &= \frac{1/4}{2} \left[e^{(0)^2} + 2e^{(\frac{1}{4})^2} + 2e^{(\frac{1}{2})^2} + 2e^{(\frac{3}{4})^2} + e^{(1)^2} \right] \\ &= \frac{1}{8} \left[1 + 2e^{\frac{1}{16}} + 2e^{\frac{1}{4}} + 2e^{\frac{9}{16}} + e \right] \\ &\approx \boxed{1.491}.\end{aligned}$$

- (b) We have $\frac{d}{dx}(e^{x^2}) = 2xe^{x^2}$, and $\frac{d^2}{dx^2}(e^{x^2}) = 2e^{x^2} + 4x^2e^{x^2}$. The graph of $|f''(x)| = |2e^{x^2} + 4x^2e^{x^2}|$ shows that the maximum $M = 2e + 4(1)^2e^{1^2} \approx 16.31$. We obtain

$$\text{Error} \leq \frac{(1-0)^3(16.31)}{12(4)^2} \approx 0.085$$

- (c) We require

$$\begin{aligned}\text{Error} &\leq \frac{(1-0)^3(16.31)}{12(n)^2} = \frac{1.359}{n^2} < 0.0001 \\ \frac{1.359}{0.0001} &< n^2 \\ \sqrt{\frac{1.359}{0.0001}} &< n \\ 116.6 &< n\end{aligned}$$

So we need $n = \boxed{117}$.

11. (a) With $n = 4$ we have $\Delta x = \frac{0-(-1)}{4} = \frac{1}{4}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned} \int_{-1}^0 \frac{dx}{\sqrt{1-x^3}} &\approx \frac{\Delta x}{2} \left[f(-1) + 2f\left(\frac{-3}{4}\right) + 2f\left(\frac{-1}{2}\right) + 2f\left(\frac{-1}{4}\right) + f(0) \right] \\ &= \frac{1/4}{2} \left[\frac{1}{\sqrt{1-(-1)^3}} + 2\frac{1}{\sqrt{1-(-3/4)^3}} + 2\frac{1}{\sqrt{1-(-1/2)^3}} \right. \\ &\quad \left. + 2\frac{1}{\sqrt{1-(-1/4)^3}} + \frac{1}{\sqrt{1-(0)^3}} \right] \\ &= \frac{1}{8} \left[\frac{1}{2}\sqrt{2} + \frac{16}{91}\sqrt{91} + \frac{4}{3}\sqrt{2} + \frac{16}{65}\sqrt{65} + 1 \right] \\ &\approx \boxed{0.907}. \end{aligned}$$

- (b) We have $\frac{d}{dx}\left(\frac{1}{\sqrt{1-x^3}}\right) = \frac{3x^2}{2(1-x^3)^{\frac{3}{2}}}$, and $\frac{d^2}{dx^2}\left(\frac{1}{\sqrt{1-x^3}}\right) = \frac{3x(5x^3+4)}{4(1-x^3)^{\frac{5}{2}}}$. The graph of $|f''(x)| = \left|\frac{3x(5x^3+4)}{4(1-x^3)^{\frac{5}{2}}}\right|$ shows that the maximum $M \leq 1$. We obtain

$$\text{Error} \leq \frac{(0-(-1))^3(1)}{12(4)^2} = \frac{1}{192}$$

- (c) We require

$$\begin{aligned} \text{Error} &\leq \frac{(0-(-1))^3(1)}{12(n)^2} = \frac{1}{12n^2} < 0.0001 \\ \frac{1}{0.0001(12)} &< n^2 \\ \sqrt{\frac{1}{0.0001(12)}} &< n \\ 28.87 &< n \end{aligned}$$

So we need $n = \boxed{29}$.

12. (a) With $n = 3$ we have $\Delta x = \frac{1-0}{3} = \frac{1}{3}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned} \int_0^1 \frac{dx}{\sqrt{1+x^3}} &\approx \frac{\Delta x}{2} \left[f(0) + 2f\left(\frac{1}{3}\right) + 2f\left(\frac{2}{3}\right) + f(1) \right] \\ &= \frac{1/3}{2} \left[\frac{1}{\sqrt{1+(0)^3}} + 2\frac{1}{\sqrt{1+(\frac{1}{3})^3}} + 2\frac{1}{\sqrt{1+(\frac{2}{3})^3}} + \frac{1}{\sqrt{1+(1)^3}} \right] \\ &= \frac{1}{6} \left[1 + \frac{3}{7}\sqrt{21} + \frac{6}{35}\sqrt{105} + \frac{1}{2}\sqrt{2} \right] \\ &\approx \boxed{0.9046}. \end{aligned}$$

- (b) We have $\frac{d}{dx} \left(\frac{1}{\sqrt{1+x^3}} \right) = \frac{-3x^2}{2(1+x^3)^{\frac{3}{2}}}$, and $\frac{d^2}{dx^2} \left(\frac{1}{\sqrt{1+x^3}} \right) = \frac{3x(5x^3-4)}{4(1+x^3)^{\frac{5}{2}}}$. The graph of $|f''(x)| = \left| \frac{3x(5x^3-4)}{4(1+x^3)^{\frac{5}{2}}} \right|$ shows that the maximum $M \leq 1$. We obtain

$$\text{Error} \leq \frac{(1-0)^3(1)}{12(4)^2} \approx 0.0052$$

- (c) We require

$$\begin{aligned} \text{Error} &\leq \frac{(1-0)^3(1)}{12(n)^2} = \frac{1}{12n^2} < 0.0001 \\ \frac{1}{0.0001(12)} &< n^2 \\ \sqrt{\frac{1}{0.0001(12)}} &< n \\ 28.87 &< n \end{aligned}$$

So we need $n = \boxed{29}$.

13. (a) With $n = 4$ we have $\Delta x = \frac{2-1}{4} = \frac{1}{4}$. So Simpson's Rule provides the approximation

$$\begin{aligned} \int_1^2 \frac{e^x}{x} dx &\approx \frac{\Delta x}{3} \left[f(1) + 4f\left(\frac{5}{4}\right) + 2f\left(\frac{3}{2}\right) + 4f\left(\frac{7}{4}\right) + f(2) \right] \\ &= \frac{1/4}{3} \left[\frac{e^1}{1} + 4\frac{e^{5/4}}{5/4} + 2\frac{e^{3/2}}{3/2} + 4\frac{e^{7/4}}{7/4} + \frac{e^2}{2} \right] \\ &= \frac{1}{12} \left[e + \frac{16}{5}e^{5/4} + \frac{4}{3}e^{3/2} + \frac{16}{7}e^{7/4} + \frac{1}{2}e^2 \right] \\ &\approx \boxed{3.059}. \end{aligned}$$

- (b) We have $\frac{d^4}{dx^4}\left(\frac{e^x}{x}\right) = \frac{1}{x^5}e^x(x^4 - 4x^3 + 12x^2 - 24x + 24)$. The graph of $|f^4(x)|$ shows $M \leq |f^{(4)}(1)| = 9e$. We obtain

$$\text{Error} \leq \frac{(2-1)^5(9e)}{180(4)^4} \approx 5.309 \times 10^{-4}$$

- (c) We require

$$\begin{aligned} \text{Error} &\leq \frac{(2-1)^5(9e)}{180(n)^4} < 0.0001 \\ \frac{9e}{0.0001(180)} &< n^4 \\ \sqrt[4]{\frac{9e}{0.0001(180)}} &< n \\ 6.072 &< n \end{aligned}$$

Since n must be even, we need $n = \boxed{8}$.

14. (a) With $n = 4$ we have $\Delta x = \frac{2\pi - 3\pi/2}{4} = \frac{\pi}{8}$. So Simpson's Rule provides the approximation

$$\begin{aligned} \int_{3\pi/2}^{2\pi} \frac{\cos x}{x} dx &\approx \frac{\Delta x}{3} \left[f\left(\frac{3\pi}{2}\right) + 4f\left(\frac{13\pi}{8}\right) + 2f\left(\frac{7\pi}{4}\right) + 4f\left(\frac{15\pi}{8}\right) + f(2\pi) \right] \\ &= \frac{\pi/8}{3} \left[\frac{\cos(3\pi/2)}{3\pi/2} + 4\frac{\cos(13\pi/8)}{13\pi/8} + 2\frac{\cos(7\pi/4)}{7\pi/4} + 4\frac{\cos(15\pi/8)}{15\pi/8} + \frac{\cos(2\pi)}{2\pi} \right] \\ &\approx \boxed{0.1759}. \end{aligned}$$

- (b) We have $\frac{d^4}{dx^4}\left(\frac{\cos x}{x}\right) = \frac{1}{x^5}(24\cos x - 12x^2\cos x + x^4\cos x - 4x^3\sin x + 24x\sin x)$. The graph of $|f^4(x)|$ shows $M \leq 0.2$. We obtain

$$\text{Error} \leq \frac{(2\pi - 3\pi/2)^5(0.2)}{180(4)^4} \approx 4.151 \times 10^{-5}$$

(c) We require

$$\begin{aligned}\text{Error} &\leq \frac{(2\pi - 3\pi/2)^5(0.2)}{180(n)^4} = \frac{1.063 \times 10^{-2}}{n^4} < 0.0001 \\ \frac{1.063 \times 10^{-2}}{0.0001} &< n^4 \\ \sqrt[4]{\frac{1.063 \times 10^{-2}}{0.0001}} &< n \\ 3.211 &< n\end{aligned}$$

Since n must be even, we need $n = \boxed{4}$.

15. (a) With $n = 4$ we have $\Delta x = \frac{1-0}{4} = \frac{1}{4}$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_0^1 e^{-x^2} dx &\approx \frac{\Delta x}{3} \left[f(0) + 4f\left(\frac{1}{4}\right) + 2f\left(\frac{1}{2}\right) + 4f\left(\frac{3}{4}\right) + f(1) \right] \\ &= \frac{1/4}{3} \left[e^{-(0)^2} + 4e^{-(1/4)^2} + 2e^{-(1/2)^2} + 4e^{-(3/4)^2} + e^{-(1)^2} \right] \\ &= \frac{1}{12} \left[1 + 4e^{-\frac{1}{16}} + 2e^{-\frac{1}{4}} + 4e^{-\frac{9}{16}} + e^{-1} \right] \\ &\approx \boxed{0.747}.\end{aligned}$$

(b) We have $\frac{d^4}{dx^4}(e^{-x^2}) = 4e^{-x^2}(4x^4 - 12x^2 + 3)$. The graph of $|f^4(x)|$ shows $M \leq 12$. We obtain

$$\text{Error} \leq \frac{(1-0)^5(12)}{180(4)^4} \approx 2.604 \times 10^{-4}$$

(c) We require

$$\begin{aligned}\text{Error} &\leq \frac{(1-0)^5(12)}{180(n)^4} = \frac{1}{15n^4} < 0.0001 \\ \frac{1}{0.0001(15)} &< n^4 \\ \sqrt[4]{\frac{1}{0.0001(15)}} &< n \\ 5.081 &< n\end{aligned}$$

We need $n = \boxed{6}$.

16. (a) With $n = 4$ we have $\Delta x = \frac{1-0}{4} = \frac{1}{4}$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_0^1 e^{x^2} dx &\approx \frac{\Delta x}{3} \left[f(0) + 4f\left(\frac{1}{4}\right) + 2f\left(\frac{1}{2}\right) + 4f\left(\frac{3}{4}\right) + f(1) \right] \\ &= \frac{1/4}{3} \left[e^{(0)^2} + 4e^{(1/4)^2} + 2e^{(1/2)^2} + 4e^{(3/4)^2} + e^{(1)^2} \right] \\ &= \frac{1}{12} \left[1 + 4e^{\frac{1}{16}} + 2e^{\frac{1}{4}} + 4e^{\frac{9}{16}} + e \right] \\ &\approx \boxed{1.464}.\end{aligned}$$

- (b) We have $\frac{d^4}{dx^4}(e^{x^2}) = 4e^{x^2}(4x^4 + 12x^2 + 3)$. The graph of $|f''''(x)|$ shows $M = 76e \approx 206.6$. We obtain

$$\text{Error} \leq \frac{(1-0)^5(76e)}{180(4)^4} \approx 4.483 \times 10^{-3}$$

- (c) We require

$$\begin{aligned}\text{Error} &\leq \frac{(1-0)^5(76e)}{180(n)^4} \approx \frac{1.148}{(n)^4} < 0.0001 \\ \frac{1.148}{0.0001} &< n^4 \\ \sqrt[4]{\frac{1.148}{0.0001}} &< n \\ 10.35 &< n\end{aligned}$$

Since n must be even, we need $n = \boxed{12}$.

17. (a) With $n = 4$ we have $\Delta x = \frac{0-(-1)}{4} = \frac{1}{4}$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_{-1}^0 \frac{dx}{\sqrt{1-x^3}} &\approx \frac{\Delta x}{3} \left[f(-1) + 4f\left(\frac{-3}{4}\right) + 2f\left(\frac{-1}{2}\right) + 4f\left(\frac{-1}{4}\right) + f(0) \right] \\ &= \frac{1/4}{3} \left[\frac{1}{\sqrt{1-(-1)^3}} + 4\frac{1}{\sqrt{1-(-3/4)^3}} + 2\frac{1}{\sqrt{1-(-1/2)^3}} \right. \\ &\quad \left. + 4\frac{1}{\sqrt{1-(-1/4)^3}} + \frac{1}{\sqrt{1-(0)^3}} \right] \\ &= \frac{1}{12} \left[\frac{1}{2}\sqrt{2} + \frac{32}{91}\sqrt{91} + \frac{4}{3}\sqrt{2} + \frac{32}{65}\sqrt{65} + 1 \right] \\ &\approx \boxed{0.910}.\end{aligned}$$

(b) We have $\frac{d^4}{dx^4} \left(\frac{1}{\sqrt{1-x^3}} \right) = \frac{135x^2(7x^6+40x^3+16)}{16(1-x^3)^{\frac{9}{2}}}$. The graph of $|f^4(x)|$ shows $M \leq 15$. We obtain

$$\text{Error} \leq \frac{(0 - (-1))^5(15)}{180(4)^4} \approx 3.255 \times 10^{-4}$$

(c) We require

$$\begin{aligned} \text{Error} &\leq \frac{(0 - (-1))^5(15)}{180(n)^4} = \frac{1}{12(n)^4} < 0.0001 \\ \frac{1}{0.0001(12)} &< n^4 \\ \sqrt[4]{\frac{1}{0.0001(12)}} &< n \\ 5.373 &< n \end{aligned}$$

We need $n = \boxed{6}$.

18. (a) With $n = 4$ we have $\Delta x = \frac{1-0}{4} = \frac{1}{4}$. So Simpson's Rule provides the approximation

$$\begin{aligned} \int_0^1 \frac{dx}{\sqrt{1+x^2}} &\approx \frac{\Delta x}{3} \left[f(0) + 4f\left(\frac{1}{4}\right) + 2f\left(\frac{1}{2}\right) + 4f\left(\frac{3}{4}\right) + f(1) \right] \\ &= \frac{1/4}{3} \left[\frac{1}{\sqrt{1+(0)^2}} + 4\frac{1}{\sqrt{1+(1/4)^2}} + 2\frac{1}{\sqrt{1+(1/2)^2}} \right. \\ &\quad \left. + 4\frac{1}{\sqrt{1+(3/4)^2}} + \frac{1}{\sqrt{1+(1)^2}} \right] \\ &= \frac{1}{12} \left[1 + \frac{16}{17}\sqrt{17} + \frac{4}{5}\sqrt{5} + \frac{16}{5} + \frac{1}{2}\sqrt{2} \right] \\ &\approx \boxed{0.8814}. \end{aligned}$$

(b) We have $\frac{d^4}{dx^4} \left(\frac{1}{\sqrt{1+x^2}} \right) = \frac{24x^4-72x^2+9}{(x^2+1)^{\frac{9}{2}}}$. The graph of $|f^4(x)|$ shows $M = 9$. We obtain

$$\text{Error} \leq \frac{(1-0)^5(9)}{180(4)^4} = \frac{1}{5120} \approx 1.953 \times 10^{-4}$$

(c) We require

$$\begin{aligned} \text{Error} &\leq \frac{(1-0)^5(9)}{180(n)^4} = \frac{1}{20(n)^4} < 0.0001 \\ \frac{1}{0.0001(20)} &< n^4 \\ \sqrt[4]{500} &< n \\ 4.729 &< n \end{aligned}$$

We need $n = \boxed{6}$.

19. (a) $\int_1^2 \frac{dx}{x} = [\ln x]_1^2 = \ln 2 - \ln 1 = \ln 2$.

(b) With $n = 5$ we have $\Delta x = \frac{2-1}{5} = \frac{1}{5}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned} \int_1^2 \frac{dx}{x} &\approx \frac{\Delta x}{2} \left[f(1) + 2f\left(\frac{6}{5}\right) + 2f\left(\frac{7}{5}\right) + 2f\left(\frac{8}{5}\right) + 2f\left(\frac{9}{5}\right) + f(2) \right] \\ &= \frac{1/5}{2} \left[\frac{1}{1} + 2\frac{1}{6/5} + 2\frac{1}{7/5} + 2\frac{1}{8/5} + 2\frac{1}{9/5} + \frac{1}{2} \right] \\ &= \frac{1}{10} \left[1 + \frac{5}{3} + \frac{10}{7} + \frac{5}{4} + \frac{10}{9} + \frac{1}{2} \right] \\ &= \frac{1753}{2520} \\ &\approx \boxed{0.6956}. \end{aligned}$$

(c) With $n = 6$ we have $\Delta x = \frac{2-1}{6} = \frac{1}{6}$. So Simpson's Rule provides the approximation

$$\begin{aligned} \int_1^2 \frac{dx}{x} &\approx \frac{\Delta x}{3} \left[f(1) + 4f\left(\frac{7}{6}\right) + 2f\left(\frac{4}{3}\right) + 4f\left(\frac{3}{2}\right) + 2f\left(\frac{5}{3}\right) + 4f\left(\frac{11}{6}\right) + f(2) \right] \\ &= \frac{1/6}{3} \left[\frac{1}{1} + 4\frac{1}{7/6} + 2\frac{1}{4/3} + 4\frac{1}{3/2} + 2\frac{1}{5/3} + 4\frac{1}{11/6} + \frac{1}{2} \right] \\ &= \frac{1}{18} \left[\frac{1}{1} + \frac{24}{7} + \frac{3}{2} + \frac{8}{3} + \frac{6}{5} + \frac{24}{11} + \frac{1}{2} \right] \\ &= \frac{14411}{20790} \\ &\approx \boxed{0.6932}. \end{aligned}$$

20. The area is given by the integral $\int_2^{4.4} f(x) dx$, which we approximate by Simpson's Rule, with $\Delta x = 0.4$.

$$\begin{aligned}\int_2^{4.4} f(x) dx &\approx \frac{\Delta x}{3} [f(2.0) + 4f(2.4) + 2f(2.8) + 4f(3.2) + 2f(3.6) + 4f(4.0) + f(4.4)] \\ &= \frac{0.4}{3} [3.03 + 4(4.61) + 2(5.80) + 4(6.59) + 2(7.76) + 4(8.46) + 9.19] \\ &\approx \boxed{15.73}.\end{aligned}$$

21. The arc length is given by $\int_0^{\pi/2} \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx = \int_0^{\pi/2} \sqrt{1 + (\cos x)^2} dx = \int_0^{\pi/2} \sqrt{1 + \cos^2 x} dx$.

- (a) With $n = 4$ we have $\Delta x = \frac{(\pi/2)-0}{4} = \frac{\pi}{8}$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_0^{\pi/2} \sqrt{1 + \cos^2 x} dx &\approx \frac{\Delta x}{3} \left[f(0) + 4f\left(\frac{\pi}{8}\right) + 2f\left(\frac{\pi}{4}\right) + 4f\left(\frac{3\pi}{8}\right) + f\left(\frac{\pi}{2}\right) \right] \\ &= \frac{\pi/8}{3} \left[\sqrt{1 + \cos^2 0} + 4\sqrt{1 + \cos^2 \frac{\pi}{8}} + 2\sqrt{1 + \cos^2 \frac{\pi}{4}} \right. \\ &\quad \left. + 4\sqrt{1 + \cos^2 \frac{3\pi}{8}} + \sqrt{1 + \cos^2 \frac{\pi}{2}} \right] \\ &\approx \boxed{1.910}.\end{aligned}$$

- (b) With $n = 3$ we have $\Delta x = \frac{(\pi/2)-0}{3} = \frac{\pi}{6}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_0^{\pi/2} \sqrt{1 + \cos^2 x} dx &\approx \frac{\Delta x}{2} \left[f(0) + 2f\left(\frac{\pi}{6}\right) + 2f\left(\frac{\pi}{3}\right) + f\left(\frac{\pi}{2}\right) \right] \\ &= \frac{\pi/6}{2} \left[\sqrt{1 + \cos^2 0} + 2\sqrt{1 + \cos^2 \frac{\pi}{6}} + 2\sqrt{1 + \cos^2 \frac{\pi}{3}} + \sqrt{1 + \cos^2 \frac{\pi}{2}} \right] \\ &\approx \boxed{1.910}.\end{aligned}$$

22. The arc length is given by $\int_0^4 \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx = \int_0^4 \sqrt{1 + (e^x)^2} dx = \int_0^4 \sqrt{1 + e^{2x}} dx$.

- (a) With $n = 4$ we have $\Delta x = \frac{4-0}{4} = 1$. So Simpson's Rule provides the approximation

$$\begin{aligned}\int_0^4 \sqrt{1 + e^{2x}} dx &\approx \frac{\Delta x}{3} [f(0) + 4f(1) + 2f(2) + 4f(3) + f(4)] \\ &= \frac{1}{3} \left[\sqrt{1 + e^{2(0)}} + 4\sqrt{1 + e^{2(1)}} + 2\sqrt{1 + e^{2(2)}} + 4\sqrt{1 + e^{2(3)}} + \sqrt{1 + e^{2(4)}} \right] \\ &\approx \boxed{54.32}.\end{aligned}$$

- (b) With $n = 8$ we have $\Delta x = \frac{4-0}{8} = \frac{1}{2}$. So the Trapezoidal Rule provides the approxi-

mation

$$\begin{aligned}
 \int_0^4 \sqrt{1+e^{2x}} dx &\approx \frac{\Delta x}{2} [f(0) + 2f(1/2) + 2f(1) + 2f(3/2) + 2f(2) \\
 &\quad + 2f(5/2) + 2f(3) + 2f(7/2) + f(4)] \\
 &= \frac{1}{2} \left[\sqrt{1+e^{2(0)}} + 2\sqrt{1+e^{2(\frac{1}{2})}} + 2\sqrt{1+e^{2(1)}} + 2\sqrt{1+e^{2(\frac{3}{2})}} \right. \\
 &\quad \left. + 2\sqrt{1+e^{2(2)}} + 2\sqrt{1+e^{2(\frac{5}{2})}} + 2\sqrt{1+e^{2(3)}} + 2\sqrt{1+e^{2(\frac{7}{2})}} + \sqrt{1+e^{2(4)}} \right] \\
 &\approx \boxed{55.17}.
 \end{aligned}$$

23. The work is given by the integral $\int_1^{2.5} p dV$, which we approximate by Simpson's Rule, with $\Delta V = 0.25$.

$$\begin{aligned}
 \int_1^{2.5} p dV &\approx \frac{\Delta V}{3} [f(1.0) + 4f(1.25) + 2f(1.5) + 4f(1.75) + 2f(2.0) + 4f(2.25) + f(2.5)] \\
 &= \frac{0.25}{3} [68.7 + 4(55.0) + 2(45.8) + 4(39.3) + 2(34.4) + 4(30.5) + 27.5] \\
 &\approx \boxed{62.983 \text{ inch-pounds}}.
 \end{aligned}$$

24. The work is given by the integral $\int_0^{50} F dx$, which we approximate by the Trapezoidal Rule, with $\Delta x = 5$.

$$\begin{aligned}
 \int_0^{50} F dx &\approx \frac{\Delta x}{2} [f(0) + 2f(5) + 2f(10) + 2f(15) + 2f(20) \\
 &\quad + 2f(25) + f(30) + 2f(35) + 2f(40) + 2f(45) + f(50)] \\
 &= \frac{5}{2} [100 + 2(80) + 2(66) + 2(56) + 2(50) + 2(45) + 2(40) + 2(36) + 2(33) + 2(30) + 28] \\
 &= \boxed{2500}.
 \end{aligned}$$

25. The volume is given by the integral $\int_0^{150} S dx$, which we approximate by the Trapezoidal Rule, with $\Delta x = 25$.

$$\begin{aligned}
 \int_0^{150} S dx &\approx \frac{\Delta x}{2} [f(0) + 2f(25) + 2f(50) + 2f(75) + 2f(100) + 2f(125) + f(150)] \\
 &= \frac{25}{2} [105 + 2(118) + 2(142) + 2(120) + 2(110) + 2(90) + 78] \\
 &\approx \boxed{16,787.5 \text{ m}^3}.
 \end{aligned}$$

26. Let y represent the vertical distance of the pond at position x . Then the area is given by the integral $\int_0^{20} y dx$, which we approximate by Simpson's Rule, with $\Delta x = 5$.

$$\begin{aligned}
 \int_0^{20} y dx &\approx \frac{\Delta x}{3} [f(0) + 4f(5) + 2f(10) + 4f(15) + f(20)] \\
 &= \frac{5}{3} [0 + 4(12) + 2(19) + 4(13) + 2(13) + 0] \\
 &\approx \boxed{273.3 \text{ ft}^2}.
 \end{aligned}$$

27. The volume is given by the integral $\int_0^{25} A \, dx$. We first approximate by the Trapezoidal Rule, with $\Delta x = 2.5$.

$$\begin{aligned}\int_0^{25} A \, dx &\approx \frac{\Delta x}{2} [f(0) + 2f(2.5) + 2f(5.0) + 2f(7.5) + 2f(10) + 2f(12.5) \\ &\quad + 2f(15.0) + 2f(17.5) + 2f(20) + 2f(22.5) + f(25)] \\ &= \frac{2.5}{2} [0 + 2(2510) + 2(3860) + 2(4870) + 2(5160) + 2(5590) \\ &\quad + 2(5810) + 2(6210) + 2(6890) + 2(7680) + 8270] \\ &\approx \boxed{131,787.5 \text{ m}^3}.\end{aligned}$$

We next approximate by Simpson's Rule.

$$\begin{aligned}\int_0^{25} A \, dx &\approx \frac{\Delta x}{3} [f(0) + 4f(2.5) + 2f(5.0) + 4f(7.5) + 2f(10) + 4f(12.5) \\ &\quad + 2f(15.0) + 4f(17.5) + 2f(20) + 4f(22.5) + f(25)] \\ &= \frac{2.5}{3} [0 + 4(2510) + 2(3860) + 4(4870) + 2(5160) + 4(5590) \\ &\quad + 2(5810) + 4(6210) + 2(6890) + 4(7680) + 8270] \\ &\approx \boxed{132,625 \text{ m}^3}.\end{aligned}$$

28. The area is given by the integral $\int_0^{80} y \, dx$. We approximate by the Trapezoidal Rule, with $\Delta x = 10$.

$$\begin{aligned}\int_0^{80} y \, dx &\approx \frac{\Delta x}{2} [f(0) + 2f(10) + 2f(20) + 2f(30) + 2f(40) + \\ &\quad + 2f(50) + 2f(60) + 2f(70) + f(80)] \\ &= \frac{10}{2} [5 + 2(10) + 2(13.2) + 2(15) \\ &\quad + 2(15.6) + 2(12) + 2(6) + 2(4) + 0] \\ &\approx \boxed{783.0 \text{ m}^2}.\end{aligned}$$

29. The volume is given by the integral $\int_2^8 \pi y^2 \, dx$. We approximate by the Trapezoidal Rule, with $\Delta x = 2$.

$$\begin{aligned}\int_2^8 \pi y^2 \, dx &\approx \frac{\Delta x}{2} [f(2) + 2f(4) + 2f(6) + f(8)] \\ &= \frac{2}{2} [\pi(1)^2 + 2\pi(3)^2 + 2\pi(3.5)^2 + \pi(3)^2] \\ &\approx \boxed{164.934}.\end{aligned}$$

30. The distance traveled is given by the integral $\int_0^3 v \, dt$.

(a) We approximate by the Trapezoidal Rule, with $\Delta t = 0.5$.

$$\begin{aligned}\int_0^3 v \, dt &\approx \frac{\Delta t}{2} [f(0) + 2f(0.5) + 2f(1) + 2f(1.5) + 2f(2) + 2f(2.5) + f(3)] \\ &= \frac{0.5}{2} [5.1 + 2(5.3) + 2(5.6) + 2(6.1) + 2(6.8) + 2(6.7) + 6.5] \\ &= \boxed{18.15 \text{ m}}.\end{aligned}$$

(b) We approximate by Simpson's Rule, with $\Delta t = 0.5$.

$$\begin{aligned}\int_0^3 v \, dt &\approx \frac{\Delta t}{3} [f(0) + 4f(0.5) + 2f(1) + 4f(1.5) + 2f(2) + 4f(2.5) + f(3)] \\ &= \frac{0.5}{3} [5.1 + 4(5.3) + 2(5.6) + 4(6.1) + 2(6.8) + 4(6.7) + 6.5] \\ &= \boxed{18.13 \text{ m}}.\end{aligned}$$

31. The volume is given by $\int_0^1 \pi (\sin^{-1} y)^2 \, dy$.

(a) With $n = 4$ we have $\Delta y = \frac{1-0}{4} = \frac{1}{4}$. Using the disk method, Simpson's Rule provides the approximation

$$\begin{aligned}\int_0^1 \pi (\sin^{-1} y)^2 \, dy &\approx \frac{\Delta y}{3} \left[f(0) + 4f\left(\frac{1}{4}\right) + 2f\left(\frac{1}{2}\right) + 4f\left(\frac{3}{4}\right) + f(1) \right] \\ &= \frac{1/4}{3} \left[\pi (\sin^{-1} 0)^2 + 4 \left(\pi \left(\sin^{-1} \frac{1}{4} \right)^2 \right) + 2 \left(\pi \left(\sin^{-1} \frac{1}{2} \right)^2 \right) \right. \\ &\quad \left. + 4 \left(\pi \left(\sin^{-1} \frac{3}{4} \right)^2 \right) + \pi (\sin^{-1} 1)^2 \right] \\ &\approx \boxed{1.6095}.\end{aligned}$$

Using the shell method, we have $\Delta x = \frac{\pi/2-0}{4} = \frac{\pi}{8}$. Simpson's Rule provides the approximation

$$\begin{aligned}\int_0^{\pi/2} 2\pi x (1 - \sin x) \, dx &\approx \frac{\Delta x}{3} \left[f(0) + 4f\left(\frac{\pi}{8}\right) + 2f\left(\frac{\pi}{4}\right) + 4f\left(\frac{3\pi}{8}\right) + f\left(\frac{\pi}{2}\right) \right] \\ &= \frac{\pi/8}{3} \left[2\pi(0)(1 - \sin(0)) + 4 \left(2\pi \left(\frac{\pi}{8} \right) \left(1 - \sin \left(\frac{\pi}{8} \right) \right) \right) + 2 \left(2\pi \left(\frac{\pi}{4} \right) \left(1 - \sin \left(\frac{\pi}{4} \right) \right) \right) \right. \\ &\quad \left. + 4 \left(2\pi \left(\frac{3\pi}{8} \right) \left(1 - \sin \left(\frac{3\pi}{8} \right) \right) \right) + 2\pi \left(\frac{\pi}{2} \right) \left(1 - \sin \left(\frac{\pi}{2} \right) \right) \right] \\ &\approx \boxed{1.4709}.\end{aligned}$$

(b) With $n = 3$ we have $\Delta y = \frac{1-0}{3} = \frac{1}{3}$. Using the disk method, Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_0^1 \pi (\sin^{-1} y)^2 \, dy &\approx \frac{\Delta y}{2} \left[f(0) + 2f\left(\frac{1}{3}\right) + 2f\left(\frac{2}{3}\right) + f(1) \right] \\ &= \frac{1/3}{2} \left[\pi (\sin^{-1} 0) + 2 \left(\pi \left(\sin^{-1} \frac{1}{3} \right)^2 \right) + 2 \left(\pi \left(\sin^{-1} \frac{2}{3} \right)^2 \right) + \pi (\sin^{-1} 1)^2 \right] \\ &\approx \boxed{1.9705}.\end{aligned}$$

Using the shell method, we have $\Delta x = \frac{\pi/2-0}{3} = \frac{\pi}{6}$. The Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_0^{\pi/2} 2\pi x (1 - \sin x) \, dx &\approx \frac{\Delta x}{2} \left[f(0) + 2f\left(\frac{\pi}{6}\right) + 2f\left(\frac{\pi}{3}\right) + f\left(\frac{\pi}{2}\right) \right] \\ &= \frac{\pi/6}{2} \left[2\pi(0)(1 - \sin(0)) + 2 \left(2\pi \left(\frac{\pi}{6} \right) \left(1 - \sin \left(\frac{\pi}{6} \right) \right) \right) \right. \\ &\quad \left. + 2 \left(2\pi \left(\frac{\pi}{3} \right) \left(1 - \sin \left(\frac{\pi}{3} \right) \right) \right) + 2\pi \left(\frac{\pi}{2} \right) \left(1 - \sin \left(\frac{\pi}{2} \right) \right) \right] \\ &\approx \boxed{1.3228}.\end{aligned}$$

32. The arc length is given by $\int_0^8 \sqrt{1 + (dy/dx)^2} dx$. We use implicit differentiation, and obtain

$$\begin{aligned} 9x^2 + 100y^2 &= 900 \\ 18x + 200y \frac{dy}{dx} &= 0 \\ \frac{dy}{dx} &= -\frac{9x}{100y} \end{aligned}$$

So $\left(\frac{dy}{dx}\right)^2 = \left(-\frac{9x}{100y}\right)^2 = \frac{81x^2}{100(100y^2)} = \frac{81x^2}{100(900-9x^2)} = \frac{9x^2}{100(100-x^2)}$, and

$$\begin{aligned} \int_0^8 \sqrt{1 + (dy/dx)^2} dx &= \int_0^8 \sqrt{1 + \frac{9x^2}{100(100-x^2)}} dx \\ &= \int_0^8 \frac{1}{10} \sqrt{\frac{10000 - 91x^2}{100 - x^2}} dx \end{aligned}$$

The Trapezoidal Rule, with $n = 4$ and $\Delta x = \frac{8-0}{4} = 2$ is used.

$$\begin{aligned} \int_0^8 \sqrt{1 + (dy/dx)^2} dx &\approx \frac{\Delta x}{2} [f(0) + 2f(2) + 2f(4) + 2f(6) + f(8)] \\ &= \frac{2}{2} \left(\frac{1}{10}\right) \left[\sqrt{\frac{10000 - 91(0)^2}{100 - (0)^2}} + 2 \left(\sqrt{\frac{10000 - 91(2)^2}{100 - (2)^2}} \right) \right. \\ &\quad \left. + 2 \left(\sqrt{\frac{10000 - 91(4)^2}{100 - (4)^2}} \right) + 2 \left(\sqrt{\frac{10000 - 91(6)^2}{100 - (6)^2}} \right) + \sqrt{\frac{10000 - 91(8)^2}{100 - (8)^2}} \right] \\ &\approx \boxed{8.148}. \end{aligned}$$

33. (a) With $n = 6$ we have $\Delta x = \frac{\pi-0}{6} = \frac{\pi}{6}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned} \int_0^\pi f(x) dx &\approx \frac{\Delta x}{2} \left[f(0) + 2f\left(\frac{\pi}{6}\right) + 2f\left(\frac{\pi}{3}\right) + 2f\left(\frac{\pi}{2}\right) + 2f\left(\frac{2\pi}{3}\right) + 2f\left(\frac{5\pi}{6}\right) + f(2\pi) \right] \\ &= \frac{\pi/6}{2} \left[1 + 2 \frac{\sin(\pi/6)}{\pi/6} + 2 \frac{\sin(\pi/3)}{\pi/3} + 2 \frac{\sin(\pi/2)}{\pi/2} \right. \\ &\quad \left. + 2 \frac{\sin(2\pi/3)}{2\pi/3} + 2 \frac{\sin(5\pi/6)}{5\pi/6} + \frac{\sin(2\pi)}{2\pi} \right] \\ &\approx \boxed{1.845}. \end{aligned}$$

(b) Simpson's Rule provides the approximation

$$\begin{aligned} \int_0^\pi f(x) dx &\approx \frac{\Delta x}{3} \left[f(0) + 4f\left(\frac{\pi}{6}\right) + 2f\left(\frac{\pi}{3}\right) + 4f\left(\frac{\pi}{2}\right) + 2f\left(\frac{2\pi}{3}\right) + 4f\left(\frac{5\pi}{6}\right) + f(2\pi) \right] \\ &= \frac{\pi/6}{3} \left[1 + 4 \frac{\sin(\pi/6)}{\pi/6} + 2 \frac{\sin(\pi/3)}{\pi/3} + 4 \frac{\sin(\pi/2)}{\pi/2} \right. \\ &\quad \left. + 2 \frac{\sin(2\pi/3)}{2\pi/3} + 4 \frac{\sin(5\pi/6)}{5\pi/6} + \frac{\sin(2\pi)}{2\pi} \right] \\ &\approx \boxed{1.852}. \end{aligned}$$

34. (a) With $n = 20$ we have $\Delta x = \frac{1-(-1)}{20} = \frac{1}{10}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned}\int_{-1}^1 5e^{-x^2} dx &\approx \frac{\Delta x}{2} [f(-1) + 2f(-0.9) + \cdots + 2f(0.9) + f(1)] \\ &= \frac{1/10}{2} \left[5e^{-(-1)^2} + 2\left(5e^{-(-0.9)^2}\right) + \cdots + 2\left(5e^{-(0.9)^2}\right) + 5e^{-(1)^2} \right] \\ &\approx \boxed{7.462}.\end{aligned}$$

- (b) Simpson's Rule provides the approximation

$$\begin{aligned}\int_{-1}^1 5e^{-x^2} dx &\approx \frac{\Delta x}{3} [f(-1) + 4f(-0.9) + 2f(-0.8) + \cdots + 4f(0.9) + f(1)] \\ &= \frac{1/10}{3} \left[5e^{-(-1)^2} + 4\left(5e^{-(-0.9)^2}\right) + 2\left(5e^{-(-0.9)^2}\right) \right. \\ &\quad \left. + \cdots + 4\left(5e^{-(0.9)^2}\right) + 5e^{-(1)^2} \right] \\ &\approx \boxed{7.468}.\end{aligned}$$

- (c) Using a CAS, we obtain $\int_{-1}^1 5e^{-x^2} dx \approx \boxed{7.468}$.

Challenge Problems

35. Since $T_n = \frac{1}{2}(L_n + R_n)$ where L_n is the Riemann Sum using left endpoints, and R_n is the Riemann Sum using right endpoints, we have

$$\begin{aligned}\lim_{n \rightarrow \infty} T_n &= \lim_{n \rightarrow \infty} \frac{1}{2}(L_n + R_n) \\ &= \frac{1}{2} \lim_{n \rightarrow \infty} L_n + \frac{1}{2} \lim_{n \rightarrow \infty} R_n \\ &= \frac{1}{2} \int_a^b f(x) dx + \frac{1}{2} \int_a^b f(x) dx \\ &= \int_a^b f(x) dx.\end{aligned}$$

36. Since $f^{(4)}(x) = \frac{d^4}{dx^4}(Ax^3 + Bx^2 + Cx + D) = 0$, we have $M = 0$, and the error obtained using Simpson's Rule satisfies

$$\text{Error} \leq \frac{(b-a)^5(0)}{180n^4} = 0.$$

So an approximation using Simpson's Rule, with any n , gives the exact value of $\int_a^b f(x) dx$.

7.7: Integration Using Tables and Computer Algebra Systems

Skill Building

1. We use formula 126,

$$\int e^{ax} \cos bx \, dx = \frac{e^{ax}}{a^2 + b^2} (a \cos bx + b \sin bx) + C,$$

with $a = 2$ and $b = 1$. We obtain

$$\begin{aligned} \int e^{2x} \cos x \, dx &= \frac{e^{2x}}{2^2 + 1^2} (2 \cos x + \sin x) + C \\ &= \boxed{\frac{1}{5} e^{2x} (2 \cos x + \sin x) + C}. \end{aligned}$$

2. First let $u = 2x + 3$, so $x = \frac{u-3}{2}$ and $\frac{1}{2} du = dx$, and substitute to obtain

$$\begin{aligned} \int e^{5x+1} \sin(2x+3) \, dx &= \int e^{5(\frac{u-3}{2})+1} \sin u \, \frac{1}{2} du \\ &= \frac{1}{2} \int e^{\frac{5}{2}u - \frac{13}{2}} \sin u \, du \\ &= \frac{1}{2} e^{-\frac{13}{2}} \int e^{\frac{5}{2}u} \sin u \, du. \end{aligned}$$

We now use formula 125,

$$\int e^{ax} \sin bx \, dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) + C,$$

with $a = \frac{5}{2}$ and $b = 1$. We obtain

$$\begin{aligned} \frac{1}{2} e^{-\frac{13}{2}} \int e^{\frac{5}{2}u} \sin u \, du &= \frac{1}{2} e^{-\frac{13}{2}} \left(\frac{e^{\frac{5}{2}u}}{\left(\frac{5}{2}\right)^2 + 1^2} \left(\frac{5}{2} \sin u - \cos u \right) \right) + C \\ &= \frac{1}{2} e^{-\frac{13}{2}} \left(\frac{e^{\frac{5}{2}(2x+3)}}{\left(\frac{5}{2}\right)^2 + 1^2} \left(\frac{5}{2} \sin(2x+3) - \cos(2x+3) \right) \right) + C \\ &= \boxed{\frac{2}{29} e^{5x+1} \left(\frac{5}{2} \sin(2x+3) - \cos(2x+3) \right) + C}. \end{aligned}$$

3. We use formula 40,

$$\int x \sqrt{a+bx} \, dx = \frac{2}{15b^2} (3bx - 2a)(a+bx)^{3/2} + C,$$

with $b = 4$ and $a = 3$. We obtain

$$\begin{aligned} \int x \sqrt{4x+3} \, dx &= \int x \sqrt{3+4x} \, dx \\ &= \frac{2}{15(4)^2} (3(4)x - 2(3))(3+4x)^{3/2} + C \\ &= \frac{1}{120} (12x - 6)(3+4x)^{3/2} + C \\ &= \boxed{\frac{1}{20} (2x - 1)(3+4x)^{3/2} + C}. \end{aligned}$$

4. We use formula 61,

$$\int \frac{1}{(x^2 - a^2)^{3/2}} dx = -\frac{x}{\sqrt{x^2 - a^2}} + C,$$

with $a = 1$. We obtain

$$\begin{aligned} \int \frac{1}{(x^2 - 1)^{3/2}} dx &= \int \frac{1}{(x^2 - 1^2)^{3/2}} dx \\ &= -\frac{x}{\sqrt{x^2 - 1^2}} + C \\ &= \boxed{-\frac{x}{\sqrt{x^2 - 1}} + C} \end{aligned}$$

5. First let $u = x + 1$, so $x = u - 1$ and $du = dx$, and substitute to obtain

$$\begin{aligned} \int (x + 1)\sqrt{4x + 5} dx &= \int u\sqrt{4(u - 1) + 5} du \\ &= \int u\sqrt{1 + 4u} du. \end{aligned}$$

We use formula 40,

$$\int x\sqrt{a + bx} dx = \frac{2}{15b^2}(3bx - 2a)(a + bx)^{3/2} + C,$$

with $b = 4$ and $a = 1$. We obtain

$$\begin{aligned} \int (x + 1)\sqrt{4x + 5} dx &= \int u\sqrt{1 + 4u} du \\ &= \frac{2}{15(4)^2}(3(4)u - 2(1))(1 + 4u)^{3/2} + C \\ &= \frac{1}{60}(6u - 1)(1 + 4u)^{3/2} + C \\ &= \frac{1}{60}(6(x + 1) - 1)(1 + 4(x + 1))^{3/2} + C \\ &= \boxed{\frac{1}{60}(6x + 5)(4x + 5)^{3/2} + C}. \end{aligned}$$

6. We let $u = 2x + 3$, so $\frac{1}{2}du = dx$. We substitute to obtain

$$\int \frac{dx}{[(2x + 3)^2 - 1]^{3/2}} = \int \frac{1}{(u^2 - 1)^{3/2}} \frac{1}{2} du.$$

We use formula 61,

$$\int \frac{1}{(x^2 - a^2)^{3/2}} dx = -\frac{x}{\sqrt{x^2 - a^2}} + C,$$

with $a = 1$. We obtain

$$\begin{aligned}
\int \frac{dx}{\left[(2x+3)^2 - 1\right]^{3/2}} &= \frac{1}{2} \int \frac{1}{(u^2 - 1)^{3/2}} du \\
&= \frac{1}{2} \int \frac{1}{(u^2 - 1^2)^{3/2}} du \\
&= -\frac{1}{2} \frac{u}{\sqrt{u^2 - 1^2}} + C \\
&= -\frac{u}{2\sqrt{u^2 - 1}} + C \\
&= \boxed{-\frac{2x+3}{2\sqrt{(2x+3)^2 - 1}} + C}.
\end{aligned}$$

7. We use formula 45,

$$\int \frac{dx}{x\sqrt{a+bx}} = \frac{1}{\sqrt{a}} \ln \left| \frac{\sqrt{a+bx} - \sqrt{a}}{\sqrt{a+bx} + \sqrt{a}} \right| + C, \quad a > 0,$$

with $a = 6 > 0$, and $b = 4$. We obtain

$$\begin{aligned}
\int \frac{dx}{x\sqrt{4x+6}} &= \int \frac{dx}{x\sqrt{6+4x}} \\
&= \boxed{\frac{1}{\sqrt{6}} \ln \left| \frac{\sqrt{6+4x} - \sqrt{6}}{\sqrt{6+4x} + \sqrt{6}} \right| + C}.
\end{aligned}$$

8. We use formula 45,

$$\int \frac{dx}{x\sqrt{a+bx}} = \frac{1}{\sqrt{a}} \ln \left| \frac{\sqrt{a+bx} - \sqrt{a}}{\sqrt{a+bx} + \sqrt{a}} \right| + C, \quad a > 0,$$

with $a = 8 > 0$, and $b = 1$. We obtain

$$\int \frac{dx}{x\sqrt{8+x}} = \boxed{\frac{1}{\sqrt{8}} \ln \left| \frac{\sqrt{8+x} - \sqrt{8}}{\sqrt{8+x} + \sqrt{8}} \right| + C}.$$

9. We use formula 47,

$$\int \frac{\sqrt{a+bx}}{x} dx = 2\sqrt{a+bx} + a \int \frac{dx}{x\sqrt{a+bx}},$$

with $a = 6$, and $b = 4$. We obtain

$$\begin{aligned}
\int \frac{\sqrt{4x+6}dx}{x} &= \int \frac{\sqrt{6+4x}dx}{x} \\
&= 2\sqrt{6+4x} + 6 \int \frac{dx}{x\sqrt{6+4x}}.
\end{aligned}$$

We now use formula 45,

$$\int \frac{dx}{x\sqrt{a+bx}} = \frac{1}{\sqrt{a}} \ln \left| \frac{\sqrt{a+bx} - \sqrt{a}}{\sqrt{a+bx} + \sqrt{a}} \right| + C, \quad a > 0,$$

with $a = 6 > 0$, and $b = 4$. We obtain

$$\begin{aligned}\int \frac{\sqrt{4x+6}dx}{x} &= 2\sqrt{6+4x} + 6\left(\frac{1}{\sqrt{6}} \ln \left| \frac{\sqrt{6+4x}-\sqrt{6}}{\sqrt{6+4x}+\sqrt{6}} \right| \right) + C \\ &= \boxed{2\sqrt{6+4x} + \sqrt{6} \ln \left| \frac{\sqrt{6+4x}-\sqrt{6}}{\sqrt{6+4x}+\sqrt{6}} \right| + C}.\end{aligned}$$

10. We use formula 48,

$$\int \frac{\sqrt{a+bx}}{x^2} dx = -\frac{\sqrt{a+bx}}{x} + \frac{b}{2} \int \frac{dx}{x\sqrt{a+bx}},$$

with $a = 8$, and $b = 1$. We obtain

$$\int \frac{\sqrt{8+x}}{x^2} dx = -\frac{\sqrt{8+x}}{x} + \frac{1}{2} \int \frac{dx}{x\sqrt{8+x}}.$$

We now use formula 45,

$$\int \frac{dx}{x\sqrt{a+bx}} = \frac{1}{\sqrt{a}} \ln \left| \frac{\sqrt{a+bx}-\sqrt{a}}{\sqrt{a+bx}+\sqrt{a}} \right| + C, \quad a > 0,$$

with $a = 8 > 0$, and $b = 1$. We obtain

$$\begin{aligned}\int \frac{\sqrt{8+x}}{x^2} dx &= -\frac{\sqrt{8+x}}{x} + \frac{1}{2} \left(\frac{1}{\sqrt{8}} \ln \left| \frac{\sqrt{8+x}-\sqrt{8}}{\sqrt{8+x}+\sqrt{8}} \right| \right) + C \\ &= \boxed{-\frac{\sqrt{8+x}}{x} + \frac{\sqrt{2}}{8} \ln \left| \frac{\sqrt{8+x}-2\sqrt{2}}{\sqrt{8+x}+2\sqrt{2}} \right| + C}.\end{aligned}$$

11. We repeatedly use formula 123,

$$\int x^m (\ln x)^n dx = \frac{x^{m+1} (\ln x)^n}{m+1} - \frac{n}{m+1} \int x^m (\ln x)^{n-1} dx$$

with $m = 3$ and $n = 2$ initially, and obtain

$$\begin{aligned}\int x^3 (\ln x)^2 dx &= \frac{x^{3+1} (\ln x)^2}{3+1} - \frac{2}{3+1} \int x^3 (\ln x)^{2-1} dx \\ &= \frac{1}{4} x^4 (\ln x)^2 - \frac{1}{2} \int x^3 \ln x dx.\end{aligned}$$

And we use formula 123 again, with $m = 3$ and $n = 1$, to obtain

$$\begin{aligned}\int x^3 (\ln x)^2 dx &= \frac{1}{4} x^4 (\ln x)^2 - \frac{1}{2} \left(\frac{x^{3+1} (\ln x)^1}{3+1} - \frac{1}{3+1} \int x^3 (\ln x)^{1-1} dx \right) \\ &= \frac{1}{4} x^4 (\ln x)^2 - \frac{1}{2} \left(\frac{1}{4} x^4 \ln x - \frac{1}{4} \int x^3 dx \right) \\ &= \frac{1}{4} x^4 (\ln x)^2 - \frac{1}{8} x^4 \ln x + \frac{1}{8} \left(\frac{1}{4} x^4 \right) + C \\ &= \boxed{\frac{1}{4} x^4 (\ln x)^2 - \frac{1}{8} x^4 \ln x + \frac{1}{32} x^4 + C}.\end{aligned}$$

12. We use formula 123,

$$\int x^m (\ln x)^n dx = \frac{x^{m+1} (\ln x)^n}{m+1} - \frac{n}{m+1} \int x^m (\ln x)^{n-1} dx$$

with $m = 3$ and $n = 2$, and obtain

$$\begin{aligned} \int x^3 (\ln x)^2 dx &= \frac{x^{3+1} (\ln x)^2}{3+1} - \frac{2}{3+1} \int x^3 (\ln x)^{2-1} dx \\ &= \frac{x^4 (\ln x)^2}{4} - \frac{1}{2} \int x^3 \ln x dx. \end{aligned}$$

We now use formula 120,

$$\int x^n \ln x dx = \frac{x^{n+1}}{n+1} \left(\ln x - \frac{1}{n+1} \right) + C$$

with $n = 3$ and obtain

$$\begin{aligned} \int x^3 (\ln x)^2 dx &= \frac{x^4 (\ln x)^2}{4} - \frac{1}{2} \left(\frac{x^{3+1}}{3+1} \left(\ln x - \frac{1}{3+1} \right) \right) + C \\ &= \boxed{\frac{1}{4} x^4 \ln^2 x - \frac{1}{8} x^4 \ln x + \frac{1}{32} x^4 + C}. \end{aligned}$$

13. Let $u = 2x$ to obtain

$$\int \sin^{-1}(2x) dx = \frac{1}{2} \int \sin^{-1} u du,$$

and then by formula 106,

$$\begin{aligned} &= \frac{1}{2} \left(u \sin^{-1} u + \sqrt{1-u^2} \right) + C \\ &= \frac{1}{2} \left((2x) \sin^{-1}(2x) + \sqrt{1-(2x)^2} \right) + C \\ &= \boxed{x \sin^{-1}(2x) + \frac{1}{2} \sqrt{1-4x^2} + C}. \end{aligned}$$

14. Let $u = -3x$ to obtain

$$\int \tan^{-1}(-3x) dx = -\frac{1}{3} \int \tan^{-1} u du,$$

and then by formula 108,

$$\begin{aligned} &= -\frac{1}{3} \left(u \tan^{-1} u - \frac{1}{2} \ln(1+u^2) \right) + C \\ &= -\frac{1}{3} \left((3x) \tan^{-1}(3x) - \frac{1}{2} \ln(1+(3x)^2) \right) + C \\ &= \boxed{-x \tan^{-1}(3x) + \frac{1}{6} \ln(1+9x^2) + C}, \end{aligned}$$

15. We complete the square, and write $3x - x^2 = \frac{9}{4} - (x - \frac{3}{2})^2$. Then substitute $u = x - \frac{3}{2}$, split the integral, and use symmetry to obtain

$$\begin{aligned}
 \int_1^2 \frac{x^3}{\sqrt{3x - x^2}} dx &= \int_1^2 \frac{x^3}{\sqrt{\frac{9}{4} - (x - \frac{3}{2})^2}} dx \\
 &= \int_{-\frac{1}{2}}^{\frac{1}{2}} \frac{(u + \frac{3}{2})^3}{\sqrt{\frac{9}{4} - u^2}} du \\
 &= \int_{-\frac{1}{2}}^{\frac{1}{2}} \frac{u^3 + \frac{9}{2}u^2 + \frac{27}{4}u + \frac{27}{8}}{\sqrt{\frac{9}{4} - u^2}} du \\
 &= \int_{-\frac{1}{2}}^{\frac{1}{2}} \frac{u^3 + \frac{27}{4}u}{\sqrt{\frac{9}{4} - u^2}} du + \int_{-\frac{1}{2}}^{\frac{1}{2}} \frac{\frac{9}{2}u^2 + \frac{27}{8}}{\sqrt{\frac{9}{4} - u^2}} du \\
 &= 0 + 2 \int_0^{\frac{1}{2}} \frac{(-\frac{9}{2})(\frac{9}{4} - u^2) + \frac{27}{2}}{\sqrt{\frac{9}{4} - u^2}} du \\
 &= -9 \int_0^{\frac{1}{2}} \sqrt{\frac{9}{4} - u^2} du + 27 \int_0^{\frac{1}{2}} \frac{1}{\sqrt{\frac{9}{4} - u^2}} du.
 \end{aligned}$$

Now use Formulas 62 and 17 to get

$$\begin{aligned}
 \int_1^2 \frac{x^3}{\sqrt{3x - x^2}} dx &= -9 \left[\frac{u}{2} \sqrt{\frac{9}{4} - u^2} + \frac{9}{2} \sin^{-1} \frac{u}{\frac{3}{2}} \right]_0^{\frac{1}{2}} + 27 \left[\sin^{-1} \frac{u}{\frac{3}{2}} \right]_0^{\frac{1}{2}} \\
 &= -9 \left(\frac{\frac{1}{2}}{2} \sqrt{\frac{9}{4} - \left(\frac{1}{2}\right)^2} + \frac{9}{8} \sin^{-1} \frac{2(\frac{1}{2})}{3} - \left(\frac{0}{2} \sqrt{\frac{9}{4} - 0^2} + \frac{9}{4} \sin^{-1} \frac{2(0)}{3} \right) \right) \\
 &\quad + 27 \left(\sin^{-1} \frac{2(\frac{1}{2})}{3} - \sin^{-1} \frac{2(0)}{3} \right) \\
 &= -9 \left(\frac{\sqrt{2}}{4} + \frac{9}{8} \sin^{-1} \frac{1}{3} - 0 \right) + 27 \left(\sin^{-1} \frac{1}{3} - 0 \right) \\
 &= \boxed{\frac{135}{8} \sin^{-1} \frac{1}{3} - \frac{9\sqrt{2}}{4}}.
 \end{aligned}$$

16. We use formula 59,

$$\int \frac{dx}{x^2 \sqrt{x^2 + a^2}} = -\frac{\sqrt{x^2 + a^2}}{a^2 x} + C,$$

with $a = \sqrt{2}$. We obtain

$$\begin{aligned}
 \int_1^e \frac{dx}{x^2 \sqrt{x^2 + 2}} &= \int_1^e \frac{dx}{x^2 \sqrt{x^2 + (\sqrt{2})^2}} \\
 &= \left[-\frac{\sqrt{x^2 + (\sqrt{2})^2}}{(\sqrt{2})^2 x} \right]_1^e \\
 &= -\frac{\sqrt{e^2 + 2}}{2e} - \left(-\frac{\sqrt{1^2 + 2}}{2(1)} \right) \\
 &= \boxed{-\frac{\sqrt{e^2 + 2}}{2e} + \frac{\sqrt{3}}{2}}.
 \end{aligned}$$

17. (a) Using a CAS we obtain

$$\int e^{2x} \cos x \, dx = \boxed{\frac{e^{2x}}{5} (\sin x + 2 \cos x) + C}.$$

(b) We obtained in problem 1,

$$\int e^{2x} \sin x \, dx = \boxed{\frac{1}{5} e^{2x} (2 \cos x + \sin x) + C}.$$

(c) Since

$$\frac{e^{2x}}{5} (\sin x + 2 \cos x) = \frac{1}{5} e^{2x} (2 \cos x + \sin x)$$

we see that the results are equivalent.

18. (a) Using a CAS we obtain

$$\int e^{5x+1} \sin(2x+3) \, dx = \boxed{-\frac{1}{29} e^{5x+1} (2 \cos(2x+3) - 5 \sin(2x+3)) + C}.$$

(b) We obtained in problem 2,

$$\int e^{2x} \sin x \, dx = \boxed{\frac{2}{29} e^{5x+1} \left(\frac{5}{2} \sin(2x+3) - \cos(2x+3) \right) + C}.$$

(c) Since

$$\begin{aligned}
 -\frac{1}{29} e^{5x+1} (2 \cos(2x+3) - 5 \sin(2x+3)) &= -\frac{2}{29} e^{5x+1} \left(\cos(2x+3) - \frac{5}{2} \sin(2x+3) \right) \\
 &= \frac{2}{29} e^{5x+1} \left(\frac{5}{2} \sin(2x+3) - \cos(2x+3) \right)
 \end{aligned}$$

we see that the results are equivalent.

19. (a) Using a CAS we obtain

$$\int x \sqrt{4x+3} \, dx = \boxed{\frac{1}{20} (2x-1)(4x+3)^{\frac{3}{2}} + C}.$$

(b) We obtained in problem 3,

$$\int x\sqrt{4x+3} \, dx = \boxed{\frac{1}{20}(2x-1)(3+4x)^{3/2} + C}.$$

(c) Since

$$\frac{1}{20}(2x-1)(4x+3)^{\frac{3}{2}} = \frac{1}{20}(2x-1)(3+4x)^{3/2}$$

we see that the results are equivalent.

20. (a) Using a CAS we obtain

$$\int \frac{1}{(x^2-1)^{3/2}} \, dx = \boxed{-\frac{x}{\sqrt{x^2-1}} + C}.$$

(b) We obtained in problem 4,

$$\int \frac{1}{(x^2-1)^{3/2}} \, dx = \boxed{-\frac{x}{\sqrt{x^2-1}} + C}$$

(c) Since

$$-\frac{x}{\sqrt{x^2-1}} = -\frac{x}{\sqrt{x^2-1}}$$

we see that the results are equivalent.

21. (a) Using a CAS we obtain

$$\int (x+1)\sqrt{4x+5} \, dx = \boxed{\frac{1}{60}(4x+5)^{\frac{3}{2}}(6x+5) + C}.$$

(b) We obtained in problem 5,

$$\int (x+1)\sqrt{4x+5} \, dx = \boxed{\frac{1}{60}(6x+5)(4x+5)^{3/2} + C}.$$

(c) Since

$$\frac{1}{60}(4x+5)^{\frac{3}{2}}(6x+5) = \frac{1}{60}(6x+5)(4x+5)^{3/2}$$

we see that the results are equivalent.

22. (a) Using a CAS we obtain

$$\int \frac{dx}{\left[(2x+3)^2-1\right]^{3/2}} = \boxed{-\frac{1}{8} \frac{4x+6}{\sqrt{x^2+3x+2}} + C}.$$

(b) We obtained in problem 6,

$$\int \frac{dx}{\left[(2x+3)^2-1\right]^{3/2}} = \boxed{-\frac{2x+3}{2\sqrt{(2x+3)^2-1}} + C}.$$

(c) Since

$$\begin{aligned}
-\frac{1}{8} \frac{4x+6}{\sqrt{x^2+3x+2}} &= -\frac{1}{4} \frac{2x+3}{\sqrt{x^2+3x+2}} \\
&= -\frac{2x+3}{2\sqrt{4x^2+12x+8}} \\
&= -\frac{2x+3}{2\sqrt{4(x^2+3x+2)}} \\
&= -\frac{2x+3}{2\sqrt{4x^2+12x+8}} \\
&= -\frac{2x+3}{2\sqrt{4x^2+12x+9-1}} \\
&= -\frac{2x+3}{2\sqrt{(2x+3)^2-1}},
\end{aligned}$$

we see that the results are equivalent.

23. (a) Using a CAS we obtain

$$\int \frac{dx}{x\sqrt{4x+6}} = \boxed{-\frac{1}{3}\sqrt{6} \tanh^{-1}\left(\frac{\sqrt{4x+6}}{6}\sqrt{6}\right) + C}.$$

(b) We obtained in problem 7,

$$\int \frac{dx}{x\sqrt{4x+6}} = \boxed{\frac{1}{\sqrt{6}} \ln \left| \frac{\sqrt{6+4x}-\sqrt{6}}{\sqrt{6+4x}+\sqrt{6}} \right| + C}.$$

(c) Using the identity

$$\tanh^{-1} x = \frac{1}{2} \ln \left| \frac{1+x}{1-x} \right|$$

we obtain

$$\begin{aligned}
-\frac{1}{3}\sqrt{6} \tanh^{-1}\left(\frac{\sqrt{4x+6}}{6}\sqrt{6}\right) &= -\frac{1}{3}\sqrt{6} \left(\frac{1}{2} \ln \left| \frac{1 + \frac{\sqrt{4x+6}}{6}\sqrt{6}}{1 - \frac{\sqrt{4x+6}}{6}\sqrt{6}} \right| \right) \\
&= \frac{1}{\sqrt{6}} \ln \left| \frac{1 - \frac{\sqrt{4x+6}}{\sqrt{6}}}{1 + \frac{\sqrt{4x+6}}{\sqrt{6}}} \right| \\
&= \frac{1}{\sqrt{6}} \ln \left| \frac{\sqrt{6} - \sqrt{4x+6}}{\sqrt{6} + \sqrt{4x+6}} \right| \\
&= \frac{1}{\sqrt{6}} \ln \left| \frac{\sqrt{6+4x} - \sqrt{6}}{\sqrt{6+4x} + \sqrt{6}} \right|
\end{aligned}$$

and we see that the results are equivalent.

24. (a) Using a CAS we obtain

$$\int \frac{dx}{x\sqrt{8+x}} = \boxed{-\frac{1}{2}\sqrt{2} \tanh^{-1}\left(\frac{1}{4}\sqrt{x+8}\sqrt{2}\right) + C}.$$

(b) We obtained in problem 8,

$$\int \frac{dx}{x\sqrt{8+x}} = \boxed{\frac{1}{\sqrt{8}} \ln \left| \frac{\sqrt{8+x}-\sqrt{8}}{\sqrt{8+x}+\sqrt{8}} \right| + C}.$$

(c) Using the identity

$$\tanh^{-1} x = \frac{1}{2} \ln \left| \frac{1+x}{1-x} \right|,$$

we obtain

$$\begin{aligned} -\frac{1}{2}\sqrt{2} \tanh^{-1} \left(\frac{1}{4}\sqrt{x+8}\sqrt{2} \right) &= -\frac{1}{2}\sqrt{2} \left(\frac{1}{2} \ln \left| \frac{1+\frac{1}{4}\sqrt{x+8}\sqrt{2}}{1-\frac{1}{4}\sqrt{x+8}\sqrt{2}} \right| \right) \\ &= \frac{1}{2\sqrt{2}} \ln \left| \frac{1-\frac{1}{4}\sqrt{x+8}\sqrt{2}}{1+\frac{1}{4}\sqrt{x+8}\sqrt{2}} \right| \\ &= \frac{1}{\sqrt{8}} \ln \left| \frac{4/\sqrt{2}-\sqrt{x+8}}{4/\sqrt{2}+\sqrt{x+8}} \right| \\ &= \frac{1}{\sqrt{8}} \ln \left| \frac{\sqrt{8}-\sqrt{x+8}}{\sqrt{8}+\sqrt{x+8}} \right| \\ &= \frac{1}{\sqrt{8}} \ln \left| \frac{\sqrt{8+x}-\sqrt{8}}{\sqrt{8+x}+\sqrt{8}} \right|, \end{aligned}$$

and we see that the results are equivalent.

25. (a) Using a CAS we obtain

$$\int \frac{\sqrt{4x+6}dx}{x} = \boxed{2\sqrt{4x+6} - 2\sqrt{6} \tanh^{-1} \left(\frac{1}{6}\sqrt{4x+6}\sqrt{6} \right) + C}.$$

(b) We obtained in problem 9,

$$\int \frac{\sqrt{4x+6}dx}{x} = \boxed{2\sqrt{6+4x} + \sqrt{6} \ln \left| \frac{\sqrt{6+4x}-\sqrt{6}}{\sqrt{6+4x}+\sqrt{6}} \right| + C}.$$

(c) Using the identity

$$\tanh^{-1} x = \frac{1}{2} \ln \left| \frac{1+x}{1-x} \right|,$$

we obtain

$$\begin{aligned} 2\sqrt{4x+6} - 2\sqrt{6} \tanh^{-1} \left(\frac{1}{6}\sqrt{4x+6}\sqrt{6} \right) &= 2\sqrt{4x+6} - 2\sqrt{6} \left(\frac{1}{2} \ln \left| \frac{1+\frac{1}{6}\sqrt{4x+6}\sqrt{6}}{1-\frac{1}{6}\sqrt{4x+6}\sqrt{6}} \right| \right) \\ &= 2\sqrt{6+4x} + \sqrt{6} \ln \left| \frac{\sqrt{6}-\sqrt{4x+6}}{\sqrt{6}+\sqrt{4x+6}} \right| \\ &= 2\sqrt{6+4x} + \sqrt{6} \ln \left| \frac{\sqrt{6+4x}-\sqrt{6}}{\sqrt{6+4x}+\sqrt{6}} \right| \end{aligned}$$

and we see that the results are equivalent.

26. (a) Using a CAS we obtain

$$\int \frac{\sqrt{8+x}}{x^2} dx = \boxed{-\frac{\sqrt{x+8}}{x} - \frac{1}{4}\sqrt{2} \tanh^{-1}\left(\frac{1}{4}\sqrt{x+8}\sqrt{2}\right) + C}.$$

(b) We obtained in problem 10,

$$\int \frac{\sqrt{8+x}}{x^2} dx = \boxed{-\frac{\sqrt{8+x}}{x} + \frac{\sqrt{2}}{8} \ln \left| \frac{\sqrt{8+x}-2\sqrt{2}}{\sqrt{8+x}+2\sqrt{2}} \right| + C}.$$

(c) Using the identity

$$\tanh^{-1} x = \frac{1}{2} \ln \left| \frac{1+x}{1-x} \right|,$$

we obtain

$$\begin{aligned} -\frac{\sqrt{x+8}}{x} - \frac{1}{4}\sqrt{2} \tanh^{-1}\left(\frac{1}{4}\sqrt{x+8}\sqrt{2}\right) &= -\frac{\sqrt{8+x}}{x} - \frac{1}{4}\sqrt{2} \left(\frac{1}{2} \ln \left| \frac{1 + \frac{1}{4}\sqrt{x+8}\sqrt{2}}{1 - \frac{1}{4}\sqrt{x+8}\sqrt{2}} \right| \right) \\ &= -\frac{\sqrt{8+x}}{x} + \frac{\sqrt{2}}{8} \ln \left| \frac{2\sqrt{2} - \sqrt{x+8}}{2\sqrt{2} + \sqrt{x+8}} \right| \\ &= -\frac{\sqrt{8+x}}{x} + \frac{\sqrt{2}}{8} \ln \left| \frac{\sqrt{x+8} - 2\sqrt{2}}{\sqrt{x+8} + 2\sqrt{2}} \right| \end{aligned}$$

and we see that the results are equivalent.

27. (a) Using a CAS we obtain

$$\int x^3 (\ln x)^2 dx = \boxed{\frac{1}{32}x^4 (8 \ln^2 x - 4 \ln x + 1) + C}.$$

(b) We obtained in problem 11,

$$\int \frac{e^x}{x^3} dx = \boxed{\frac{1}{4}x^4 (\ln x)^2 - \frac{1}{8}x^4 \ln x + \frac{1}{32}x^4 + C}.$$

(c) Since

$$\frac{1}{32}x^4 (8 \ln^2 x - 4 \ln x + 1) = \frac{1}{4}x^4 (\ln x) - \frac{1}{8}x^4 \ln x + \frac{1}{32}x^4,$$

we see that the results are equivalent.

28. (a) Using a CAS we obtain

$$\int x^3 (\ln x)^2 dx = \boxed{\frac{1}{32}x^4 (8 \ln^2 x - 4 \ln x + 1) + C}.$$

(b) We obtained in problem 12,

$$\int x^3 (\ln x)^2 dx = \boxed{\frac{1}{4}x^4 \ln^2 x - \frac{1}{8}x^4 \ln x + \frac{1}{32}x^4 + C}.$$

(c) Since

$$\frac{1}{32}x^4 (8 \ln^2 x - 4 \ln x + 1) = \frac{1}{4}x^4 \ln^2 x - \frac{1}{8}x^4 \ln x + \frac{1}{32}x^4$$

we see that the results are equivalent.

29. (a) Using a CAS we obtain

$$\int \sin^{-1}(2x) dx = \boxed{\frac{1}{2}\sqrt{1-4x^2} + x \sin^{-1}(2x) + C}.$$

(b) We obtained in problem 13,

$$\int \sin^{-1}(2x) dx = \boxed{x \sin^{-1}(2x) + \frac{1}{2}\sqrt{1-4x^2} + C}.$$

(c) Since

$$\frac{1}{2}\sqrt{1-4x^2} + x \sin^{-1}(2x) = x \sin^{-1}(2x) + \frac{1}{2}\sqrt{1-4x^2}$$

we see that the results are equivalent.

30. (a) Using a CAS we obtain

$$\int \tan^{-1}(-3x) dx = \boxed{-x \tan^{-1}(3x) + \frac{1}{6} \ln(9x^2 + 1) + C}.$$

(b) We obtained in problem 14,

$$\int \tan^{-1}(3x) dx = \boxed{-x \tan^{-1}(3x) + \frac{1}{6} \ln(1 + 9x^2) + C}.$$

(c) Since

$$-x \tan^{-1}(3x) + \frac{1}{6} \ln(9x^2 + 1) = -x \tan^{-1}(3x) + \frac{1}{6} \ln(1 + 9x^2)$$

we see that the results are equivalent.

31. (a) Using a CAS we obtain

$$\int_1^2 \frac{x^3}{\sqrt{3x-x^2}} dx = \boxed{\frac{135}{8} \sin^{-1} \frac{1}{3} - \frac{9}{4} \sqrt{2}}.$$

(b) We obtained in problem 15,

$$\int_1^e \frac{dx}{x^2 \sqrt{x^2 + 2}} = \boxed{\frac{135}{8} \sin^{-1} \frac{1}{3} - \frac{9}{4} \sqrt{2}}.$$

(c) Since

$$\frac{135}{8} \sin^{-1} \frac{1}{3} - \frac{9}{4} \sqrt{2} = \frac{135}{8} \sin^{-1} \frac{1}{3} - \frac{9}{4} \sqrt{2}$$

we see that the results are equivalent.

32. (a) Using a CAS we obtain

$$\int_1^e \frac{dx}{x^2 \sqrt{x^2 + 2}} = \boxed{\frac{1}{2} \sqrt{3} - \frac{1}{2} e^{-1} \sqrt{e^2 + 2}}.$$

(b) We obtained in problem 16,

$$\int_1^e \frac{dx}{x^2 \sqrt{x^2 + 2}} = \boxed{-\frac{\sqrt{e^2+2}}{2e} + \frac{\sqrt{3}}{2}}.$$

(c) Since

$$\begin{aligned}\frac{1}{2}\sqrt{3} - \frac{1}{2}e^{-1}\sqrt{e^2+2} &= -\frac{1}{2}e^{-1}\sqrt{e^2+2} + \frac{1}{2}\sqrt{3} \\ &= -\frac{\sqrt{e^2+2}}{2e} + \frac{\sqrt{3}}{2}\end{aligned}$$

we see that the results are equivalent.

33. Using a CAS we obtain

$$\int \sqrt{1+x^3} \, dx = \int \sqrt{x^3+1} \, dx$$

and we conclude that this integral cannot be expressed using elementary functions.

34. Using a CAS we obtain

$$\int \sqrt{1+\sin x} \, dx = \frac{2}{\cos x}(\sin x - 1)\sqrt{\sin x + 1} + C$$

and we conclude that this integral can be expressed using elementary functions.

35. Using a CAS we obtain

$$\int e^{-x^2} \, dx = \frac{1}{2}\sqrt{\pi} \operatorname{erf}(x) + C$$

and we conclude that this integral cannot be expressed using elementary functions.

36. Using a CAS we obtain

$$\int \frac{\cos x}{x} \, dx = \operatorname{Ci}(x) + C$$

and we conclude that this integral cannot be expressed using elementary functions.

37. Using a CAS we obtain

$$\int x \tan x \, dx = \frac{1}{2}ix^2 - i \operatorname{dilog}(ie^{ix}) - i\pi \tan^{-1}(e^{ix}) - i \operatorname{dilog}(-ie^{ix}) + C$$

and we conclude that this integral cannot be expressed using elementary functions.

38. Using a CAS we obtain

$$\int \sqrt{1+e^x} \, dx = \boxed{2\sqrt{e^x+1} + \ln(\sqrt{e^x+1}-1) - \ln(\sqrt{e^x+1}+1) + C}.$$

7.8: Improper Integrals

Concepts and Vocabulary

1. (c), an improper
2. (b) diverges
3. False
4. True
5. False
6. $\lim_{t \rightarrow b^-} \int_a^t f(x) dx$

Skill Building

7. The integral is improper, since upper limit of integration is ∞ .
8. The integral is not improper, since the function $f(x) = x^3$ is continuous on the closed interval $[0, 5]$.
9. The integral is not improper, since the function $f(x) = \frac{1}{x-1}$ is continuous on the closed interval $[2, 3]$.
10. The integral is improper, since the function $f(x) = \frac{1}{x-1}$ is undefined, at the endpoint $x = 1$.
11. The integral is improper, since the function $f(x) = \frac{1}{x}$ is undefined, at the endpoint $x = 0$.
12. The integral is not improper, since the function $f(x) = \frac{1}{x^2+1}$ is continuous on the closed interval $[-1, 1]$.
13. The integral is improper, since the function $f(x) = \frac{x}{x^2-1}$ is undefined, at the endpoint $x = 1$.
14. The integral is improper, since the upper limit of integration is ∞ .
15. We evaluate

$$\begin{aligned} \int_1^\infty \frac{dx}{x^3} &= \lim_{b \rightarrow \infty} \int_1^b \frac{dx}{x^3} \\ &= \lim_{b \rightarrow \infty} \left[-\frac{1}{2x^2} \right]_1^b \\ &= \lim_{b \rightarrow \infty} \left[-\frac{1}{2b^2} - \left(-\frac{1}{2(1)^2} \right) \right] \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} - \frac{1}{2b^2} \right] \\ &= \frac{1}{2}. \end{aligned}$$

The improper integral converges to $\frac{1}{2}$.

16. We evaluate

$$\begin{aligned}\int_{-\infty}^{-10} \frac{dx}{x^2} &= \lim_{a \rightarrow -\infty} \int_a^{-10} \frac{dx}{x^2} \\&= \lim_{a \rightarrow -\infty} \left[-\frac{1}{x} \right]_a^{-10} \\&= \lim_{a \rightarrow -\infty} \left[-\frac{1}{-10} - \left(-\frac{1}{a} \right) \right] \\&= \lim_{a \rightarrow -\infty} \left[\frac{1}{a} + \frac{1}{10} \right] \\&= \frac{1}{10}.\end{aligned}$$

The improper integral converges to $\boxed{\frac{1}{10}}$.

17. We evaluate

$$\begin{aligned}\int_0^{\infty} e^{2x} dx &= \lim_{b \rightarrow \infty} \int_0^b e^{2x} dx \\&= \lim_{b \rightarrow \infty} \left[\frac{1}{2} e^{2x} \right]_0^b \\&= \lim_{b \rightarrow \infty} \left[\frac{1}{2} e^{2(b)} - \frac{1}{2} e^{2(0)} \right] \\&= \lim_{b \rightarrow \infty} \left[\frac{1}{2} e^{2b} - \frac{1}{2} \right] \\&= \infty.\end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

18. We evaluate

$$\begin{aligned}\int_0^{\infty} e^{-x} dx &= \lim_{b \rightarrow \infty} \int_0^b e^{-x} dx \\&= \lim_{b \rightarrow \infty} [-e^{-x}]_0^b \\&= \lim_{b \rightarrow \infty} [-e^{-b} - (-e^{-0})] \\&= \lim_{b \rightarrow \infty} [1 - e^{-b}] \\&= 1.\end{aligned}$$

The improper integral converges to $\boxed{1}$.

19. We evaluate

$$\begin{aligned}\int_{-\infty}^{-1} \frac{4}{x} dx &= \lim_{a \rightarrow -\infty} \int_a^{-1} \frac{4}{x} dx \\&= \lim_{a \rightarrow -\infty} [4 \ln |x|]_a^{-1} \\&= \lim_{a \rightarrow -\infty} [4 \ln |-1| - 4 \ln |a|] \\&= \lim_{a \rightarrow -\infty} [-4 \ln |a|] \\&= -\infty.\end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

20. We evaluate

$$\begin{aligned}\int_1^\infty \frac{4}{x} dx &= \lim_{b \rightarrow \infty} \int_1^b \frac{4}{x} dx \\&= \lim_{b \rightarrow \infty} [4 \ln |x|]_1^b \\&= \lim_{b \rightarrow \infty} [4 \ln |b| - 4 \ln |1|] \\&= \lim_{b \rightarrow \infty} [4 \ln |b|] \\&= \infty.\end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

21. We evaluate

$$\begin{aligned}\int_3^\infty \frac{dx}{(x-1)^4} &= \lim_{b \rightarrow \infty} \int_3^b \frac{dx}{(x-1)^4} \\&= \lim_{b \rightarrow \infty} \left[-\frac{1}{3(x-1)^3} \right]_3^b \\&= \lim_{b \rightarrow \infty} \left[-\frac{1}{3(b-1)^3} - \left(-\frac{1}{3(3-1)^3} \right) \right] \\&= \lim_{b \rightarrow \infty} \left[\frac{1}{24} - \frac{1}{3(b-1)^3} \right] \\&= \frac{1}{24}.\end{aligned}$$

The improper integral converges to $\boxed{\frac{1}{24}}$.

22. We evaluate

$$\begin{aligned}\int_{-\infty}^0 \frac{dx}{(x-1)^4} &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{dx}{(x-1)^4} \\&= \lim_{a \rightarrow -\infty} \left[-\frac{1}{3(x-1)^3} \right]_a^0 \\&= \lim_{a \rightarrow -\infty} \left[-\frac{1}{3(0-1)^3} - \left(-\frac{1}{3(a-1)^3} \right) \right] \\&= \lim_{a \rightarrow -\infty} \left[\frac{1}{3(a-1)^3} + \frac{1}{3} \right] \\&= \frac{1}{3}.\end{aligned}$$

The improper integral converges to $\boxed{\frac{1}{3}}$.

23. We evaluate

$$\begin{aligned}
 \int_{-\infty}^{\infty} \frac{dx}{x^2 + 4} &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{dx}{x^2 + 4} + \lim_{b \rightarrow \infty} \int_0^b \frac{dx}{x^2 + 4} \\
 &= \lim_{a \rightarrow -\infty} \left[\frac{1}{2} \tan^{-1} \frac{x}{2} \right]_a^0 + \lim_{b \rightarrow \infty} \left[\frac{1}{2} \tan^{-1} \frac{x}{2} \right]_0^b \\
 &= \lim_{a \rightarrow -\infty} \left[\frac{1}{2} \tan^{-1} \frac{0}{2} - \frac{1}{2} \tan^{-1} \frac{a}{2} \right] + \lim_{b \rightarrow \infty} \left[\frac{1}{2} \tan^{-1} \frac{b}{2} - \frac{1}{2} \tan^{-1} \frac{0}{2} \right] \\
 &= \lim_{a \rightarrow -\infty} \left[-\frac{1}{2} \tan^{-1} \frac{a}{2} \right] + \lim_{b \rightarrow \infty} \left[\frac{1}{2} \tan^{-1} \frac{b}{2} \right] \\
 &= \frac{-1}{2} \left(-\frac{\pi}{2} \right) + \frac{1}{2} \left(\frac{\pi}{2} \right) \\
 &= \frac{\pi}{2}
 \end{aligned}$$

The improper integral converges to $\boxed{\frac{\pi}{2}}$.

24. We evaluate

$$\begin{aligned}
 \int_{-\infty}^{\infty} \frac{dx}{x^2 + 1} &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{dx}{x^2 + 1} + \lim_{b \rightarrow \infty} \int_0^b \frac{dx}{x^2 + 1} \\
 &= \lim_{a \rightarrow -\infty} [\tan^{-1} x]_a^0 + \lim_{b \rightarrow \infty} [\tan^{-1} x]_0^b \\
 &= \lim_{a \rightarrow -\infty} [\tan^{-1} 0 - \tan^{-1} a] + \lim_{b \rightarrow \infty} [\tan^{-1} b - \tan^{-1} 0] \\
 &= \lim_{a \rightarrow -\infty} [-\tan^{-1} a] + \lim_{b \rightarrow \infty} [\tan^{-1} b] \\
 &= -\left(-\frac{\pi}{2} \right) + \left(\frac{\pi}{2} \right) \\
 &= \pi.
 \end{aligned}$$

The improper integral converges to $\boxed{\pi}$.

25. We evaluate

$$\begin{aligned}
 \int_0^1 \frac{dx}{x^2} &= \lim_{a \rightarrow 0^+} \int_a^1 \frac{dx}{x^2} \\
 &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{x} \right]_a^1 \\
 &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{1} - \left(-\frac{1}{a} \right) \right] \\
 &= \lim_{a \rightarrow 0^+} \left[\frac{1}{a} - 1 \right] \\
 &= \infty.
 \end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

26. We evaluate

$$\begin{aligned}\int_0^1 \frac{dx}{x^3} &= \lim_{a \rightarrow 0^+} \int_a^1 \frac{dx}{x^3} \\&= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2x^2} \right]_a^1 \\&= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2(1)^2} - \left(-\frac{1}{2a^2} \right) \right] \\&= \lim_{a \rightarrow 0^+} \left[\frac{1}{2a^2} - \frac{1}{2} \right] \\&= \infty.\end{aligned}$$

The improper integral diverges.

27. We evaluate

$$\begin{aligned}\int_0^1 \frac{dx}{x} &= \lim_{a \rightarrow 0^+} \int_a^1 \frac{dx}{x} \\&= \lim_{a \rightarrow 0^+} [\ln |x|]_a^1 \\&= \lim_{a \rightarrow 0^+} [\ln |1| - \ln |a|] \\&= \lim_{a \rightarrow 0^+} [-\ln |a|] \\&= \infty.\end{aligned}$$

The improper integral diverges.

28. We evaluate

$$\begin{aligned}\int_4^6 \frac{dx}{x-4} &= \lim_{a \rightarrow 4^+} \int_a^6 \frac{dx}{x-4} \\&= \lim_{a \rightarrow 4^+} [\ln |x-4|]_a^6 \\&= \lim_{a \rightarrow 4^+} [\ln |6-4| - \ln |a-4|] \\&= \lim_{a \rightarrow 4^+} [\ln 2 - \ln |a-4|] \\&= \infty.\end{aligned}$$

The improper integral diverges.

29. We evaluate

$$\begin{aligned}\int_0^4 \frac{dx}{\sqrt{4-x}} &= \lim_{b \rightarrow 4^-} \int_0^b \frac{dx}{\sqrt{4-x}} \\&= \lim_{b \rightarrow 4^-} [-2\sqrt{4-x}]_0^b \\&= \lim_{b \rightarrow 4^-} \left[-2\sqrt{4-b} - (-2\sqrt{4-0}) \right] \\&= \lim_{b \rightarrow 4^-} [4 - 2\sqrt{4-b}] \\&= 4.\end{aligned}$$

The improper integral converges to 4.

30. Let $u = 5 - x$ and substitute to obtain

$$\begin{aligned}
 \int_1^5 \frac{x \, dx}{\sqrt{5-x}} &= \int_4^0 \frac{(5-u)(-du)}{\sqrt{u}} \\
 &= \int_0^4 (5u^{-1/2} - u^{1/2}) \, du \\
 &= \lim_{a \rightarrow 0^+} \int_a^4 (5u^{-1/2} - u^{1/2}) \, du \\
 &= \lim_{a \rightarrow 0^+} \left[10\sqrt{u} - \frac{2}{3}u^{\frac{3}{2}} \right]_a^4 \\
 &= \lim_{a \rightarrow 0^+} \left[10\sqrt{4} - \frac{2}{3}(4)^{\frac{3}{2}} - \left(10\sqrt{a} - \frac{2}{3}a^{\frac{3}{2}} \right) \right] \\
 &= \lim_{a \rightarrow 0^+} \left[\frac{2}{3}a^{\frac{3}{2}} - 10\sqrt{a} + \frac{44}{3} \right] \\
 &= \frac{44}{3}.
 \end{aligned}$$

The improper integral converges to $\boxed{\frac{44}{3}}$.

31. We split the integral into two improper integrals:

$$\int_{-1}^1 \frac{dx}{\sqrt[3]{x}} = \int_{-1}^0 \frac{dx}{\sqrt[3]{x}} + \int_0^1 \frac{dx}{\sqrt[3]{x}}.$$

We consider

$$\begin{aligned}
 \int_{-1}^0 \frac{dx}{\sqrt[3]{x}} &= \lim_{b \rightarrow 0^-} \int_{-1}^b \frac{dx}{\sqrt[3]{x}} \\
 &= \lim_{b \rightarrow 0^-} \left[\frac{3}{2}x^{\frac{2}{3}} \right]_{-1}^b \\
 &= \lim_{b \rightarrow 0^-} \left[\frac{3}{2}b^{\frac{2}{3}} - \frac{3}{2}(-1)^{\frac{2}{3}} \right] \\
 &= \lim_{b \rightarrow 0^-} \left[\frac{3}{2}b^{\frac{2}{3}} - \frac{3}{2} \right] \\
 &= -\frac{3}{2}.
 \end{aligned}$$

And

$$\begin{aligned}
 \int_0^1 \frac{dx}{\sqrt[3]{x}} &= \lim_{a \rightarrow 0^+} \int_a^1 \frac{dx}{\sqrt[3]{x}} \\
 &= \lim_{a \rightarrow 0^+} \left[\frac{3}{2}x^{\frac{2}{3}} \right]_a^1 \\
 &= \lim_{a \rightarrow 0^+} \left[\frac{3}{2}(1)^{\frac{2}{3}} - \frac{3}{2}(a)^{\frac{2}{3}} \right] \\
 &= \lim_{a \rightarrow 0^+} \left[\frac{3}{2} - \frac{3}{2}a^{\frac{2}{3}} \right] \\
 &= \frac{3}{2}.
 \end{aligned}$$

We conclude that the improper integral $\int_{-1}^1 \frac{dx}{\sqrt[3]{x}}$ converges to $-\frac{3}{2} + \frac{3}{2} = \boxed{0}$.

32. We split the integral into two improper integrals:

$$\int_0^3 \frac{dx}{(x-2)^2} = \int_0^2 \frac{dx}{(x-2)^2} + \int_2^3 \frac{dx}{(x-2)^2}.$$

We consider

$$\begin{aligned} \int_0^2 \frac{dx}{(x-2)^2} &= \lim_{b \rightarrow 2^-} \int_0^b \frac{dx}{(x-2)^2} \\ &= \lim_{b \rightarrow 2^-} \left[-\frac{1}{x-2} \right]_0^b \\ &= \lim_{b \rightarrow 2^-} \left[-\frac{1}{b-2} - \left(-\frac{1}{0-2} \right) \right] \\ &= \lim_{b \rightarrow 2^-} \left[-\frac{1}{b-2} - \frac{1}{2} \right] \\ &= \infty. \end{aligned}$$

We conclude that the improper integral $\int_0^3 \frac{dx}{(x-2)^2}$ diverges.

33. We evaluate

$$\begin{aligned} \int_0^\infty \cos x \, dx &= \lim_{b \rightarrow \infty} \int_0^b \cos x \, dx \\ &= \lim_{b \rightarrow \infty} [\sin x]_0^b \\ &= \lim_{b \rightarrow \infty} [\sin b - \sin 0] \\ &= \lim_{b \rightarrow \infty} [\sin b]. \end{aligned}$$

Since this limit does not exist, the improper integral diverges.

34. We evaluate

$$\begin{aligned} \int_0^\infty \sin(\pi x) \, dx &= \lim_{b \rightarrow \infty} \int_0^b \sin(\pi x) \, dx \\ &= \lim_{b \rightarrow \infty} \left[-\frac{1}{\pi} \cos(\pi x) \right]_0^b \\ &= \lim_{b \rightarrow \infty} \left[-\frac{1}{\pi} \cos(\pi b) - \left(-\frac{1}{\pi} \cos(\pi(0)) \right) \right] \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{\pi} - \frac{1}{\pi} \cos \pi b \right]. \end{aligned}$$

Since this limit does not exist, the improper integral diverges.

35. We evaluate

$$\begin{aligned} \int_{-\infty}^0 e^x \, dx &= \lim_{a \rightarrow -\infty} \int_a^0 e^x \, dx \\ &= \lim_{a \rightarrow -\infty} [e^x]_a^0 \\ &= \lim_{a \rightarrow -\infty} [e^0 - e^a] \\ &= \lim_{a \rightarrow -\infty} [1 - e^a] \\ &= 1 - 0 \\ &= 1. \end{aligned}$$

The improper integral converges to $\boxed{1}$.

36. We evaluate

$$\begin{aligned}
 \int_{-\infty}^0 e^{-x} dx &= \lim_{a \rightarrow -\infty} \int_a^0 e^{-x} dx \\
 &= \lim_{a \rightarrow -\infty} [-e^{-x}]_a^0 \\
 &= \lim_{a \rightarrow -\infty} [-e^{-0} - (-e^{-a})] \\
 &= \lim_{a \rightarrow -\infty} [-1 + e^{-a}] \\
 &= \infty.
 \end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

37. Let $u = x^2$ and substitute

$$\begin{aligned}
 \int_0^{\pi/2} \frac{x dx}{\sin x^2} &= \int_0^{\pi^2/4} \frac{\frac{1}{2} du}{\sin u} \\
 &= \frac{1}{2} \int_0^{\pi^2/4} \csc u du \\
 &= \lim_{a \rightarrow 0^+} \frac{1}{2} \int_a^{\pi^2/4} \csc u du \\
 &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2} \ln |\csc u + \cot u| \right]_a^{\pi^2/4} \\
 &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2} \ln \left| \csc \frac{\pi^2}{4} + \cot \frac{\pi^2}{4} \right| + \frac{1}{2} \ln |\csc a + \cot a| \right] \\
 &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2} \ln \left| \csc \frac{\pi^2}{4} + \cot \frac{\pi^2}{4} \right| + \frac{1}{2} \ln |\csc a + \cot a| \right] \\
 &= \infty
 \end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

38. We evaluate

$$\begin{aligned}
 \int_0^1 \frac{\ln x dx}{x} &= \lim_{a \rightarrow 0^+} \int_a^1 \frac{\ln x dx}{x} \\
 &= \lim_{a \rightarrow 0^+} \left[\frac{1}{2} \ln^2 x \right]_a^1 \\
 &= \lim_{a \rightarrow 0^+} \left[\frac{1}{2} \ln^2 1 - \frac{1}{2} \ln^2 a \right] \\
 &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2} \ln^2 a \right] \\
 &= -\infty
 \end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

39. We evaluate

$$\begin{aligned}
 \int_0^1 \frac{dx}{1-x^2} &= \lim_{b \rightarrow 1^-} \int_0^b \frac{dx}{(1-x)(1+x)} \\
 &= \lim_{b \rightarrow 1^-} \int_0^b \left(\frac{1}{2(x+1)} - \frac{1}{2(x-1)} \right) dx \\
 &= \lim_{b \rightarrow 1^-} \left[\frac{1}{2} \ln(x+1) - \frac{1}{2} \ln|x-1| \right]_0^b \\
 &= \lim_{b \rightarrow 1^-} \left[\frac{1}{2} \ln(b+1) - \frac{1}{2} \ln|b-1| - \left(\frac{1}{2} \ln(0+1) - \frac{1}{2} \ln|0-1| \right) \right] \\
 &= \lim_{b \rightarrow 1^-} \left[\frac{1}{2} \ln(b+1) - \frac{1}{2} \ln|b-1| \right] \\
 &= \infty
 \end{aligned}$$

The improper integral diverges.

40. We evaluate

$$\begin{aligned}
 \int_1^2 \frac{dx}{\sqrt{x^2-1}} &= \lim_{a \rightarrow 1^+} \int_a^2 \frac{dx}{\sqrt{x^2-1}} \\
 &= \lim_{a \rightarrow 1^+} \left[\ln \left| x + \sqrt{x^2-1} \right| \right]_a^2 \quad (\text{by Formula 55}) \\
 &= \lim_{a \rightarrow 1^+} \left[\ln \left| 2 + \sqrt{2^2-1} \right| - \ln \left| a + \sqrt{a^2-1} \right| \right] \\
 &= \lim_{a \rightarrow 1^+} \left[\ln(\sqrt{3}+2) - \ln \left| a + \sqrt{a^2-1} \right| \right] \\
 &= \ln(\sqrt{3}+2).
 \end{aligned}$$

The improper integral converges to $\ln(\sqrt{3}+2)$.

41. We evaluate the improper integral, and use a partial fraction decomposition.

$$\begin{aligned}
 \int_0^1 \frac{dx}{(1-x^2)^2} &= \lim_{b \rightarrow 1^-} \int_0^b \frac{dx}{(1-x^2)^2} \\
 &= \lim_{b \rightarrow 1^-} \int_0^b \frac{dx}{(1-x)^2(1+x)^2} \\
 &= \lim_{b \rightarrow 1^-} \int_0^b \left(\frac{1}{4(x+1)} - \frac{1}{4(x-1)} + \frac{1}{4(x-1)^2} + \frac{1}{4(x+1)^2} \right) dx \\
 &= \lim_{b \rightarrow 1^-} \left[\frac{1}{4} \ln|x+1| - \frac{1}{4} \ln|x-1| - \frac{1}{4(x-1)} - \frac{1}{4(x+1)} \right]_0^b \\
 &= \lim_{b \rightarrow 1^-} \left(\frac{1}{4} \ln|b+1| - \frac{1}{4} \ln|b-1| - \frac{1}{4b-4} - \frac{1}{4b+4} \right) \\
 &= \infty.
 \end{aligned}$$

The improper integral diverges.

42. We split the integral into two improper integrals:

$$\int_0^2 \frac{dx}{(x-1)^2} = \int_0^1 \frac{dx}{(x-1)^2} + \int_1^2 \frac{dx}{(x-1)^2}.$$

We consider

$$\begin{aligned}
 \int_0^1 \frac{dx}{(x-1)^2} &= \lim_{t \rightarrow 1^-} \int_0^t \frac{dx}{(x-1)^2} \\
 &= \lim_{t \rightarrow 1^-} \left[\frac{1}{1-x} \right]_0^t \\
 &= \lim_{t \rightarrow 1^-} \left(\frac{1}{1-t} - \frac{1}{1} \right) \\
 &= \infty.
 \end{aligned}$$

We conclude that the improper integral $\int_0^2 \frac{dx}{(x-1)^2}$ diverges.

43. We evaluate

$$\begin{aligned}
 \int_0^{\pi/4} \tan(2x) dx &= \lim_{b \rightarrow \frac{\pi}{4}^-} \int_0^b \tan(2x) dx \\
 &= \lim_{b \rightarrow \frac{\pi}{4}^-} \left[\frac{1}{2} \ln |\sec 2x| \right]_0^b \\
 &= \lim_{b \rightarrow \frac{\pi}{4}^-} \left(\frac{1}{2} \ln |\sec 2b| \right) \\
 &= \infty
 \end{aligned}$$

The improper integral diverges.

44. We evaluate

$$\begin{aligned}
 \int_0^{\pi/2} \csc x dx &= \lim_{a \rightarrow 0^+} \int_a^{\pi/2} \csc x dx \\
 &= \lim_{a \rightarrow 0^+} [-\ln |\csc x + \cot x|]_a^{\pi/2} \\
 &= \lim_{a \rightarrow 0^+} (\ln |\csc a + \cot a|) \\
 &= \infty
 \end{aligned}$$

The improper integral diverges.

45. We evaluate

$$\int_0^\infty \frac{x dx}{\sqrt{x+1}} = \lim_{b \rightarrow \infty} \int_0^b \frac{x dx}{\sqrt{x+1}}.$$

Let $u = x + 1$, and substitute to obtain

$$\begin{aligned}
 \int_0^\infty \frac{x dx}{\sqrt{x+1}} &= \lim_{b \rightarrow \infty} \int_1^{b+1} \frac{u-1}{\sqrt{u}} du \\
 &= \lim_{b \rightarrow \infty} \int_1^{b+1} (u^{1/2} - u^{-1/2}) du \\
 &= \lim_{b \rightarrow \infty} \left[\frac{2}{3} u^{3/2} - 2\sqrt{u} \right]_1^{b+1} \\
 &= \lim_{b \rightarrow \infty} \left[\frac{2}{3} (b+1)^{3/2} - 2\sqrt{b+1} - \left(\frac{2}{3} (1+1)^{3/2} - 2\sqrt{1+1} \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[\sqrt{b+1} \left(\frac{2}{3} (b+1) - 2 \right) + \frac{2}{3} \sqrt{2} \right] \\
 &= \infty.
 \end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

46. We evaluate

$$\begin{aligned}\int_2^\infty \frac{dx}{x\sqrt{x^2-1}} &= \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x\sqrt{x^2-1}} \\ &= \lim_{b \rightarrow \infty} [\sec^{-1} x]_2^b \\ &= \lim_{b \rightarrow \infty} (\sec^{-1} b - \sec^{-1} 2) \\ &= \frac{\pi}{2} - \frac{\pi}{3} \\ &= \frac{\pi}{6}.\end{aligned}$$

The improper integral converges to $\boxed{\frac{\pi}{6}}$.

47. We split the integral into two improper integrals:

$$\int_{-\infty}^\infty \frac{dx}{x^2+4x+5} = \int_{-\infty}^0 \frac{dx}{x^2+4x+5} + \int_0^\infty \frac{dx}{x^2+4x+5}.$$

We consider

$$\begin{aligned}\int_0^\infty \frac{dx}{x^2+4x+5} &= \lim_{b \rightarrow \infty} \int_0^b \frac{dx}{x^2+4x+5} \\ &= \lim_{b \rightarrow \infty} \int_0^b \frac{dx}{(x+2)^2+1} \\ &= \lim_{b \rightarrow \infty} [\tan^{-1}(x+2)]_0^b \\ &= \lim_{b \rightarrow \infty} [\tan^{-1}(b+2) - \tan^{-1}(0+2)] \\ &= \frac{\pi}{2} - \tan^{-1} 2.\end{aligned}$$

We now determine

$$\begin{aligned}\int_{-\infty}^0 \frac{dx}{x^2+4x+5} &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{dx}{x^2+4x+5} \\ &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{dx}{(x+2)^2+1} \\ &= \lim_{a \rightarrow -\infty} [\tan^{-1}(x+2)]_a^0 \\ &= \lim_{a \rightarrow -\infty} [\tan^{-1}(0+2) - \tan^{-1}(a+2)] \\ &= \tan^{-1} 2 - \left(-\frac{\pi}{2}\right) \\ &= \tan^{-1} 2 + \frac{\pi}{2}.\end{aligned}$$

We conclude that the improper integral converges, with $\int_{-\infty}^\infty \frac{dx}{x^2+4x+5} = \left(\frac{\pi}{2} - \tan^{-1} 2\right) + \left(\tan^{-1} 2 + \frac{\pi}{2}\right) = \boxed{\pi}$.

48. We split the integral into two improper integrals:

$$\int_{-\infty}^\infty \frac{dx}{e^x + e^{-x}} = \int_{-\infty}^0 \frac{dx}{e^x + e^{-x}} + \int_0^\infty \frac{dx}{e^x + e^{-x}}.$$

We consider

$$\begin{aligned}\int_0^\infty \frac{dx}{e^x + e^{-x}} &= \lim_{b \rightarrow \infty} \int_0^b \frac{dx}{e^x + e^{-x}} \\ &= \lim_{b \rightarrow \infty} \int_0^b \frac{e^x dx}{e^{2x} + 1}\end{aligned}$$

Let $u = e^x$, and substitute to obtain

$$\begin{aligned}\int_0^\infty \frac{dx}{e^x + e^{-x}} &= \lim_{b \rightarrow \infty} \int_1^{e^b} \frac{du}{u^2 + 1} \\ &= \lim_{b \rightarrow \infty} [\tan^{-1} u]_1^{e^b} \\ &= \lim_{b \rightarrow \infty} [\tan^{-1} e^b - \tan^{-1} 1] \\ &= \frac{\pi}{2} - \frac{\pi}{4} \\ &= \frac{\pi}{4}.\end{aligned}$$

We now determine

$$\begin{aligned}\int_{-\infty}^0 \frac{dx}{e^x + e^{-x}} &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{dx}{e^x + e^{-x}} \\ &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{e^x dx}{e^{2x} + 1}\end{aligned}$$

Let $u = e^x$, and substitute to obtain

$$\begin{aligned}\int_{-\infty}^0 \frac{dx}{e^x + e^{-x}} &= \lim_{a \rightarrow -\infty} \int_{e^a}^1 \frac{du}{u^2 + 1} \\ &= \lim_{a \rightarrow -\infty} [\tan^{-1} u]_{e^a}^1 \\ &= \lim_{a \rightarrow -\infty} [\tan^{-1} 1 - \tan^{-1} e^a] \\ &= \frac{\pi}{4} - (0) \\ &= \frac{\pi}{4}.\end{aligned}$$

We conclude that the improper integral converges, with $\int_{-\infty}^\infty \frac{dx}{e^x + e^{-x}} = \left(\frac{\pi}{4}\right) + \left(\frac{\pi}{4}\right) = \boxed{\frac{\pi}{2}}$.

49. We evaluate

$$\begin{aligned}\int_{-\infty}^2 \frac{dx}{\sqrt{4-x}} &= \lim_{a \rightarrow -\infty} \int_a^2 \frac{dx}{\sqrt{4-x}} \\ &= \lim_{a \rightarrow -\infty} [-2\sqrt{4-x}]_a^2 \\ &= \lim_{a \rightarrow -\infty} [-2\sqrt{4-2} - (-2\sqrt{4-a})] \\ &= \lim_{a \rightarrow -\infty} [2\sqrt{4-a} - 2\sqrt{2}] \\ &= \infty.\end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

50. We evaluate

$$\int_{-\infty}^1 \frac{x \, dx}{\sqrt{2-x}} = \lim_{a \rightarrow -\infty} \int_a^1 \frac{x \, dx}{\sqrt{2-x}}$$

Let $u = 2 - x$ and substitute to obtain

$$\begin{aligned} \int_{-\infty}^1 \frac{x \, dx}{\sqrt{2-x}} &= \lim_{a \rightarrow -\infty} \int_{2-a}^1 \frac{(2-u)}{\sqrt{u}} (-du) \\ &= - \lim_{a \rightarrow -\infty} \int_{2-a}^1 \left(2u^{-1/2} - u^{1/2} \right) du \\ &= - \lim_{a \rightarrow -\infty} \left[4\sqrt{u} - \frac{2}{3}u^{\frac{3}{2}} \right]_{2-a}^1 \\ &= - \lim_{a \rightarrow -\infty} \left[\left(4\sqrt{1} - \frac{2}{3}(1)^{\frac{3}{2}} \right) - \left(4\sqrt{2-a} - \frac{2}{3}(2-a)^{\frac{3}{2}} \right) \right] \\ &= - \lim_{a \rightarrow -\infty} \left(\frac{2}{3}(2-a)^{\frac{3}{2}} - 4\sqrt{2-a} + \frac{10}{3} \right) \\ &= - \lim_{a \rightarrow -\infty} \left(\sqrt{2-a} \left(\frac{2}{3}(2-a) - 4 \right) + \frac{10}{3} \right) \\ &= -\infty. \end{aligned}$$

The improper integral diverges.

51. We evaluate

$$\begin{aligned} \int_2^4 \frac{2x \, dx}{\sqrt[3]{x^2-4}} &= \lim_{a \rightarrow 2^+} \int_a^4 \frac{2x \, dx}{\sqrt[3]{x^2-4}} \\ &= \lim_{a \rightarrow 2^+} \left[\frac{3}{2}(x^2-4)^{2/3} \right]_a^4 \\ &= \lim_{a \rightarrow 2^+} \left[\frac{3}{2}(4^2-4)^{2/3} - \frac{3}{2}(a^2-4)^{2/3} \right] \\ &= \lim_{a \rightarrow 2^+} \left[3(18)^{1/3} - \frac{3}{2}(a^2-4)^{2/3} \right] \\ &= \boxed{3\sqrt[3]{18}}. \end{aligned}$$

The improper integral converges to $3\sqrt[3]{18}$.

52. We evaluate

$$\begin{aligned} \int_0^\pi \frac{1}{1-\cos x} \, dx &= \lim_{a \rightarrow 0^+} \int_a^\pi \frac{1}{1-\cos x} \, dx \\ &= \lim_{a \rightarrow 0^+} \int_a^\pi \frac{1+\cos x}{\sin^2 x} \, dx \\ &= \lim_{a \rightarrow 0^+} \int_a^\pi (\csc^2 x + \csc x \cot x) \, dx \end{aligned}$$

$$\begin{aligned}
&= \lim_{a \rightarrow 0^+} [-\cot x - \csc x]_a^\pi \\
&= \lim_{a \rightarrow 0^+} \left[-\frac{\cos x + 1}{\sin x} \right]_a^\pi \\
&= \lim_{a \rightarrow 0^+} \left[-\frac{(\cos x + 1)(\cos x - 1)}{\sin x(\cos x - 1)} \right]_a^\pi \\
&= \lim_{a \rightarrow 0^+} \left[\frac{\sin^2 x}{\sin x(\cos x - 1)} \right]_a^\pi \\
&= \lim_{a \rightarrow 0^+} \left[\frac{\sin x}{\cos x - 1} \right]_a^\pi \\
&= \lim_{a \rightarrow 0^+} \left[\frac{\sin \pi}{\cos \pi - 1} - \left(\frac{\sin a}{\cos a - 1} \right) \right] \\
&= \lim_{a \rightarrow 0^+} \left[-\frac{\sin a}{\cos a - 1} \right] \\
&= \lim_{a \rightarrow 0^+} \left[\frac{\cos a + 1}{\sin a} \right] \\
&= \infty.
\end{aligned}$$

The improper integral diverges.

53. We split the integral into two improper integrals:

$$\int_{-1}^1 \frac{dx}{x^3} = \int_{-1}^0 \frac{dx}{x^3} + \int_0^1 \frac{dx}{x^3}.$$

We consider

$$\begin{aligned}
\int_{-1}^0 \frac{dx}{x^3} &= \lim_{b \rightarrow 0^-} \int_{-1}^b \frac{dx}{x^3} \\
&= \lim_{b \rightarrow 0^-} \left[-\frac{1}{2x^2} \right]_{-1}^b \\
&= \lim_{b \rightarrow 0^-} \left[-\frac{1}{2b^2} - \left(-\frac{1}{2(-1)^2} \right) \right] \\
&= \lim_{b \rightarrow 0^-} \left[\frac{1}{2} - \frac{1}{2b^2} \right] \\
&= -\infty.
\end{aligned}$$

We conclude that the improper integral $\int_{-1}^1 \frac{dx}{x^3}$ diverges.

54. We split the integral into two improper integrals:

$$\int_0^2 \frac{dx}{x-1} = \int_0^1 \frac{dx}{x-1} + \int_1^2 \frac{dx}{x-1}.$$

We consider

$$\begin{aligned}
\int_0^1 \frac{dx}{x-1} &= \lim_{b \rightarrow 1^-} \int_0^b \frac{dx}{x-1} \\
&= \lim_{b \rightarrow 1^-} [\ln |x-1|]_0^b \\
&= \lim_{b \rightarrow 1^-} [\ln |b-1| - \ln |0-1|] \\
&= \lim_{b \rightarrow 1^-} [\ln |b-1|] \\
&= -\infty.
\end{aligned}$$

We conclude that the improper integral $\int_0^2 \frac{dx}{x-1}$ diverges.

55. We split the integral into two improper integrals:

$$\int_0^2 \frac{dx}{(x-1)^{1/3}} = \int_0^1 \frac{dx}{(x-1)^{1/3}} + \int_1^2 \frac{dx}{(x-1)^{1/3}}.$$

We consider

$$\begin{aligned}
\int_0^1 \frac{dx}{(x-1)^{1/3}} &= \lim_{b \rightarrow 1^-} \int_0^b \frac{dx}{(x-1)^{1/3}} \\
&= \lim_{b \rightarrow 1^-} \left[\frac{3}{2} (x-1)^{\frac{2}{3}} \right]_0^b \\
&= \lim_{b \rightarrow 1^-} \left[\frac{3}{2} (b-1)^{\frac{2}{3}} - \frac{3}{2} (0-1)^{\frac{2}{3}} \right] \\
&= \lim_{b \rightarrow 1^-} \left[\frac{3}{2} (b-1)^{\frac{2}{3}} - \frac{3}{2} \right] \\
&= -\frac{3}{2}.
\end{aligned}$$

And

$$\begin{aligned}
\int_1^2 \frac{dx}{(x-1)^{1/3}} &= \lim_{a \rightarrow 1^+} \int_a^2 \frac{dx}{(x-1)^{1/3}} \\
&= \lim_{a \rightarrow 1^+} \left[\frac{3}{2} (x-1)^{\frac{2}{3}} \right]_a^2 \\
&= \lim_{a \rightarrow 1^+} \left[\frac{3}{2} (2-1)^{\frac{2}{3}} - \frac{3}{2} (a-1)^{\frac{2}{3}} \right] \\
&= \lim_{a \rightarrow 1^+} \left[\frac{3}{2} - \frac{3}{2} (a-1)^{\frac{2}{3}} \right] \\
&= \frac{3}{2}.
\end{aligned}$$

We conclude that the improper integral $\int_0^2 \frac{dx}{(x-1)^{1/3}}$ converges to $-\frac{3}{2} + \frac{3}{2} = \boxed{0}$.

56. We split the integral into two improper integrals:

$$\int_{-1}^1 \frac{dx}{x^{5/3}} = \int_{-1}^0 \frac{dx}{x^{5/3}} + \int_0^1 \frac{dx}{x^{5/3}}.$$

We consider

$$\begin{aligned}
 \int_{-1}^0 \frac{dx}{x^{5/3}} &= \lim_{b \rightarrow 0^-} \int_{-1}^b \frac{dx}{x^{5/3}} \\
 &= \lim_{b \rightarrow 0^-} \left[-\frac{3}{2x^{2/3}} \right]_{-1}^b \\
 &= \lim_{b \rightarrow 0^-} \left[-\frac{3}{2b^{2/3}} - \left(-\frac{3}{2(-1)^{2/3}} \right) \right] \\
 &= \lim_{b \rightarrow 0^-} \left[\frac{3}{2} - \frac{3}{2b^{2/3}} \right] \\
 &= -\infty.
 \end{aligned}$$

We conclude that the improper integral $\int_{-1}^1 \frac{dx}{x^{5/3}}$ diverges.

57. We evaluate

$$\begin{aligned}
 \int_1^2 \frac{dx}{(2-x)^{3/4}} &= \lim_{b \rightarrow 2^-} \int_1^b \frac{dx}{(2-x)^{3/4}} \\
 &= \lim_{b \rightarrow 2^-} \left[-4(2-x)^{1/4} \right]_1^b \\
 &= \lim_{b \rightarrow 2^-} \left[-4(2-b)^{1/4} - \left(-4(2-1)^{1/4} \right) \right] \\
 &= \lim_{b \rightarrow 2^-} \left[4 - 4\sqrt[4]{2-b} \right] \\
 &= 4.
 \end{aligned}$$

The improper integral converges to 4.

58. We evaluate

$$\begin{aligned}
 \int_0^4 \frac{dx}{\sqrt{8x-x^2}} &= \lim_{a \rightarrow 0^+} \int_a^4 \frac{dx}{\sqrt{8x-x^2}} \\
 &= \lim_{a \rightarrow 0^+} \int_a^4 \frac{dx}{\sqrt{16-(4-x)^2}} \\
 &= \lim_{a \rightarrow 0^+} \left[-\sin^{-1} \left(\frac{4-x}{4} \right) \right]_a^4 \\
 &= \lim_{a \rightarrow 0^+} \left[-\sin^{-1} \left(\frac{4-4}{4} \right) - \left(-\sin^{-1} \left(\frac{4-a}{4} \right) \right) \right] \\
 &= \lim_{a \rightarrow 0^+} \left[\sin^{-1} \left(\frac{4-a}{4} \right) \right] \\
 &= \frac{\pi}{2}.
 \end{aligned}$$

The improper integral converges to $\frac{\pi}{2}$.

59. We evaluate

$$\begin{aligned}
 \int_a^{3a} \frac{2x \, dx}{(x^2 - a^2)^{3/2}} &= \lim_{t \rightarrow a^+} \int_t^{3a} \frac{2x \, dx}{(x^2 - a^2)^{3/2}} \\
 &= \lim_{t \rightarrow a^+} \left[-2(x^2 - a^2)^{-1/2} \right]_t^{3a} \\
 &= \lim_{t \rightarrow a^+} \left[-2((3a)^2 - a^2)^{-1/2} - \left(-2(t^2 - a^2)^{-1/2} \right) \right] \\
 &= \lim_{t \rightarrow a^+} \left[-2(8a^2)^{-1/2} + 2(t^2 - a^2)^{-1/2} \right] \\
 &= \infty.
 \end{aligned}$$

The improper integral diverges.

60. We evaluate

$$\begin{aligned}
 \int_0^3 \frac{x \, dx}{(9 - x^2)^{3/2}} &= \lim_{b \rightarrow 3^-} \int_0^b \frac{x \, dx}{(9 - x^2)^{3/2}} \\
 &= \lim_{b \rightarrow 3^-} \left[(9 - x^2)^{-1/2} \right]_0^b \\
 &= \lim_{b \rightarrow 3^-} \left[(9 - b^2)^{-1/2} - (9 - 0^2)^{-1/2} \right] \\
 &= \lim_{b \rightarrow 3^-} \left[(9 - b^2)^{-1/2} - \frac{1}{3} \right] \\
 &= \infty.
 \end{aligned}$$

The improper integral diverges.

61. We evaluate

$$\begin{aligned}
 \int_0^\infty x e^{-x^2} \, dx &= \lim_{b \rightarrow \infty} \int_0^b x e^{-x^2} \, dx \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{1}{2} e^{-x^2} \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{1}{2} e^{-b^2} - \left(-\frac{1}{2} e^{-0^2} \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} - \frac{1}{2} e^{-b^2} \right] \\
 &= \frac{1}{2}.
 \end{aligned}$$

The improper integral converges to $\frac{1}{2}$.

62. We evaluate, using formula 125,

$$\begin{aligned}
 \int_0^\infty e^{-x} \sin x \, dx &= \lim_{b \rightarrow \infty} \int_0^b e^{-x} \sin x \, dx \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} e^{-x} (-\sin x - \cos x) \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} e^{-b} (-\sin b - \cos b) - \left(\frac{1}{2} e^{-0} (-\sin 0 - \cos 0) \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} - \frac{1}{2} e^{-b} (\cos b + \sin b) \right] \\
 &= \frac{1}{2}.
 \end{aligned}$$

The improper integral converges to $\boxed{\frac{1}{2}}$.

63. (a) We have

$$\frac{1}{\sqrt{x^2 - 1}} \geq \frac{1}{\sqrt{x^2}} = \frac{1}{x}.$$

By the comparison test, since $p = 1$ and $\int_1^\infty \frac{1}{x} \, dx$ diverges, we conclude that $\int_1^\infty \frac{1}{\sqrt{x^2 - 1}} \, dx$ diverges.

64. (a) We have

$$\frac{2}{\sqrt{x^2 - 4}} > \frac{2}{\sqrt{x^2}} = \frac{2}{x}.$$

By the comparison test, since $p = 1$ and $\int_2^\infty \frac{1}{x} \, dx$ diverges, we conclude that $\int_2^\infty \frac{2}{\sqrt{x^2 - 4}} \, dx$ diverges.

65. (a) We have

$$\frac{1 + e^{-x}}{x} \geq \frac{1}{x}.$$

By the comparison test, since $p = 1$ and $\int_1^\infty \frac{1}{x} \, dx$ diverges, we conclude that $\int_1^\infty \frac{1 + e^{-x}}{x} \, dx$ diverges.

66. (a) For $x \geq 1$, we have

$$e^{-x} \leq \frac{1}{x}$$

so

$$\frac{3e^{-x}}{x} \leq \frac{3}{x^2}.$$

By the comparison test, since $p = 2$ and $\int_1^\infty \frac{3}{x^2} \, dx$ converges, we conclude that $\int_1^\infty \frac{3e^{-x}}{x} \, dx$ converges.

(b) Using a CAS we obtain

$$\int_1^\infty \frac{3e^{-x}}{x} \, dx \approx \boxed{0.6582}.$$

67. (a) We have

$$\sin^2 x \leq 1$$

so

$$\frac{\sin^2 x}{x^2} \leq \frac{1}{x^2}.$$

By the comparison test, since $p = 2$ and $\int_1^\infty \frac{1}{x^2} dx$ converges, we conclude that $\int_1^\infty \frac{\sin^2 x}{x^2} dx$ converges.

(b) Using a CAS we obtain

$$\int_1^\infty \frac{\sin^2 x}{x^2} dx \approx \boxed{0.673}.$$

68. (a) We have

$$\cos^2 x \leq 1$$

so

$$\frac{\cos^2 x}{x^2} \leq \frac{1}{x^2}.$$

By the comparison test, since $p = 2$ and $\int_1^\infty \frac{1}{x^2} dx$ converges, we conclude that $\int_1^\infty \frac{\cos^2 x}{x^2} dx$ converges.

(b) Using a CAS we obtain

$$\int_1^\infty \frac{\cos^2 x}{x^2} dx \approx \boxed{0.3265}.$$

69. (a) We have

$$\frac{1}{(x+1)\sqrt{x}} \leq \frac{1}{x\sqrt{x}} = \frac{1}{x^{3/2}}.$$

By the comparison test, since $p = \frac{3}{2}$ and $\int_1^\infty \frac{1}{x^{3/2}} dx$ converges, we conclude that $\int_1^\infty \frac{1}{(x+1)\sqrt{x}} dx$ converges.

(b) Using a CAS we obtain

$$\int_1^\infty \frac{1}{(x+1)\sqrt{x}} dx = \boxed{\frac{\pi}{2}}.$$

70. (a) We have

$$\frac{1}{x\sqrt{1+x^2}} \leq \frac{1}{x\sqrt{x^2}} = \frac{1}{x^2}.$$

By the comparison test, since $p = 2$ and $\int_1^\infty \frac{1}{x^2} dx$ converges, we conclude that $\int_1^\infty \frac{1}{x\sqrt{1+x^2}} dx$ converges.

(b) Using a CAS we obtain

$$\int_1^\infty \frac{1}{x\sqrt{1+x^2}} dx \approx \boxed{0.8814}.$$

Applications and Extensions

71. The area is given by the improper integral $\int_0^\infty \left(\frac{1}{x+1} - \frac{1}{x+2} \right) dx$. We evaluate

$$\begin{aligned}
 \int_0^\infty \left(\frac{1}{x+1} - \frac{1}{x+2} \right) dx &= \lim_{b \rightarrow \infty} \int_0^b \left(\frac{1}{x+1} - \frac{1}{x+2} \right) dx \\
 &= \lim_{b \rightarrow \infty} [\ln|x+1| - \ln|x+2|]_0^b \\
 &= \lim_{b \rightarrow \infty} [\ln|b+1| - \ln|b+2| - (\ln|0+1| - \ln|0+2|)] \\
 &= \lim_{b \rightarrow \infty} [\ln 2 + \ln|b+1| - \ln|b+2|] \\
 &= \lim_{b \rightarrow \infty} \left[\ln 2 + \ln \left| \frac{b+1}{b+2} \right| \right] \\
 &= \boxed{\ln 2}.
 \end{aligned}$$

72. The area is given by the improper integral $\int_0^\infty \frac{1}{1+x^2} dx$. We evaluate

$$\begin{aligned}
 \int_0^\infty \frac{1}{1+x^2} dx &= \lim_{b \rightarrow \infty} \int_0^b \frac{1}{1+x^2} dx \\
 &= \lim_{b \rightarrow \infty} [\tan^{-1} x]_0^b \\
 &= \lim_{b \rightarrow \infty} [\tan^{-1} b - \tan^{-1} 0] \\
 &= \lim_{b \rightarrow \infty} [\tan^{-1} b] \\
 &= \boxed{\frac{\pi}{2}}.
 \end{aligned}$$

73. The volume is given by the improper integral $\int_0^\infty \pi(e^{-x})^2 dx$. We evaluate

$$\begin{aligned}
 \int_0^\infty \pi(e^{-x})^2 dx &= \lim_{b \rightarrow \infty} \int_0^b \pi e^{-2x} dx \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{1}{2} \pi e^{-2x} \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{1}{2} \pi e^{-2b} - \left(-\frac{1}{2} \pi e^{-2(0)} \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} \pi - \frac{1}{2} \pi e^{-2b} \right] \\
 &= \boxed{\frac{\pi}{2}}.
 \end{aligned}$$

74. The volume is given by the improper integral $\int_1^\infty \pi \left(\frac{1}{\sqrt{x}} \right)^2 dx$. We evaluate

$$\begin{aligned}
 \int_1^\infty \pi \left(\frac{1}{\sqrt{x}} \right)^2 dx &= \lim_{b \rightarrow \infty} \int_1^b \pi \frac{1}{x} dx \\
 &= \lim_{b \rightarrow \infty} [\pi \ln|x|]_1^b \\
 &= \lim_{b \rightarrow \infty} [\pi \ln|b| - \pi \ln|1|] \\
 &= \lim_{b \rightarrow \infty} [\pi \ln b] \\
 &= \infty.
 \end{aligned}$$

So the volume of the solid of revolution is $\boxed{\text{not defined}}$.

75. The area is given by the improper integral $\int_{-\infty}^{\infty} \frac{8a^3}{x^2+4a^2} dx = \int_{-\infty}^0 \frac{8a^3}{x^2+4a^2} dx + \int_0^{\infty} \frac{8a^3}{x^2+4a^2} dx$.

We evaluate first

$$\begin{aligned} \int_{-\infty}^0 \frac{8a^3}{x^2+4a^2} dx &= \lim_{t \rightarrow -\infty} \int_t^0 \frac{8a^3}{x^2+4a^2} dx \\ &= \lim_{t \rightarrow -\infty} \left[(8a^3) \frac{1}{2a} \tan^{-1} \left(\frac{x}{2a} \right) \right]_t^0 \\ &= \lim_{t \rightarrow -\infty} \left[(8a^3) \frac{1}{2a} \tan^{-1} \left(\frac{0}{2a} \right) - (8a^3) \frac{1}{2a} \tan^{-1} \left(\frac{t}{2a} \right) \right] \\ &= \lim_{t \rightarrow -\infty} \left[-4a^2 \tan^{-1} \left(\frac{t}{2a} \right) \right] \\ &= (-4a^2) \left(-\frac{\pi}{2} \right) \\ &= 2\pi a^2. \end{aligned}$$

We next evaluate

$$\begin{aligned} \int_0^{\infty} \frac{8a^3}{x^2+4a^2} dx &= \lim_{t \rightarrow \infty} \int_0^t \frac{8a^3}{x^2+4a^2} dx \\ &= \lim_{t \rightarrow \infty} \left[(8a^3) \frac{1}{2a} \tan^{-1} \left(\frac{x}{2a} \right) \right]_0^t \\ &= \lim_{t \rightarrow \infty} \left[(8a^3) \frac{1}{2a} \tan^{-1} \left(\frac{t}{2a} \right) - (8a^3) \frac{1}{2a} \tan^{-1} \left(\frac{0}{2a} \right) \right] \\ &= \lim_{t \rightarrow \infty} \left[4a^2 \tan^{-1} \left(\frac{t}{2a} \right) \right] \\ &= (4a^2) \left(\frac{\pi}{2} \right) \\ &= 2\pi a^2. \end{aligned}$$

So the area under the graph is $2\pi a^2 + 2\pi a^2 = \boxed{4\pi a^2}$.

76. (a) One can consider the total reaction as the rate of reaction times time. When the rate is not constant, the total reaction is given by the integral of the rate of reaction for $t \geq 0$. This integral is equal to the area under the graph of $y = r(t)$ on $[0, \infty)$.

(b) We evaluate the improper integral

$$\begin{aligned} \int_0^{\infty} r(t) dt &= \int_0^{\infty} te^{-t^2} dt \\ &= \lim_{b \rightarrow \infty} \int_0^b te^{-t^2} dt \\ &= \lim_{b \rightarrow \infty} \left[-\frac{1}{2} e^{-t^2} \right]_0^b \\ &= \lim_{b \rightarrow \infty} \left[-\frac{1}{2} e^{-b^2} - \left(-\frac{1}{2} e^{-0^2} \right) \right] \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} - \frac{1}{2} e^{-b^2} \right] \\ &= \frac{1}{2}. \end{aligned}$$

So the total reaction is $\boxed{\frac{1}{2}}$.

77. (a) We have $R(t) = 100$, and $r = 0.08$. So the present value of the asset is given by the improper integral

$$\begin{aligned}
 \int_0^{\infty} R(t)e^{-rt} dt &= \lim_{b \rightarrow \infty} \int_0^b 100e^{-(0.08)t} dt \\
 &= \lim_{b \rightarrow \infty} \left[\frac{100}{-0.08} e^{-0.08t} \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[\frac{100}{-0.08} e^{-0.08b} - \left(\frac{100}{-0.08} e^{-0.08(0)} \right) \right] \\
 &= \lim_{b \rightarrow \infty} [1250 - 1250e^{-0.08b}] \\
 &= 1250.
 \end{aligned}$$

The present value of the asset is \$1250.00.

- (b) Now with $R(t) = 1000 + 80t$, and $r = 0.07$, the present value of the asset is given by the improper integral

$$\begin{aligned}
 \int_0^{\infty} R(t)e^{-rt} dt &= \lim_{b \rightarrow \infty} \int_0^b (1000 + 80t)e^{-(0.07)t} dt \\
 &= \lim_{b \rightarrow \infty} \left[1000 \int_0^b e^{-(0.07)t} dt + 80 \int_0^b te^{-at} dt \right] \\
 &= \lim_{b \rightarrow \infty} \left[1000 \frac{1}{-0.07} e^{-0.07t} + 80 \left(-\frac{1}{(0.07)^2} e^{-(0.07)t} ((0.07)t + 1) \right) \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[1000 \frac{1}{-0.07} e^{-0.07b} + 80 \left(-\frac{1}{(0.07)^2} e^{-(0.07)b} ((0.07)b + 1) \right) \right. \\
 &\quad \left. - \left(1000 \frac{1}{-0.07} e^{-0.07(0)} + 80 \left(-\frac{1}{(0.07)^2} e^{-(0.07)(0)} ((0.07)(0) + 1) \right) \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1000}{-0.07} e^{-0.07b} + 80 \left(-\frac{1}{(0.07)^2} e^{-(0.07)b} ((0.07)b + 1) \right) \right. \\
 &\quad \left. - \left(\frac{1000}{-0.07} - \frac{80}{(0.07)^2} \right) \right] \\
 &= - \left(\frac{1000}{-0.07} - \frac{80}{(0.07)^2} \right) \\
 &\approx 30,612.
 \end{aligned}$$

The present value of the asset is approximately $\boxed{\$30,612}$.

78. We evaluate the improper integral

$$\begin{aligned}
\int_0^\infty Ri^2 dt &= \lim_{b \rightarrow \infty} \int_0^b R \left(I e^{-Rt/L} \right)^2 dt \\
&= \lim_{b \rightarrow \infty} \int_0^b RI^2 e^{-2Rt/L} dt \\
&= \lim_{b \rightarrow \infty} \left[\frac{RI^2}{-2R/L} e^{-2Rt/L} \right]_0^b \\
&= \lim_{b \rightarrow \infty} \left[-\frac{1}{2} LI^2 e^{-2Rb/L} - \left(-\frac{1}{2} LI^2 e^{-2R(0)/L} \right) \right] \\
&= \lim_{b \rightarrow \infty} \left[\frac{1}{2} LI^2 - \frac{1}{2} LI^2 e^{-2Rb/L} \right] \\
&= \boxed{\frac{1}{2} LI^2}.
\end{aligned}$$

79. We evaluate the improper integral

$$\begin{aligned}
\frac{2\pi N I r}{10} \int_x^\infty \frac{dy}{(r^2 + y^2)^{3/2}} &= \frac{2\pi N I r}{10} \lim_{b \rightarrow \infty} \int_x^b \frac{dy}{(r^2 + y^2)^{3/2}} \\
&= \frac{2\pi N I r}{10} \lim_{b \rightarrow \infty} \left[\frac{1}{r^2} \frac{y}{\sqrt{r^2 + y^2}} \right]_x^b \quad (\text{by Formula 61}) \\
&= \frac{2\pi N I r}{10} \lim_{b \rightarrow \infty} \left[\frac{1}{r^2} \frac{b}{\sqrt{r^2 + b^2}} - \frac{1}{r^2} \frac{x}{\sqrt{r^2 + x^2}} \right] \\
&= \frac{2\pi N I r}{10} \lim_{b \rightarrow \infty} \left[\frac{1}{r^2} \frac{1}{\sqrt{(r/b)^2 + 1}} - \frac{1}{r^2} \frac{x}{\sqrt{r^2 + x^2}} \right] \\
&= \frac{2\pi N I r}{10} \frac{1}{r^2} \left(1 - \frac{x}{\sqrt{r^2 + x^2}} \right) \\
&= \boxed{\frac{\pi N I}{5r} \left(1 - \frac{x}{\sqrt{r^2 + x^2}} \right)}.
\end{aligned}$$

80. We evaluate the improper integral by splitting into two integrals.

$$\frac{r I m}{10} \int_{-\infty}^\infty \frac{dy}{(r^2 + y^2)^{3/2}} = \frac{r I m}{10} \left[\int_{-\infty}^0 \frac{dy}{(r^2 + y^2)^{3/2}} + \int_0^\infty \frac{dy}{(r^2 + y^2)^{3/2}} \right]$$

We first evaluate

$$\begin{aligned}
 \int_{-\infty}^0 \frac{dy}{(r^2 + y^2)^{3/2}} &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{dy}{(r^2 + y^2)^{3/2}} \\
 &= \lim_{a \rightarrow -\infty} \left[\frac{1}{r^2} \frac{y}{\sqrt{r^2 + y^2}} \right]_a^0 \quad (\text{by Formula 61}) \\
 &= \lim_{a \rightarrow -\infty} \left[\frac{1}{r^2} \frac{0}{\sqrt{r^2 + 0^2}} - \frac{1}{r^2} \frac{a}{\sqrt{r^2 + a^2}} \right] \\
 &= \lim_{a \rightarrow -\infty} \left[\frac{1}{r^2 \sqrt{1 + (r/a)^2}} \right] \\
 &= \frac{1}{r^2}.
 \end{aligned}$$

And we evaluate

$$\begin{aligned}
 \int_0^\infty \frac{dy}{(r^2 + y^2)^{3/2}} &= \lim_{b \rightarrow \infty} \int_0^b \frac{dy}{(r^2 + y^2)^{3/2}} \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{r^2} \frac{y}{\sqrt{r^2 + y^2}} \right]_0^b \quad (\text{by Formula 61}) \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{r^2} \frac{b}{\sqrt{r^2 + b^2}} - \frac{1}{r^2} \frac{0}{\sqrt{r^2 + 0^2}} \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{r^2 \sqrt{1 + (r/b)^2}} \right] \\
 &= \frac{1}{r^2}.
 \end{aligned}$$

So

$$\begin{aligned}
 \frac{rIm}{10} \int_{-\infty}^\infty \frac{dy}{(r^2 + y^2)^{3/2}} &= \frac{rIm}{10} \left[\frac{1}{r^2} + \frac{1}{r^2} \right] \\
 &= \boxed{\frac{mI}{5r}}.
 \end{aligned}$$

81. We have $W = \int_1^\infty F(r) dr$, where F is the force acting on an object. So we evaluate the improper integral

$$\begin{aligned}
 \int_1^\infty F(r) dr &= \lim_{b \rightarrow \infty} \int_1^b \frac{GmM}{r^2} dr \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{GmM}{r} \right]_1^b \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{GmM}{b} - \left(-\frac{GmM}{1} \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[GmM - \frac{GmM}{b} \right] \\
 &= \boxed{GmM}.
 \end{aligned}$$

82. If $\alpha \geq 0$, then $\int_0^1 x^\alpha dx$ converges as an ordinary definite integral. If $-1 < \alpha < 0$, then

$$\begin{aligned}\int_0^1 x^\alpha dx &= \lim_{a \rightarrow 0^+} \int_a^1 x^\alpha dx \\ &= \lim_{a \rightarrow 0^+} \left[\frac{x^{\alpha+1}}{\alpha+1} \right]_a^1 \\ &= \lim_{a \rightarrow 0^+} \left[\frac{1^{\alpha+1}}{\alpha+1} - \frac{a^{\alpha+1}}{\alpha+1} \right] \\ &= \frac{1}{\alpha+1},\end{aligned}$$

and the improper integral converges. If $\alpha = -1$, then

$$\begin{aligned}\int_0^1 x^\alpha dx &= \lim_{a \rightarrow 0^+} \int_a^1 x^{-1} dx \\ &= \lim_{a \rightarrow 0^+} [\ln |x|]_a^1 \\ &= \lim_{a \rightarrow 0^+} [\ln |1| - \ln |a|] \\ &= \infty,\end{aligned}$$

and the improper integral diverges. And if $\alpha < -1$,

$$\begin{aligned}\int_0^1 x^\alpha dx &= \lim_{a \rightarrow 0^+} \int_a^1 x^\alpha dx \\ &= \lim_{a \rightarrow 0^+} \left[\frac{x^{\alpha+1}}{\alpha+1} \right]_a^1 \\ &= \lim_{a \rightarrow 0^+} \left[\frac{1^{\alpha+1}}{\alpha+1} - \frac{a^{\alpha+1}}{\alpha+1} \right] \\ &= \infty,\end{aligned}$$

and the improper integral diverges. So $\int_0^1 x^\alpha dx$ converges for $\boxed{-1 < \alpha}$.

83. We evaluate the improper integral

$$\int_0^\infty x e^{-x} dx = \lim_{b \rightarrow \infty} \int_0^b x e^{-x} dx.$$

Let $u = x$, $du = dx$, and $dv = e^{-x} dx$, $v = -e^{-x}$, and use integration by parts.

$$\begin{aligned}\int_0^\infty x e^{-x} dx &= \lim_{b \rightarrow \infty} \left[[x(-e^{-x})]_0^b - \int_0^b (-e^{-x}) dx \right] \\ &= \lim_{b \rightarrow \infty} \left[-be^{-b} + \int_0^b e^{-x} dx \right] \\ &= \lim_{b \rightarrow \infty} \left[-be^{-b} + [-e^{-x}]_0^b \right] \\ &= \lim_{b \rightarrow \infty} \left[-be^{-b} + [-e^{-b} - (-e^{-0})] \right] \\ &= \lim_{b \rightarrow \infty} \left[-be^{-b} + 1 - e^{-b} \right] \\ &= \boxed{1}.\end{aligned}$$

84. We evaluate the improper integral

$$\int_0^1 x \ln x \, dx = \lim_{a \rightarrow 0^+} \int_a^1 x \ln x \, dx.$$

Let $u = \ln x$, $du = \frac{1}{x} dx$, and $dv = x \, dx$, $v = \frac{1}{2}x^2$, and use integration by parts.

$$\begin{aligned} \int_0^1 x \ln x \, dx &= \lim_{a \rightarrow 0^+} \left[\left[(\ln x) \left(\frac{1}{2}x^2 \right) \right]_a^1 - \int_a^1 \left(\frac{1}{2}x^2 \right) \left(\frac{1}{x} \right) dx \right] \\ &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2}a^2 \ln a - \frac{1}{2} \int_a^1 x \, dx \right] \\ &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2}a^2 \ln a - \frac{1}{2} \left[\frac{1}{2}x^2 \right]_a^1 \right] \\ &= \lim_{a \rightarrow 0^+} \left[-\frac{1}{2}a^2 \ln a - \frac{1}{2} \left(\frac{1}{2} - \frac{1}{2}a^2 \right) \right] \\ &= \lim_{a \rightarrow 0^+} \left[\frac{1}{4}a^2 - \frac{1}{2}a^2 \ln a - \frac{1}{4} \right] \\ &= \boxed{-\frac{1}{4}}. \end{aligned}$$

85. We evaluate the improper integral

$$\int_0^\infty e^{-x} \cos x \, dx = \lim_{b \rightarrow \infty} \int_0^b e^{-x} \cos x \, dx.$$

We use integration by parts to obtain formula 126, and so

$$\begin{aligned} \int_0^\infty e^{-x} \cos x \, dx &= \lim_{b \rightarrow \infty} \left[\frac{1}{2}e^{-x}(-\cos x + \sin x) \right]_0^b \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{2}e^{-b}(-\cos b + \sin b) - \left(\frac{1}{2}e^{-0}(-\cos 0 + \sin 0) \right) \right] \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} - \frac{1}{2}e^{-b}(\cos b - \sin b) \right] \\ &= \boxed{\frac{1}{2}}. \end{aligned}$$

86. We evaluate the improper integral

$$\int_0^\infty \tan^{-1} x \, dx = \lim_{b \rightarrow \infty} \int_0^b \tan^{-1} x \, dx.$$

Let $u = \tan^{-1} x$, $du = \frac{1}{1+x^2} dx$, and $dv = dx$, $v = x$, and use integration by parts.

$$\begin{aligned} \int_0^\infty \tan^{-1} x \, dx &= \lim_{b \rightarrow \infty} \left[[x \tan^{-1} x]_0^b - \int_0^b x \left(\frac{1}{1+x^2} \right) dx \right] \\ &= \lim_{b \rightarrow \infty} \left[b \tan^{-1} b - \left[\frac{1}{2} \ln(x^2 + 1) \right]_0^b \right] \\ &= \lim_{b \rightarrow \infty} \left[b \tan^{-1} b - \frac{1}{2} \ln(b^2 + 1) \right] \\ &= \infty, \end{aligned}$$

and the improper integral $\boxed{\text{diverges}}$.

87. We evaluate the improper integral

$$\begin{aligned}
 \int_0^\infty \sin x \, dx &= \lim_{b \rightarrow \infty} \int_0^b \sin x \, dx \\
 &= \lim_{b \rightarrow \infty} [-\cos x]_0^b \\
 &= \lim_{b \rightarrow \infty} [-\cos b - (-\cos 0)] \\
 &= \lim_{b \rightarrow \infty} [1 - \cos b].
 \end{aligned}$$

Since this limit does not exist, the improper integral $\int_0^\infty \sin x \, dx$ diverges. We now evaluate the improper integral

$$\begin{aligned}
 \int_{-\infty}^0 \sin x \, dx &= \lim_{a \rightarrow -\infty} \int_a^0 \sin x \, dx \\
 &= \lim_{a \rightarrow -\infty} [-\cos x]_a^0 \\
 &= \lim_{a \rightarrow -\infty} [-\cos 0 - (-\cos a)] \\
 &= \lim_{a \rightarrow -\infty} [\cos a - 1].
 \end{aligned}$$

Since this limit does not exist, the improper integral $\int_{-\infty}^0 \sin x \, dx$ diverges. We now determine

$$\begin{aligned}
 \lim_{t \rightarrow \infty} \int_{-t}^t \sin x \, dx &= \lim_{t \rightarrow \infty} [\cos x]_{-t}^t \\
 &= \lim_{t \rightarrow \infty} [\cos t - (\cos(-t))] \\
 &= \lim_{t \rightarrow \infty} [\cos t - \cos(t)] \\
 &= \lim_{t \rightarrow \infty} [0] \\
 &= \boxed{0}.
 \end{aligned}$$

88. If we let $f(x) = x + \frac{1/\pi}{1+x^2}$, then

$$\begin{aligned}
 \int_0^\infty \left(x + \frac{1/\pi}{1+x^2} \right) dx &= \lim_{b \rightarrow \infty} \int_0^b \left(x + \frac{1/\pi}{1+x^2} \right) dx \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{2}x^2 + \frac{1}{\pi} \tan^{-1} x \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{2}b^2 + \frac{1}{\pi} \tan^{-1} b \right] \\
 &= \infty,
 \end{aligned}$$

so this integral diverges. And

$$\begin{aligned}
 \int_{-\infty}^0 x \, dx &= \lim_{a \rightarrow -\infty} \int_a^0 \left(x + \frac{1/\pi}{1+x^2} \right) dx \\
 &= \lim_{a \rightarrow -\infty} \left[\frac{1}{2}x^2 + \frac{1}{\pi} \tan^{-1} x \right]_a^0 \\
 &= \lim_{a \rightarrow -\infty} \left[-\frac{1}{2}a^2 - \frac{1}{\pi} \tan^{-1} a \right] \\
 &= -\infty,
 \end{aligned}$$

so this integral also diverges. But

$$\begin{aligned}
 \lim_{t \rightarrow \infty} \int_{-t}^t \left(x + \frac{1/\pi}{1+x^2} \right) dx &= \lim_{t \rightarrow \infty} \left[\frac{1}{2} x^2 + \frac{1}{\pi} \tan^{-1} x \right]_{-t}^t \\
 &= \lim_{t \rightarrow \infty} \left[\frac{1}{2} t^2 + \frac{1}{\pi} \tan^{-1} t - \left(\frac{1}{2} (-t)^2 + \frac{1}{\pi} \tan^{-1} (-t) \right) \right] \\
 &= \lim_{t \rightarrow \infty} \left[\frac{2}{\pi} \tan^{-1} t \right] \\
 &= 1.
 \end{aligned}$$

89. Since

$$\frac{1}{\sqrt{2+\sin x}} \geq \frac{1}{\sqrt{2+1}} = \frac{1}{\sqrt{3}}$$

for all x , and since $\int_0^\infty \frac{1}{3} dx$ diverges, by the Comparison Test, $\int_0^\infty \frac{1}{\sqrt{2+\sin x}} dx$ diverges.

90. Since for $x \geq 2$

$$\frac{\ln x}{\sqrt{x^2-1}} \geq \frac{\ln 2}{\sqrt{x^2}} = \frac{\ln 2}{x}$$

and $\int_2^\infty \frac{\ln 2}{x} dx$ diverges, by the Comparison Test, $\int_2^\infty \frac{\ln x}{\sqrt{x^2-1}} dx$ diverges.

91. (a) We evaluate the improper integral, and let $u = x^n$, $du = nx^{n-1} dx$, $dv = e^{-x} dx$, and $v = -e^{-x}$. We obtain

$$\begin{aligned}
 \int_0^\infty x^n e^{-x} dx &= \lim_{b \rightarrow \infty} \int_0^b x^n e^{-x} dx \\
 &= \lim_{b \rightarrow \infty} \left[[x^n (-e^{-x})]_0^b - \int_0^b nx^{n-1} (-e^{-x}) dx \right] \\
 &= \lim_{b \rightarrow \infty} \left[-b^n e^{-b} + n \int_0^b x^{n-1} e^{-x} dx \right] \\
 &= \lim_{b \rightarrow \infty} [-b^n e^{-b}] + \lim_{b \rightarrow \infty} \left[n \int_0^b x^{n-1} e^{-x} dx \right] \\
 &= 0 + n \lim_{b \rightarrow \infty} \left[\int_0^b x^{n-1} e^{-x} dx \right] \\
 &= n \int_0^\infty x^{n-1} e^{-x} dx
 \end{aligned}$$

(b) Using part (a) repeatedly, we obtain

$$\begin{aligned}
\int_0^\infty x^n e^{-x} dx &= n \int_0^\infty x^{n-1} e^{-x} dx \\
&= n(n-1) \int_0^\infty x^{n-2} e^{-x} dx \\
&= \dots \\
&= [n(n-1) \cdots 1] \int_0^\infty e^{-x} dx \\
&= (n!) \lim_{b \rightarrow \infty} \int_0^b e^{-x} dx \\
&= (n!) \lim_{b \rightarrow \infty} [-e^{-x}]_0^b \\
&= (n!) \lim_{b \rightarrow \infty} [-e^{-b} - (-e^{-0})] \\
&= (n!) \lim_{b \rightarrow \infty} [1 - e^{-b}] \\
&= n!.
\end{aligned}$$

92. We evaluate the improper integral, and obtain for $p \neq 1$

$$\begin{aligned}
\int_e^\infty \frac{dx}{x(\ln x)^p} &= \lim_{b \rightarrow \infty} \int_e^b \frac{dx}{x(\ln x)^p} \\
&= \lim_{b \rightarrow \infty} \left[\frac{\ln^{1-p} x}{1-p} \right]_e^b \\
&= \lim_{b \rightarrow \infty} \left[\frac{\ln^{1-p} b}{1-p} - \frac{\ln^{1-p} e}{1-p} \right] \\
&= \lim_{b \rightarrow \infty} \left[\frac{\ln^{1-p} b}{1-p} - \frac{1}{1-p} \right].
\end{aligned}$$

If $p > 1$, then $1-p < 0$, and

$$\int_e^\infty \frac{dx}{x(\ln x)^p} = \lim_{b \rightarrow \infty} \left[\frac{\ln^{1-p} b}{1-p} - \frac{1}{1-p} \right] = \frac{1}{p-1}.$$

If $p < 1$, then $1-p > 0$, and

$$\int_e^\infty \frac{dx}{x(\ln x)^p} = \lim_{b \rightarrow \infty} \left[\frac{\ln^{1-p} b}{1-p} - \frac{1}{1-p} \right] = \infty.$$

And if $p = 1$, we have

$$\begin{aligned}
\int_e^\infty \frac{dx}{x(\ln x)^p} &= \lim_{b \rightarrow \infty} \int_e^b \frac{dx}{x \ln x} \\
&= \lim_{b \rightarrow \infty} [\ln(\ln x)]_e^b \\
&= \lim_{b \rightarrow \infty} [\ln(\ln b) - \ln(\ln e)] \\
&= \lim_{b \rightarrow \infty} [\ln(\ln b) - 0] \\
&= \infty.
\end{aligned}$$

So $\int_e^\infty \frac{dx}{x(\ln x)^p}$ converges if $p > 1$, and diverges if $p \leq 1$.

93. We evaluate the improper integral, and obtain for $p \neq 1$

$$\begin{aligned}\int_a^b \frac{dx}{(x-a)^p} &= \lim_{t \rightarrow a^+} \int_t^b \frac{dx}{(x-a)^p} \\ &= \lim_{t \rightarrow a^+} \left[\frac{(x-a)^{1-p}}{1-p} \right]_t^b \\ &= \lim_{t \rightarrow a^+} \left[\frac{(b-a)^{1-p}}{1-p} - \frac{(t-a)^{1-p}}{1-p} \right].\end{aligned}$$

If $p > 1$, then $1-p < 0$, and

$$\int_a^b \frac{dx}{(x-a)^p} = \lim_{t \rightarrow a^+} \left[\frac{(b-a)^{1-p}}{1-p} - \frac{(t-a)^{1-p}}{1-p} \right] = \infty.$$

If $0 < p < 1$, then $1-p > 0$, and

$$\int_a^b \frac{dx}{(x-a)^p} = \lim_{t \rightarrow a^+} \left[\frac{(b-a)^{1-p}}{1-p} - \frac{(t-a)^{1-p}}{1-p} \right] = \frac{(b-a)^{1-p}}{1-p}.$$

And if $p = 1$, we have

$$\begin{aligned}\int_a^b \frac{dx}{(x-a)^p} &= \lim_{t \rightarrow a^+} \int_t^b \frac{dx}{x-a} \\ &= \lim_{t \rightarrow a^+} [\ln |x-a|]_t^b \\ &= \lim_{t \rightarrow a^+} [\ln |b-a| - \ln |t-a|] \\ &= \infty.\end{aligned}$$

So $\int_a^b \frac{dx}{(x-a)^p}$ converges if $0 < p < 1$, and diverges if $p \geq 1$.

94. We evaluate the improper integral, and obtain for $p \neq 1$

$$\begin{aligned}\int_a^b \frac{dx}{(b-x)^p} &= \lim_{t \rightarrow b^-} \int_a^t \frac{dx}{(b-x)^p} \\ &= \lim_{t \rightarrow b^-} \left[\frac{-(b-x)^{1-p}}{1-p} \right]_a^t \\ &= \lim_{t \rightarrow b^-} \left[\frac{-(b-t)^{1-p}}{1-p} - \left(-\frac{(b-a)^{1-p}}{1-p} \right) \right].\end{aligned}$$

If $p > 1$, then $1-p < 0$, and

$$\int_a^b \frac{dx}{(b-x)^p} = \lim_{t \rightarrow b^-} \left[\frac{-(b-t)^{1-p}}{1-p} - \left(-\frac{(b-a)^{1-p}}{1-p} \right) \right] = \infty.$$

If $0 < p < 1$, then $1-p > 0$, and

$$\int_a^b \frac{dx}{(b-x)^p} = \lim_{t \rightarrow b^-} \left[\frac{-(b-t)^{1-p}}{1-p} - \left(-\frac{(b-a)^{1-p}}{1-p} \right) \right] = \frac{(b-a)^{1-p}}{1-p}.$$

And if $p = 1$, we have

$$\begin{aligned}
 \int_a^b \frac{dx}{(b-x)^p} &= \lim_{t \rightarrow b^-} \int_a^t \frac{dx}{b-x} \\
 &= \lim_{t \rightarrow b^-} [-\ln |b-x|]_a^t \\
 &= \lim_{t \rightarrow b^-} [-\ln |b-t| - (-\ln |b-a|)] \\
 &= \infty.
 \end{aligned}$$

So $\int_a^b \frac{dx}{(b-x)^p}$ converges if $0 < p < 1$, and diverges if $p \geq 1$.

95. If $p = 0$, then $\frac{1}{(x-a)^p} = 1$ for all x in $(a, b]$, and so $\int_a^b \frac{dx}{(x-a)^p} = b - a$. Likewise, $\frac{1}{(b-a)^p} = 1$ for all x in $[a, b)$, so $\int_a^b \frac{dx}{(b-x)^p} = 1$. And if $p < 0$, then $\frac{1}{(x-a)^p}$ and $\frac{1}{(b-a)^p}$ are continuous on $[a, b]$, so the integrals $\int_a^b \frac{dx}{(x-a)^p}$ and $\int_a^b \frac{dx}{(b-x)^p}$ are ordinary definite integrals, and hence converge. For example, $\int_1^2 \frac{dx}{(x-1)^{-1}} = \int_1^2 (x-1) dx = \left[\frac{1}{2}(x-1)^2 \right]_1^2 = \frac{1}{2}$.

96. Suppose $\int_a^\infty g(x) dx$ diverges, then since $g(x) \geq 0$, we know that $\int_a^\infty g(x) dx = \infty$. If M is any real number, then there exists b such that for every $b \leq t$,

$$M \leq \int_a^b g(x) dx \leq \int_a^b f(x) dx \leq \int_a^t f(x) dx.$$

So $\lim_{t \rightarrow \infty} \int_a^t f(x) dx = \infty$, by definition of an infinite limit. So $\int_a^\infty f(x) dx$ diverges.

Now suppose $\int_a^\infty f(x) dx$ converges. Then $\int_a^\infty g(x) dx$ must also converge, since from the above, we otherwise would conclude that $\int_a^\infty f(x) dx$ diverges.

97. We evaluate, for $s > 0$,

$$\begin{aligned}
 L\{f(x)\} &= \int_0^\infty e^{-sx} f(x) dx \\
 &= \int_0^\infty e^{-sx} x dx \\
 &= \lim_{b \rightarrow \infty} \int_0^b e^{-sx} x dx \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{1}{s^2} e^{-sx} (sx + 1) \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{1}{s^2} e^{-bs} (bs + 1) - \left(-\frac{1}{s^2} e^{-(0)s} ((0)s + 1) \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{s^2} - \frac{1}{s^2} e^{-bs} (bs + 1) \right] \\
 &= \boxed{\frac{1}{s^2}}.
 \end{aligned}$$

98. We evaluate, for $s > 0$,

$$\begin{aligned}
 L\{f(x)\} &= \int_0^{\infty} e^{-sx} f(x) dx \\
 &= \int_0^{\infty} e^{-sx} \cos x dx \\
 &= \lim_{b \rightarrow \infty} \int_0^b e^{-sx} \cos x dx \\
 &= \lim_{b \rightarrow \infty} \left[\frac{e^{-xs}(\sin x - s \cos x)}{s^2 + 1} \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[\frac{e^{-bs}(\sin b - s \cos b)}{s^2 + 1} - \frac{e^{-(0)s}(\sin(0) - s \cos(0))}{s^2 + 1} \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{s}{s^2 + 1} + e^{-bs} \frac{\sin b - s \cos b}{s^2 + 1} \right] \\
 &= \boxed{\frac{s}{s^2 + 1}}.
 \end{aligned}$$

99. We evaluate, for $s > 0$,

$$\begin{aligned}
 L\{f(x)\} &= \int_0^{\infty} e^{-sx} f(x) dx \\
 &= \int_0^{\infty} e^{-sx} \sin x dx \\
 &= \lim_{b \rightarrow \infty} \int_0^b e^{-sx} \sin x dx \\
 &= \lim_{b \rightarrow \infty} \left[\frac{-e^{-sx}(\cos x + s \sin x)}{s^2 + 1} \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[\frac{-e^{-bs}(\cos b + s \sin b)}{s^2 + 1} - \frac{-e^{-(0)s}(\cos(0) + s \sin(0))}{s^2 + 1} \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{s^2 + 1} - e^{-bs} \frac{\cos b + s \sin b}{s^2 + 1} \right] \\
 &= \boxed{\frac{1}{s^2 + 1}}.
 \end{aligned}$$

100. We evaluate, for $s > 1$,

$$\begin{aligned}
 L\{f(x)\} &= \int_0^\infty e^{-sx} f(x) dx \\
 &= \int_0^\infty e^{-sx} e^x dx \\
 &= \lim_{b \rightarrow \infty} \int_0^b e^{x(1-s)} dx \\
 &= \lim_{b \rightarrow \infty} \left[\frac{e^{x(1-s)}}{1-s} \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[\frac{e^{b(1-s)}}{1-s} - \frac{e^{(0)(1-s)}}{1-s} \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{s-1} - \frac{e^{-b(s-1)}}{s-1} \right] \\
 &= \boxed{\frac{1}{s-1}}.
 \end{aligned}$$

But for $s \leq 1$, $\int_0^\infty e^{-sx} e^x dx$ diverges.

101. We evaluate, for $s > a$,

$$\begin{aligned}
 L\{f(x)\} &= \int_0^\infty e^{-sx} f(x) dx \\
 &= \int_0^\infty e^{-sx} e^{ax} dx \\
 &= \lim_{b \rightarrow \infty} \int_0^b e^{x(a-s)} dx \\
 &= \lim_{b \rightarrow \infty} \left[\frac{e^{x(a-s)}}{a-s} \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[\frac{e^{b(a-s)}}{a-s} - \frac{e^{0(a-s)}}{a-s} \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{e^{-b(s-a)}}{a-s} - \frac{1}{a-s} \right] \\
 &= \boxed{\frac{1}{s-a}}.
 \end{aligned}$$

But for $s \leq a$, $\int_0^\infty e^{-sx} e^x dx$ diverges.

102. We evaluate, for $s > 0$,

$$\begin{aligned}
 L\{f(x)\} &= \int_0^\infty e^{-sx} f(x) dx \\
 &= \int_0^\infty e^{-sx} (1) dx \\
 &= \lim_{b \rightarrow \infty} \int_0^b e^{-sx} dx \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{1}{s} e^{-sx} \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[-\frac{1}{s} e^{-bs} - \left(-\frac{1}{s} e^{-(0)s} \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[\frac{1}{s} - \frac{1}{s} e^{-bs} \right] \\
 &= \boxed{\frac{1}{s}}.
 \end{aligned}$$

Challenge Problems

103. The arc length is given by $\int_0^1 \sqrt{1 + (dy/dx)^2} dx$. We differentiate, and obtain

$$\begin{aligned}
 \frac{dy}{dx} &= \frac{d}{dx} \left(\sqrt{x - x^2} - \sin^{-1} \sqrt{x} \right) \\
 &= \frac{1}{2} (x - x^2)^{-1/2} (1 - 2x) - \frac{1}{\sqrt{1 - (\sqrt{x})^2}} \frac{1}{2\sqrt{x}} \\
 &= \frac{1 - 2x}{2\sqrt{x - x^2}} - \frac{1}{2\sqrt{x - x^2}} \\
 &= \frac{-x}{\sqrt{x - x^2}}
 \end{aligned}$$

So

$$\begin{aligned}
 \sqrt{1 + (dy/dx)^2} &= \sqrt{1 + \left(\frac{-x}{\sqrt{x - x^2}} \right)^2} \\
 &= \sqrt{1 + \frac{x^2}{x - x^2}} \\
 &= \frac{1}{\sqrt{1 - x}}
 \end{aligned}$$

We now evaluate the improper integral.

$$\begin{aligned}
 \int_0^1 \frac{1}{\sqrt{1 - x}} dx &= \lim_{b \rightarrow 1^-} \int_0^b (1 - x)^{-1/2} dx \\
 &= \lim_{b \rightarrow 1^-} \left[-2\sqrt{1 - x} \right]_0^b \\
 &= \lim_{b \rightarrow 1^-} \left[-2\sqrt{1 - b} - (-2\sqrt{1 - 0}) \right] \\
 &= \lim_{b \rightarrow 1^-} \left[2 - 2\sqrt{1 - b} \right] \\
 &= \boxed{2}.
 \end{aligned}$$

104. We evaluate the improper integral

$$\int_{-\infty}^a e^{(x-e^x)} dx = \lim_{x \rightarrow -\infty} \int_x^a e^x e^{-e^x} dx.$$

Let $u = e^x$, then $du = e^x dx$, and we obtain

$$\begin{aligned} \int_{-\infty}^a e^{(x-e^x)} dx &= \lim_{x \rightarrow -\infty} \int_{e^x}^{e^a} e^{-u} du \\ &= \lim_{x \rightarrow -\infty} [-e^{-u}]_{e^x}^{e^a} \\ &= \lim_{x \rightarrow -\infty} [-e^{-e^a} - (-e^{-e^x})] \\ &= \lim_{x \rightarrow -\infty} [e^{-e^x} - e^{-e^a}] \\ &= \boxed{1 - e^{-e^a}}. \end{aligned}$$

105. We split the integral into two improper integrals:

$$\int_{-\infty}^{\infty} e^{(x-e^x)} dx = \lim_{x \rightarrow -\infty} \int_x^0 e^x e^{-e^x} dx + \lim_{x \rightarrow \infty} \int_0^x e^x e^{-e^x} dx.$$

For the first integral, let $u = e^x$, then $du = e^x dx$, and we obtain

$$\begin{aligned} \lim_{x \rightarrow -\infty} \int_x^0 e^x e^{-e^x} dx &= \lim_{x \rightarrow -\infty} \int_{e^x}^1 e^{-u} du \\ &= \lim_{x \rightarrow -\infty} [-e^{-u}]_{e^x}^1 \\ &= \lim_{x \rightarrow -\infty} [-e^{-1} - (-e^{-e^x})] \\ &= \lim_{x \rightarrow -\infty} [e^{-e^x} - e^{-1}] \\ &= 1 - \frac{1}{e}. \end{aligned}$$

For the second integral, let $u = e^x$, then $du = e^x dx$, and we obtain

$$\begin{aligned} \lim_{x \rightarrow \infty} \int_0^x e^x e^{-e^x} dx &= \lim_{x \rightarrow \infty} \int_1^{e^x} e^{-u} du \\ &= \lim_{x \rightarrow \infty} [-e^{-u}]_1^{e^x} \\ &= \lim_{x \rightarrow \infty} [-e^{-e^x} - (-e^{-1})] \\ &= \lim_{x \rightarrow \infty} [e^{-1} - e^{-e^x}] \\ &= \frac{1}{e}. \end{aligned}$$

So we have

$$\int_{-\infty}^{\infty} e^{(x-e^x)} dx = \left(1 - \frac{1}{e}\right) + \frac{1}{e} = \boxed{1}.$$

106. (a) We need to show that $\int_0^{\ln 2} e^{-x} dx = \int_{\ln 2}^{\infty} e^{-x} dx$. For the first integral we have

$$\begin{aligned}\int_0^{\ln 2} e^{-x} dx &= [-e^{-x}]_0^{\ln 2} \\ &= -e^{-\ln 2} - (-e^{-0}) \\ &= -\frac{1}{2} + 1 \\ &= \frac{1}{2}.\end{aligned}$$

The improper integral is determined next,

$$\begin{aligned}\int_{\ln 2}^{\infty} e^{-x} dx &= \lim_{b \rightarrow \infty} \int_{\ln 2}^b e^{-x} dx \\ &= \lim_{b \rightarrow \infty} [-e^{-x}]_{\ln 2}^b \\ &= \lim_{b \rightarrow \infty} [-e^{-b} - (-e^{-\ln 2})] \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} - e^{-b} \right] \\ &= \frac{1}{2} - 0 \\ &= \frac{1}{2}.\end{aligned}$$

So the areas are equal.

(b) The volume obtained by rotating the first region about the x-axis is

$$\begin{aligned}\int_0^{\ln 2} \pi (e^{-x})^2 dx &= \int_0^{\ln 2} \pi e^{-2x} dx \\ &= \left[-\frac{\pi}{2} e^{-2x} \right]_0^{\ln 2} \\ &= -\frac{\pi}{2} e^{-2(\ln 2)} - \left(-\frac{\pi}{2} e^{-2(0)} \right) \\ &= \frac{3\pi}{8}.\end{aligned}$$

The volume obtained by rotating the second region about the x-axis is given by the improper integral

$$\begin{aligned}\int_{\ln 2}^{\infty} \pi (e^{-x})^2 dx &= \lim_{b \rightarrow \infty} \int_{\ln 2}^b \pi e^{-2x} dx \\ &= \lim_{b \rightarrow \infty} \left[-\frac{\pi}{2} e^{-2x} \right]_{\ln 2}^b \\ &= \lim_{b \rightarrow \infty} \left[-\frac{\pi}{2} e^{-2b} - \left(-\frac{\pi}{2} e^{-2 \ln 2} \right) \right] \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{8} \pi - \frac{1}{2} \pi e^{-2b} \right] \\ &= \frac{\pi}{8}.\end{aligned}$$

So the volume of the first solid is three times the volume of the second solid.

107. Since $a < b$, $f(x) \geq 0$ for all x . The integral of f is 0 outside of the interval $[a, b]$, and so we have

$$\int_{-\infty}^{\infty} f(x) dx = \int_a^b \frac{1}{b-a} dx = \frac{1}{b-a}(b-a) = 1.$$

We conclude that f is a probability density function.

108. We have $f(x) \geq 0$ for all x . The integral of f is 0 for $x < 0$, and so we have

$$\begin{aligned} \int_{-\infty}^{\infty} f(x) dx &= \int_0^{\infty} \frac{1}{a} e^{-x/a} dx \\ &= \lim_{b \rightarrow \infty} \int_0^b \frac{1}{a} e^{-x/a} dx \\ &= \lim_{b \rightarrow \infty} \left[-e^{-\frac{1}{a}x} \right]_0^b \\ &= \lim_{b \rightarrow \infty} \left[-e^{-\frac{1}{a}b} - \left(-e^{-\frac{1}{a}(0)} \right) \right] \\ &= \lim_{b \rightarrow \infty} \left[1 - e^{-\frac{1}{a}b} \right] \\ &= 1. \end{aligned}$$

We conclude that f is a probability density function.

109. We need to evaluate

$$\begin{aligned} \int_{-\infty}^{\infty} xf(x) dx &= \int_a^b x \frac{1}{b-a} dx \\ &= \frac{1}{b-a} \int_a^b x dx \\ &= \frac{1}{b-a} \left[\frac{1}{2}b^2 - \frac{1}{2}a^2 \right] \\ &= \frac{(b-a)(b+a)}{2(b-a)} \\ &= \frac{a+b}{2}. \end{aligned}$$

The mean of f is $\mu = \boxed{\frac{a+b}{2}}$.

110. We need to evaluate

$$\begin{aligned} \int_{-\infty}^{\infty} xf(x) dx &= \int_0^{\infty} \frac{1}{a} xe^{-x/a} dx \\ &= \lim_{b \rightarrow \infty} \int_0^b \frac{1}{a} xe^{-x/a} dx \\ &= \lim_{b \rightarrow \infty} \left[-e^{-\frac{1}{a}x}(a+x) \right]_0^b \\ &= \lim_{b \rightarrow \infty} \left[-e^{-\frac{1}{a}b}(a+b) - \left(-e^{-\frac{1}{a}(0)}(a+0) \right) \right] \\ &= \lim_{b \rightarrow \infty} \left[a - e^{-\frac{1}{a}b}(a+b) \right] \\ &= a. \end{aligned}$$

The mean of f is $\mu = \boxed{a}$.

111. We need to evaluate

$$\begin{aligned}
 \int_{-\infty}^{\infty} (x - \mu)^2 f(x) dx &= \int_a^b \left(x - \frac{a+b}{2}\right)^2 \frac{1}{b-a} dx \\
 &= \frac{1}{b-a} \int_a^b \left(x - \frac{a+b}{2}\right)^2 dx \\
 &= \frac{1}{b-a} \left[\frac{1}{3} \left(x - \frac{a+b}{2}\right)^3 \right]_a^b \\
 &= \frac{1}{b-a} \left[\frac{1}{3} \left(b - \frac{a+b}{2}\right)^3 - \frac{1}{3} \left(a - \frac{a+b}{2}\right)^3 \right] \\
 &= \frac{1}{b-a} \left[\frac{1}{3} \left(\frac{1}{2}b - \frac{1}{2}a\right)^3 - \frac{1}{3} \left(\frac{1}{2}a - \frac{1}{2}b\right)^3 \right] \\
 &= \frac{1}{24(b-a)} [2(b-a)^3] \\
 &= \frac{(b-a)^2}{12}.
 \end{aligned}$$

The variance of f is $\sigma^2 = \boxed{\frac{(b-a)^2}{12}}$. The standard deviation is $\sigma = \frac{b-a}{2\sqrt{3}}$.

112. We need to evaluate

$$\begin{aligned}
 \int_{-\infty}^{\infty} (x - \mu)^2 f(x) dx &= \int_0^{\infty} \frac{1}{a} (x-a)^2 e^{-x/a} dx \\
 &= \lim_{b \rightarrow \infty} \int_0^b \frac{1}{a} (x-a)^2 e^{-x/a} dx \\
 &= \lim_{b \rightarrow \infty} \left[-e^{-\frac{1}{a}x} (a^2 + x^2) \right]_0^b \\
 &= \lim_{b \rightarrow \infty} \left[-e^{-\frac{1}{a}b} (a^2 + b^2) - \left(-e^{-\frac{1}{a}0} (a^2 + 0^2) \right) \right] \\
 &= \lim_{b \rightarrow \infty} \left[a^2 - e^{-\frac{1}{a}b} (a^2 + b^2) \right] \\
 &= a^2.
 \end{aligned}$$

The variance of f is $\sigma^2 = \boxed{a^2}$. The standard deviation is $\sigma = a$.

Chapter 7 Review Exercises

1. We complete the square: $x^2 + 4x + 20 = (x + 2)^2 + 16$. Then we let $u = x + 2$ to obtain

$$\begin{aligned} \int \frac{dx}{x^2 + 4x + 20} &= \int \frac{dx}{(x + 2)^2 + 4^2} \\ &= \int \frac{du}{u^2 + 4^2} \\ &= \frac{1}{4} \tan^{-1} \frac{u}{4} + C \\ &= \boxed{\frac{1}{4} \tan^{-1} \left(\frac{x+2}{4} \right) + C}. \end{aligned}$$

2. We rewrite the integral to obtain the derivative of the denominator, complete the square with $y^2 + y + 1 = \left(y + \frac{1}{2}\right)^2 + \frac{3}{4}$, and let $u = y + \frac{1}{2}$ to obtain

$$\begin{aligned} \int \frac{y + 1}{y^2 + y + 1} dy &= \int \frac{\frac{1}{2}(2y + 1) + \frac{1}{2}}{y^2 + y + 1} dy \\ &= \frac{1}{2} \int \frac{2y + 1}{y^2 + y + 1} dx + \frac{1}{2} \int \frac{dx}{\left(y + \frac{1}{2}\right)^2 + \frac{3}{4}} \\ &= \frac{1}{2} \ln(y^2 + y + 1) + \frac{1}{2} \int \frac{du}{u^2 + \left(\frac{\sqrt{3}}{2}\right)^2} \\ &= \frac{1}{2} \ln(y^2 + y + 1) + \frac{1}{2} \left(\frac{2}{\sqrt{3}} \tan^{-1} \frac{u}{\sqrt{3}/2} \right) + C \\ &= \frac{1}{2} \ln(y^2 + y + 1) + \frac{1}{\sqrt{3}} \tan^{-1} \frac{2y + 1}{\sqrt{3}} + C \\ &= \boxed{\frac{1}{2} \ln(y^2 + y + 1) + \frac{\sqrt{3}}{3} \tan^{-1} \frac{\sqrt{3}(2y+1)}{3} + C}. \end{aligned}$$

3. Factor out $\sec \phi \tan \phi$. Then let $u = \sec \phi$, so $du = \sec \phi \tan \phi d\phi$. We substitute and obtain

$$\begin{aligned} \int \sec^3 \phi \tan \phi d\phi &= \int \sec^2 \phi \sec \phi \tan \phi d\phi \\ &= \int u^2 du \\ &= \frac{1}{3} u^3 + C \\ &= \boxed{\frac{1}{3} \sec^3 \phi + C}. \end{aligned}$$

4. We use the identity $\cot^2 \theta = \csc^2 \theta - 1$.

$$\begin{aligned} \int \cot^2 \theta \csc \theta d\theta &= \int (\csc^2 \theta - 1) \csc \theta d\theta \\ &= \int \csc^3 \theta d\theta - \int \csc \theta d\theta \\ &= -\frac{1}{2} \csc \theta \cot \theta + \frac{1}{2} \ln |\csc \theta - \cot \theta| \\ &\quad - \ln |\csc \theta - \cot \theta| + C \quad (\text{using Formulas 89 and 14}) \\ &= \boxed{-\frac{1}{2} \csc \theta \cot \theta - \frac{1}{2} \ln |\csc \theta - \cot \theta| + C}. \end{aligned}$$

5. Factor out $\sin \phi$ and use the identity $\sin^2 \phi = 1 - \cos^2 \phi$.

$$\begin{aligned}\int \sin^3 \phi \, d\phi &= \int \sin^2 \phi \sin \phi \, d\phi \\ &= \int (1 - \cos^2 \phi) \sin \phi \, d\phi.\end{aligned}$$

Let $u = \cos \phi$, then $du = -\sin \phi \, d\phi$, so $\sin \phi \, d\phi = -du$. We substitute and obtain

$$\begin{aligned}\int \sin^3 \phi \, d\phi &= \int (1 - u^2)(-du) \\ &= \int (u^2 - 1) \, du \\ &= \frac{1}{3}u^3 - u + C \\ &= \boxed{\frac{1}{3} \cos^3 \phi - \cos \phi + C}.\end{aligned}$$

6. Let $x = 2 \sin \theta$, then $dx = 2 \cos \theta \, d\theta$. We substitute and obtain

$$\begin{aligned}\int \frac{x^2}{\sqrt{4 - x^2}} \, dx &= \int \frac{(2 \sin \theta)^2}{\sqrt{4 - (2 \sin \theta)^2}} (2 \cos \theta) \, d\theta \\ &= 8 \int \frac{\sin^2 \theta}{\sqrt{4 - 4 \sin^2 \theta}} \cos \theta \, d\theta \\ &= 4 \int \frac{\sin^2 \theta}{\cos \theta} \cos \theta \, d\theta \\ &= 4 \int \sin^2 \theta \, d\theta \\ &= 4 \int \frac{1 - \cos(2\theta)}{2} \, d\theta \\ &= 2 \int (1 - \cos(2\theta)) \, d\theta \\ &= 2 \left(\theta - \frac{1}{2} \sin 2\theta \right) + C \\ &= 2\theta - 2 \sin \theta \cos \theta + C.\end{aligned}$$

We have $\theta = \sin^{-1}(\frac{x}{2})$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/2)^2} = \frac{1}{2}\sqrt{4 - x^2}$. We obtain

$$\begin{aligned}\int \frac{x^2}{\sqrt{4 - x^2}} \, dx &= 2 \sin^{-1} \left(\frac{x}{2} \right) - 2 \left(\frac{x}{2} \right) \left(\frac{1}{2} \sqrt{4 - x^2} \right) + C \\ &= \boxed{2 \sin^{-1} \left(\frac{x}{2} \right) - \frac{1}{2} x \sqrt{4 - x^2} + C}.\end{aligned}$$

7. Let $u = x + 2$, so $du = dx$, then substitute.

$$\int \frac{dx}{\sqrt{(x+2)^2 - 1}} = \int \frac{dx}{\sqrt{u^2 - 1}}$$

Let $u = \sec \theta$, then $du = \sec \theta \tan \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{\sqrt{(x+2)^2 - 1}} &= \int \frac{\sec \theta \tan \theta d\theta}{\sqrt{\sec^2 \theta - 1}} \\ &= \int \frac{\sec \theta \tan \theta d\theta}{\tan \theta} \\ &= \int \sec \theta d\theta \\ &= \ln |\sec \theta + \tan \theta| + C. \end{aligned}$$

We have $\sec \theta = u = x + 2$, so $\tan \theta = \sqrt{\sec^2 \theta - 1} = \sqrt{u^2 - 1} = \sqrt{(x+2)^2 - 1}$. We obtain

$$\int \frac{dx}{\sqrt{(x+2)^2 - 1}} = \boxed{\ln \left| x + 2 + \sqrt{(x+2)^2 - 1} \right| + C}.$$

8. We use integration by parts with $u = x$ and $dv = \sin(2x) dx$. Then $du = dx$ and $v = \frac{1}{2}(-\cos(2x)) = -\frac{1}{2}\cos(2x)$. We obtain

$$\begin{aligned} \int_0^{\pi/4} x \sin(2x) dx &= \left[x \left(-\frac{1}{2} \cos(2x) \right) \right]_0^{\pi/4} - \int_0^{\pi/4} \left(-\frac{1}{2} \cos(2x) \right) dx \\ &= \left(-\frac{1}{2} \left(\frac{\pi}{4} \right) \cos \left(2 \left(\frac{\pi}{4} \right) \right) \right) - \left(-\frac{1}{2} (0) \cos(2(0)) \right) + \frac{1}{2} \int_0^{\pi/4} \cos(2x) dx \\ &= 0 + \frac{1}{2} \left[\frac{1}{2} \sin 2x \right]_0^{\pi/4} \\ &= \frac{1}{2} \left(\frac{1}{2} \sin 2 \left(\frac{\pi}{4} \right) \right) - \frac{1}{2} \left(\frac{1}{2} \sin 2(0) \right) \\ &= \boxed{\frac{1}{4}}. \end{aligned}$$

9. We use integration by parts with $u = v$ and $dw = \csc^2 w dw$. Then $du = dv$ and $w = -\cot v$. We obtain

$$\begin{aligned} \int v \csc^2 v dv &= v(-\cot v) - \int (-\cot v) dv \\ &= -v \cot v + \int \cot v dv \\ &= \boxed{-v \cot v + \ln |\sin v| + C}. \end{aligned}$$

10. Factor out $\cos x$ and use the identity $\cos^2 x = 1 - \sin^2 x$.

$$\begin{aligned} \int \sin^2 x \cos^3 x dx &= \int \sin^2 x \cos^2 x \cos x dx \\ &= \int \sin^2 x (1 - \sin^2 x) \cos x dx. \end{aligned}$$

Let $u = \sin x$, then $du = \cos x \, dx$. We substitute and obtain

$$\begin{aligned}
 \int \sin^2 x \cos^3 x \, dx &= \int u^2(1-u^2) \, du \\
 &= \int (u^2 - u^4) \, du \\
 &= \frac{1}{3}u^3 - \frac{1}{5}u^5 + C \\
 &= \boxed{\frac{1}{3}\sin^3 x - \frac{1}{5}\sin^5 x + C}.
 \end{aligned}$$

11. Let $x = 2 \sin \theta$, then $dx = 2 \cos \theta \, d\theta$. We substitute and obtain

$$\begin{aligned}
 \int (4-x^2)^{3/2} \, dx &= \int \left(4 - (2 \sin \theta)^2\right)^{3/2} (2 \cos \theta) \, d\theta \\
 &= 2 \int (2 \cos \theta)^3 \cos \theta \, d\theta \\
 &= 16 \int \cos^4 \theta \, d\theta \\
 &= 16 \int \left(\frac{1 + \cos(2\theta)}{2}\right)^2 \, d\theta \\
 &= 4 \int (1 + 2 \cos(2\theta) + \cos^2(2\theta)) \, d\theta \\
 &= 4(\theta + \sin(2\theta)) + 4 \int \frac{1 + \cos(4\theta)}{2} \, d\theta \\
 &= 4\theta + 4 \sin(2\theta) + 2\theta + \frac{1}{2} \sin(4\theta) + C \\
 &= 6\theta + 8 \sin \theta \cos \theta + \sin(2\theta) \cos(2\theta) + C \\
 &= 6\theta + 8 \sin \theta \cos \theta + 2 \sin \theta \cos \theta (1 - 2 \sin^2 \theta) + C
 \end{aligned}$$

We have $\theta = \sin^{-1}\left(\frac{x}{2}\right)$, and $\cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - (x/2)^2} = \frac{1}{2}\sqrt{4 - x^2}$. We obtain

$$\begin{aligned}
 \int (4-x^2)^{3/2} \, dx &= 6 \sin^{-1}\left(\frac{x}{2}\right) + 8\left(\frac{x}{2}\right)\left(\frac{1}{2}\sqrt{4-x^2}\right) \\
 &\quad + 2\left(\frac{x}{2}\right)\left(\frac{1}{2}\sqrt{4-x^2}\right)\left(1 - 2\left(\frac{x}{2}\right)^2\right) + C \\
 &= \boxed{6 \sin^{-1}\left(\frac{x}{2}\right) + 2x\sqrt{4-x^2} + \frac{1}{4}x\sqrt{4-x^2}(2-x^2) + C}.
 \end{aligned}$$

12. We use partial fractions to obtain

$$\begin{aligned}
 \frac{3x^2 + 1}{x^3 + 2x^2 - 3x} &= \frac{3x^2 + 1}{x(x+3)(x-1)} \\
 &= \frac{A}{x} + \frac{B}{x+3} + \frac{C}{x-1} \\
 3x^2 + 1 &= A(x+3)(x-1) + Bx(x-1) + Cx(x+3).
 \end{aligned}$$

When $x = 1$ we obtain $C = 1$, when $x = -3$, we have $B = 7/3$, and when $x = 0$, we obtain

$A = -1/3$. So

$$\begin{aligned}\int \frac{3x^2 + 1}{x^3 + 2x^2 - 3x} dx &= \int \left(\frac{-1/3}{x} + \frac{7/3}{x+3} + \frac{1}{x-1} \right) dx \\ &= \int \frac{-1/3}{x} dx + \int \frac{7/3}{x+3} dx + \int \frac{1}{x-1} dx \\ &= \boxed{-\frac{1}{3} \ln |x| + \frac{7}{3} \ln |x+3| + \ln |x-1| + C}.\end{aligned}$$

13. Let $u = e^t$, so $du = e^t dt$. We substitute to obtain

$$\begin{aligned}\int \frac{e^{2t}}{e^t - 2} dt &= \int \frac{e^t}{e^t - 2} e^t dt \\ &= \int \frac{u}{u - 2} du \\ &= \int \frac{u - 2 + 2}{u - 2} du \\ &= \int \left(1 + \frac{2}{u - 2} \right) du \\ &= u + 2 \ln |u - 2| + C \\ &= \boxed{e^t + 2 \ln |e^t - 2| + C}.\end{aligned}$$

14. We rewrite the integral, and obtain

$$\int \frac{dy}{5 + 4y + 4y^2} = \int \frac{dy}{4 + (1 + 2y)^2}.$$

Let $u = 1 + 2y$, so $du = 2 dy$, and substitute:

$$\begin{aligned}\int \frac{dy}{5 + 4y + 4y^2} &= \int \frac{\frac{1}{2} du}{2^2 + u^2} \\ &= \frac{1}{2} \left(\frac{1}{2} \right) \tan^{-1} \frac{u}{2} + C \\ &= \boxed{\frac{1}{4} \tan^{-1} \frac{1+2y}{2} + C}.\end{aligned}$$

15. We use partial fractions to obtain

$$\begin{aligned}\frac{x}{x^4 - 16} &= \frac{x}{(x^2 - 4)(x^2 + 4)} \\ &= \frac{x}{(x - 2)(x + 2)(x^2 + 4)} \\ &= \frac{A}{x - 2} + \frac{B}{x + 2} + \frac{Cx + D}{x^2 + 4}\end{aligned}$$

so

$$x = A(x + 2)(x^2 + 4) + B(x - 2)(x^2 + 4) + (Cx + D)(x - 2)(x + 2).$$

Let $x = 2$ to obtain $A = 1/16$, and $x = -2$ to get $B = 1/16$. We now have

$$\begin{aligned}x &= \frac{1}{16}(x + 2)(x^2 + 4) + \frac{1}{16}(x - 2)(x^2 + 4) + (Cx + D)(x - 2)(x + 2) \\ x &= \left(C + \frac{1}{8} \right) x^3 + Dx^2 + \left(\frac{1}{2} - 4C \right) x - 4D.\end{aligned}$$

Equating coefficients, we obtain $C = -1/8$ and $D = 0$. So

$$\begin{aligned}
 \int \frac{x \, dx}{x^4 - 16} &= \int \left(\frac{1/16}{x-2} + \frac{1/16}{x+2} + \frac{(-1/8)x}{x^2+4} \right) dx \\
 &= \frac{1}{16} \ln |x-2| + \frac{1}{16} \ln |x+2| - \frac{1}{16} \ln (x^2+4) + C \\
 &= \frac{1}{16} \ln |x^2-4| - \frac{1}{16} \ln (x^2+4) + C \\
 &= \boxed{\frac{1}{16} \ln \left| \frac{x^2-4}{x^2+4} \right| + C}.
 \end{aligned}$$

16. Let $y = x^2$, so $dy = 2x \, dx$ and $x \, dx = \frac{1}{2} dy$. We substitute and obtain

$$\begin{aligned}
 \int x^3 e^{x^2} \, dx &= \int x^2 e^{x^2} x \, dx \\
 &= \int y e^y \frac{1}{2} dy \\
 &= \frac{1}{2} \int y e^y \, dy.
 \end{aligned}$$

We use integration by parts with $u = y$, $du = dy$, $dv = e^y \, dy$, and $v = e^y$. We obtain

$$\begin{aligned}
 \int x^3 e^{x^2} \, dx &= \frac{1}{2} \left(y e^y - \int e^y \, dy \right) \\
 &= \frac{1}{2} (y e^y - e^y) + C \\
 &= \boxed{\frac{1}{2} x^2 e^{x^2} - \frac{1}{2} e^{x^2} + C}.
 \end{aligned}$$

17. Let $u = y + 1$, so $du = dy$ and $y = u - 1$. We substitute and obtain

$$\begin{aligned}
 \int \frac{y^2 \, dy}{(y+1)^3} &= \int \frac{(u-1)^2 \, du}{u^3} \\
 &= \int \frac{u^2 - 2u + 1}{u^3} \, du \\
 &= \int \left(\frac{1}{u} - 2u^{-2} + u^{-3} \right) \, du \\
 &= \ln |u| + \frac{2}{u} - \frac{1}{2u^2} + C \\
 &= \boxed{\ln |y+1| + \frac{2}{y+1} - \frac{1}{2(y+1)^2} + C}.
 \end{aligned}$$

18. Let $x = 5 \tan \theta$, then $dx = 5 \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{x^2 + 25}} &= \int \frac{5 \sec^2 \theta}{(5 \tan \theta)^2 \sqrt{(5 \tan \theta)^2 + 25}} d\theta \\ &= \frac{1}{5} \int \frac{\sec^2 \theta}{\tan^2 \theta \sqrt{25 \tan^2 \theta + 25}} d\theta \\ &= \frac{1}{25} \int \frac{\sec^2 \theta}{\tan^2 \theta \sec \theta} d\theta \\ &= \frac{1}{25} \int \frac{\sec \theta}{\tan^2 \theta} d\theta \\ &= \frac{1}{25} \int \frac{\cos \theta}{\sin^2 \theta} d\theta. \end{aligned}$$

Let $u = \sin \theta$, then $du = \cos \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{x^2 + 25}} &= \frac{1}{25} \int \frac{1}{u^2} du \\ &= \frac{1}{25} \left(-\frac{1}{u} \right) + C \\ &= -\frac{1}{25} \csc \theta + C. \end{aligned}$$

We have $\tan \theta = \frac{x}{5}$, so $\cot \theta = \frac{5}{x}$, and $\csc \theta = \sqrt{1 + \cot^2 \theta} = \sqrt{1 + \left(\frac{5}{x}\right)^2} = \frac{1}{x} \sqrt{x^2 + 25}$. We obtain

$$\begin{aligned} \int \frac{dx}{x^2 \sqrt{x^2 + 25}} &= -\frac{1}{25} \frac{1}{x} \sqrt{x^2 + 25} + C \\ &= \boxed{-\frac{\sqrt{x^2 + 25}}{25x} + C}. \end{aligned}$$

19. We use integration by parts with $u = x$ and $dv = \sec^2 x dx$. Then $du = dx$ and $v = \tan x$. We obtain

$$\begin{aligned} \int x \sec^2 x dx &= x \tan x - \int \tan x dx \\ &= \boxed{x \tan x - \ln |\sec x| + C}. \end{aligned}$$

20. We complete the square: $16 + 4x - 2x^2 = 2(8 + 2x - x^2) = 2(9 - (x - 1)^2)$. Then we let $u = (x - 1)$ to obtain

$$\begin{aligned} \int \frac{dx}{\sqrt{16 + 4x - 2x^2}} &= \int \frac{dx}{\sqrt{2(9 - (x - 1)^2)}} \\ &= \frac{1}{\sqrt{2}} \int \frac{du}{\sqrt{3^2 - u^2}} \\ &= \frac{1}{\sqrt{2}} \sin^{-1} \left(\frac{u}{3} \right) + C \\ &= \boxed{\frac{\sqrt{2}}{2} \sin^{-1} \left(\frac{x-1}{3} \right) + C}. \end{aligned}$$

21. We use integration by parts with $u = \ln(1 - y)$, $du = \frac{-1}{1-y} dy$, $dv = dy$, and $v = y$. We obtain

$$\begin{aligned}
 \int \ln(1 - y) dy &= y \ln(1 - y) - \int y \left(\frac{-1}{1-y} \right) dy \\
 &= y \ln(1 - y) - \int \frac{-y}{1-y} dy \\
 &= y \ln(1 - y) - \int \frac{(1-y) - 1}{1-y} dy \\
 &= y \ln(1 - y) - \int \left(1 - \frac{1}{1-y} \right) dy \\
 &= \boxed{y \ln(1 - y) - y - \ln(1 - y) + C}.
 \end{aligned}$$

22. We use partial fractions to obtain

$$\begin{aligned}
 \frac{x^3 - 2x - 1}{(x^2 + 1)^2} &= \frac{Ax + B}{x^2 + 1} + \frac{Cx + D}{(x^2 + 1)^2} \\
 x^3 - 2x - 1 &= (Ax + B)(x^2 + 1) + Cx + D \\
 x^3 - 2x - 1 &= Ax^3 + Bx^2 + (A + C)x + (B + D).
 \end{aligned}$$

We equate coefficients, and obtain $A = 1$, $B = 0$, $C = -3$, and $D = -1$. We now have

$$\begin{aligned}
 \int \frac{x^3 - 2x - 1}{(x^2 + 1)^2} dx &= \int \left(\frac{x}{x^2 + 1} - \frac{3x + 1}{(x^2 + 1)^2} \right) dx \\
 &= \frac{1}{2} \ln(x^2 + 1) - 3 \int \frac{x}{(x^2 + 1)^2} dx - \int \frac{1}{(x^2 + 1)^2} dx \\
 &= \frac{1}{2} \ln(x^2 + 1) + \frac{3}{2(x^2 + 1)} - \int \frac{1}{(x^2 + 1)^2} dx.
 \end{aligned}$$

For the remaining integral, we let $x = \tan \theta$, and obtain

$$\begin{aligned}
 \int \frac{1}{(x^2 + 1)^2} dx &= \int \frac{\sec^2 \theta}{\sec^4 \theta} d\theta \\
 &= \int \cos^2 \theta d\theta \\
 &= \frac{1}{2} \int (1 + \cos(2\theta)) d\theta \\
 &= \frac{1}{2} \left(\theta + \frac{1}{2} \sin 2\theta \right) + C \\
 &= \frac{1}{2} (\theta + \sin \theta \cos \theta) + C \\
 &= \frac{1}{2} \left(\theta + \frac{\tan \theta}{\sec^2 \theta} \right) + C.
 \end{aligned}$$

Since $x = \tan \theta$, $\sec \theta = \sqrt{\tan^2 \theta + 1} = \sqrt{x^2 + 1}$, and we have

$$\begin{aligned}
 \int \frac{1}{(x^2 + 1)^2} dx &= \frac{1}{2} \tan^{-1} x + \frac{1}{2} \frac{x}{(\sqrt{x^2 + 1})^2} + C \\
 &= \frac{1}{2} \tan^{-1} x + \frac{1}{2} \frac{x}{x^2 + 1} + C.
 \end{aligned}$$

And so we obtain

$$\int \frac{x^3 - 2x - 1}{(x^2 + 1)^2} dx = \boxed{\frac{1}{2} \ln(x^2 + 1) + \frac{3}{2(x^2 + 1)} - \frac{1}{2} \tan^{-1} x - \frac{1}{2} \frac{x}{x^2 + 1} + C}.$$

23. We use partial fractions to obtain

$$\begin{aligned} \frac{3x^2 + 2}{x^3 - x^2} &= \frac{3x^2 + 2}{x^2(x - 1)} \\ &= \frac{A}{x} + \frac{B}{x^2} + \frac{C}{x - 1} \\ 3x^2 + 2 &= Ax(x - 1) + B(x - 1) + Cx^2. \end{aligned}$$

Let $x = 1$ to obtain $C = 5$. Let $x = 0$ to get $B = -2$. Then

$$\begin{aligned} 3x^2 + 2 &= Ax(x - 1) + (-2)(x - 1) + 5x^2 \\ 3x^2 + 2 &= (A + 5)x^2 + (-A - 2)x + 2. \end{aligned}$$

We equate coefficients and determine $A = -2$. We now have

$$\begin{aligned} \int \frac{3x^2 + 2}{x^3 - x^2} dx &= \int \left(\frac{-2}{x} + \frac{-2}{x^2} + \frac{5}{x - 1} \right) dx \\ &= \boxed{-2 \ln |x| + \frac{2}{x} + 5 \ln |x - 1| + C}. \end{aligned}$$

24. Let $y = \sqrt{2/3} \tan \theta$, then $dy = \sqrt{2/3} \sec^2 \theta d\theta$. We substitute and obtain

$$\begin{aligned} \int \frac{dy}{\sqrt{2 + 3y^2}} &= \int \frac{\sqrt{2/3} \sec^2 \theta d\theta}{\sqrt{2 + 3(\sqrt{2/3} \tan \theta)^2}} \\ &= \int \frac{\sqrt{2/3} \sec^2 \theta d\theta}{\sqrt{2 + 2 \tan^2 \theta}} \\ &= \frac{1}{\sqrt{3}} \int \frac{1}{\sec \theta} (\sec^2 \theta) d\theta \\ &= \frac{1}{\sqrt{3}} \int \sec \theta d\theta \\ &= \frac{1}{\sqrt{3}} \ln |\sec \theta + \tan \theta| + C. \end{aligned}$$

We have $\tan \theta = \sqrt{3/2}y$, and $\sec \theta = \sqrt{1 + \tan^2 \theta} = \sqrt{1 + (3/2)y^2} = \frac{\sqrt{2}}{2} \sqrt{2 + 3y^2}$. We obtain

$$\begin{aligned} \int \frac{dy}{\sqrt{2 + 3y^2}} &= \frac{1}{\sqrt{3}} \ln \left| \frac{\sqrt{2}}{2} \sqrt{2 + 3y^2} + \sqrt{3/2}y \right| + C \\ &= \frac{1}{\sqrt{3}} \ln \left| \frac{\sqrt{2}}{2} \sqrt{2 + 3y^2} + \frac{\sqrt{6}}{2}y \right| + C \\ &= \boxed{\frac{\sqrt{3}}{3} \ln \left| \sqrt{4 + 6y^2} + \sqrt{6}y \right| + C}. \end{aligned}$$

25. We use integration by parts with $u = \sin^{-1} x$, $du = \frac{1}{\sqrt{1-x^2}} dx$, $dv = x^2 dx$, and $v = \frac{1}{3}x^3$. We obtain

$$\begin{aligned}\int x^2 \sin^{-1} x \, dx &= \frac{1}{3}x^3 \sin^{-1} x - \int \left(\frac{1}{3}x^3\right) \frac{1}{\sqrt{1-x^2}} dx \\ &= \frac{1}{3}x^3 \sin^{-1} x - \frac{1}{3} \int \frac{x^2}{\sqrt{1-x^2}} x \, dx.\end{aligned}$$

Now let $u = 1 - x^2$, so $du = -2x \, dx$, $x \, dx = -\frac{1}{2} du$, and $x^2 = 1 - u$. We substitute and obtain

$$\begin{aligned}\int x^2 \sin^{-1} x \, dx &= \frac{1}{3}x^3 \sin^{-1} x - \frac{1}{3} \int \frac{1-u}{\sqrt{u}} \left(-\frac{1}{2}\right) du \\ &= \frac{1}{3}x^3 \sin^{-1} x + \frac{1}{6} \int (u^{-1/2} - u^{1/2}) du \\ &= \frac{1}{3}x^3 \sin^{-1} x + \frac{1}{6} \left(2\sqrt{u} - \frac{2}{3}u^{3/2}\right) + C \\ &= \boxed{\frac{1}{3}x^3 \sin^{-1} x + \frac{1}{3}\sqrt{1-x^2} - \frac{1}{9}(1-x^2)^{3/2} + C}.\end{aligned}$$

26. Let $x = \frac{4}{3} \tan \theta$, then $dx = \frac{4}{3} \sec^2 \theta \, d\theta$. We substitute and obtain

$$\begin{aligned}\int \sqrt{16+9x^2} \, dx &= \int \sqrt{16+9\left(\frac{4}{3}\tan\theta\right)^2} \left(\frac{4}{3}\sec^2\theta\right) d\theta \\ &= \frac{4}{3} \int \sqrt{16+16\tan^2\theta} \sec^2\theta \, d\theta \\ &= \frac{4}{3} \int (4\sec\theta) \sec^2\theta \, d\theta \\ &= \frac{16}{3} \int \sec^3\theta \, d\theta \\ &= \frac{16}{3} \left[\frac{1}{2} \sec\theta \tan\theta + \frac{1}{2} \ln |\sec\theta + \tan\theta| \right] + C \\ &= \frac{8}{3} \sec\theta \tan\theta + \frac{8}{3} \ln |\sec\theta + \tan\theta| + C.\end{aligned}$$

We have $\tan \theta = \frac{3x}{4}$, and $\sec \theta = \sqrt{1+\tan^2 \theta} = \sqrt{1+\left(\frac{3x}{4}\right)^2} = \frac{1}{4}\sqrt{16+9x^2}$. We obtain

$$\begin{aligned}\int \sqrt{16+9x^2} \, dx &= \frac{8}{3} \left(\frac{1}{4} \sqrt{16+9x^2} \right) \left(\frac{3x}{4} \right) + \frac{8}{3} \ln \left| \frac{1}{4} \sqrt{16+9x^2} + \frac{3x}{4} \right| + C \\ &= \frac{1}{2} x \sqrt{16+9x^2} + \frac{8}{3} \ln \left| \sqrt{16+9x^2} + 3x \right| - \frac{8}{3} \ln 4 + C \\ &= \boxed{\frac{1}{2} x \sqrt{16+9x^2} + \frac{8}{3} \ln \left| \sqrt{16+9x^2} + 3x \right| + C}.\end{aligned}$$

27. We use partial fractions to obtain

$$\begin{aligned}\frac{1}{x^2+2x} &= \frac{1}{2(x+2)} \\ &= \frac{A}{x} + \frac{B}{x+2} \\ 1 &= A(x+2) + Bx.\end{aligned}$$

When $x = -2$ we obtain $B = -1/2$, and when $x = 0$, we have $A = 1/2$. So

$$\begin{aligned}\int \frac{dx}{x^2 + 2x} &= \int \left(\frac{1/2}{x} + \frac{-1/2}{x+2} \right) dx \\ &= \frac{1}{2} \ln |x| - \frac{1}{2} \ln |x+2| + C \\ &= \boxed{\frac{1}{2} \ln \left| \frac{x}{x+2} \right| + C}.\end{aligned}$$

28. We use formula 105, with $m = 4$, $n = 4$, and we have

$$\begin{aligned}\int \sin^4 y \cos^4 y dy &= -\frac{\sin^3 y \cos^5 y}{4+4} + \frac{4-1}{4+4} \int \sin^{4-2} y \cos^4 y dy \\ &= -\frac{\sin^3 y \cos^5 y}{8} + \frac{3}{8} \int \sin^2 y \cos^4 y dy.\end{aligned}$$

With $m = 2$, $n = 4$ we have

$$\begin{aligned}\int \sin^4 y \cos^4 y dy &= -\frac{\sin^3 y \cos^5 y}{8} + \frac{3}{8} \left(-\frac{\sin y \cos^5 y}{2+4} + \frac{2-1}{2+4} \int \sin^{2-2} y \cos^4 y dy \right) \\ &= -\frac{\sin^3 y \cos^5 y}{8} - \frac{\sin y \cos^5 y}{16} + \frac{1}{16} \int \cos^4 y dy.\end{aligned}$$

We now can use formula 91, and obtain

$$\begin{aligned}\int \sin^4 y \cos^4 y dy &= -\frac{\sin^3 y \cos^5 y}{8} - \frac{\sin y \cos^5 y}{16} + \frac{1}{16} \left(\frac{1}{4} \cos^3 y \sin y + \frac{4-1}{4} \int \cos^2 y dy \right) \\ &= -\frac{\sin^3 y \cos^5 y}{8} - \frac{\sin y \cos^5 y}{16} + \frac{\cos^3 y \sin y}{64} + \frac{3}{64} \int \cos^2 y dy.\end{aligned}$$

Finally, from formula 85, we have

$$\begin{aligned}\int \sin^4 y \cos^4 y dy &= -\frac{\sin^3 y \cos^5 y}{8} - \frac{\sin y \cos^5 y}{16} + \frac{\cos^3 y \sin y}{64} + \frac{3}{64} \left(\frac{y}{2} + \frac{\sin 2y}{4} \right) + C \\ &= \boxed{-\frac{\sin^3 y \cos^5 y}{8} - \frac{\sin y \cos^5 y}{16} + \frac{\cos^3 y \sin y}{64} + \frac{3y}{128} + \frac{3 \sin 2y}{256} + C}.\end{aligned}$$

29. We use partial fractions to obtain

$$\begin{aligned}\frac{w-2}{1-w^2} &= \frac{w-2}{(1-w)(1+w)} \\ &= \frac{A}{1-w} + \frac{B}{1+w} \\ w-2 &= A(1+w) + B(1-w).\end{aligned}$$

Let $w = -1$ to obtain $B = -3/2$, and let $w = 1$ to obtain $A = -1/2$. We now have

$$\begin{aligned}\int \frac{w-2}{1-w^2} dw &= \int \left(\frac{-1/2}{1-w} + \frac{-3/2}{1+w} \right) dw \\ &= \boxed{\frac{1}{2} \ln |1-w| - \frac{3}{2} \ln |1+w| + C}.\end{aligned}$$

30. Let $u = x^2 - 4$, so $du = 2x dx$, and $x dx = \frac{1}{2} du$. We substitute and obtain

$$\begin{aligned}\int \frac{x}{\sqrt{x^2 - 4}} dx &= \int \frac{1}{\sqrt{u}} \left(\frac{1}{2}\right) du \\ &= \frac{1}{2} \int u^{-1/2} du \\ &= \frac{1}{2} (2\sqrt{u}) + C \\ &= \boxed{\sqrt{x^2 - 4} + C}.\end{aligned}$$

31. Let $u = \sqrt{x}$, so $du = \frac{1}{2\sqrt{x}} dx$ and $\frac{1}{\sqrt{x}} dx = 2 du$. We substitute and obtain

$$\begin{aligned}\int \frac{1}{\sqrt{x}} \cos^2 \sqrt{x} dx &= \int (\cos^2 u)(2) du \\ &= 2 \int \frac{1 + \cos(2u)}{2} du \\ &= \int (1 + \cos(2u)) du \\ &= u + \frac{1}{2} \sin(2u) + C \\ &= u + \sin u \cos u + C \\ &= \boxed{\sqrt{x} + \sin \sqrt{x} \cos \sqrt{x} + C}.\end{aligned}$$

32. We use formula 96, and obtain

$$\begin{aligned}\int \sin\left(\frac{\pi}{2}x\right) \sin(\pi x) dx &= -\frac{\sin\left(\frac{\pi}{2} + \pi\right)x}{2\left(\frac{\pi}{2} + \pi\right)} + \frac{\sin\left(\frac{\pi}{2} - \pi\right)x}{2\left(\frac{\pi}{2} - \pi\right)} + C \\ &= -\frac{\sin\left(\frac{3\pi}{2}x\right)}{3\pi} + \frac{\sin\left(-\frac{\pi}{2}x\right)}{-\pi} + C \\ &= \boxed{-\frac{\sin\left(\frac{3\pi}{2}x\right)}{3\pi} + \frac{\sin\left(\frac{\pi}{2}x\right)}{\pi} + C}.\end{aligned}$$

33. We use formula 98, and obtain

$$\begin{aligned}\int \sin x \cos(2x) dx &= -\frac{\cos(1+2)x}{2(1+2)} - \frac{\cos(1-2)x}{2(1-2)} + C \\ &= \boxed{\frac{1}{2} \cos x - \frac{1}{6} \cos(3x) + C}.\end{aligned}$$

34. Let $x = 2 \cos \theta$, so $dx = -2 \sin \theta d\theta$, and the limits of integration are $\theta = \cos^{-1} \frac{0}{2} = \frac{\pi}{2}$ and $\theta = \cos^{-1} \frac{1}{2} = \frac{\pi}{3}$. We substitute and obtain

$$\begin{aligned}\int_0^1 \frac{x^2}{\sqrt{4-x^2}} dx &= \int_{\pi/2}^{\pi/3} \frac{(2 \cos \theta)^2}{\sqrt{4-(2 \cos \theta)^2}} (-2 \sin \theta) d\theta \\ &= -8 \int_{\pi/2}^{\pi/3} \frac{\cos^2 \theta \sin \theta}{2 \sin \theta} d\theta \\ &= 4 \int_{\pi/3}^{\pi/2} \cos^2 \theta d\theta\end{aligned}$$

$$\begin{aligned}
&= 4 \int_{\pi/3}^{\pi/2} \frac{1 + \cos 2\theta}{2} d\theta \\
&= 2 \int_{\pi/3}^{\pi/2} (1 + \cos 2\theta) d\theta \\
&= 2 \left[\theta + \frac{1}{2} \sin 2\theta \right]_{\pi/3}^{\pi/2} \\
&= 2 \left[\frac{\pi}{2} + \frac{1}{2} \sin \left(2 \left(\frac{\pi}{2} \right) \right) - \left(\frac{\pi}{3} + \frac{1}{2} \sin \left(2 \left(\frac{\pi}{3} \right) \right) \right) \right] \\
&= 2 \left[\frac{1}{2} \pi - \left(\frac{1}{3} \pi + \frac{1}{4} \sqrt{3} \right) \right] \\
&= \boxed{\frac{1}{3} \pi - \frac{1}{2} \sqrt{3}}.
\end{aligned}$$

35. Let $u = 1 + x^2$, then $du = 2x dx$, so $x dx = \frac{1}{2} du$. The lower limit of integration is $u = 1 + 0^2 = 1$, and the upper limit becomes $u = 1 + (\sqrt{3})^2 = 4$. We substitute to obtain

$$\begin{aligned}
\int_0^{\sqrt{3}} \frac{x dx}{\sqrt{1+x^2}} &= \int_1^4 \frac{\frac{1}{2} du}{\sqrt{u}} \\
&= \int_1^4 \frac{1}{2} u^{-1/2} du \\
&= \left[u^{1/2} \right]_1^4 \\
&= 4^{1/2} - 1^{1/2} \\
&= \boxed{1}.
\end{aligned}$$

36. (a) Let $u = 2x$, so $du = 2 dx$. We substitute and obtain

$$\int \frac{\cos^2 2x}{\sin^3 2x} dx = \frac{1}{2} \int \cos^2 u (\sin u)^{-3} du.$$

We use Formula 105 with $m = -3$ and $n = 2$, and obtain

$$\begin{aligned}
\int \frac{\cos^2 2x}{\sin^3 2x} dx &= \frac{1}{2} \left(\frac{(\sin u)^{-3+1} \cos^{2-1} u}{-3+2} + \frac{2-1}{-3+2} \int \cos^{2-2} u (\sin u)^{-3} du \right) \\
&= \frac{-\cos u}{2 \sin^2 u} - \frac{1}{2} \int \csc^3 u du.
\end{aligned}$$

Next use Formula 89, and we have

$$\begin{aligned}
\int \frac{\cos^2 2x}{\sin^3 2x} dx &= \frac{-\cos u}{2 \sin^2 u} - \frac{1}{2} \left(-\frac{1}{2} \csc u \cot u + \frac{1}{2} \ln |\csc u - \cot u| \right) + C \\
&= -\frac{1}{2} \cos 2x \csc^2 2x + \frac{1}{4} \csc 2x \cot 2x - \frac{1}{4} \ln |\csc 2x - \cot 2x| + C.
\end{aligned}$$

(b) Using a CAS we obtain

$$\int \frac{\cos^2 2x}{\sin^3 2x} dx = \boxed{-\frac{1}{4} \frac{\cos^3(2x)}{\sin^2(2x)} - \frac{1}{4} \cos(2x) - \frac{1}{4} \ln |\csc(2x) - \cot(2x)| + C}.$$

(c) We simplify the first two terms of the antiderivative in part (a),

$$\begin{aligned}
-\frac{1}{2} \cos 2x \csc^2 2x + \frac{1}{4} \csc 2x \cot 2x &= -\frac{1}{2} \cos 2x \csc^2 2x + \frac{1}{4} \csc 2x (\cos 2x \csc 2x) \\
&= -\frac{1}{2} \cos 2x \csc^2 2x + \frac{1}{4} \csc^2 2x \cos 2x \\
&= -\frac{1}{4} \cos (2x) \csc^2 (2x).
\end{aligned}$$

And likewise, in part (b), we obtain

$$\begin{aligned}
-\frac{1}{4} \frac{\cos^3 (2x)}{\sin^2 (2x)} - \frac{1}{4} \cos (2x) &= -\frac{1}{4} \frac{\cos (2x) (1 - \sin^2 (2x))}{\sin^2 (2x)} - \frac{1}{4} \cos (2x) \\
&= -\frac{1}{4} \cos (2x) \csc^2 (2x) + \frac{1}{4} \cos (2x) - \frac{1}{4} \cos (2x) \\
&= -\frac{1}{4} \cos (2x) \csc^2 (2x).
\end{aligned}$$

And so adding the same logarithm terms, we see that our results above are equal.

37. We integrate by parts, with $u = \tan^{-1} x$, $du = \frac{1}{1+x^2} dx$, $dv = x^n dx$, and $v = \frac{1}{n+1} x^{n+1}$. We obtain

$$\begin{aligned}
\int x^n \tan^{-1} x dx &= \left(\frac{1}{n+1} x^{n+1} \right) \tan^{-1} x - \int \left(\frac{1}{n+1} x^{n+1} \right) \frac{1}{1+x^2} dx \\
&= \frac{x^{n+1}}{n+1} \tan^{-1} x - \frac{1}{n+1} \int \frac{x^{n+1}}{1+x^2} dx.
\end{aligned}$$

38. We integrate by parts, with $u = x^n$, $du = nx^{n-1} dx$, $dv = (ax+b)^{1/2} dx$, and $v = \frac{2}{3a}(ax+b)^{3/2}$. We obtain

$$\begin{aligned}
\int x^n (ax+b)^{1/2} dx &= (x^n) \left(\frac{2}{3a} (ax+b)^{3/2} \right) - \int \left(\frac{2}{3a} (ax+b)^{3/2} \right) (nx^{n-1}) dx \\
&= \frac{2x^n}{3a} (ax+b)^{3/2} - \frac{2n}{3a} \int (ax+b)(ax+b)^{1/2} (x^{n-1}) dx \\
&= \frac{2x^n}{3a} (ax+b)^{3/2} \\
&\quad - \frac{2n}{3a} \left(\int (ax)(ax+b)^{1/2} (x^{n-1}) dx + \int (b)(ax+b)^{1/2} (x^{n-1}) dx \right) \\
&= \frac{2x^n}{3a} (ax+b)^{3/2} - \frac{2n}{3} \int x^n (ax+b)^{1/2} dx - \frac{2bn}{3a} \int x^{n-1} (ax+b)^{1/2} dx.
\end{aligned}$$

We add $\frac{2n}{3} \int x^n (ax+b)^{1/2} dx$ to each side and obtain

$$\begin{aligned}
\left(1 + \frac{2n}{3} \right) \int x^n (ax+b)^{1/2} dx &= \frac{2x^n}{3a} (ax+b)^{3/2} - \frac{2bn}{3a} \int x^{n-1} (ax+b)^{1/2} dx \\
\left(\frac{2n+3}{3} \right) \int x^n (ax+b)^{1/2} dx &= \frac{2x^n}{3a} (ax+b)^{3/2} - \frac{2bn}{3a} \int x^{n-1} (ax+b)^{1/2} dx \\
\int x^n (ax+b)^{1/2} dx &= \frac{3}{2n+3} \frac{2x^n}{3a} (ax+b)^{3/2} - \frac{3}{2n+3} \frac{2bn}{3a} \int x^{n-1} (ax+b)^{1/2} dx \\
&= \frac{2x^n}{(2n+3)a} (ax+b)^{3/2} - \frac{2bn}{(2n+3)a} \int x^{n-1} (ax+b)^{1/2} dx
\end{aligned}$$

39. We evaluate

$$\int_1^{\infty} \frac{e^{-\sqrt{x}}}{\sqrt{x}} dx = \lim_{b \rightarrow \infty} \int_1^b x^{-1/2} e^{-x^{1/2}} dx.$$

Let $u = x^{1/2}$, then $du = \frac{1}{2}x^{-1/2} dx$. We substitute to obtain

$$\begin{aligned} \int_1^{\infty} \frac{e^{-\sqrt{x}}}{\sqrt{x}} dx &= \lim_{b \rightarrow \infty} \int_1^{b^{1/2}} 2e^{-u} du \\ &= \lim_{b \rightarrow \infty} [-2e^{-u}]_1^{b^{1/2}} \\ &= \lim_{b \rightarrow \infty} [-2e^{-b^{1/2}} - (-2e^{-1})] \\ &= \lim_{b \rightarrow \infty} [-2e^{-b^{1/2}} + 2e^{-1}] \\ &= \frac{2}{e}. \end{aligned}$$

The improper integral converges to $\boxed{\frac{2}{e}}$.

40. We evaluate

$$\int_0^1 \frac{\sin \sqrt{x}}{\sqrt{x}} dx = \lim_{a \rightarrow 0^+} \int_a^1 x^{-1/2} \sin(x^{1/2}) dx.$$

Let $u = x^{1/2}$, then $du = \frac{1}{2}x^{-1/2} dx$. We substitute to obtain

$$\begin{aligned} \int_0^1 \frac{\sin \sqrt{x}}{\sqrt{x}} dx &= \lim_{a \rightarrow 0^+} \int_{\sqrt{a}}^1 2 \sin u du \\ &= \lim_{a \rightarrow 0^+} [-2 \cos u]_{\sqrt{a}}^1 \\ &= \lim_{a \rightarrow 0^+} [-2 \cos 1 - (-2 \cos \sqrt{a})] \\ &= \lim_{a \rightarrow 0^+} [-2 \cos 1 + 2 \cos \sqrt{a}] \\ &= -2 \cos 1 + 2(1) \\ &= 2 - 2 \cos 1. \end{aligned}$$

The improper integral converges to $\boxed{2 - 2 \cos 1}$.

41. We evaluate

$$\int_0^1 \frac{x dx}{\sqrt{1-x^2}} = \lim_{b \rightarrow 1^-} \int_0^b \frac{x dx}{\sqrt{1-x^2}}.$$

Let $u = 1 - x^2$ and substitute to obtain

$$\begin{aligned} \int_0^1 \frac{x dx}{\sqrt{1-x^2}} &= \lim_{b \rightarrow 1^-} \int_1^{1-b^2} \frac{-\frac{1}{2} du}{\sqrt{u}} \\ &= \lim_{b \rightarrow 1^-} \left(-\frac{1}{2}\right) \int_1^{1-b^2} u^{-1/2} du \\ &= \lim_{b \rightarrow 1^-} \left[\left(-\frac{1}{2}\right) 2\sqrt{u}\right]_1^{1-b^2} \\ &= \lim_{b \rightarrow 1^-} [-\sqrt{u}]_1^{1-b^2} \\ &= \lim_{b \rightarrow 1^-} [-\sqrt{1-b^2} - (-\sqrt{1})] \\ &= 1. \end{aligned}$$

The improper integral converges to $\boxed{1}$.

42. We evaluate

$$\int_{-\infty}^0 xe^x dx = \lim_{a \rightarrow -\infty} \int_a^0 xe^x dx.$$

We let $u = x$, $du = dx$, $dv = e^x dx$, and $v = e^x$ and integrate by parts to obtain

$$\begin{aligned} \int_{-\infty}^0 xe^x dx &= \lim_{a \rightarrow -\infty} \left([xe^x]_a^0 - \int_a^0 e^x dx \right) \\ &= \lim_{a \rightarrow -\infty} \left(-ae^a - [e^x]_a^0 \right) \\ &= \lim_{a \rightarrow -\infty} \left(-ae^a - (e^0 - e^a) \right) \\ &= -1. \end{aligned}$$

The improper integral converges to $\boxed{-1}$.

43. We evaluate

$$\begin{aligned} \int_0^{\pi/2} \frac{\sin x}{\cos x} dx &= \lim_{b \rightarrow (\pi/2)^-} \int_0^b \tan x dx \\ &= \lim_{b \rightarrow (\pi/2)^-} [\ln |\sec x|]_0^b \\ &= \lim_{b \rightarrow (\pi/2)^-} [\ln |\sec b| - \ln |\sec 0|] \\ &= \lim_{b \rightarrow (\pi/2)^-} [\ln |\sec b|] \\ &= \infty \end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

44. We evaluate

$$\int_1^\infty \frac{\sqrt{1+x^{1/8}}}{x^{3/4}} dx = \lim_{b \rightarrow \infty} \int_1^b \frac{\sqrt{1+x^{1/8}}}{x^{3/4}} dx.$$

Let $u = 1 + x^{1/8}$, then $du = \frac{1}{8}x^{-7/8} dx$, so $dx = 8(u-1)^7 du$. We substitute and obtain

$$\begin{aligned} \int_1^\infty \frac{\sqrt{1+x^{1/8}}}{x^{3/4}} dx &= \lim_{b \rightarrow \infty} \int_2^{1+b^{1/8}} \frac{\sqrt{u}}{(u-1)^6} 8(u-1)^7 du \\ &= \lim_{b \rightarrow \infty} 8 \int_2^{1+b^{1/8}} \sqrt{u} (u-1) du \\ &= \lim_{b \rightarrow \infty} 8 \int_2^{1+b^{1/8}} (u^{3/2} - u^{1/2}) du \\ &= \lim_{b \rightarrow \infty} \left[\frac{16}{15} \left(3u^{\frac{5}{2}} - 5u^{\frac{3}{2}} \right) \right]_2^{1+b^{1/8}} \\ &= \lim_{b \rightarrow \infty} \left[\frac{16}{15} \left(3 \left(1 + b^{1/8} \right)^{\frac{5}{2}} - 5 \left(1 + b^{1/8} \right)^{\frac{3}{2}} \right) - \frac{16}{15} \left(3(2)^{\frac{5}{2}} - 5(2)^{\frac{3}{2}} \right) \right] \\ &= \lim_{b \rightarrow \infty} \left[\frac{16}{15} \left(1 + b^{1/8} \right)^{\frac{3}{2}} \left(3 \left(1 + b^{1/8} \right) - 5 \right) - \frac{16}{15} \left(3(2)^{\frac{5}{2}} - 5(2)^{\frac{3}{2}} \right) \right] \\ &= \infty. \end{aligned}$$

The improper integral $\boxed{\text{diverges}}$.

45. Since

$$\frac{1 + e^{-x}}{x} \geq \frac{1}{x}$$

for all x , and since $\int_1^\infty \frac{1}{x} dx$ diverges, by the Comparison Test, $\int_1^\infty \frac{1+e^{-x}}{x} dx$ diverges.

46. Since

$$\frac{x}{(1+x)^3} \leq \frac{x}{x^3} = \frac{1}{x^2}$$

for all $x > 0$, and since $\int_0^\infty \frac{1}{x^2} dx$ converges, by the Comparison Test, $\int_0^\infty \frac{x}{(1+x)^3} dx$ converges.

47. We use integration by parts with $u = x^2$ and $dv = \cos x dx$. Then

$$\int x^2 \cos x dx = x^2 \sin x - \int 2x \sin x dx$$

Then $f(x) = \boxed{x^2 \sin x}$.

48. (a) The volume is given by the integral $\int_1^e \pi(\ln x)^2 dx$. We use integration by parts with $u = (\ln x)^2$ and $dv = \pi dx$. Then $du = \frac{2 \ln x}{x} dx$ and $v = \pi x$. We obtain

$$\begin{aligned} \int_1^e \pi(\ln x)^2 dx &= \left[(\ln x)^2 (\pi x) \right]_1^e - \int_1^e (\pi x) \left(\frac{2 \ln x}{x} \right) dx \\ &= \left[(\ln e)^2 (\pi e) - (\ln 1)^2 (\pi(1)) \right] - 2\pi \int_1^e \ln x dx \\ &= \pi e - 2\pi \int_1^e \ln x dx \end{aligned}$$

We use integration by parts again with $u = \ln x$ and $dv = dx$. Then $du = \frac{1}{x} dx$ and $v = x$. We obtain

$$\begin{aligned} \int_1^e \pi(\ln x)^2 dx &= \pi e - 2\pi \left([(\ln x)x]_1^e - \int_1^e x \left(\frac{1}{x} \right) dx \right) \\ &= \pi e - 2\pi \left([(\ln e)e - (\ln 1)1] - \int_1^e dx \right) \\ &= \pi e - 2\pi(e - (e - 1)) \\ &= \boxed{\pi e - 2\pi}. \end{aligned}$$

(b) The volume is given by the integral $\int_1^e 2\pi x \ln x dx$. We use integration by parts with $u = \ln x$ and $dv = 2\pi x dx$. Then $du = \frac{1}{x} dx$ and $v = \pi x^2$. We obtain

$$\begin{aligned} \int_1^e 2\pi x \ln x dx &= [(\ln x)(\pi x^2)]_1^e - \int_1^e (\pi x^2) \left(\frac{1}{x} \right) dx \\ &= \left[(\ln e)(\pi e^2) - (\ln 1)(\pi(1)^2) \right] - \pi \int_1^e x dx \\ &= \pi e^2 - \pi \left[\frac{1}{2} x^2 \right]_1^e \\ &= \pi e^2 - \pi \left(\frac{1}{2} e^2 - \frac{1}{2} (1)^2 \right) \\ &= \boxed{\frac{1}{2} \pi e^2 + \frac{1}{2} \pi}. \end{aligned}$$

49. The arc length is given by $\int_0^{\pi/2} \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx = \int_0^{\pi/2} \sqrt{1 + (\cos x)^2} dx = \int_0^{\pi/2} \sqrt{1 + \cos^2 x} dx$.

(a) With $n = 3$ we have $\Delta x = \frac{(\pi/2)-0}{3} = \frac{\pi}{6}$. So the Trapezoidal Rule provides the approximation

$$\begin{aligned} \int_0^{\pi/2} \sqrt{1 + \cos^2 x} dx &\approx \frac{\Delta x}{2} \left[f(0) + 2f\left(\frac{\pi}{6}\right) + 2f\left(\frac{\pi}{3}\right) + f\left(\frac{\pi}{2}\right) \right] \\ &= \frac{\pi/6}{2} \left[\sqrt{1 + \cos^2 0} + 2\sqrt{1 + \cos^2 \frac{\pi}{6}} + 2\sqrt{1 + \cos^2 \frac{\pi}{3}} + \sqrt{1 + \cos^2 \frac{\pi}{2}} \right] \\ &\approx \boxed{1.910}. \end{aligned}$$

(b) With $n = 4$ we have $\Delta x = \frac{(\pi/2)-0}{4} = \frac{\pi}{8}$. So Simpson's Rule provides the approximation

$$\begin{aligned} \int_0^{\pi/2} \sqrt{1 + \cos^2 x} dx &\approx \frac{\Delta x}{3} \left[f(0) + 4f\left(\frac{\pi}{8}\right) + 2f\left(\frac{\pi}{4}\right) + 4f\left(\frac{3\pi}{8}\right) + f\left(\frac{\pi}{2}\right) \right] \\ &= \frac{\pi/8}{3} \left[\sqrt{1 + \cos^2 0} + 4\sqrt{1 + \cos^2 \frac{\pi}{8}} + 2\sqrt{1 + \cos^2 \frac{\pi}{4}} + 4\sqrt{1 + \cos^2 \frac{3\pi}{8}} + \sqrt{1 + \cos^2 \frac{\pi}{2}} \right] \\ &\approx \boxed{1.910}. \end{aligned}$$

50. The distance traveled is given by the integral $\int_1^4 v dt$. We approximate by the Trapezoidal Rule, with $\Delta t = 0.5$.

$$\begin{aligned} \int_1^4 v dx &\approx \frac{\Delta t}{2} [f(1) + 2f(1.5) + 2f(2) + 2f(2.5) + 2f(3) + 2f(3.5) + f(4)] \\ &= \frac{0.5}{2} [3 + 2(4.3) + 2(4.6) + 2(5.1) + 2(5.8) + 2(6.2) + 6.6] \\ &= \boxed{15.4 \text{ meters}}. \end{aligned}$$

51. The area is given by the improper integral

$$\begin{aligned} \int_0^1 x^{-2/3} dx &= \lim_{a \rightarrow 0^+} \int_a^1 x^{-2/3} dx \\ &= \lim_{a \rightarrow 0^+} \left[3x^{1/3} \right]_a^1 \\ &= \lim_{a \rightarrow 0^+} \left[3(1)^{1/3} - 3(a)^{1/3} \right] \\ &= 3. \end{aligned}$$

The area of the region is $\boxed{3}$.

52. The volume is given by the improper integral

$$\begin{aligned} \int_0^1 \pi \left(x^{-2/3} \right)^2 dx &= \lim_{a \rightarrow 0^+} \int_a^1 \pi x^{-4/3} dx \\ &= \lim_{a \rightarrow 0^+} \left[-3\pi x^{-1/3} \right]_a^1 \\ &= \lim_{a \rightarrow 0^+} \left[-3\pi(1)^{-1/3} - \left(-3\pi(a)^{-1/3} \right) \right] \\ &= \infty. \end{aligned}$$

The improper integral diverges, so the volume does not exist.

Chapter 8: Infinite Series

8.1 Sequences

Concepts and Vocabulary

1. **False:** A sequence is a function whose domain is the set of positive *integers* and not the set of positive *real numbers*.
2. **False:** A sequence $\{s_n\}$ is convergent to a limit L if $\lim_{n \rightarrow \infty} s_n = L$. ($L = 0$ is a special case, but in general a sequence that is convergent will converge to a real number L .)
3. **True:** This is because if $f(x)$ is a related function of the sequence $\{s_n\}$ then if $\lim_{x \rightarrow \infty} f(x) = L$ it follows that $\lim_{n \rightarrow \infty} s_n = L$ (theorem, p.544).
4. **(b) :** Bounded, because no term of $\{s_n\}$ will ever exceed in absolute value, K .
5. **False:** Consider the sequence $\{s_n\} = \{\sin(\frac{\pi}{2}n)\}$ (see p.549, fig.13). This sequence is bounded by ± 1 , but it never converges as it oscillates between -1 and $+1$.
6. **True:** A sequence whose n^{th} term cannot be bounded in absolute value by any finite real number cannot converge to a finite real number.
7. **False:** A sequence is decreasing if and only if $s_n > s_{n+1}$ for $n \geq 1$.
8. **False:** As an example, consider the sequence $\{t_n\} = \left\{1 + \frac{(-1)^n}{n^2}\right\}$ (see fig.14, p.549). This sequence is not monotonic, but it converges to the limit 1.
9. **False:** If the sequence $\{s_n\}$ is increasing then the algebraic ratio $\frac{s_{n+1}}{s_n} > 1$ for all $n \geq 1$.
10. **(b) :** This follows from the properties of a monotonic function. A function whose derivative is < 0 at $x = x_0$ is decreasing in an open interval about $x = x_0$. Since the function is a related function of the sequence $\{s_n\}$ it follows that the sequence is also decreasing.
11. **True:** It is only the eventual (large n) terms of the sequence which determine its convergence or divergence properties.
12. **False:** A bounded, monotonic sequence will be a convergent sequence (see theorem, p.549).

Skill Building

13. $s_n = \frac{n+1}{n}$. Put $n = 1, 2, 3, 4$. Then $s_1 = 2$; $s_2 = \frac{3}{2}$; $s_3 = \frac{4}{3}$; $s_4 = \frac{5}{4}$. The first four terms of the sequence are $2, \frac{3}{2}, \frac{4}{3}, \frac{5}{4}$.
14. $s_n = \frac{2}{n^2}$. Put $n = 1, 2, 3, 4$. Then $s_1 = 2$; $s_2 = \frac{2}{4} = \frac{1}{2}$; $s_3 = \frac{2}{9}$; $s_4 = \frac{2}{16} = \frac{1}{8}$. The first four terms of the sequence are $2, \frac{1}{2}, \frac{2}{9}, \frac{1}{8}$.
15. $s_n = \ln n$. Put $n = 1, 2, 3, 4$. Then $s_1 = \ln 1 = 0$; $s_2 = \ln 2$; $s_3 = \ln 3$; $s_4 = \ln 4$. The first four terms of the sequence are $0, \ln 2, \ln 3, \ln 4$.

16. $s_n = \frac{n}{\ln(n+1)}$. Put $n = 1, 2, 3, 4$. Then $s_1 = \frac{1}{\ln 2}$; $s_2 = \frac{2}{\ln 3}$; $s_3 = \frac{3}{\ln 4}$; $s_4 = \frac{4}{\ln 5}$. The first four terms of the sequence are $\boxed{\frac{1}{\ln 2}, \frac{2}{\ln 3}, \frac{3}{\ln 4}, \frac{4}{\ln 5}}$.

17. $s_n = \frac{(-1)^{n+1}}{2n+1}$. Put $n = 1, 2, 3, 4$. Then $s_1 = \frac{(-1)^2}{2+1} = \frac{1}{3}$; $s_2 = \frac{(-1)^3}{4+1} = -\frac{1}{5}$; $s_3 = \frac{(-1)^4}{6+1} = \frac{1}{7}$; $s_4 = \frac{(-1)^5}{8+1} = -\frac{1}{9}$. The first four terms of the sequence are $\boxed{\frac{1}{3}, -\frac{1}{5}, \frac{1}{7}, -\frac{1}{9}}$.

18. $s_n = \frac{1-(-1)^n}{2}$. Put $n = 1, 2, 3, 4$. Then $s_1 = \frac{1-(-1)^1}{2} = \frac{1+1}{2} = 1$; $s_2 = \frac{1-(-1)^2}{2} = \frac{1-1}{2} = 0$; $s_3 = \frac{1-(-1)^3}{2} = \frac{1+1}{2} = 1$; $s_4 = \frac{1-(-1)^4}{2} = \frac{1-1}{2} = 0$. The first four terms of the sequence are $\boxed{1, 0, 1, 0}$.

19. $s_n = \begin{cases} (-1)^{n+1} & \text{if } n \text{ is even} \\ 1 & \text{if } n \text{ is odd.} \end{cases}$ Put $n = 1, 2, 3, 4$. Then $s_1 = 1$; $s_2 = (-1)^{2+1} = (-1)^3 = -1$; $s_3 = 1$; $s_4 = (-1)^{4+1} = (-1)^5 = -1$. The first four terms of the sequence are $\boxed{1, -1, 1, -1}$.

20. $s_n = \begin{cases} n^2 + n & \text{if } n \text{ is even} \\ 4n + 1 & \text{if } n \text{ is odd.} \end{cases}$ Put $n = 1, 2, 3, 4$. Then $s_1 = 4(1) + 1 = 5$; $s_2 = 2^2 + 2 = 6$; $s_3 = 4(3) + 1 = 13$; $s_4 = 4^2 + 4 = 20$. The first four terms of the sequence are $\boxed{5, 6, 13, 20}$.

21. $s_n = \frac{n!}{2^n}$. Put $n = 1, 2, 3, 4$. Then $s_1 = \frac{1!}{2^1} = \frac{1}{2}$; $s_2 = \frac{2!}{2^2} = \frac{2 \cdot 1}{2 \cdot 2} = \frac{1}{2}$; $s_3 = \frac{3!}{2^3} = \frac{3 \cdot 2 \cdot 1}{8} = \frac{3}{4}$; $s_4 = \frac{4!}{2^4} = \frac{4 \cdot 3 \cdot 2 \cdot 1}{16} = \frac{3}{2}$. The first four terms of the sequence are $\boxed{\frac{1}{2}, \frac{1}{2}, \frac{3}{4}, \frac{3}{2}}$.

22. $s_n = \frac{n!}{n^2}$. Put $n = 1, 2, 3, 4$. Then $s_1 = \frac{1!}{1^2} = 1$; $s_2 = \frac{2!}{2^2} = \frac{2 \cdot 1}{4} = \frac{1}{2}$; $s_3 = \frac{3!}{3^2} = \frac{3 \cdot 2 \cdot 1}{9} = \frac{2}{3}$; $s_4 = \frac{4!}{4^2} = \frac{4 \cdot 3 \cdot 2 \cdot 1}{16} = \frac{3}{2}$. The first four terms of the sequence are $\boxed{1, \frac{1}{2}, \frac{2}{3}, \frac{3}{2}}$.

23. $2, 4, 6, 8, 10, \dots$ Observe that this is the set of even numbers. The n^{th} of term of the sequence is $\boxed{2n}$.

24. $1, 3, 5, 7, 9, \dots$ Observe that this is the set of odd numbers. The n^{th} term of the sequence is $\boxed{2n - 1}$. (We don't write $2n + 1$ because the first term, for $n = 1$, needs to be 1.)

25. $2, 4, 8, 16, 32, \dots$ Notice that each term is two times the preceding term. So the n^{th} term $= 2 \times (n-1)^{\text{st}}$ term $= 2 \times 2 \times (n-2)^{\text{nd}}$ term $= \dots$ etc. The n^{th} term of the sequence is $\boxed{2^n}$.

26. $1, 8, 27, 64, 125, \dots$ Here, each term is a perfect cube. The n^{th} term of the sequence is $\boxed{n^3}$.

27. $\frac{1}{2}, -\frac{1}{3}, \frac{1}{4}, -\frac{1}{5}, \frac{1}{6}, \dots$ Notice that every even term appears with a minus sign. So we need a factor of $(-1)^{n+1}$ to appear in the n^{th} term of the sequence, which is $\boxed{(-1)^{n+1} \frac{1}{n+1}}$.

28. $1, -2, 3, -4, 5, \dots$ Notice that every even term appears with a minus sign. So we need a factor of $(-1)^{n+1}$ to appear in the n^{th} term of the sequence, which is $\boxed{(-1)^{n+1} n}$.

29. $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \dots$ Each term has both numerator and denominator increasing, with denominator being 1 more than the numerator. So the n^{th} term of the sequence is $\boxed{\frac{n}{n+1}}$.

30. $\frac{1}{2}, \frac{4}{3}, \frac{9}{4}, \frac{16}{5}, \dots$ The numerators are all perfect squares, while the denominators are just the consecutive positive integers plus 1. So the n^{th} term of the sequence is $\boxed{\frac{n^2}{n+1}}$.

31. $1, 1, 2, 6, 24, 120, 720, \dots$ The rapidly increasing sequence indicates that the factorial could be involved. The n^{th} term of the sequence $\boxed{(n-1)!}$ generates this sequence because $(1-1)! = 0! = 1$; $(2-1)! = 1! = 1$; $(3-1)! = 2! = 2$, and so on.

32. $1, 1, \frac{1}{2}, \frac{1}{6}, \frac{1}{24}, \frac{1}{120}, \dots$ The rapidly increasing denominators could mean the factorial appears there. The n^{th} term of the sequence $\boxed{\frac{1}{(n-1)!}}$ generates this sequence because $\frac{1}{(1-1)!} = \frac{1}{0!} = \frac{1}{1} = 1$; $\frac{1}{(2-1)!} = \frac{1}{1!} = 1$; $\frac{1}{(3-1)!} = \frac{1}{2!} = \frac{1}{2}$, and so on.

33. The n^{th} term of the sequence is $s_n = \frac{3}{n}$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{3}{n} = 3 \cdot \lim_{n \rightarrow \infty} \frac{1}{n} = 3 \cdot 0 = 0,$$

where the constant multiple property of convergent sequences was used. The limit of the sequence is $\boxed{0}$.

34. The n^{th} term of the sequence is $s_n = -\frac{2}{n}$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} -\frac{2}{n} = (-2) \cdot \lim_{n \rightarrow \infty} \frac{1}{n} = (-2) \cdot 0 = 0,$$

where the constant multiple property of convergent sequences was used. The limit of the sequence is $\boxed{0}$.

35. The n^{th} term of the sequence is $s_n = 1 - \frac{1}{n}$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n}\right) = \lim_{n \rightarrow \infty} 1 - \lim_{n \rightarrow \infty} \frac{1}{n} = 1 - 0 = 1,$$

where the sum and difference property of convergent sequences was used. The limit of the sequence is $\boxed{1}$.

36. The n^{th} term of the sequence is $s_n = \frac{1}{n} + 4$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(\frac{1}{n} + 4\right) = \lim_{n \rightarrow \infty} \frac{1}{n} + \lim_{n \rightarrow \infty} 4 = 0 + 4 = 4,$$

where the sum and difference property of convergent sequences was used. The limit of the sequence is $\boxed{4}$.

37. The n^{th} term of the sequence is $s_n = \frac{4n+2}{n} = 4 + \frac{2}{n}$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(4 + \frac{2}{n}\right) = \lim_{n \rightarrow \infty} 4 + \lim_{n \rightarrow \infty} \frac{2}{n} = \lim_{n \rightarrow \infty} 4 + 2 \cdot \lim_{n \rightarrow \infty} \frac{1}{n} = 4 + 2 \cdot 0 = 4,$$

where the sum and difference and constant multiple properties of convergent sequences were used. The limit of the sequence is $\boxed{4}$.

38. The n^{th} term of the sequence is $s_n = \frac{2n+1}{n} = 2 + \frac{1}{n}$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(2 + \frac{1}{n}\right) = \lim_{n \rightarrow \infty} 2 + \lim_{n \rightarrow \infty} \frac{1}{n} = 2 + 0 = 2,$$

where the sum and difference property of convergent sequences was used. The limit of the sequence is $\boxed{2}$.

39. The n^{th} term of the sequence is $s_n = \left(\frac{2-n}{n^2}\right)^4 = \left(\frac{2}{n^2} - \frac{1}{n}\right)^4$. We have $\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(\frac{2}{n^2} - \frac{1}{n}\right)^4 = \left[\lim_{n \rightarrow \infty} \left(\frac{2}{n^2} - \frac{1}{n}\right)\right]^4 = \left[\lim_{n \rightarrow \infty} \frac{2}{n^2} - \lim_{n \rightarrow \infty} \frac{1}{n}\right]^4 = \left[2 \cdot \lim_{n \rightarrow \infty} \frac{1}{n^2} - \lim_{n \rightarrow \infty} \frac{1}{n}\right]^4 = [2 \cdot 0 - 0]^4 = 0$, where the power, sum and difference, and constant multiple properties of convergent sequences were used. The limit of the sequence is $\boxed{0}$.

40. The n^{th} term of the sequence is $s_n = \left(\frac{n^3-2n}{n^3}\right)^2 = \left(1 - \frac{2}{n^2}\right)^2$. We have $\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(1 - \frac{2}{n^2}\right)^2 = \left[\lim_{n \rightarrow \infty} \left(1 - \frac{2}{n^2}\right)\right]^2 = \left[\lim_{n \rightarrow \infty} 1 - \lim_{n \rightarrow \infty} \frac{2}{n^2}\right]^2 = \left[\lim_{n \rightarrow \infty} 1 - 2 \cdot \lim_{n \rightarrow \infty} \frac{1}{n^2}\right]^2 = [1 - 2 \cdot 0]^2 = 1^2 = 1$, where the power, sum and difference, and constant multiple properties of convergent sequences were used. The limit of the sequence is $\boxed{1}$.

41. The n^{th} term of the sequence is $s_n = \sqrt{\frac{n+1}{n^2}} = \sqrt{\frac{1}{n} + \frac{1}{n^2}}$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \sqrt{\frac{1}{n} + \frac{1}{n^2}} = \left[\lim_{n \rightarrow \infty} \left(\frac{1}{n} + \frac{1}{n^2}\right)\right]^{\frac{1}{2}} = \left[\lim_{n \rightarrow \infty} \frac{1}{n} + \lim_{n \rightarrow \infty} \frac{1}{n^2}\right]^{\frac{1}{2}} = [0 + 0]^{\frac{1}{2}} = 0,$$

where the power and sum and difference properties of convergent sequences were used. The limit of the sequence is $\boxed{0}$.

42. The n^{th} term of the sequence is $s_n = \sqrt[3]{8 - \frac{1}{n}} = \left(8 - \frac{1}{n}\right)^{\frac{1}{3}}$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(8 - \frac{1}{n}\right)^{\frac{1}{3}} = \left[\lim_{n \rightarrow \infty} \left(8 - \frac{1}{n}\right)\right]^{\frac{1}{3}} = \left[\lim_{n \rightarrow \infty} 8 - \lim_{n \rightarrow \infty} \frac{1}{n}\right]^{\frac{1}{3}} = [8 - 0]^{\frac{1}{3}} = 2,$$

where the power and sum and difference properties of convergent sequences were used. The limit of the sequence is $\boxed{2}$.

43. The n^{th} term of the sequence is $s_n = \left(1 - \frac{1}{n}\right)\left(1 - \frac{1}{n^2}\right)$. We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n}\right)\left(1 - \frac{1}{n^2}\right) &= \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n}\right) \cdot \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n^2}\right) \\ &= \left(1 - \lim_{n \rightarrow \infty} \frac{1}{n}\right) \cdot \left(1 - \lim_{n \rightarrow \infty} \frac{1}{n^2}\right) \\ &= (1 - 0)(1 - 0) = 1, \end{aligned}$$

where the product and sum and difference properties of convergent sequences were used. The limit of the sequence is $\boxed{1}$.

44. The n^{th} term of the sequence is $s_n = \left(1 - \frac{1}{n}\right)\left(1 - \frac{1}{n^2}\right)\left(1 - \frac{1}{n^3}\right)$. We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n}\right)\left(1 - \frac{1}{n^2}\right)\left(1 - \frac{1}{n^3}\right) &= \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n}\right) \cdot \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n^2}\right) \cdot \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n^3}\right) \\ &= \left(1 - \lim_{n \rightarrow \infty} \frac{1}{n}\right) \cdot \left(1 - \lim_{n \rightarrow \infty} \frac{1}{n^2}\right) \cdot \left(1 - \lim_{n \rightarrow \infty} \frac{1}{n^3}\right) \\ &= (1 - 0)(1 - 0)(1 - 0) = 1, \end{aligned}$$

where the product and sum and difference properties of convergent sequences were used. The limit of the sequence is $\boxed{1}$.

45. Consider a sequence $\{s_n\}$ with $s_n = \frac{n+1}{3n} = \frac{1}{3} + \frac{1}{3n}$. This sequence converges because

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(\frac{1}{3} + \frac{1}{3n}\right) = \lim_{n \rightarrow \infty} \frac{1}{3} + \lim_{n \rightarrow \infty} \frac{1}{3n} = \lim_{n \rightarrow \infty} \frac{1}{3} + \frac{1}{3} \cdot \lim_{n \rightarrow \infty} \frac{1}{n} = \frac{1}{3} + 0 = \frac{1}{3},$$

where the sum and difference and constant multiple properties of convergent sequences were used. Then by the theorem on p.543, since the function $f(x) = \ln x$ is continuous at $x = \frac{1}{3}$, the sequence $\{f(s_n)\}$

converges, and limit of the sequence $\{f(s_n)\} = \{\ln(\frac{n+1}{3n})\}$ is $\boxed{\ln\left(\frac{1}{3}\right)}$.

46. Consider a sequence $\{s_n\}$ with $s_n = \frac{n^2+2}{2n^2+3}$. This sequence converges because

$$\begin{aligned}\lim_{n \rightarrow \infty} s_n &= \lim_{n \rightarrow \infty} \frac{n^2+2}{2n^2+3} = \lim_{n \rightarrow \infty} \frac{1 + \frac{2}{n^2}}{2 + \frac{3}{n^2}} = \frac{\lim_{n \rightarrow \infty} (1 + \frac{2}{n^2})}{\lim_{n \rightarrow \infty} (2 + \frac{3}{n^2})} \\ &= \frac{\lim_{n \rightarrow \infty} 1 + \lim_{n \rightarrow \infty} \frac{2}{n^2}}{\lim_{n \rightarrow \infty} 2 + \lim_{n \rightarrow \infty} \frac{3}{n^2}} = \frac{\lim_{n \rightarrow \infty} 1 + 2 \cdot \lim_{n \rightarrow \infty} \frac{1}{n^2}}{\lim_{n \rightarrow \infty} 2 + 3 \cdot \lim_{n \rightarrow \infty} \frac{1}{n^2}} \\ &= \frac{1 + 2 \cdot 0}{2 + 3 \cdot 0} = \frac{1}{2},\end{aligned}$$

where the quotient, sum and difference, and constant multiple properties of convergent sequences were used. The function $f(x) = \ln x$ is continuous at $x = \frac{1}{2}$. By the theorem on p. 543, the sequence $\{f(s_n)\}$

converges, and the limit of the sequence $\{f(s_n)\} = \left\{\ln\left(\frac{n^2+2}{2n^2+3}\right)\right\}$ is $\boxed{\ln\left(\frac{1}{2}\right)}$.

47. Consider the sequence $\{s_n\}$ with $s_n = \frac{4}{n} - 2$. This sequence converges because

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(\frac{4}{n} - 2\right) = \lim_{n \rightarrow \infty} \frac{4}{n} - \lim_{n \rightarrow \infty} 2 = 4 \cdot \lim_{n \rightarrow \infty} \frac{1}{n} - \lim_{n \rightarrow \infty} 2 = 4 \cdot 0 - 2 = -2,$$

where the sum and difference and constant multiple properties of convergent sequences were used. The function $f(x) = e^x$ is continuous at $x = -2$. By the theorem on p. 543, the sequence $\{f(s_n)\}$ converges, and the limit of the sequence $\{f(s_n)\} = \{e^{(4/n)-2}\}$ is $\boxed{e^{-2}}$.

48. Consider the sequence $\{s_n\}$ with $s_n = 3 + \frac{6}{n}$. This sequence converges because

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(3 + \frac{6}{n}\right) = \lim_{n \rightarrow \infty} 3 + \lim_{n \rightarrow \infty} \frac{6}{n} = \lim_{n \rightarrow \infty} 3 + 6 \cdot \lim_{n \rightarrow \infty} \frac{1}{n} = 3 + 6 \cdot 0 = 3,$$

where the sum and difference and constant multiple properties of convergent sequences were used. The function $f(x) = e^x$ is continuous at $x = 3$. By the theorem on p.543, the sequence $\{f(s_n)\}$ converges, and the limit of the sequence $\{f(s_n)\} = \{e^{3+(6/n)}\}$ is $\boxed{e^3}$.

49. Consider the sequence $\{s_n\}$ with $s_n = \frac{1}{n}$. This sequence converges because $\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$. The function $f(x) = \sin x$ is continuous at $x = 0$. By the theorem on p.543, the sequence $\{f(s_n)\}$ converges, and the limit of the sequence $\{f(s_n)\} = \left\{\sin\left(\frac{1}{n}\right)\right\}$ will be $\sin(0) = \boxed{0}$.

50. Consider the sequence $\{s_n\}$ with $s_n = \frac{1}{n}$. This sequence converges because $\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$. The function $f(x) = \cos x$ is continuous at $x = 0$. By the theorem on p.543, the sequence $\{f(s_n)\}$ converges, and the limit of the sequence $\{f(s_n)\} = \left\{\cos\left(\frac{1}{n}\right)\right\}$ will be $\cos(0) = \boxed{1}$.

51. The function $f(x) = \frac{x^2-4}{x^2+x-2}$ is a related function of the sequence $\left\{\frac{n^2-4}{n^2+n-2}\right\}$. Since

$$\begin{aligned}
\lim_{x \rightarrow \infty} f(x) &= \lim_{x \rightarrow \infty} \frac{x^2 - 4}{x^2 + x - 2} = \lim_{x \rightarrow \infty} \frac{1 - \frac{4}{x^2}}{1 + \frac{1}{x} - \frac{2}{x^2}} \\
&= \frac{\lim_{x \rightarrow \infty} (1 - \frac{4}{x^2})}{\lim_{x \rightarrow \infty} (1 + \frac{1}{x} - \frac{2}{x^2})} = \frac{\lim_{x \rightarrow \infty} 1 - \lim_{x \rightarrow \infty} \frac{4}{x^2}}{\lim_{x \rightarrow \infty} 1 + \lim_{x \rightarrow \infty} \frac{1}{x} - \lim_{x \rightarrow \infty} \frac{2}{x^2}} \\
&= \frac{1 - 0}{1 + 0 - 0} = 1,
\end{aligned}$$

the sequence $\left\{ \frac{n^2-4}{n^2+n-2} \right\}$ also converges and its limit is $\boxed{1}$.

52. The function $f(x) = \frac{x+2}{x^2+6x+8}$ is a related function of the sequence $\left\{ \frac{n+2}{n^2+6n+8} \right\}$. Since

$$\begin{aligned}
\lim_{x \rightarrow \infty} f(x) &= \lim_{x \rightarrow \infty} \frac{x+2}{x^2+6x+8} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x} + \frac{2}{x^2}}{1 + \frac{6}{x} + \frac{8}{x^2}} \\
&= \frac{\lim_{x \rightarrow \infty} (\frac{1}{x} + \frac{2}{x^2})}{\lim_{x \rightarrow \infty} (1 + \frac{6}{x} + \frac{8}{x^2})} = \frac{\lim_{x \rightarrow \infty} \frac{1}{x} + \lim_{x \rightarrow \infty} \frac{2}{x^2}}{\lim_{x \rightarrow \infty} 1 + \lim_{x \rightarrow \infty} \frac{6}{x} + \lim_{x \rightarrow \infty} \frac{8}{x^2}} \\
&= \frac{0+0}{1+0+0} = 0,
\end{aligned}$$

the sequence $\left\{ \frac{n+2}{n^2+6n+8} \right\}$ also converges and its limit is $\boxed{0}$.

53. We write the n^{th} term of the sequence $\{s_n\} = \left\{ \frac{n^2}{2n+1} - \frac{n^2}{2n-1} \right\}$ as

$$s_n = \frac{n^2}{2n+1} - \frac{n^2}{2n-1} = \frac{n^2[(2n-1) - (2n+1)]}{(2n)^2 - 1^2} = \frac{n^2(-2)}{4n^2 - 1} = -\frac{2n^2}{4n^2 - 1}.$$

The function $f(x) = -\frac{2x^2}{4x^2-1}$ is a related function of the sequence $\{s_n\}$. Since

$$\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} -\frac{2x^2}{4x^2-1} = \lim_{x \rightarrow \infty} \frac{-2}{4 - \frac{1}{x^2}} = \frac{\lim_{x \rightarrow \infty} (-2)}{\lim_{x \rightarrow \infty} (4 - \frac{1}{x^2})} = \frac{\lim_{x \rightarrow \infty} (-2)}{\lim_{x \rightarrow \infty} 4 - \lim_{x \rightarrow \infty} \frac{1}{x^2}} = \frac{-2}{4-0} = -\frac{1}{2},$$

the sequence $\{s_n\} = \left\{ \frac{n^2}{2n+1} - \frac{n^2}{2n-1} \right\}$ also converges and its limit is $\boxed{-\frac{1}{2}}$.

54. The function $f(x) = \frac{6x^4-5}{7x^4+3}$ is a related function of the sequence $\left\{ \frac{6n^4-5}{7n^4+3} \right\}$. Since

$$\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{6x^4-5}{7x^4+3} = \lim_{x \rightarrow \infty} \frac{6 - \frac{5}{x^4}}{7 + \frac{3}{x^4}} = \frac{\lim_{x \rightarrow \infty} (6 - \frac{5}{x^4})}{\lim_{x \rightarrow \infty} (7 + \frac{3}{x^4})} = \frac{\lim_{x \rightarrow \infty} 6 - \lim_{x \rightarrow \infty} \frac{5}{x^4}}{\lim_{x \rightarrow \infty} 7 + \lim_{x \rightarrow \infty} \frac{3}{x^4}} = \frac{6-0}{7+0} = \frac{6}{7},$$

the sequence $\left\{ \frac{6n^4-5}{7n^4+3} \right\}$ also converges and its limit is $\boxed{\frac{6}{7}}$.

55. The function $f(x) = \frac{\sqrt{x}+2}{\sqrt{x}+5}$ is a related function of the sequence $\left\{ \frac{\sqrt{n}+2}{\sqrt{n}+5} \right\}$. Since

$$\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{\sqrt{x}+2}{\sqrt{x}+5} = \lim_{x \rightarrow \infty} \frac{1 + \frac{2}{\sqrt{x}}}{1 + \frac{5}{\sqrt{x}}} = \frac{\lim_{x \rightarrow \infty} (1 + \frac{2}{\sqrt{x}})}{\lim_{x \rightarrow \infty} (1 + \frac{5}{\sqrt{x}})} = \frac{\lim_{x \rightarrow \infty} 1 + \lim_{x \rightarrow \infty} \frac{2}{\sqrt{x}}}{\lim_{x \rightarrow \infty} 1 + \lim_{x \rightarrow \infty} \frac{5}{\sqrt{x}}} = \frac{1+0}{1+0} = 1,$$

the sequence $\left\{\frac{\sqrt{n+2}}{\sqrt{n+5}}\right\}$ also converges and its limit is $\boxed{1}$.

56. The function $f(x) = \frac{\sqrt{x}}{e^x}$ is a related function of the sequence $\left\{\frac{\sqrt{n}}{e^n}\right\}$. Using L'Hôpital's rule, since

$$\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{\sqrt{x}}{e^x} = \lim_{x \rightarrow \infty} \frac{\frac{1}{2\sqrt{x}}}{e^x} = \lim_{x \rightarrow \infty} \frac{1}{2\sqrt{x}e^x} = 0,$$

the sequence $\left\{\frac{\sqrt{n}}{e^n}\right\}$ also converges and its limit is $\boxed{0}$.

57. The function $f(x) = \frac{x^2}{3^x}$ is a related function of the sequence $\left\{\frac{n^2}{3^n}\right\}$. Using L'Hôpital's rule, since

$$\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{x^2}{3^x} = \lim_{x \rightarrow \infty} \frac{2x}{3^x \ln 3} = \lim_{x \rightarrow \infty} \frac{2}{3^x (\ln 3)^2} = 0,$$

the sequence $\left\{\frac{n^2}{3^n}\right\}$ also converges and its limit is $\boxed{0}$.

58. The function $f(x) = \frac{(x-1)^2}{e^x}$ is a related function of the sequence $\left\{\frac{(n-1)^2}{e^n}\right\}$. Using L'Hôpital's rule, since

$$\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{(x-1)^2}{e^x} = \lim_{x \rightarrow \infty} \frac{2(x-1)}{e^x} = \lim_{x \rightarrow \infty} \frac{2}{e^x} = 0,$$

the sequence $\left\{\frac{(n-1)^2}{e^n}\right\}$ also converges and its limit is $\boxed{0}$.

59. To see if the sequence $\{s_n\} = \left\{\frac{(-1)^n}{3n^2}\right\}$ converges, consider the absolute value of the n^{th} term:

$$|s_n| = \left|\frac{(-1)^n}{3n^2}\right| \leq \frac{1}{3n^2}.$$

That means $-\frac{1}{3n^2} \leq \frac{(-1)^n}{3n^2} \leq \frac{1}{3n^2}$. The sequence $\{s_n\}$ is bounded below by the sequence $\{a_n\} = \left\{-\frac{1}{3n^2}\right\}$ and bounded above by the sequence $\{b_n\} = \left\{\frac{1}{3n^2}\right\}$. Since $a_n \leq s_n \leq b_n$ for all n , and $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{-1}{3n^2} = (-\frac{1}{3}) \cdot \lim_{n \rightarrow \infty} \frac{1}{n^2} = -\frac{1}{3} \cdot 0 = 0$ and $\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{1}{3n^2} = \frac{1}{3} \cdot \lim_{n \rightarrow \infty} \frac{1}{n^2} = \frac{1}{3} \cdot 0 = 0$, then by the Squeeze Theorem, the sequence $\{s_n\} = \left\{\frac{(-1)^n}{3n^2}\right\}$ converges, and its limit is $\boxed{0}$.

60. To see if the sequence $\{s_n\} = \left\{\frac{(-1)^n}{\sqrt{n}}\right\}$ converges, consider the absolute value of the n^{th} term:

$$|s_n| = \left|\frac{(-1)^n}{\sqrt{n}}\right| \leq \frac{1}{\sqrt{n}}.$$

That means $-\frac{1}{\sqrt{n}} \leq \frac{(-1)^n}{\sqrt{n}} \leq \frac{1}{\sqrt{n}}$. The sequence $\{s_n\}$ is bounded below by the sequence $\{a_n\} = \left\{-\frac{1}{\sqrt{n}}\right\}$ and bounded above by the sequence $\{b_n\} = \left\{\frac{1}{\sqrt{n}}\right\}$. Since $a_n \leq s_n \leq b_n$ for all n , and $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{-1}{\sqrt{n}} = 0$ and $\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n}} = 0$, then by the Squeeze Theorem, the sequence $\{s_n\} = \left\{\frac{(-1)^n}{\sqrt{n}}\right\}$ converges, and its limit is $\boxed{0}$.

61. To see if the sequence $\{s_n\} = \left\{\frac{\sin n}{n}\right\}$ converges, consider the absolute value of the n^{th} term:

$$|s_n| = \left|\frac{\sin n}{n}\right| \leq \frac{1}{n}.$$

That is, $-\frac{1}{n} \leq \frac{\sin n}{n} \leq \frac{1}{n}$. The sequence $\{s_n\}$ is bounded below by the sequence $\{a_n\} = \left\{-\frac{1}{n}\right\}$ and bounded above by the sequence $\{b_n\} = \left\{\frac{1}{n}\right\}$. Since $a_n \leq s_n \leq b_n$ for all n , and $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} -\frac{1}{n} = 0$ and

$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$, then by the Squeeze Theorem, the sequence $\{s_n\} = \left\{\frac{\sin n}{n}\right\}$ converges, and its limit is $\boxed{0}$.

62. To see if the sequence $\{s_n\} = \left\{\frac{\cos n}{n}\right\}$ converges, consider the absolute value of the n^{th} term:

$$|s_n| = \left|\frac{\cos n}{n}\right| \leq \frac{1}{n}.$$

That is, $-\frac{1}{n} \leq \frac{\cos n}{n} \leq \frac{1}{n}$. The sequence $\{s_n\}$ is bounded below by the sequence $\{a_n\} = \left\{-\frac{1}{n}\right\}$ and bounded above by the sequence $\{b_n\} = \left\{\frac{1}{n}\right\}$. Since $a_n \leq s_n \leq b_n$ for all n , and $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{-1}{n} = 0$ and

$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$, then by the Squeeze Theorem, the sequence $\{s_n\} = \left\{\frac{\cos n}{n}\right\}$ converges, and its limit is $\boxed{0}$.

63. The sequence $\{s_n\} = \{\cos(\pi n)\}$ oscillates between -1 and $+1$ for odd n or even n respectively. There is no single number that the terms of the sequence approach as $n \rightarrow \infty$. So the sequence $\{s_n\} = \{\cos(\pi n)\}$ diverges.

64. The sequence $\{s_n\} = \left\{\cos\left(\frac{\pi}{2}n\right)\right\}$ oscillates between $0, -1$ or $+1$ depending on whether n is odd, a multiple of 2 , or a multiple of 4 , respectively. There is no single number that the terms of the sequence approach as $n \rightarrow \infty$. So the sequence $\{s_n\} = \left\{\cos\left(\frac{\pi}{2}n\right)\right\}$ diverges.

65. The sequence is $\{s_n\} = \{\sqrt{n}\}$. The terms of the sequence are $1, \sqrt{2}, \sqrt{3}, \sqrt{4}, \dots$. Given any positive number $M > 1$, we choose a positive integer $N > M^2 > 1$. Then whenever $n > N > 1$, we have

$$s_n = \sqrt{n} > \sqrt{N} > M.$$

That is, the sequence $\{s_n\} = \{\sqrt{n}\}$ diverges to infinity.

66. The sequence is $\{s_n\} = \{n^2\}$. The terms of the sequence are $1, 4, 9, 16, \dots$. Given any positive number $M > 1$, we choose a positive integer $N > \sqrt{M} > 1$. Then whenever $n > N > 1$, we have

$$s_n = n^2 > N^2 > M.$$

That is, the sequence $\{s_n\} = \{n^2\}$ diverges to infinity.

67. The sequence $\{s_n\} = \left\{\left(-\frac{1}{3}\right)^n\right\}$ converges to the limit of $\boxed{0}$ because $-1 < -\frac{1}{3} < 1$.

68. The sequence $\{s_n\} = \left\{\left(\frac{1}{3}\right)^n\right\}$ converges to the limit of $\boxed{0}$ because $-1 < \frac{1}{3} < 1$.

69. The sequence $\{s_n\} = \left\{\left(\frac{5}{4}\right)^n\right\}$ diverges to infinity because $\frac{5}{4} > 1$.

70. The sequence $\{s_n\} = \left\{\left(\frac{\pi}{2}\right)^n\right\}$ diverges to infinity because $\frac{\pi}{2} > 1$.

71. The sequence is $\{s_n\} = \left\{\frac{n+(-1)^n}{n}\right\}$. The terms of the sequence are $0, \frac{3}{2}, \frac{2}{3}, \frac{5}{4}, \frac{4}{5}, \dots$. The sequence appears to approach the limit $L = 1$ by oscillating on either side of 1 . Let $\epsilon > 0$. Then

$$|s_n - L| = \left|\frac{n+(-1)^n}{n} - 1\right| = \left|\frac{(-1)^n}{n}\right| = \frac{1}{n}.$$

We have $|s_n - L| < \epsilon$ if $n > \lceil \frac{1}{\epsilon} \rceil = N$. This establishes that the sequence converges to the limit $\boxed{1}$.
(Note: $\lceil x \rceil$ means the integer part of x .)

72. The sequence is $\{s_n\} = \left\{\frac{1}{n} + (-1)^n\right\}$. The terms of the sequence are $0, \frac{1}{2} + 1 = \frac{3}{2}, \frac{1}{3} - 1 = -\frac{2}{3}, \frac{1}{4} + 1 = \frac{5}{4}, \frac{1}{5} - 1 = -\frac{4}{5}, \dots$. The terms of the sequence oscillate between positive and negative numbers, with the positive terms tending to the limit of 1 from above, and the negative terms tending to a limit of -1 from above. Since there is no single number that the terms of the sequence approach as $n \rightarrow \infty$, the sequence $\{s_n\} = \left\{\frac{1}{n} + (-1)^n\right\}$ diverges.

73. The sequence $\{s_n\} = \left\{\frac{\ln n}{n}\right\}$. The sequence has limit

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{\ln n}{n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{x}}{1} = 0,$$

using L'Hôpital rule. This proves the sequence is convergent. By the theorem in the middle of p.547, the sequence being convergent is bounded, that is, it is bounded both from above and from below.

74. The sequence is $\{s_n\} = \left\{\frac{\sin n}{n}\right\}$. We have the following bound

$$|s_n| = \left|\frac{\sin n}{n}\right| \leq \frac{1}{n}$$

which means $-\frac{1}{n} \leq \frac{\sin n}{n} \leq \frac{1}{n}$. The sequence $\{s_n\}$ is bounded below by the sequence $\left\{-\frac{1}{n}\right\}$ and bounded above by the sequence $\left\{\frac{1}{n}\right\}$. As $n \rightarrow \infty$, both these bounding sequences converge to 0. This means the sequence $\{s_n\} = \left\{\frac{\sin n}{n}\right\}$ is convergent to the same limit by the Squeeze Theorem. By the theorem in the middle of p.547, the sequence being convergent is bounded, that is, it is bounded both from above and from below.

75. The sequence is $\{s_n\} = \left\{n + \frac{1}{n}\right\}$. As $n \rightarrow \infty$, $\frac{1}{n} \rightarrow 0$, but n grows without limit. So there is no upper bound. However, a lower bound for the sequence is 2 (the value of s_n for $n = 1$), in that all terms of the sequence exceed 2. So the sequence $\{s_n\} = \left\{n + \frac{1}{n}\right\}$ is bounded only from below.

76. The sequence $\{s_n\} = \left\{\frac{3}{n+1}\right\}$ is bounded from below by 0 (the limit of s_n as $n \rightarrow \infty$), and bounded from above by $\frac{3}{2}$ (the value of s_n for $n = 1$, since the sequence is decreasing). So the sequence $\{s_n\} = \left\{\frac{3}{n+1}\right\}$ is bounded both from above and from below.

77. The sequence $\{s_n\} = \left\{\frac{n^2}{n+1}\right\}$ is bounded from below by $\frac{1}{2}$ (the value of s_n for $n = 1$), but it is not bounded from above since

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{n^2}{n+1} = \lim_{x \rightarrow \infty} \frac{x^2}{x+1} = \lim_{x \rightarrow \infty} \frac{2x}{1} = \infty,$$

by using L'Hôpital's rule on a related function of the sequence. So the sequence $\{s_n\} = \left\{\frac{n^2}{n+1}\right\}$ is bounded only from below.

78. The sequence $\{s_n\} = \left\{\frac{2^n}{n^2}\right\}$ is bounded from below. The terms of the sequence are $\frac{2}{1}, \frac{4}{4} = 1, \frac{8}{9}, \frac{16}{16} = 1, \frac{32}{25}, \dots$. Note that the lower bound of the sequence is 1. It cannot be less than 1, since $2^n \geq n^2$ for all values of n . That this sequence has no upper bound is seen by examining

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{2^n}{n^2} = \lim_{x \rightarrow \infty} \frac{2^x}{x^2} = \lim_{x \rightarrow \infty} \frac{2^x(\ln 2)}{2x} = \lim_{x \rightarrow \infty} \frac{2^x(\ln 2)^2}{2} = \infty,$$

by using L'Hôpital's rule on a related function of the sequence. So the sequence $\{s_n\} = \left\{\frac{2^n}{n^2}\right\}$ is bounded only from below.

79. The terms of the sequence $\{s_n\} = \left\{\left(-\frac{1}{2}\right)^n\right\}$ are $-\frac{1}{2}, \frac{1}{4}, -\frac{1}{8}, \frac{1}{16}, \dots$. The sequence is bounded below by $-\frac{1}{2}$ and is bounded above by 0, since $\lim_{n \rightarrow \infty} \left(-\frac{1}{2}\right)^n = 0$, because $-1 \leq -\frac{1}{2} \leq 1$. So the sequence $\{s_n\} = \left\{\left(-\frac{1}{2}\right)^n\right\}$ is bounded both from above and from below.

80. The terms of sequence $\{s_n\} = \{\sqrt{n}\}$ are $1, \sqrt{2}, \sqrt{3}, \dots$. The sequence is bounded from below by 1 but grows without limit as $n \rightarrow \infty$ (as was shown in Problem **65**), and is not bounded from above. So the sequence $\{s_n\} = \{\sqrt{n}\}$ is bounded only from below.

81. The first three terms of the sequence $\{s_n\} = \left\{\frac{3^n}{(n+1)^3}\right\}$ are $s_1 = 0.375$, $s_2 \approx 0.333$, $s_3 \approx 0.422$. Since $s_1 > s_2$, but $s_2 < s_3$, the sequence is not monotonic. To see if it eventually increases, use the Algebraic Ratio Test on the sequence. We have

$$\frac{s_{n+1}}{s_n} = \frac{3^{n+1}/(n+2)^3}{3^n/(n+1)^3} = 3 \cdot \left(\frac{n+1}{n+2}\right)^3 > 1$$

when $\left(\frac{n+1}{n+2}\right)^3 > \frac{1}{3}$ or $\frac{n+1}{n+2} > \frac{1}{\sqrt[3]{3}}$. That is

$$\begin{aligned}\sqrt[3]{3}n + \sqrt[3]{3} &> n + 2 \\ (\sqrt[3]{3} - 1)n &> 2 - \sqrt[3]{3} \\ n &> \frac{2 - \sqrt[3]{3}}{\sqrt[3]{3} - 1} = \frac{0.5577\dots}{0.4422\dots} > 1.\end{aligned}$$

So for $n \geq 2$ the sequence $\{s_n\} = \left\{\frac{3^n}{(n+1)^3}\right\}$ will be a nonmonotonic and an eventually increasing one.

82. We use the Algebraic Difference Test on the sequence $\{s_n\} = \left\{\frac{2n+1}{n}\right\}$. We have

$$s_{n+1} - s_n = \frac{2n+3}{n+1} - \frac{2n+1}{n} = \frac{2n^2 + 3n - 2n^2 - 3n - 1}{n(n+1)} = -\frac{1}{n(n+1)} < 0,$$

whenever $n \geq 1$. This means the sequence $\{s_n\} = \left\{\frac{2n+1}{n}\right\}$ is a decreasing one for $n \geq 1$.

83. The sequence is $\left\{\frac{\ln n}{\sqrt{n}}\right\}$. A related function of the sequence is $f(x) = \frac{\ln x}{\sqrt{x}}$. Compute the derivative:

$$f'(x) = \frac{\sqrt{x} \cdot (\ln x)' - \ln x \cdot (\sqrt{x})'}{(\sqrt{x})^2} = \frac{\sqrt{x} \cdot \frac{1}{x} - \ln x \cdot \frac{1}{2\sqrt{x}}}{x} = \frac{1}{x^{3/2}} \left[1 - \frac{\ln x}{2}\right] < 0$$

when $1 - \frac{\ln x}{2} < 0$, or $\ln x > 2$ or $x > e^2 = 7.389\dots$. So the sequence $\left\{\frac{\ln n}{\sqrt{n}}\right\}$ is an eventually decreasing one for $n \geq 8$. This means that for $n < 8$, the sequence is increasing, so it is nonmonotonic.

84. We use the Algebraic Ratio Test on the sequence $\{s_n\} = \left\{\frac{\sqrt{n+1}}{n}\right\}$. We have

$$\frac{s_{n+1}}{s_n} = \frac{\sqrt{n+2}/(n+1)}{\sqrt{n+1}/n} = \frac{\sqrt{n+2}}{\sqrt{n+1}} \cdot \frac{n}{(n+1)} < 1$$

whenever

$$\begin{aligned}\sqrt{n+2}(n) &< \sqrt{n+1}(n+1) \\ (n+2)n^2 &< (n+1)(n+1)^2 \\ n^3 + 2n^2 &< n^3 + 3n^2 + 3n + 1 \\ 0 &< n^2 + 3n + 1.\end{aligned}$$

This happens whenever $n \geq 1$. So the sequence $\{s_n\} = \left\{\frac{\sqrt{n+1}}{n}\right\}$ is a decreasing one for $n \geq 1$, and is monotonic as well.

85. The sequence is $\{s_n\} = \left\{\left(\frac{1}{3}\right)^n\right\}$. We use the Algebraic Ratio Test:

$$\frac{s_{n+1}}{s_n} = \frac{(1/3)^{n+1}}{(1/3)^n} = \frac{1}{3} < 1.$$

So the sequence $\{s_n\} = \left\{\left(\frac{1}{3}\right)^n\right\}$ is a decreasing one for $n \geq 1$, and is monotonic as well.

86. The sequence is $\{s_n\} = \left\{\frac{n^2}{5^n}\right\}$. We use the Algebraic Ratio Test:

$$\frac{s_{n+1}}{s_n} = \frac{(n+1)^2/5^{n+1}}{n^2/5^n} = \frac{(n+1)^2 5^n}{5^{n+1} n^2} = \frac{1}{5} \left(1 + \frac{1}{n}\right)^2 < 1$$

whenever

$$\begin{aligned} \left(1 + \frac{1}{n}\right)^2 &< 5 \\ 1 + \frac{1}{n} &< \sqrt{5} \\ \frac{1}{n} &< \sqrt{5} - 1 \\ n &> \frac{1}{\sqrt{5} - 1} = \frac{\sqrt{5} + 1}{4} = 0.809... \end{aligned}$$

So the sequence $\{s_n\} = \left\{\frac{n^2}{5^n}\right\}$ is a decreasing one for $n \geq 1$, and it is also monotonic.

87. We use the Algebraic Ratio Test on the sequence $\{s_n\} = \left\{\frac{n!}{3^n}\right\}$. We have:

$$\frac{s_{n+1}}{s_n} = \frac{(n+1)!}{n!} \cdot \frac{3^n}{3^{n+1}} = \frac{1}{3} \cdot (n+1) \geq 1$$

whenever $n+1 \geq 3$, or $n \geq 2$. So the sequence $\{s_n\} = \left\{\frac{n!}{3^n}\right\}$ is an eventually nondecreasing one for $n \geq 2$. Since the sequence increases for $n < 2$, it is nonmonotonic.

88. We use the Algebraic Ratio Test on the sequence $\{s_n\} = \left\{\frac{n!}{n^2}\right\}$. We have:

$$\frac{s_{n+1}}{s_n} = \frac{(n+1)!}{n!} \cdot \frac{n^2}{(n+1)^2} = n+1 \cdot \frac{n^2}{(n+1)^2} = \frac{n^2}{n+1} > 1$$

if $n^2 > n+1$. This happens whenever $n^2 - n - 1 > 0$ or $n > \frac{1+\sqrt{5}}{2} = 1.618...$. So the sequence $\{s_n\} = \left\{\frac{n!}{n^2}\right\}$ is an increasing one for $n \geq 2$. Since the sequence is decreasing for $n < 2$, it is nonmonotonic.

89. The sequence $\{s_n\} = \{ne^{-n}\}$ is bounded from below by zero, since its terms are positive for all n . Examine the derivative of a related function $f(x) = xe^{-x}$ of the sequence :

$$f'(x) = e^{-x} - xe^{-x} = e^{-x}(1-x) < 0$$

if $x > 1$. This shows the sequence is a decreasing one for all $n \geq 1$. Since the sequence is bounded from below and is decreasing, it will converge.

90. The sequence is $\{s_n\} = \{\tan^{-1}n\}$. Since $\tan^{-1}n < \frac{\pi}{2}$ for any positive integer n , the sequence is bounded from above by $\frac{\pi}{2}$. Consider a related function of the sequence $f(x) = \tan^{-1}x$. Since $f'(x) = \frac{1}{1+x^2} > 0$ when $x > 0$, this shows the sequence is increasing for $n \geq 1$. Since the sequence is increasing and is bounded from above, it will converge.

91. The sequence is $\{s_n\} = \left\{\frac{n}{n+1}\right\}$. Since $n < n+1$ for all $n \geq 1$ the sequence is bounded from above by 1. Using the Algebraic Ratio Test,

$$\frac{s_{n+1}}{s_n} = \frac{n+1}{n+2} \cdot \frac{n+1}{n} > 1$$

provided

$$\begin{aligned}(n+1)^2 &> n(n+2) \\ n^2 + 2n + 1 &> n^2 + 2n \\ 1 &> 0.\end{aligned}$$

So the sequence is always increasing for any $n \geq 1$. Since the sequence is bounded from above and is increasing, it will converge.

92. The sequence is $\{s_n\} = \left\{\frac{n}{n^2+1}\right\}$. The sequence is bounded from below by 0 since the terms of the sequence are positive for all n . Consider a related function of the sequence, $f(x) = \frac{x}{x^2+1}$. Now its derivative

$$f'(x) = \frac{(x^2+1)x' - x(x^2+1)'}{(x^2+1)^2} = \frac{x^2+1-2x^2}{(x^2+1)^2} = \frac{1-x^2}{(x^2+1)^2} \leq 0$$

for $x \geq 1$. Since a related function of the sequence is nonincreasing for $x \geq 1$ this shows the sequence is nonincreasing for $n \geq 1$. Since the sequence is bounded from below and is nonincreasing, it will converge.

93. The sequence $\{s_n\} = \left\{2 - \frac{1}{n}\right\}$ is bounded from above by 2 since $\frac{1}{n} < 1$ for all values of n . Also, this sequence is increasing since the Algebraic Difference Test gives

$$s_{n+1} - s_n = 2 - \frac{1}{n+1} - 2 + \frac{1}{n} = \frac{1}{n} - \frac{1}{n+1} = \frac{n+1-n}{n(n+1)} = \frac{1}{n(n+1)} > 0$$

for $n \geq 1$. Since the sequence is bounded from above and is increasing, it will converge.

94. The sequence $\{s_n\} = \left\{\frac{n}{2^n}\right\}$ is bounded from below by 0 since its terms are positive for all n . To show the sequence is monotonic, we use the Algebraic Ratio Test:

$$\frac{s_{n+1}}{s_n} = \frac{n+1}{2^{n+1}} \cdot \frac{2^n}{n} = \frac{1}{2} \left(1 + \frac{1}{n}\right) \leq 1$$

whenever $1 + \frac{1}{n} \leq 2$, or $\frac{1}{n} \leq 1$, or $n \geq 1$. This shows the sequence is nonincreasing for $n \geq 1$. Since the sequence is bounded from below and is nonincreasing, it will converge.

95. The sequence $\{s_n\} = \left\{\frac{3}{n} + 6\right\}$ is bounded from below by 6 since $\frac{3}{n} > 0$ for all n . To check the monotonicity of the sequence, we use the Algebraic Difference Test:

$$s_{n+1} - s_n = \frac{3}{n+1} + 6 - \frac{3}{n} - 6 = -\frac{3}{n(n+1)} < 0$$

whenever $n \geq 1$. This shows the sequence is decreasing. Since the sequence is decreasing and is bounded from below, it will converge. Next, compute

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(\frac{3}{n} + 6\right) = \lim_{n \rightarrow \infty} \frac{3}{n} + \lim_{n \rightarrow \infty} 6 = 0 + 6 = 6,$$

where the sum and difference property of convergent sequences was used. So the limit to which the sequence will converge is $\boxed{6}$.

96. The sequence $\{s_n\} = \left\{2 - \frac{4}{n}\right\}$ is bounded from above by 2 since $\frac{4}{n} > 0$ for all n . To check the monotonicity of the sequence, we use the Algebraic Difference Test:

$$s_{n+1} - s_n = 2 - \frac{4}{n+1} - 2 + \frac{4}{n} = \frac{4}{n(n+1)} > 0$$

for $n \geq 1$. This shows the sequence is an increasing one. Since the sequence is bounded from above by 2 and increasing, it will $\boxed{\text{converge}}$. Next, compute

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(2 - \frac{4}{n}\right) = \lim_{n \rightarrow \infty} 2 - 4 \cdot \lim_{n \rightarrow \infty} \frac{1}{n} = 2 - 4 \cdot 0 = 2,$$

where the sum and difference and the constant multiple properties of convergent sequences have been used. So the limit to which the sequence will converge is $\boxed{2}$.

97. The sequence is $\{s_n\} = \left\{\ln\left(\frac{n+1}{3n}\right)\right\}$. The sequence $\{a_n\} = \left\{\frac{n+1}{3n}\right\} = \left\{\frac{1}{3} + \frac{1}{3n}\right\}$ is bounded from below by $\frac{1}{3}$ since $\frac{1}{3n} > 0$ for all n . Also, the sequence $\{a_n\}$ is decreasing as can be seen by the Algebraic Difference Test:

$$a_{n+1} - a_n = \frac{1}{3} + \frac{1}{3(n+1)} - \frac{1}{3} - \frac{1}{3n} = -\frac{1}{3n(n+1)} < 0$$

for $n \geq 1$. So the sequence $\{a_n\}$, being bounded from below and decreasing, converges. To find the limit of the sequence $\{a_n\}$, we compute:

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left(\frac{1}{3} + \frac{1}{3n}\right) = \lim_{n \rightarrow \infty} \frac{1}{3} + \lim_{n \rightarrow \infty} \frac{1}{3n} = \frac{1}{3} + 0 = \frac{1}{3},$$

where the sum and difference property of convergent sequences has been used. Since $f(x) = \ln x$ is continuous at $x = \frac{1}{3}$, then by the theorem on p.543, the sequence $\{f(a_n)\} = \{s_n\}$ will also $\boxed{\text{converge}}$, and to the limit of $\ln\left(\frac{1}{3}\right) = \boxed{-\ln 3}$.

98. The sequence is $\{s_n\} = \left\{\cos\left(n\pi + \frac{\pi}{2}\right)\right\}$. For any value of n , the value of $s_n = 0$. This means the sequence is bounded from below, is nonincreasing, and so it $\boxed{\text{converges}}$ to the limit of $\boxed{0}$.

99. The sequence $\{s_n\} = \{(-1)^n \sqrt{n}\}$ has terms $-1, \sqrt{2}, -\sqrt{3}, \sqrt{4}, -\sqrt{5}, \dots$. As $n \rightarrow \infty$, the sequence oscillates between increasing positive and negative terms without bound. So the sequence $\boxed{\text{diverges}}$.

100. The sequence is $\{s_n\} = \left\{\frac{(-1)^n}{2n}\right\}$. Consider

$$|s_n| = \left|\frac{(-1)^n}{2n}\right| \leq \frac{1}{2n}$$

that is, $-\frac{1}{2n} \leq \frac{(-1)^n}{2n} \leq \frac{1}{2n}$.

If $\{a_n\} = \left\{-\frac{1}{2n}\right\}$ and $\{b_n\} = \left\{\frac{1}{2n}\right\}$, we have $a_n \leq s_n \leq b_n$. Also, $\{a_n\}$ and $\{b_n\}$ are convergent sequences because 0 is an upper bound for the increasing sequence $\{a_n\}$ and 0 is a lower bound for the decreasing sequence $\{b_n\}$. By the Squeeze Theorem, this shows that the sequence $\{s_n\} = \left\{\frac{(-1)^n}{2n}\right\}$ also $\boxed{\text{converges}}$ and to the same limit of $\boxed{0}$.

101. The sequence $\{s_n\} = \left\{\frac{3^{n+1}}{4^{n+1}}\right\} = \left\{\left(\frac{3}{4}\right)^n + \frac{1}{4^n}\right\}$ is bounded from below by 0 since the n^{th} term is positive for all n . To check monotonicity, we use the Algebraic Difference Test:

$$s_{n+1} - s_n = \frac{3^{n+1} + 1}{4^{n+1}} - \frac{3^n + 1}{4^n} = \frac{3 \cdot 3^n + 1 - 4 \cdot 3^n - 4}{4^{n+1}} = \frac{-3^n - 3}{4^{n+1}} < 0$$

for $n \geq 1$. This means the sequence is decreasing. Since the sequence $\{s_n\} = \{\frac{3^n+1}{4^n}\}$ is bounded from below and decreasing, it converges. To find the limit, compute:

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(\frac{3}{4}\right)^n + \lim_{n \rightarrow \infty} \frac{1}{4^n} = 0 + 0 = 0,$$

since $-1 \leq \frac{3}{4} \leq 1$. So the sequence converges to a limit of 0.

102. The sequence is $\{s_n\} = \{n + \sin \frac{1}{n}\}$. As $\lim_{n \rightarrow \infty} n = \infty$, the sequence will diverge.

103. The sequence $\{s_n\} = \left\{\frac{\ln(n+1)}{n+1}\right\}$ is bounded from below by 0 since $\ln(n+1) > 0$ for all $n \geq 1$. A related function of the sequence is $f(x) = \frac{\ln(x+1)}{x+1}$. Now since

$$f'(x) = \frac{(x+1)\frac{1}{x+1} - \ln(x+1) \cdot 1}{(x+1)^2} = \frac{1 - \ln(x+1)}{(x+1)^2} < 0$$

for $x > e - 1$, it means the function is decreasing, and so the sequence is decreasing as well for $n \geq 2$. Since the sequence is bounded from below and decreasing, it converges. To find the limit, compute:

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{\ln(n+1)}{n+1} = \lim_{x \rightarrow \infty} \frac{\ln(x+1)}{x+1} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x+1}}{1} = 0$$

using L'Hôpital's rule. So the sequence converges to a limit of 0.

104. A related function of the sequence $\{s_n\} = \left\{\frac{\ln(n+1)}{\sqrt{n}}\right\}$ is $f(x) = \frac{\ln(x+1)}{\sqrt{x}}$. By the Theorem on p.544, we have

$$\lim_{n \rightarrow \infty} s_n = \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{\ln(x+1)}{\sqrt{x}} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x+1}}{\frac{1}{2\sqrt{x}}} = \lim_{x \rightarrow \infty} \frac{2\sqrt{x}}{x+1} = \lim_{x \rightarrow \infty} \frac{2 \cdot \frac{1}{\sqrt{x}}}{1} = 0,$$

using L'Hôpital's rule. So the sequence converges to a limit of 0.

105. The sequence $\{s_n\} = \{0.5^n\}$ converges to a limit of 0, since $-1 < 0.5 < 1$.

106. The sequence $\{s_n\} = \{(-2)^n\}$ diverges, since $-2 < -1$.

107. The sequence $\{s_n\} = \left\{\cos \frac{\pi}{n}\right\}$ is bounded from above by 1 since $|\cos \frac{\pi}{n}| \leq 1$. A related function of the sequence is $f(x) = \cos \frac{\pi}{x}$. Since

$$f'(x) = -\sin \frac{\pi}{x} \cdot \left(-\frac{\pi}{x^2}\right) = \frac{\pi}{x^2} \sin \frac{\pi}{x} > 0$$

for $x > 1$, the function is increasing, which means the sequence is increasing for $n \geq 1$. Since the sequence is bounded above and increasing, it converges. To find the limit, compute:

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \cos \frac{\pi}{n} = \cos 0 = 1.$$

So the sequence converges to a limit of 1.

108. The sequence $\{s_n\} = \left\{\sin \frac{\pi}{n}\right\}$ is bounded from below by 0 since $\sin \frac{\pi}{n} > 0$ for all $n \geq 1$. A related function of the sequence is $f(x) = \sin \frac{\pi}{x}$. Since

$$f'(x) = \cos \frac{\pi}{x} \cdot \left(-\frac{\pi}{x^2}\right) = -\frac{\pi}{x^2} \cos \frac{\pi}{x} < 0$$

for $x > 2$, the function is decreasing, which means the sequence is decreasing for $n \geq 2$. Since the sequence $\{s_n\} = \{\sin \frac{\pi}{n}\}$ is bounded below and decreasing, it converges. To find the limit, compute:

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \sin \frac{\pi}{n} = \sin 0 = 0.$$

So the sequence converges to a limit of 0.

109. The sequence is $\{s_n\} = \{\cos(\frac{n}{e^n})\}$. Consider the sequence $\{b_n\} = \{\frac{n}{e^n}\}$. The sequence $\{b_n\}$ is bounded from below by 0 since its terms are positive for all $n \geq 1$. A related function of the sequence $\{b_n\}$ is $f(x) = \frac{x}{e^x}$. We have

$$f'(x) = \frac{e^x - xe^x}{e^{2x}} = \frac{e^x(1-x)}{e^{2x}} < 0$$

if $x > 1$, which shows the function $f(x)$ is decreasing. So the sequence $\{b_n\}$ is decreasing for $n > 1$. This establishes that the sequence $\{b_n\}$ converges since it is bounded from below and is decreasing. To find the limit of the sequence $\{b_n\}$, compute:

$$\lim_{n \rightarrow \infty} b_n = \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{x}{e^x} = \lim_{x \rightarrow \infty} \frac{1}{e^x} = 0,$$

using L'Hôpital's rule. Since $g(x) = \cos x$ is continuous at $x = 0$, from the theorem on p.543, it follows that the sequence $\{g(b_n)\} = \{s_n\} = \{\cos(\frac{n}{e^n})\}$ also converges, to the value $\cos 0 = \span style="border: 1px solid black; padding: 0 2px;">1.$

110. The sequence is $\{s_n\} = \{\sin(\frac{(n+1)^3}{e^n})\}$. Consider the sequence $\{b_n\} = \{\frac{(n+1)^3}{e^n}\}$. The sequence $\{b_n\}$ is bounded from below by 0 since its terms are positive for all $n \geq 1$. A related function of the sequence $\{b_n\}$ is $f(x) = \frac{(x+1)^3}{e^x}$. We have

$$f'(x) = \frac{e^x \cdot 3(x+1)^2 - (x+1)^3 \cdot e^x}{e^{2x}} = \frac{e^x(x+1)^2[3 - (x+1)]}{e^{2x}} \leq 0$$

whenever $x \geq 2$, which shows the function $f(x)$ is a nonincreasing function. So $\{b_n\}$ is a nonincreasing sequence for $n \geq 2$. This establishes that the sequence $\{b_n\}$ converges, since it is bounded from below and nonincreasing. To find the limit of the sequence $\{b_n\}$, compute:

$$\lim_{n \rightarrow \infty} b_n = \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{(x+1)^3}{e^x} = \lim_{x \rightarrow \infty} \frac{3(x+1)^2}{e^x} = \lim_{x \rightarrow \infty} \frac{3 \cdot 2(x+1)}{e^x} = \lim_{x \rightarrow \infty} \frac{3 \cdot 2 \cdot 1}{e^x} = 0,$$

using L'Hôpital's rule. Since $g(x) = \sin x$ is continuous at $x = 0$, from the theorem on p.543, the sequence $\{g(b_n)\} = \{s_n\} = \{\sin(\frac{(n+1)^3}{e^n})\}$ also converges, with a limit $\sin 0 = \span style="border: 1px solid black; padding: 0 2px;">0.$

111. The sequence is $\{s_n\} = \{e^{1/n}\}$. Consider the sequence $\{b_n\} = \{\frac{1}{n}\}$. The sequence $\{b_n\}$ is bounded from below by 0 since its terms are positive for all $n \geq 1$. Since

$$\frac{b_{n+1}}{b_n} = \frac{n}{n+1} < 1$$

when $n \geq 1$, the sequence $\{b_n\}$ is decreasing according to the Algebraic Ratio Test. Because the sequence $\{b_n\}$ is bounded from below and decreasing, it converges. To find the limit of the sequence $\{b_n\}$, compute:

$$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0.$$

Now the function $f(x) = e^x$ is continuous at $x = 0$. So by the theorem on p.543, this means the sequence $\{f(b_n)\} = \{s_n\} = \{e^{1/n}\}$ also converges, to a limit $e^0 = \span style="border: 1px solid black; padding: 0 2px;">1.$

112. The sequence is $\{s_n\} = \{\frac{e^n}{n}\}$. Consider a related function of the sequence, $f(x) = \frac{e^x}{x}$. We have using L'Hôpital's rule:

$$\lim_{n \rightarrow \infty} s_n = \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{e^x}{x} = \lim_{x \rightarrow \infty} \frac{e^x}{1} = \infty.$$

This means the sequence $\{s_n\} = \{\frac{e^n}{n}\}$ *diverges.*

113. The sequence $\{s_n\} = \{1 + (\frac{1}{2})^n\}$ is bounded from below by 1, since $(\frac{1}{2})^n > 0$ for all $n \geq 1$. Using the Algebraic Difference Test, we have

$$s_{n+1} - s_n = 1 + \frac{1}{2^{n+1}} - 1 - \frac{1}{2^n} = \frac{1}{2 \cdot 2^n} - \frac{1}{2^n} = -\frac{1}{2 \cdot 2^n} = -\frac{1}{2^{n+1}} < 0$$

for $n \geq 1$. This shows the sequence is a decreasing one. Since the sequence $\{s_n\} = \{1 + (\frac{1}{2})^n\}$ is bounded from below and decreasing, it *converges.* To find the limit, compute:

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left[1 + \left(\frac{1}{2} \right)^n \right] = \lim_{n \rightarrow \infty} 1 + \lim_{n \rightarrow \infty} \left(\frac{1}{2} \right)^n = 1 + 0 = 1,$$

since $-1 < \frac{1}{2} < 1$. So the sequence converges to a limit of 1.

114. The sequence $\{s_n\} = \{1 - (\frac{1}{2})^n\}$ is bounded from above by 1, since $(\frac{1}{2})^n > 0$ for all $n \geq 1$. Using the Algebraic Difference Test, we have

$$s_{n+1} - s_n = 1 - \frac{1}{2^{n+1}} - 1 + \frac{1}{2^n} = -\frac{1}{2 \cdot 2^n} + \frac{1}{2^n} = \frac{1}{2 \cdot 2^n} = \frac{1}{2^{n+1}} > 0$$

for $n \geq 1$. This shows the sequence is an increasing one. Since the sequence $\{s_n\} = \{1 - (\frac{1}{2})^n\}$ is bounded from above and increasing, it *converges.* To find the limit, compute:

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left[1 - \left(\frac{1}{2} \right)^n \right] = \lim_{n \rightarrow \infty} 1 - \lim_{n \rightarrow \infty} \left(\frac{1}{2} \right)^n = 1 - 0 = 1,$$

since $-1 < \frac{1}{2} < 1$. So the sequence converges to a limit of 1.

Applications and Extensions

115. The sequence $\{s_n\} = \left\{ \frac{n^2 \tan^{-1} n}{n^2 + 1} \right\}$ is bounded from above since

$$\frac{n^2 \tan^{-1} n}{n^2 + 1} < \tan^{-1} n < \frac{\pi}{2}$$

for all $n \geq 1$. A related function of the sequence is $f(x) = \frac{x^2 \tan^{-1} x}{x^2 + 1}$. Since

$$f'(x) = \frac{(x^2 + 1)[2x \tan^{-1} x + \frac{x^2}{1+x^2}] - x^2 \tan^{-1} x \cdot 2x}{(x^2 + 1)^2} = \frac{2x \tan^{-1} x + x^2}{(x^2 + 1)^2} > 0$$

for $x > 1$, the function is increasing, which means the sequence $\{s_n\}$ is increasing for $n \geq 1$. Since the sequence is bounded from above and increasing, it *converges.*

116. The sequence $\{s_n\} = \{n \sin \frac{1}{n}\}$ has an upper bound of 1 since $|\frac{\sin n}{n}| \leq \frac{1}{n}$. A related function of the sequence is $f(x) = x \sin \frac{1}{x}$. We have

$$f'(x) = \sin \frac{1}{x} + x \cdot \cos \frac{1}{x} \cdot \left(-\frac{1}{x^2} \right) = \sin \frac{1}{x} - \frac{1}{x} \cos \frac{1}{x} > 0$$

whenever $\tan \frac{1}{x} > \frac{1}{x}$. This inequality is seen to be satisfied for all $x \geq 1$ as follows: Let $g(y) = \tan y - y$. Then $g'(y) = \sec^2 y - 1 \geq 0$ when $\frac{1}{\cos^2 y} \geq 1$ or $\cos^2 y \leq 1$, which is true for all $y \geq 0$. This shows that $g(y)$ is an increasing function for all $y \in [0, \frac{\pi}{2})$. Since $g(0) = 0$, this means that $g(y) \geq 0$ for all $y \in [0, \frac{\pi}{2})$, that is, $\tan y \geq y$. If $y = \frac{1}{x}$, then this means that $g(x) = \tan \frac{1}{x} - \frac{1}{x}$ is increasing (at least) in the interval $x \in [1, \infty)$, and since $g(1) = \tan 1 - 1 \approx 0.557 > 0$, it follows that $g(x) > 0$, or $\tan \frac{1}{x} > \frac{1}{x}$ for $x \in [1, \infty)$. That is, the function $f(x)$ is increasing, and the sequence in turn is increasing for $n \geq 1$. Since the sequence $\{s_n\} = \{n \sin \frac{1}{n}\}$ is bounded from above and increasing, it converges.

Alternative Solution: We invoke the Theorem on p.544, and compute the limit on a related function $f(x) = x \sin \frac{1}{x}$ as follows:

$$\lim_{n \rightarrow \infty} s_n = \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} x \sin \frac{1}{x} = \lim_{y \rightarrow 0} \frac{1}{y} \sin y = 1,$$

where $y = \frac{1}{x}$, and using the standard limit result that $\lim_{y \rightarrow 0} \frac{\sin y}{y} = 1$. Since a related function of the sequence converges to a finite limit, it means the sequence also converges (and converges to the same limit).

117. The sequence is $\{s_n\} = \left\{ \frac{n + \sin n}{n + \cos(4n)} \right\}$. Consider $\lim_{n \rightarrow \infty} \frac{\sin n}{n}$. Since $\left| \frac{\sin n}{n} \right| \leq \frac{1}{n}$, we have $-\frac{1}{n} \leq \frac{\sin n}{n} \leq \frac{1}{n}$. Since $\lim_{n \rightarrow \infty} \pm \frac{1}{n} = 0$, by the Squeeze theorem, $\lim_{n \rightarrow \infty} \frac{\sin n}{n} = 0$. Similarly, since $\left| \frac{\cos(4n)}{n} \right| \leq \frac{1}{n}$, we have $-\frac{1}{n} \leq \frac{\cos(4n)}{n} \leq \frac{1}{n}$, and since $\lim_{n \rightarrow \infty} \pm \frac{1}{n} = 0$, by the Squeeze theorem, $\lim_{n \rightarrow \infty} \frac{\cos(4n)}{n} = 0$. We have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{n + \sin n}{n + \cos(4n)} = \lim_{n \rightarrow \infty} \frac{1 + \frac{\sin n}{n}}{1 + \frac{\cos(4n)}{n}} = \frac{1 + \lim_{n \rightarrow \infty} \frac{\sin n}{n}}{1 + \lim_{n \rightarrow \infty} \frac{\cos(4n)}{n}} = \frac{1 + 0}{1 + 0} = 1.$$

The terms of the sequence oscillate on either side of 1, while this calculation shows that the sequence converges to a limit of 1.

118. The sequence is $\{s_n\} = \left\{ \frac{n^2}{2n+1} \sin \frac{1}{n} \right\}$. A related function of the sequence is $f(x) = \frac{x^2}{2x+1} \sin \frac{1}{x}$. We have

$$\begin{aligned} \lim_{n \rightarrow \infty} s_n &= \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{x^2}{2x+1} \sin \frac{1}{x} \\ &= \lim_{x \rightarrow \infty} \frac{x}{2x+1} \frac{\sin \frac{1}{x}}{\frac{1}{x}} = \lim_{y \rightarrow 0} \frac{1}{2+y} \frac{\sin y}{y} \quad (\text{Use } y = \frac{1}{x}) \\ &= \lim_{y \rightarrow 0} \frac{1}{2+y} \cdot \lim_{y \rightarrow 0} \frac{\sin y}{y} = \frac{1}{2} \cdot 1 = \frac{1}{2}. \end{aligned}$$

So the sequence $\{s_n\} = \left\{ \frac{n^2}{2n+1} \sin \frac{1}{n} \right\}$ converges to a limit of $\frac{1}{2}$.

119. The sequence is $\{s_n\} = \{\ln n - \ln(n+1)\} = \left\{ \ln \frac{n}{n+1} \right\}$. The sequence $\{b_n\} = \left\{ \frac{n}{n+1} \right\}$ is bounded from above by 1 since $\frac{n}{n+1} < 1$ for all $n \geq 1$. The sequence $\{b_n\}$ is increasing by the Algebraic Ratio Test:

$$\frac{b_{n+1}}{b_n} = \frac{n+1}{n+2} \frac{n+1}{n} = \frac{n^2 + 2n + 1}{n^2 + 2n} > 1$$

for $n \geq 1$. So the sequence $\{b_n\}$, being both bounded from above and increasing, is convergent. To find the limit of the sequence $\{b_n\}$, compute:

$$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{n}{n+1} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n}} = \frac{1}{1+0} = 1.$$

Since $f(x) = \ln x$ is a continuous function at $x = 1$, by the theorem on p.543, the sequence

$\{f(b_n)\} = \{s_n\} = \{\ln n - \ln(n+1)\} = \left\{\ln \frac{n}{n+1}\right\}$ converges to the limit $\ln 1 = 0$.

120. The sequence is $\{s_n\} = \left\{\ln n^2 + \ln \frac{1}{n^2+1}\right\} = \left\{\ln \left(\frac{n^2}{n^2+1}\right)\right\}$. The sequence $\{b_n\} = \left\{\frac{n^2}{n^2+1}\right\}$ is bounded from above by 1 since $\frac{n^2}{n^2+1} < 1$ for all $n \geq 1$. The sequence $\{b_n\}$ is increasing by the Algebraic Ratio Test:

$$\frac{b_{n+1}}{b_n} = \frac{(n+1)^2}{(n+1)^2+1} \cdot \frac{(n^2+1)}{n^2} = \frac{n^2(n+1)^2 + (n+1)^2}{n^2[(n+1)^2+1]} = \frac{n^2(n+1)^2 + n^2 + 2n + 1}{n^2(n+1)^2 + n^2} > 1$$

for $n \geq 1$. So the sequence $\{b_n\}$, being both bounded from above and increasing, is convergent. To find the limit of the sequence $\{b_n\}$, compute:

$$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{n^2}{n^2+1} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n^2}} = \frac{1}{1+0} = 1.$$

Since $f(x) = \ln x$ is continuous at $x = 1$, by the theorem on p.543, the sequence

$\{f(b_n)\} = \{s_n\} = \left\{\ln n^2 + \ln \frac{1}{n^2+1}\right\}$ converges to the limit $\ln 1 = 0$.

121. The sequence is $\{s_n\} = \left\{\frac{n^2}{\sqrt{n^2+1}}\right\}$. Since

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{n^2}{\sqrt{n^2+1}} = \lim_{n \rightarrow \infty} \frac{n}{\sqrt{1 + \frac{1}{n^2}}} = \infty,$$

this sequence diverges.

122. The sequence is $\{s_n\} = \left\{\frac{5^n}{(n+1)^2}\right\}$. Using the L'Hôpital rule on a related function of the sequence we have:

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{5^n}{(n+1)^2} = \lim_{x \rightarrow \infty} \frac{5^x}{(x+1)^2} = \lim_{x \rightarrow \infty} \frac{5^x \ln 5}{2(x+1)} = \lim_{x \rightarrow \infty} \frac{5^x (\ln 5)^2}{2} = \infty.$$

This sequence diverges.

123. The sequence is $\{s_n\} = \left\{\frac{2^n}{(2)(4)(6)\cdots(2n)}\right\} = \left\{\frac{2^n}{2^n(1 \cdot 2 \cdot 3 \cdots n)}\right\} = \left\{\frac{1}{n!}\right\}$. It is bounded from below by 0 since $\frac{1}{n!} > 0$ for all $n \geq 1$. Using the Algebraic Ratio Test, we have

$$\frac{s_{n+1}}{s_n} = \frac{n!}{(n+1)!} = \frac{n!}{(n+1)n!} = \frac{1}{n+1} < 1$$

for $n \geq 1$. This shows the sequence is decreasing. Since the sequence $\{s_n\} = \left\{\frac{2^n}{(2)(4)(6)\cdots(2n)}\right\}$ is bounded from below and decreasing, it will converge.

124. The sequence is $\{s_n\} = \left\{\frac{3^{n+1}}{(3)(6)(9)\cdots(3n)}\right\} = \left\{\frac{3^{n+1}}{3^n \cdot n!}\right\} = \left\{\frac{3}{n!}\right\}$. It is bounded from below by 0 since $\frac{3}{n!} > 0$ for all $n \geq 1$. Using the algebraic ratio test, we have

$$\frac{s_{n+1}}{s_n} = \frac{n!}{(n+1)!} = \frac{n!}{(n+1)n!} = \frac{1}{n+1} < 1$$

for $n \geq 1$. This shows the sequence is decreasing. Since the sequence $\{s_n\} = \left\{\frac{3^{n+1}}{(3)(6)(9)\cdots(3n)}\right\}$ is bounded from below and decreasing, it will converge.

125. Let $f(x) = x^2 + x \cos x + 1$. Completing the square yields

$$f(x) = \left(x + \frac{\cos x}{2}\right)^2 + 1 - \frac{\cos^2 x}{4}$$

so that

$$f(x) \geq 1 - \frac{\cos^2 x}{4} \geq \frac{3}{4} > 0$$

since $\left(x + \frac{\cos x}{2}\right)^2 \geq 0$ and $\cos^2 x \leq 1$ for all x . Moreover,

$$\begin{aligned} f'(x) &= 2x - x \sin x + \cos x \\ &= x(2 - \sin x) + \cos x \\ &\geq x + \cos x && \text{since } 2 - \sin x \geq 1 \text{ because } |\sin x| \leq 1; \\ &\geq x - 1 && \text{since } -1 \leq \cos x \leq 1; \\ &> 0 \end{aligned}$$

for $x > 1$. This shows that $f(x)$ is a positive and increasing function of x for $x > 1$. It follows that

$$g(x) = \frac{1}{f(x)} = \frac{1}{x^2 + x \cos x + 1}$$

is a positive and decreasing function (because $g'(x) = -\frac{1}{f(x)^2} \cdot f'(x) < 0$ since $f'(x) > 0$) for $x > 1$. As $g(x)$ is a related function of the sequence $\{s_n\} = \left\{\frac{1}{n^2 + n \cos n + 1}\right\}$, the sequence $\{s_n\}$ is decreasing and bounded from below by 0, so it converges.

126 (a) The first eight terms of the Fibonacci sequence are $1, 1, 2, 3, 5, 8, 13, 21$.

(b) We verify that the n^{th} term given satisfies the recursive definition of the Fibonacci sequence:

1.

$$u_1 = \frac{(1 + \sqrt{5})^1 - (1 - \sqrt{5})^1}{2^1 \sqrt{5}} = \frac{(1 + \sqrt{5}) - (1 - \sqrt{5})}{2\sqrt{5}} = \frac{2\sqrt{5}}{2\sqrt{5}} = 1.$$

2.

$$u_2 = \frac{(1 + \sqrt{5})^2 - (1 - \sqrt{5})^2}{2^2 \sqrt{5}} = \frac{(1 + 2\sqrt{5} + 5) - (1 - 2\sqrt{5} + 5)}{4\sqrt{5}} = \frac{4\sqrt{5}}{4\sqrt{5}} = 1.$$

3.

$$\begin{aligned} u_{n+2} - u_n &= \frac{(1 + \sqrt{5})^{n+2} - (1 - \sqrt{5})^{n+2}}{2^{n+2} \sqrt{5}} - \frac{(1 + \sqrt{5})^n - (1 - \sqrt{5})^n}{2^n \sqrt{5}} \\ &= \frac{(1 + \sqrt{5})^2 (1 + \sqrt{5})^n - (1 - \sqrt{5})^2 (1 - \sqrt{5})^n}{4(2^n \sqrt{5})} - \frac{(1 + \sqrt{5})^n - (1 - \sqrt{5})^n}{2^n \sqrt{5}} \\ &= \frac{(1 + 5 + 2\sqrt{5})(1 + \sqrt{5})^n - (1 + 5 - 2\sqrt{5})(1 - \sqrt{5})^n}{4(2^n \sqrt{5})} - \frac{(1 + \sqrt{5})^n - (1 - \sqrt{5})^n}{2^n \sqrt{5}} \\ &= \frac{(3 + \sqrt{5})(1 + \sqrt{5})^n - (3 - \sqrt{5})(1 - \sqrt{5})^n}{2(2^n \sqrt{5})} - \frac{(1 + \sqrt{5})^n - (1 - \sqrt{5})^n}{2^n \sqrt{5}} \\ &= \frac{(3 + \sqrt{5})(1 + \sqrt{5})^n - (3 - \sqrt{5})(1 - \sqrt{5})^n - 2(1 + \sqrt{5})^n + 2(1 - \sqrt{5})^n}{2(2^n \sqrt{5})} \\ &= \frac{(3 - 2 + \sqrt{5})(1 + \sqrt{5})^n - (3 - 2 - \sqrt{5})(1 - \sqrt{5})^n}{2^{n+1} \sqrt{5}} \\ &= \frac{(1 + \sqrt{5})^{n+1} - (1 - \sqrt{5})^{n+1}}{2^{n+1} \sqrt{5}} = u_{n+1}. \end{aligned}$$

That is, $u_{n+2} = u_{n+1} + u_n$. This means that the n^{th} term of the Fibonacci sequence is given by $u_n = \frac{(1+\sqrt{5})^n - (1-\sqrt{5})^n}{2^n \sqrt{5}}$, since we have verified that it satisfies the recursive definition of the Fibonacci sequence.

127. The fish population in Mirror Lake is $p_n = rp_{n-1} + h$. We have

$$\begin{aligned} p_1 &= rp_0 + h; \\ p_2 &= rp_1 + h = r(rp_0 + h) + h \\ &= r^2p_0 + rh + h; \\ p_3 &= rp_2 + h = r(r^2p_0 + rh + h) + h \\ &= r^3p_0 + (r^2 + r + 1)h; \dots \text{ and so on.} \end{aligned}$$

The pattern is such that

$$p_n = r^n p_0 + (1 + r + r^2 + \dots + r^{n-1})h.$$

Let $S_n = 1 + r + r^2 + \dots + r^{n-1}$. Then $rS_n = r + r^2 + r^3 + \dots + r^n$. Subtracting, we have $rS_n - S_n = r^n - 1$, or $S_n = \frac{r^n - 1}{r - 1}$. So, the fish population for $p_0 = 3000$ is

$$p_n = 3000r^n + \left(\frac{r^n - 1}{r - 1} \right) h.$$

As $n \rightarrow \infty$, $r^n \rightarrow 0$ since $0 < r < 1$. We have

$$\lim_{n \rightarrow \infty} p_n = p_0 \lim_{n \rightarrow \infty} r^n + \left(\frac{1 - \lim_{n \rightarrow \infty} r^n}{1 - r} \right) h = 0 + \left(\frac{1 - 0}{1 - r} \right) h = \frac{h}{1 - r}.$$

So the sequence *converges.*

128. (a) After one time constant, the charge remaining $Q_1 = \frac{Q_0}{e} = Q_0 e^{-1}$. After two time constants, the charge remaining $Q_2 = \frac{Q_0}{e^2} = Q_0 e^{-2}$. So after n time constants, the charge remaining is $Q_n = Q_0 e^{-n}$.

(b) The sequence $\{Q_n\}$ is bounded from below by 0 since the charge Q_n is positive for all $n \geq 1$, and the sequence is decreasing as seen by the Algebraic Ratio Test:

$$\frac{Q_{n+1}}{Q_n} = \frac{Q_0 e^{-n-1}}{Q_0 e^{-n}} = \frac{1}{e} < 1.$$

Since the sequence $\{Q_n\}$ is bounded from below and is decreasing, it *converges.* Since the sequence

converges, we compute the limit: $\lim_{n \rightarrow \infty} Q_n = \lim_{n \rightarrow \infty} Q_0 e^{-n} =$ $0.$

129. (a) Intensity after the first reflection $I_1 = (0.95)I_0$. Intensity after the second reflection $I_2 = (0.95)I_1 = (0.95)(0.95)I_0 = (0.95)^2 I_0$. So, proceeding this way, the intensity after n reflections will be $I_n = (0.95)^n I_0$.

(b) We require $I_n \leq (0.02)I_0$ for the intensity after n reflections to have decreased by at least 98%. So

$$\begin{aligned} I_n &\leq (0.02)I_0 \\ n \log(0.95) &\leq \log(0.02) \\ n &\geq \frac{\log(0.02)}{\log(0.95)} \approx 76.3 \end{aligned}$$

(Note: The last inequality was reversed because for numbers less than 1, the log function is negative, so we are dividing by a negative number, which reverses inequalities.) We want at least 77 reflections.

130. (a) Let r be the average number of neutrons released per fission event. Each of these neutrons causes another fission event, each releasing on average r neutrons, for a total of r^2 neutrons on average after the second fission event. So after n fission events, r^n neutrons on average are released. For $r = 2.5$, the sequence that describes the average number of neutrons after n fission events is $\{r^n\} = \boxed{\{(2.5)^n\}}$.

(b) Since $r = 2.5 > 1$, $\lim_{n \rightarrow \infty} r^n = \infty$, so the sequence $\boxed{\text{diverges}}$.

(c) The number of fission events in the fission chain reaction of Uranium-235 increases without bound, leading to a nuclear reactor meltdown or an explosion in a nuclear bomb.

Challenge Problems

131. (a) The sequence is $\{s_n\} = \{e^{n/(n+2)}\}$. Consider the sequence $\{b_n\} = \left\{\frac{n}{n+2}\right\}$. This sequence is bounded from above by 1 since $\frac{n}{n+2} < 1$ for all $n \geq 1$. Also, the sequence $\{b_n\}$ is increasing since by the Algebraic Ratio Test:

$$\frac{b_{n+1}}{b_n} = \frac{(n+1)(n+2)}{(n+3)n} = \frac{n^2 + 3n + 2}{n^2 + 3n} > 1$$

for all $n \geq 1$. So $\{b_n\}$ is a convergent sequence since it is bounded from above and increasing. To find the limit of the sequence $\{b_n\}$, compute:

$$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{n}{n+2} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{2}{n}} = \frac{1}{1+0} = 1.$$

Since $f(x) = e^x$ is continuous at $x = 1$, by the theorem on p.543, the sequence $\{f(b_n)\} = \{s_n\} = \{e^{n/(n+2)}\}$ also $\boxed{\text{converges}}$.

(b) $\lim_{n \rightarrow \infty} e^{n/(n+2)} = \lim_{n \rightarrow \infty} f(b_n) = f(\lim_{n \rightarrow \infty} b_n) = f(1) = e^1 = \boxed{e}$.

(c) As seen by plotting the sequence $\{s_n\} = \{e^{n/(n+2)}\}$, the points seem to reach the asymptotic value of e . See figure below:

132. We need to show that when $0 < r < 1$, $\lim_{n \rightarrow \infty} r^n = 0$. Let $r = \frac{1}{1+p}$, where $p > 0$. Expanding by the Binomial Theorem,

$$|r|^n = \frac{1}{|(1+p)^n|} = \frac{1}{\left|1 + np + \frac{n(n-1)}{2}p^2 + \dots + p^n\right|} < \frac{1}{np}.$$

This means $-\frac{1}{np} < r^n < \frac{1}{np}$. Since $\lim_{n \rightarrow \infty} \left(-\frac{1}{np}\right) = 0 = \lim_{n \rightarrow \infty} \left(\frac{1}{np}\right)$, by the Squeeze Theorem, we have $\lim_{n \rightarrow \infty} r^n = 0$, which was to be proved.

133. Suppose $-1 < r < 0$, and let $s = -r$. Then $0 < s < 1$. Moreover

$$r^n = (-1)^n s^n$$

so

$$-s^n \leq r^n \leq s^n$$

for all n . From Problem 132, $\lim_{n \rightarrow \infty} s^n = 0$, therefore $\lim_{n \rightarrow \infty} r^n = 0$ by the Squeeze Theorem.

134. We need to show that if $r > 1$, then $\lim_{n \rightarrow \infty} r^n = \infty$. Let $r = 1 + p$, where $p > 0$. Then, by the Binomial Theorem, we have

$$r^n = (1 + p)^n = 1 + np + \frac{n(n-1)}{2}p^2 + \cdots + p^n > np,$$

or $r^n > np$. Since $\lim_{n \rightarrow \infty} np = \infty$ if $p > 0$, it follows that $\lim_{n \rightarrow \infty} r^n = \infty$, which was to be proved.

135. If $r < -1$, then $r = 1 + p$ means that $p < -2$. If n is even, then $r^n > 0$, and $r^n > n|p|$, from the calculation of the previous problem 134. If n is odd, then $r^n < 0$ and $r^n < -n|p|$. As $n \rightarrow \infty$, r^n oscillates without bound between large positive and negative values, so $\lim_{n \rightarrow \infty} r^n$ does not exist for $r < -1$, as was to be shown.

136. Recall that a function f is continuous at $x_0 = L$ if for every $\epsilon > 0$, there is a $\delta > 0$ such that $0 < |x - L| < \delta$ implies $|f(x) - f(L)| < \epsilon$. Let $\{s_n\}$ be a sequence with a limit L . Then $\lim_{n \rightarrow \infty} s_n = L$ means that for every $\epsilon' > 0$, there exists an $n > N$ such that $|s_n - L| < \epsilon'$. Choose x to be s_n . Set $\delta = \epsilon'$. Then for $0 < |s_n - L| < \epsilon'$, continuity of f means for $n > N$, $|f(s_n) - f(L)| < \epsilon$. But this means that $\lim_{n \rightarrow \infty} f(s_n) = f(L)$, which was to be shown.

137. We have $|s_n| = |s_n - L + L| \leq |s_n - L| + |L|$, using the Triangle Inequality. Similarly, $|L| = |L - s_n + s_n| \leq |L - s_n| + |s_n| = |s_n - L| + |s_n|$. Together these can be written as $||s_n| - |L|| \leq |s_n - L|$. If $|s_n - L| < \epsilon$ for $n > N$, then $||s_n| - |L|| \leq |s_n - L| < \epsilon$. This means that $\lim_{n \rightarrow \infty} |s_n| = |L|$.

The converse is not true. For example, the sequence $\{(-1)^n\}$ converges to 1, while the sequence $\{(-1)^n\}$ is nonconvergent as its terms oscillate between -1 and $+1$.

138. Suppose the limit of a sequence is *not* unique. Then we would have $\lim_{n \rightarrow \infty} s_n = L_1$, and $\lim_{n \rightarrow \infty} s_n = L_2$. Then we have:

$$\begin{aligned} \lim_{n \rightarrow \infty} (s_n - s_n) &= \lim_{n \rightarrow \infty} s_n - \lim_{n \rightarrow \infty} s_n \\ \lim_{n \rightarrow \infty} 0 &= 0 = L_1 - L_2 \end{aligned}$$

$$\text{or,} \quad L_1 = L_2.$$

This proves that the limit of a convergent sequence is indeed unique, since our calculation shows $L_1 = L_2$.

139. The definition of a limit at infinity of a function $f(x)$ is: $\lim_{x \rightarrow \infty} f(x) = L$ if for every $\epsilon > 0$, there is an N such that $|f(x) - L| < \epsilon$ for $x > N$.

The definition of a limit of a sequence $\{s_n\}$ is: $\lim_{n \rightarrow \infty} s_n = L$ if for every $\epsilon > 0$ there is an N such that $|s_n - L| < \epsilon$ for $n > N$.

The definitions appear identical, even though in the case of functions, the choice of N is not necessarily an integer as it is in the case of sequences.

140. (a) A related function of the sequence $\{\ln n\}$ is $f(x) = \ln x$. Since $f'(x) = \frac{1}{x} > 0$ for $x > 0$, the related function of the sequence is increasing, which means the sequence $\{\ln n\}$ is increasing for $n \geq 1$.

(b) Using the algebraic ratio test, we have $\frac{\ln(n+1)}{\ln n} > 1$, since $\ln n$ is an increasing function of n . This shows that the sequence $\{\ln n\}$ is unbounded from above.

(c) The sequence $\{\ln n\}$ is an increasing sequence that is unbounded from above, and so it will diverge.

(d) We need an N such that $N > e^{20} \approx 4.852 \times 10^8$. So the smallest N so that $\ln N > 20$ is $N = e^{20} + 1$.

(e) The zoomed-in graph of $\ln x$ for large values of x appears below:

(f) The graph suggests that the function $y = \ln x$ increases as x increases, hence the sequence $\{\ln n\}$ will diverge without bound as well, confirming the result in (c).

141. (a) For $a, b > 0$,

$$\frac{a+b}{2} - \sqrt{ab} = \frac{1}{2}(a - 2\sqrt{ab} + b) = \frac{1}{2}(\sqrt{a} - \sqrt{b})^2 > 0.$$

So $\frac{a+b}{2} > \sqrt{ab}$. If $a_{n+1} = \frac{a_n+b_n}{2}$ and $b_{n+1} = \sqrt{a_n b_n}$, then using the result we have proved, namely $\frac{a_n+b_n}{2} > \sqrt{a_n b_n}$ for all n , we have $a_{n+1} > b_{n+1}$ for all n , or, equivalently, $a_n > b_n$ for all n . Because of this, we can write $a_{n+1} = \frac{a_n+b_n}{2} < \frac{a_n+a_n}{2} = a_n$, i.e., $a_{n+1} < a_n$. So by the Algebraic Difference Test, the sequence $\{a_n\}$ decreases.

Now $a_n > b_n$ also implies $b_{n+1} = \sqrt{a_n b_n} > \sqrt{b_n b_n} = b_n$, i.e., $b_{n+1} > b_n$. So by the algebraic ratio test, the sequence $\{b_n\}$ increases. We have, since $\{a_n\}$ is decreasing $a_n < a_{n-1} < a_{n-2} < \dots < a_1$ and since $\{b_n\}$ is increasing, $b_n < b_{n+1} < b_{n+2} < \dots$. Combining this with $b_n < a_n$, or equivalently, $b_{n+1} < a_{n+1}$, we have:

$$b_1 < b_2 < \dots < b_n < b_{n+1} < a_{n+1} < a_n < \dots < a_1$$

for all n , and, in particular, $b_n < b_{n+1} < a_1$ for all n .

(b) From the chain of inequalities that appear above, it follows that $b_1 < a_{n+1} < a_n$ for all n .

(c) Let's first prove $\sqrt{a} - \sqrt{b} < a - b$ when $a > b > 0$:

$$\sqrt{a} - \sqrt{b} < a - b$$

$$\text{is the same as } \sqrt{a} - a < \sqrt{b} - b$$

$$\sqrt{a}(1 - \sqrt{a}) < \sqrt{b}(1 - \sqrt{b}).$$

$$\text{Squaring, } a(1 + a - 2\sqrt{a}) < b(1 + b - 2\sqrt{b})$$

$$< a(1 + a - 2\sqrt{b}), \quad \text{since } b < a$$

$$a(1 + a) - 2a\sqrt{a} < a(1 + a) - 2a\sqrt{b}$$

$$-2a\sqrt{a} < -2a\sqrt{b}$$

$$a\sqrt{a} > a\sqrt{b}$$

$$\sqrt{a} > \sqrt{b}$$

$$a > b$$

which is the case, ending the proof. Consider

$$0 < a_{n+1} - b_{n+1} = \frac{a_n + b_n}{2} - \sqrt{a_n b_n} = \frac{1}{2}(a_n - 2\sqrt{a_n b_n} + b_n) = \frac{1}{2}(\sqrt{a_n} - \sqrt{b_n})^2 < \frac{1}{2}(a_n - b_n) < \dots < \frac{a_1 - b_1}{2^n}$$

by repeating the process n times, and using the result proved above in the form $\sqrt{a_n} - \sqrt{b_n} < a_n - b_n$ since $b_n < a_n$. This shows that $0 < a_{n+1} - b_{n+1} < \frac{a_1 - b_1}{2^n}$.

(d) The result of part (c) shows that as $n \rightarrow \infty$, the difference between a_{n+1} and b_{n+1} , gets arbitrarily small. Since $\lim_{n \rightarrow \infty} \frac{a_1 - b_1}{2^n} = (a_1 - b_1) \lim_{n \rightarrow \infty} \left(\frac{1}{2}\right)^n = 0$, since $-1 < \frac{1}{2} < 1$, and $\lim_{n \rightarrow \infty} 0 = 0$, by the Squeeze Theorem, we have $\lim_{n \rightarrow \infty} (a_{n+1} - b_{n+1}) = 0$, which means that $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} b_n$, as required to be proved. (Note that each limit separately exists because the sequence $\{a_n\}$ is bounded from below by 0 and is decreasing, so it converges to some limit; the sequence $\{b_n\}$ is bounded from above by a_1 —see the string of inequalities in part (a)—and is increasing, so it also converges to some limit.)

142. $s_n = \frac{2^{n-1}4^n}{n!}$. Using the algebraic ratio test, we have

$$\frac{s_{n+1}}{s_n} = \frac{2^n 4^{n+1}}{(n+1)!} \frac{n!}{2^{n-1}4^n} = \frac{2 \cdot 4}{n+1} = \frac{8}{n+1} \leq 1$$

for $n \geq 7$. This shows the sequence $\{s_n\}$ is nonincreasing. Since each term of the sequence is positive, $s_n > 0$ for $n \geq 1$, the sequence $\{s_n\}$ is bounded from below. Since the sequence $\{s_n\}$ is nonincreasing and bounded from below, it *converges*.

143. $s_n = \frac{n!}{3^n \cdot 4^n}$. Using the algebraic ratio test, we have

$$\frac{s_{n+1}}{s_n} = \frac{(n+1)!}{3^{n+1} \cdot 4^{n+1}} \frac{3^n \cdot 4^n}{n!} = \frac{n+1}{12} \geq 1$$

for $n \geq 11$. The sequence is nondecreasing, so there is no upper bound. So the sequence *diverges*.

144. To see if the sequence $\{s_n\}$ is monotonic, we find the ratio $\frac{s_{n+1}}{s_n}$.

$$\frac{s_{n+1}}{s_n} = \frac{\frac{(n+1)!}{3^{n+1} + 8(n+1)}}{\frac{n!}{3^n + 8n}} = \frac{(n+1)!}{n!} \frac{3^n + 8n}{3^{n+1} + 8(n+1)} = (n+1) \frac{3^n + 8n}{3^{n+1} + 8(n+1)}.$$

Using L'Hôpital's rule on a related function of the fractional term,

$$\lim_{n \rightarrow \infty} \frac{3^n + 8n}{3^{n+1} + 8(n+1)} = \lim_{x \rightarrow \infty} \frac{3^x + 8x}{3^{x+1} + 8(x+1)} = \lim_{x \rightarrow \infty} \frac{(\ln 3)3^x + 8}{(\ln 3)3^{x+1} + 8} = \lim_{x \rightarrow \infty} \frac{(\ln 3)2^x}{(\ln 3)^2 3^{x+1}} = \lim_{x \rightarrow \infty} \frac{3^x}{3^{x+1}} = \frac{1}{3}.$$

For large n , we have $\lim_{n \rightarrow \infty} \frac{s_{n+1}}{s_n} = \lim_{n \rightarrow \infty} \frac{(n+1)}{3} = \infty$. The increasing sequence $\{s_n\}$ is not bounded from above, so it will diverge.

145. The sequence is $\{s_n\} = \{(3^n + 5^n)^{1/n}\} = \left\{5 \left(1 + \left(\frac{3}{5}\right)^n\right)^{1/n}\right\}$. The sequence is bounded from below by 5 since $\left(\frac{3}{5}\right)^n > 0$ and $\left(1 + \left(\frac{3}{5}\right)^n\right)^{1/n} > 1$. (The n^{th} root of a number greater than 1 is greater than 1.) A related function of the sequence is $f(x) = 5 \left(1 + \left(\frac{3}{5}\right)^x\right)^{1/x}$. Note that $f(x) > 0$ when $x > 0$. Taking the logarithm of both sides and differentiating with respect to x , we get

$$\ln f = \ln 5 + \frac{1}{x} \ln \left(1 + \left(\frac{3}{5}\right)^x\right);$$

$$\frac{f'}{f} = 0 - \frac{1}{x^2} \ln \left(1 + \left(\frac{3}{5}\right)^x\right) + \frac{1}{x} \cdot \frac{1}{\left(1 + \left(\frac{3}{5}\right)^x\right)} \cdot \left(\frac{3}{5}\right)^x \cdot \ln \left(\frac{3}{5}\right) < 0$$

whenever $x > 0$ since $\ln \left(\frac{3}{5}\right) < 0$. Since $f(x) > 0$, we have shown that $f'(x) < 0$, or the function is decreasing for $x > 0$. This means the sequence is decreasing for $n \geq 1$. Since the sequence is bounded from below and is decreasing, it converges, as was to be shown.

146. (a) Let a_1 and N be positive numbers. Then

$$a_{n+1} = \frac{1}{2} \left(a_n + \frac{N}{a_n}\right) = \frac{a_n^2 + N}{2a_n} > 0$$

for all $n \geq 1$. Since

$$a_n^2 - 2a_n\sqrt{n} + N = (a_n - \sqrt{N})^2 \geq 0,$$

it follows that

$$a_n^2 + N \geq 2a_n\sqrt{n}, \text{ or } \frac{a_n^2 + N}{2a_n} \geq \sqrt{N}.$$

So we have

$$a_{n+1} = \frac{a_n^2 + N}{2a_n} \geq \sqrt{N} \text{ for } n \geq 1,$$

that is, $a_n \geq \sqrt{N}$ for $n \geq 2$. By the Algebraic Ratio Test, we get

$$\frac{a_{n+1}}{a_n} = \frac{1}{2} \left(1 + \frac{N}{a_n^2} \right) \leq \frac{1}{2} \left(1 + \frac{N}{N} \right) = 1$$

for $n \geq 2$ since $a_n \geq \sqrt{N}$ for $n \geq 2$. We have shown that the sequence $\{a_n\}$ is a nonincreasing sequence that is bounded from below, so it converges. Suppose the limit of the sequence is L . Taking the limit as $n \rightarrow \infty$ of both sides of the equation

$$a_{n+1} = \frac{1}{2} \left(a_n + \frac{N}{a_n} \right)$$

yields $L = \frac{1}{2} \left(L + \frac{N}{L} \right)$ or $2L^2 = L^2 + N$, or $L = \sqrt{N}$.

(b) We want to approximate $\sqrt{28}$, so $N = 28$. Let $a_1 = 1$ (Any other value may be chosen, in which case the answers will vary for a_3 , but for a_6 , the answers will be much closer if not identical to three decimal places.) Then $a_2 = \frac{1}{2} \left[a_1 + \frac{28}{a_1} \right] = \frac{1}{2} [1 + 28] = \frac{29}{2}$. Then

$$a_3 = \frac{1}{2} \left[\frac{29}{2} + \frac{28}{(29/2)} \right] = \frac{1}{2} \left[\frac{29}{2} + \frac{56}{29} \right] = \frac{29}{4} + \frac{28}{29} \approx 8.216. \text{ Next, } a_3 = \frac{1}{2} \left[8.216 + \frac{28}{8.216} \right] \approx 5.812;$$

$a_4 = \frac{1}{2} \left[5.812 + \frac{28}{5.812} \right] \approx 5.315$; $a_5 = \frac{1}{2} \left[5.315 + \frac{28}{5.315} \right] \approx 5.292$; $a_6 = \frac{1}{2} \left[5.292 + \frac{28}{5.292} \right] \approx 5.292$. To three decimal places, we have using a calculator, $\sqrt{28} \approx 5.292$. We see that a_6 is 100% accurate and a_3 is about 91% accurate.

147. The given sequence can be rewritten as $\{s_n\} = \left\{ \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2 \cdot 4 \cdot 6 \cdots 2n} \right\} = \left\{ \frac{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdots (2n-2) \cdot (2n-1)}{(2 \cdot 4 \cdot 6 \cdots (2n-2))^2 (2n)} \right\} = \left\{ \frac{(2n-1)!}{(2^{n-1} (1 \cdot 2 \cdot 3 \cdots (n-1)))^2 \cdot 2n} \right\} = \left\{ \frac{(2n-1)!}{2^{2n-2} \cdot (n-1)! (n-1)! \cdot 2n} \right\} = \left\{ \frac{(2n-1)!}{2^{2n-1} n! (n-1)!} \right\}$. Using the algebraic ratio test, we have

$$\frac{s_{n+1}}{s_n} = \frac{(2n+1)!}{2^{2n+1} (n+1)! n!} \cdot \frac{2^{2n-1} n! (n-1)!}{(2n-1)!} = \frac{(2n+1)(2n)(2n-1)!(n-1)! 2^{2n-1}}{(2n-1)! (n+1)n(n-1)! 2^2 2^{2n-1}} = \frac{2n+1}{2n+2} < 1$$

for $n \geq 1$ which means the sequence $\{s_n\}$ is decreasing. Since the sequence is decreasing, the upper bound on the terms of the sequence is $s_1 = \frac{1}{2}$. So the sequence is bounded below by 0 and above by $\frac{1}{2}$. Hence the sequence is both monotonic and bounded as needed to be shown.

148. Expanding $\left(1 + \frac{1}{n}\right)^n$ using the Binomial Theorem, we obtain

$$\begin{aligned} \left(1 + \frac{1}{n}\right)^n &= \binom{n}{0} + \binom{n}{1} \left(\frac{1}{n}\right)^1 + \binom{n}{2} \left(\frac{1}{n}\right)^2 + \cdots + \binom{n}{k} \left(\frac{1}{n}\right)^k + \cdots + \binom{n}{n} \left(\frac{1}{n}\right)^n \\ &= 1 + n \left(\frac{1}{n}\right) + \underbrace{\frac{n(n-1)}{2!} \left(\frac{1}{n}\right)^2 + \cdots + \frac{n(n-1)(n-2) \cdots (n-k+1)}{k!} \left(\frac{1}{n}\right)^k + \cdots + \left(\frac{1}{n}\right)^n}_{n+1 \text{ terms}}. \end{aligned}$$

Simplifying, we have

$$\begin{aligned} \left(1 + \frac{1}{n}\right)^n &= 1 + 1 + \frac{1 \left(1 - \frac{1}{n}\right)}{2!} + \cdots + \frac{1 \left(1 - \frac{1}{n}\right) \left(1 - \frac{2}{n}\right) \cdots \left(1 - \frac{k-1}{n}\right)}{k!} + \\ &\quad \cdots + \frac{1 \left(1 - \frac{1}{n}\right) \left(1 - \frac{2}{n}\right) \cdots \left(1 - \frac{n-1}{n}\right)}{n!}. \end{aligned} \tag{1}$$

Next, we expand $\left(1 + \frac{1}{n+1}\right)^{n+1}$:

$$\begin{aligned} \left(1 + \frac{1}{n+1}\right)^{n+1} &= \binom{n+1}{0} + \binom{n+1}{1} \left(\frac{1}{n+1}\right)^1 + \binom{n+1}{2} \left(\frac{1}{n+1}\right)^2 + \cdots + \binom{n+1}{n+1} \left(\frac{1}{n+1}\right)^{n+1} \\ &= 1 + 1 + \underbrace{\frac{1 \left(1 - \frac{1}{n+1}\right)}{2!} + \frac{1 \left(1 - \frac{1}{n+1}\right) \left(1 - \frac{2}{n+1}\right)}{3!} + \cdots + \frac{1 \left(1 - \frac{1}{n+1}\right) \left(1 - \frac{2}{n+1}\right) \cdots \left(1 - \frac{n-1}{n+1}\right)}{n!}}_{n+1 \text{ terms}} \\ &\quad + \frac{1 \left(1 - \frac{1}{n+1}\right) \left(1 - \frac{2}{n+1}\right) \cdots \left(1 - \frac{n}{n+1}\right)}{(n+1)!}. \end{aligned} \quad (2)$$

We make two observations from equations (1) and (2):

- After the first two terms, each term of (2) is greater than the corresponding term of (1).
- The expansion of (2) has one more positive term than the expansion of (1).

So this demonstrates that

$$\left(1 + \frac{1}{n}\right)^n < \left(1 + \frac{1}{n+1}\right)^{n+1}$$

which means the sequence $\left\{\left(1 + \frac{1}{n}\right)^n\right\}$ is increasing.

To show that the sequence $\left\{\left(1 + \frac{1}{n}\right)^n\right\}$ is bounded from above, we first note that

$$\begin{aligned} \left(1 + \frac{1}{n}\right)^n &= 1 + 1 + \frac{1 \left(1 - \frac{1}{n}\right)}{2!} + \cdots + \frac{1 \left(1 - \frac{1}{n}\right) \left(1 - \frac{2}{n}\right) \cdots \left(1 - \frac{n-1}{n}\right)}{n!} \\ &< 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \cdots + \frac{1}{n!}. \end{aligned} \quad (3)$$

Now, for $n \geq 2$, we have

$$n! = n(n-1)(n-2) \cdots 3 \cdot 2 \cdot 1 = n(n-1)(n-2) \cdots 3 \cdot 2 \geq \underbrace{2 \cdot 2 \cdot 2 \cdots 2}_{n-1 \text{ terms}} = 2^{n-1},$$

that is,

$$\frac{1}{n!} \leq \frac{1}{2^{n-1}}$$

for $n \geq 2$. Going back to inequality (3), we have

$$\begin{aligned} \left(1 + \frac{1}{n}\right)^n &< 1 + \left(1 + \frac{1}{2!} + \frac{1}{3!} + \cdots + \frac{1}{n!}\right) \\ &\leq 1 + \left(1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \cdots + \frac{1}{2^{n-1}}\right). \end{aligned} \quad (4)$$

Let

$$S_n = 1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \cdots + \frac{1}{2^{n-1}}. \quad (5)$$

Then, multiplying through by $\frac{1}{2}$, we get

$$\frac{1}{2}S_n = \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \cdots + \frac{1}{2^{n-1}} + \frac{1}{2^n}. \quad (6)$$

Subtracting (6) from (5) gives

$$S_n - \frac{1}{2}S_n = \frac{1}{2}S_n = 1 - \frac{1}{2^n},$$

so that

$$S_n = \frac{1 - \left(\frac{1}{2}\right)^n}{\frac{1}{2}} = 2 \left[1 - \left(\frac{1}{2}\right)^n \right] < 2.$$

We continue the estimation of the inequality (4):

$$\left(1 + \frac{1}{n}\right)^n < 1 + S_n < 1 + 2 = 3,$$

which proves that the sequence $\left\{\left(1 + \frac{1}{n}\right)^n\right\}$ is bounded from above.

149. Let the limit of the convergent sequence $\{s_n\}$ be S . The n^{th} term of the arithmetic mean sequence $\{a_n\}$ is $a_n = \frac{1}{n}[s_1 + s_2 + \cdots + s_n]$. Let $\epsilon > 0$. Since s_n is convergent to the limit S , then there exists an N such that for all $n \geq N$ $|s_n - S| < \frac{\epsilon}{2}$. Then we have

$$\begin{aligned} |a_n - S| &= \left| \frac{1}{n} \sum_{k=1}^n (s_k) - S \right| = \frac{1}{n} \left| \sum_{k=1}^n (s_k) - ns \right| = \frac{1}{n} \left| \sum_{k=1}^n (s_k - S) \right| \\ &\leq \frac{1}{n} \sum_{k=1}^N |s_k - S| + \frac{1}{n} \sum_{k=N+1}^n |s_k - S| \end{aligned}$$

Since for $n \geq N$, $|s_n - S| < \frac{\epsilon}{2}$, the sum in the second term satisfies $\sum_{k=N+1}^n |s_k - S| < n \frac{\epsilon}{2}$. Let

$\sum_{k=1}^N |s_k - S| = M$. Choose $n \geq \max\{N, \frac{2}{\epsilon}M\}$. Then we have $|a_n - S| < \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon$, proving the result that the sequence of arithmetic means $\{a_n\}$ converges, and converges to the same limit as the original sequence $\{s_n\}$.

150. (a) From the figure below, which shows a circle of radius R circumscribing a regular polygon of n sides, we see that area of the triangle with the angle $\alpha = \frac{\pi}{n}$ indicated is

$A_{\triangle} = \frac{1}{2} \text{base} \times \text{height} = \frac{1}{2} \cdot R \sin \alpha \cdot R \cos \alpha$. Area of the polygon,

$$A_n = 2n \cdot A_{\triangle} = 2n \cdot \frac{1}{2} R^2 \sin \alpha \cos \alpha = \frac{n}{2} R^2 \sin 2\alpha, \text{ or } \boxed{A_n = \frac{n}{2} R^2 \sin \left(\frac{2\pi}{n} \right)}.$$

(b) We have, as the number of sides of the polygon grows without limit,

$$\lim_{n \rightarrow \infty} A_n = \lim_{n \rightarrow \infty} \frac{n}{2} R^2 \sin \left(\frac{2\pi}{n} \right) = \lim_{n \rightarrow \infty} \pi R^2 \frac{\sin \left(\frac{2\pi}{n} \right)}{\frac{2\pi}{n}} = \pi R^2 \lim_{y \rightarrow 0} \frac{\sin y}{y} = \pi R^2,$$

where the substitution of $y = \frac{2\pi}{n}$ was made, and the standard result $\lim_{y \rightarrow 0} \frac{\sin y}{y} = 1$ was used. This shows that as the polygon's sides increase, its area approaches that of the circumscribing circle.

151. (a) From the figure below, which shows a circle of radius r inscribed in a polygon of n sides, we have $\alpha = \frac{\pi}{n}$. Now, the area of the $\triangle ABO$, $A_{\triangle} = \frac{1}{2} \text{base} \times \text{height} = \frac{1}{2}r \cdot r \tan \alpha = \frac{1}{2}r^2 \tan \left(\frac{\pi}{n}\right)$. The area of the polygon, $A_n = 2n \times A_{\triangle} = \boxed{nr^2 \tan \left(\frac{\pi}{n}\right)}$.

(b) As the number of sides of the polygon increases without limit, we have:

$$\lim_{n \rightarrow \infty} A_n = \lim_{n \rightarrow \infty} nr^2 \tan \frac{\pi}{n} = \pi r^2 \lim_{n \rightarrow \infty} \frac{\tan \frac{\pi}{n}}{\frac{\pi}{n}} = \pi r^2 \lim_{y \rightarrow 0} \frac{\tan y}{y} = \pi r^2,$$

where the substitution of $y = \frac{\pi}{n}$ was made, and the standard result $\lim_{y \rightarrow 0} \frac{\tan y}{y} = 1$ was used. This shows that as the polygon's sides increase, its area approaches that of the inscribed circle.

152. (a) From the figure below, which shows a circle of radius R circumscribing a regular polygon of n sides, we see that the length of the segment AB is $2R \sin \alpha = 2 \left(R \sin \left(\frac{\pi}{n}\right)\right)$. The polygon has n sides, so its perimeter will be n times the length of the segment AB, or $\boxed{P_n = 2nR \sin \left(\frac{\pi}{n}\right)}$.

(b) As the number of sides is increased without limit, we expect the perimeter of inscribed polygon to approach the circumference of the circle.

$$\lim_{n \rightarrow \infty} P_n = \lim_{n \rightarrow \infty} 2nR \sin \left(\frac{\pi}{n}\right) = 2\pi R \lim_{n \rightarrow \infty} \frac{\sin \left(\frac{\pi}{n}\right)}{\frac{\pi}{n}} = 2\pi R \lim_{y \rightarrow 0} \frac{\sin y}{y} = 2\pi R,$$

where the substitution of $y = \frac{\pi}{n}$ was made, and the standard result $\lim_{y \rightarrow 0} \frac{\sin y}{y} = 1$ was used.

153. According to the definition of a convergent sequence (p.541) a sequence $\{s_l\}$ converges to a real number L if, for any number $\epsilon > 0$, there is a positive integer N so that $|s_l - L| < \epsilon$ for all integers $l > N$. Consider the absolute value of the difference of s_n and s_m :

$$|s_n - s_m| = |s_n - L + L - s_m| \leq |s_n - L| + |L - s_m|,$$

where we have used the triangle inequality. Since both sequences $\{s_n\}$ and $\{s_m\}$ converge to the same limit L , applying the definition, we can find positive integers N_1 and N_2 such that for any number $\epsilon > 0$, $|s_n - L| < \epsilon/2$ for all $n > N_1$ and $|s_m - L| < \epsilon/2$ for all $m > N_2$. . Then, since $|L - s_m| = |s_m - L|$, we have

$$|s_n - s_m| \leq |s_n - L| + |s_m - L| < \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon,$$

i.e., $|s_n - s_m| < \epsilon$, for $n, m > N$ where N is the larger of $\{N_1, N_2\}$. This shows that every convergent sequence must be a Cauchy sequence.

8.2 Infinite Series

Concepts and Vocabulary

1. **(b)**: $\sum_{k=1}^{\infty} a_k = a_1 + a_2 + \cdots + a_n + \cdots$ is called an infinite series.
2. **(d)**: $S_n = \sum_{k=1}^n a_k$ is the n^{th} partial sum, and the sequence $\{S_n\}$ is called the sequence of partial sums.
3. **True**: If a series converges then the sequence of partial sums converges. Conversely, if the sequence of partial sums converges, then the series also converges.
4. **False**: The geometric series $\sum_{k=1}^{\infty} ar^{k-1}$, $a \neq 0$, converges if $|r| < 1$, but diverges when $|r| = 1$.
5. $S = \boxed{\frac{a}{1-r}}$ is the sum of the convergent geometric series $\sum_{k=1}^{\infty} ar^{k-1}$, $a \neq 0$.
6. **False**: The limit of the n^{th} term of a series as $n \rightarrow \infty$ does not tell us if the series itself will converge. In this instance, the harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ diverges even though $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$.

Skill Building

7. $S_4 = \sum_{k=1}^4 \left(\frac{3}{4}\right)^{k-1} = \left(\frac{3}{4}\right)^0 + \left(\frac{3}{4}\right)^1 + \left(\frac{3}{4}\right)^2 + \left(\frac{3}{4}\right)^3 = 1 + \frac{3}{4} + \frac{9}{16} + \frac{27}{64} = \boxed{\frac{175}{64}}$.
8. $S_4 = \sum_{k=1}^4 \frac{(-1)^{k+1}}{3^{k-1}} = \frac{(-1)^2}{3^0} + \frac{(-1)^3}{3^1} + \frac{(-1)^4}{3^2} + \frac{(-1)^5}{3^3} = 1 - \frac{1}{3} + \frac{1}{9} - \frac{1}{27} = \boxed{\frac{20}{27}}$.
9. $S_4 = \sum_{k=1}^4 k = 1 + 2 + 3 + 4 = \boxed{10}$.
10. $S_4 = \sum_{k=1}^4 \ln k = \ln 1 + \ln 2 + \ln 3 + \ln 4 = \ln(1 \cdot 2 \cdot 3 \cdot 4) = \boxed{\ln 24}$.
11. $S_n = \sum_{k=1}^n \left(\frac{1}{k+2} - \frac{1}{k+3}\right) = \left(\frac{1}{3} - \frac{1}{4}\right) + \left(\frac{1}{4} - \frac{1}{5}\right) + \cdots + \left(\frac{1}{n+1} - \frac{1}{n+2}\right) + \left(\frac{1}{n+2} - \frac{1}{n+3}\right) = \frac{1}{3} = \frac{1}{n+3}$.
We have
$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(\frac{1}{3} - \frac{1}{n+3}\right) = \lim_{n \rightarrow \infty} \frac{1}{3} - \lim_{n \rightarrow \infty} \frac{1}{n+3} = \frac{1}{3} - 0 = \frac{1}{3}.$$

Since the sequence of partial sums converges to $\frac{1}{3}$, this means the sum of the telescoping series is $\boxed{\frac{1}{3}}$.

12. $S_n = \sum_{k=1}^n \left[\frac{1}{k^2} - \frac{1}{(k+1)^2}\right] = \left(\frac{1}{1^2} - \frac{1}{2^2}\right) + \left(\frac{1}{2^2} - \frac{1}{3^2}\right) + \cdots + \left(\frac{1}{(n-1)^2} - \frac{1}{n^2}\right) + \left(\frac{1}{n^2} - \frac{1}{(n+1)^2}\right) = 1 - \frac{1}{(n+1)^2}$.
We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{(n+1)^2}\right) = \lim_{n \rightarrow \infty} 1 - \lim_{n \rightarrow \infty} \frac{1}{(n+1)^2} = 1 - 0 = 1.$$

Since the sequence of partial sums converges to 1, this means the sum of the telescoping series is $\boxed{1}$.

$$13. S_n = \sum_{k=1}^n \left(\frac{1}{3^{k+1}} - \frac{1}{3^k} \right) = \left(\frac{1}{3^2} - \frac{1}{3} \right) + \left(\frac{1}{3^3} - \frac{1}{3^2} \right) + \cdots + \left(\frac{1}{3^n} - \frac{1}{3^{n-1}} \right) + \left(\frac{1}{3^{n+1}} - \frac{1}{3^n} \right) = \frac{1}{3^{n+1}} - \frac{1}{3}.$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(\frac{1}{3^{n+1}} - \frac{1}{3} \right) = \lim_{n \rightarrow \infty} \frac{1}{3^{n+1}} - \lim_{n \rightarrow \infty} \frac{1}{3} = 0 - \frac{1}{3} = -\frac{1}{3}.$$

Since the sequence of partial sums converges to $-\frac{1}{3}$, this means the sum of the telescoping series is $\boxed{-\frac{1}{3}}$.

$$14. S_n = \sum_{k=1}^n \left(\frac{1}{4^{k+1}} - \frac{1}{4^k} \right) = \left(\frac{1}{4^2} - \frac{1}{4} \right) + \left(\frac{1}{4^3} - \frac{1}{4^2} \right) + \cdots + \left(\frac{1}{4^n} - \frac{1}{4^{n-1}} \right) + \left(\frac{1}{4^{n+1}} - \frac{1}{4^n} \right) = \frac{1}{4^{n+1}} - \frac{1}{4}.$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(\frac{1}{4^{n+1}} - \frac{1}{4} \right) = \lim_{n \rightarrow \infty} \frac{1}{4^{n+1}} - \lim_{n \rightarrow \infty} \frac{1}{4} = 0 - \frac{1}{4} = -\frac{1}{4}.$$

Since the sequence of partial sums converges to $-\frac{1}{4}$, this means the sum of the telescoping series is $\boxed{-\frac{1}{4}}$.

$$15. \text{ We write the general term as a difference of terms: } S_n = \sum_{k=1}^n \frac{1}{4k^2-1} = \sum_{k=1}^n \frac{1}{2} \left(\frac{1}{2k-1} - \frac{1}{2k+1} \right) = \frac{1}{2} \left(\frac{1}{1} - \frac{1}{3} \right) + \frac{1}{2} \left(\frac{1}{3} - \frac{1}{5} \right) + \cdots + \frac{1}{2} \left(\frac{1}{2n-3} - \frac{1}{2n-1} \right) + \frac{1}{2} \left(\frac{1}{2n-1} - \frac{1}{2n+1} \right) = \frac{1}{2} - \frac{1}{2} \left(\frac{1}{2n+1} \right).$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(\frac{1}{2} - \frac{1}{2} \left(\frac{1}{2n+1} \right) \right) = \lim_{n \rightarrow \infty} \frac{1}{2} - \lim_{n \rightarrow \infty} \frac{1}{2} \left(\frac{1}{2n+1} \right) = \frac{1}{2} - 0 = \frac{1}{2}.$$

Since the sequence of partial sums converges to $\frac{1}{2}$, this means the sum of the telescoping series is $\boxed{\frac{1}{2}}$.

16. We write the general term as a difference of terms:

$$S_n = \sum_{k=1}^n \frac{1}{k(k+1)(k+2)} = \sum_{k=1}^n \frac{1}{2} \left(\frac{1}{k(k+1)} - \frac{1}{(k+1)(k+2)} \right) = \frac{1}{2} \left(\frac{1}{1 \cdot 2} - \frac{1}{2 \cdot 3} \right) + \frac{1}{2} \left(\frac{1}{2 \cdot 3} - \frac{1}{3 \cdot 4} \right) + \cdots + \frac{1}{2} \left(\frac{1}{(n-1)n} - \frac{1}{n(n+1)} \right) + \frac{1}{2} \left(\frac{1}{n(n+1)} - \frac{1}{(n+1)(n+2)} \right) = \frac{1}{2} \left(\frac{1}{2} - \frac{1}{(n+1)(n+2)} \right).$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{1}{2} \left(\frac{1}{2} - \frac{1}{(n+1)(n+2)} \right) = \lim_{n \rightarrow \infty} \frac{1}{4} - \lim_{n \rightarrow \infty} \frac{1}{2} \left(\frac{1}{(n+1)(n+2)} \right) = \frac{1}{4} - 0 = \frac{1}{4}.$$

Since the sequence of partial sums converges to $\frac{1}{4}$, this means the sum of the telescoping series is $\boxed{\frac{1}{4}}$.

17. $\sum_{k=1}^{\infty} (\sqrt{2})^{k-1}$. This has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \sqrt{2}$. The series will *diverge* since $|r| > 1$.

18. $\sum_{k=1}^{\infty} (0.33)^{k-1}$. This has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = 0.33$. Since $|r| < 1$, this series will *converge* to a sum of $\frac{a}{1-r} = \frac{1}{1-0.33} = \frac{1}{0.67} = \frac{100}{67}$.

19. $\sum_{k=1}^{\infty} 5 \left(\frac{1}{6} \right)^{k-1}$. This has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 5$ and $r = \frac{1}{6}$. Since $|r| < 1$, this series will *converge* to a sum of $\frac{1}{1-r} = \frac{5}{1-\frac{1}{6}} = \frac{5}{\frac{5}{6}} = \boxed{6}$.

20. $\sum_{k=1}^{\infty} 4(1.1)^{k-1}$. This has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 4$ and $r = 1.1$. The series will diverge since $|r| > 1$.

21. $\sum_{k=0}^{\infty} 7\left(\frac{1}{3}\right)^k = 7\left(\frac{1}{3}\right)^0 + \sum_{k=1}^{\infty} 7\left(\frac{1}{3}\right)^k = 7 + \sum_{k=1}^{\infty} \frac{7}{3}\left(\frac{1}{3}\right)^{k-1}$. The second term has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{7}{3}$ and $r = \frac{1}{3}$. Since $|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{\frac{7}{3}}{1-\frac{1}{3}} = \frac{7/3}{2/3} = \frac{7}{2}$. The original series will converge to a sum of $7 + \frac{7}{2} = \boxed{\frac{21}{2}}$.

22. $\sum_{k=0}^{\infty} \left(\frac{7}{4}\right)^k = \left(\frac{7}{4}\right)^0 + \sum_{k=1}^{\infty} \left(\frac{7}{4}\right)^k = 1 + \sum_{k=1}^{\infty} \frac{7}{4}\left(\frac{7}{4}\right)^{k-1}$. The second term has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{7}{4}$ and $r = \frac{7}{4}$. Since $|r| > 1$, this series will diverge, which means the original series will diverge as well.

23. $\sum_{k=1}^{\infty} (-0.38)^{k-1}$. This has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = -0.38$. Since $|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{1}{1-(-0.38)} = \frac{1}{1.38} = \frac{100}{138} = \boxed{\frac{50}{69}}$.

24. $\sum_{k=1}^{\infty} (-0.38)^k = \sum_{k=1}^{\infty} (-0.38)(-0.38)^{k-1}$. This has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = -0.38$ and $r = -0.38$. Since $|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{-0.38}{1-(-0.38)} = -\frac{0.38}{1.38} = -\frac{38}{138} = \boxed{-\frac{19}{69}}$.

25. $\sum_{k=0}^{\infty} \frac{2^{k+1}}{3^k} = \frac{2^{0+1}}{3^0} + \sum_{k=1}^{\infty} 2 \cdot \left(\frac{2}{3}\right)^k = 2 + \sum_{k=1}^{\infty} 2 \cdot \left(\frac{2}{3}\right) \left(\frac{2}{3}\right)^{k-1} = 2 + \sum_{k=1}^{\infty} \frac{4}{3} \left(\frac{2}{3}\right)^{k-1}$.

The second term has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{4}{3}$ and $r = \frac{2}{3}$. Since $|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{4/3}{1-\frac{2}{3}} = \frac{4/3}{1/3} = 4$. The original series will converge to a sum of $2 + 4 = \boxed{6}$.

26. $\sum_{k=0}^{\infty} \frac{5^k}{6^{k+1}} = \frac{5^0}{6^{0+1}} + \sum_{k=1}^{\infty} \frac{5^k}{6^{k+1}} = \frac{1}{6} + \sum_{k=1}^{\infty} \frac{5}{6^2} \cdot \frac{5^{k-1}}{6^{k-1}} = \frac{1}{6} + \sum_{k=1}^{\infty} \frac{5}{36} \cdot \left(\frac{5}{6}\right)^{k-1}$.

The second term has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{5}{36}$ and $r = \frac{5}{6}$. Since $|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{5/36}{1-\frac{5}{6}} = \frac{5/36}{1/6} = \frac{5}{6}$. The original series converges to a sum of $\frac{1}{6} + \frac{5}{6} = \boxed{1}$.

27. $\sum_{k=0}^{\infty} \frac{1}{4^{k+1}} = \frac{1}{4^{0+1}} + \sum_{k=1}^{\infty} \frac{1}{4^{k+1}} = \frac{1}{4} + \sum_{k=1}^{\infty} \frac{1}{4^2} \cdot \left(\frac{1}{4}\right)^{k-1}$.

The second term has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{1}{4^2}$ and $r = \frac{1}{4}$. Since $|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{1/4^2}{1-\frac{1}{4}} = \frac{1/16}{3/4} = \frac{1}{12}$. The original series converges to a sum of $\frac{1}{4} + \frac{1}{12} = \boxed{\frac{1}{3}}$.

28. $\sum_{k=0}^{\infty} \frac{4^{k+1}}{3^k} = \frac{4^{0+1}}{3^0} + \sum_{k=1}^{\infty} \frac{4^{k+1}}{3^k} = 4 + \sum_{k=1}^{\infty} \frac{4^2}{3} \left(\frac{4}{3}\right)^{k-1}.$

The second term has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{4^2}{3}$ and $r = \frac{4}{3}$. Since $|r| > 1$, this series *diverges*, and so does the original series.

29. $\sum_{k=1}^{\infty} \sin^{k-1} \left(\frac{\pi}{2}\right)$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \sin \frac{\pi}{2} = 1$. Since $|r| = 1$, this series *diverges*.

30. $\sum_{k=1}^{\infty} \tan^{k-1} \left(\frac{\pi}{4}\right)$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \tan \frac{\pi}{4} = 1$. Since $|r| = 1$, this series *diverges*.

31. $\sum_{k=1}^{\infty} \left(-\frac{3}{2}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = -\frac{3}{2}$. Since $|r| > 1$, this series *diverges*.

32. $\sum_{k=1}^{\infty} \left(-\frac{2}{3}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = -\frac{2}{3}$. Since $|r| < 1$, this series will *converge* to a sum of $\frac{a}{1-r} = \frac{1}{1-(-\frac{2}{3})} = \frac{1}{5/3} = \boxed{\frac{3}{5}}.$

33. $1 + \frac{1}{3} + \frac{1}{9} + \cdots + \left(\frac{1}{3}\right)^n + \cdots = \sum_{k=1}^{\infty} \left(\frac{1}{3}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \frac{1}{3}$. Since $|r| < 1$, this series *converges* to a sum of $\frac{a}{1-r} = \frac{1}{1-\frac{1}{3}} = \frac{1}{2/3} = \boxed{\frac{3}{2}}.$

34. $1 + \frac{1}{4} + \frac{1}{16} + \cdots + \left(\frac{1}{4}\right)^n + \cdots = \sum_{k=1}^{\infty} \left(\frac{1}{4}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \frac{1}{4}$. Since $|r| < 1$, this series *converges* to a sum of $\frac{a}{1-r} = \frac{1}{1-\frac{1}{4}} = \frac{1}{3/4} = \boxed{\frac{4}{3}}.$

35. $1 + 2 + 4 + \cdots + 2^n + \cdots = \sum_{k=1}^{\infty} 2^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = 2$. Since $|r| > 1$, this series will *diverge*.

36. $1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \cdots + \frac{(-1)^{n-1}}{2^{n-1}} + \cdots = \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{2^{k-1}} = \sum_{k=1}^{\infty} \left(-\frac{1}{2}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = -\frac{1}{2}$. Since $|r| < 1$, this series *converges* to a sum of $\frac{a}{1-r} = \frac{1}{1-(-\frac{1}{2})} = \frac{1}{3/2} = \boxed{\frac{2}{3}}.$

37. $\left(\frac{1}{7}\right)^2 + \left(\frac{1}{7}\right)^3 + \cdots + \left(\frac{1}{7}\right)^n + \cdots = \sum_{k=1}^{\infty} \left(\frac{1}{7}\right)^{k-1} - 1 - \frac{1}{7}.$

The first term has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \frac{1}{7}$. Since $|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{1}{1-\frac{1}{7}} = \frac{1}{6/7} = \frac{7}{6}$. The original series *converges* to a sum of

$$\frac{7}{6} - 1 - \frac{1}{7} = \boxed{\frac{1}{42}}.$$

$$38. \left(\frac{3}{4}\right)^5 + \left(\frac{3}{4}\right)^6 + \cdots + \left(\frac{3}{4}\right)^n + \cdots = \sum_{k=1}^{\infty} \left(\frac{3}{4}\right)^{k-1} - 1 - \frac{3}{4} - \left(\frac{3}{4}\right)^2 - \left(\frac{3}{4}\right)^3 - \left(\frac{3}{4}\right)^4.$$

The first term has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \frac{3}{4}$. Since $|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{1}{1-\frac{3}{4}} = \frac{1}{1/4} = 4$. The original series converges to a sum of

$$4 - 1 - \frac{3}{4} - \left(\frac{3}{4}\right)^2 - \left(\frac{3}{4}\right)^3 - \left(\frac{3}{4}\right)^4 = 3 - \frac{3}{4} - \frac{9}{16} - \frac{27}{64} - \frac{81}{256} = \boxed{\frac{243}{256}}.$$

39. The series can be written $\sum_{k=0}^{\infty} \frac{1}{k+1} = \sum_{k'=1}^{\infty} \frac{1}{k'}$, where $k' = k + 1$. This is the harmonic series, which diverges.

40. $\sum_{k=4}^{\infty} k^{-1} = \sum_{k=4}^{\infty} \frac{1}{k} = \sum_{k=1}^{\infty} \frac{1}{k} - 1 - \frac{1}{2} - \frac{1}{3}$. The first term is the harmonic series. It diverges, and so does the original series.

41. $\sum_{k=1}^{\infty} \frac{1}{100^k} = \sum_{k=1}^{\infty} \frac{1}{100} \cdot \left(\frac{1}{100}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{1}{100}$ and $r = \frac{1}{100}$.

Since $|r| < 1$, this series converges to a sum of $\frac{a}{1-r} = \frac{\frac{1}{100}}{1-\frac{1}{100}} = \frac{1/100}{99/100} = \boxed{\frac{1}{99}}$.

42. $\sum_{k=1}^{\infty} e^{-k} = \sum_{k=1}^{\infty} \frac{1}{e^k} = \sum_{k=1}^{\infty} \frac{1}{e} \cdot \left(\frac{1}{e}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{1}{e}$ and $r = \frac{1}{e}$.

Since $|r| < 1$, this series converges to a sum of $\frac{a}{1-r} = \frac{\frac{1}{e}}{1-\frac{1}{e}} = \boxed{\frac{1}{e-1}}$.

43. $\sum_{k=1}^{\infty} (-10k)$. The n^{th} partial sum is $S_n = \sum_{k=1}^n (-10k) = (-10) \sum_{k=1}^n k = (-10) \cdot \frac{n(n+1)}{2}$, using the standard formula for the sum of the first n integers. We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} (-10) \frac{n(n+1)}{2} = -\infty.$$

Since the sequence of partial sums $\{S_n\}$ diverges, the series diverges as well.

44. $\sum_{k=1}^{\infty} \frac{3k}{5}$. The n^{th} partial sum is $S_n = \sum_{k=1}^n \frac{3k}{5} = \frac{3}{5} \sum_{k=1}^n k = \frac{3}{5} \cdot \frac{n(n+1)}{2}$, using the standard formula for the sum of the first n integers. We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{3}{5} \frac{n(n+1)}{2} = \infty.$$

Since the sequence of partial sums $\{S_n\}$ diverges, the series diverges as well.

45. $\sum_{k=1}^{\infty} \cos^{k-1} \left(\frac{2\pi}{3}\right)$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \cos \frac{2\pi}{3} = -\frac{1}{2}$. Since

$|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{1}{1-(-\frac{1}{2})} = \frac{1}{\frac{3}{2}} = \boxed{\frac{2}{3}}$.

46. $\sum_{k=1}^{\infty} \sin^{k-1} \left(\frac{\pi}{6}\right)$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 1$ and $r = \sin \frac{\pi}{6} = \frac{1}{2}$. Since

$|r| < 1$, this series will converge to a sum of $\frac{a}{1-r} = \frac{1}{1-\frac{1}{2}} = \frac{1}{\frac{1}{2}} = \boxed{2}$.

47. $\sum_{k=1}^{\infty} \frac{\tan^k(\frac{\pi}{4})}{k} = \sum_{k=1}^{\infty} \frac{1}{k}$, since $\tan \frac{\pi}{4} = 1$. This is a harmonic series and so it *diverges*.

48. $\sum_{k=1}^{\infty} \frac{\sin^k(\frac{\pi}{2})}{k} = \sum_{k=1}^{\infty} \frac{1}{k}$, since $\sin \frac{\pi}{2} = 1$. This is a harmonic series and so it *diverges*.

49. $\sum_{k=1}^{\infty} \cos(\pi k) = \cos \pi + \cos 2\pi + \cos 3\pi + \cdots + \cos n\pi + \cdots$. Now, $\cos \pi = -1$, $\cos 2\pi = 1$, $\cos 3\pi = -1$, etc. In general, $\cos n\pi = (-1)^n$. So the series can be written $\sum_{k=1}^{\infty} (-1)^k = \sum_{k=1}^{\infty} (-1)(-1)^{k-1}$, which has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = -1$ and $r = -1$. Since $|r| = 1$, this series *diverges*.

50. $\sum_{k=1}^{\infty} \sin(\frac{\pi k}{2}) = \sin \frac{\pi}{2} + \sin \pi + \sin \frac{3\pi}{2} + \sin 2\pi + \cdots$. Now, $\sin \frac{\pi}{2} = 1$, $\sin \pi = 0$, $\sin \frac{3\pi}{2} = -1$, $\sin 2\pi = 0$, etc. We see that the partial sums $S_n = \sum_{k=1}^n \sin(\frac{\pi k}{2})$ will alternate between the values of $+1$ and 0 , depending on the value of n . The sequence of partial sums is $\{S_n\} = \{1, 0, 1, 0, 1, 0, \dots\}$. Since the limit of the sequence of partial sums does not exist, the series *diverges*.

51. $\sum_{k=1}^{\infty} 2^{-k} 3^{k+1} = \sum_{k=1}^{\infty} \frac{3^{k+1}}{2^k} = \sum_{k=1}^{\infty} \frac{3^2 \cdot 3^{k-1}}{2 \cdot 2^{k-1}} = \sum_{k=1}^{\infty} \frac{9}{2} \left(\frac{3}{2}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{9}{2}$ and $r = \frac{3}{2}$. Since $|r| > 1$, this series *diverges*.

52. $\sum_{k=1}^{\infty} 3^{1-k} 2^{1+k} = \sum_{k=1}^{\infty} \frac{2^{k+1}}{3^{k-1}} = \sum_{k=1}^{\infty} 2^2 \cdot \left(\frac{2}{3}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = 2^2 = 4$ and $r = \frac{2}{3}$. Since $|r| < 1$, this series will *converge* to a sum of $\frac{a}{1-r} = \frac{4}{1-\frac{2}{3}} = \frac{4}{\frac{1}{3}} = \frac{4}{1} = \boxed{12}$.

53. $\sum_{k=1}^{\infty} \left(-\frac{1}{3}\right)^k = \sum_{k=1}^{\infty} \left(-\frac{1}{3}\right) \left(-\frac{1}{3}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = -\frac{1}{3}$ and $r = -\frac{1}{3}$. Since $|r| < 1$, this series *converges* to a sum of $\frac{a}{1-r} = \frac{-\frac{1}{3}}{1-(-\frac{1}{3})} = \frac{-1/3}{4/3} = \boxed{-\frac{1}{4}}$.

54. $\sum_{k=1}^{\infty} \frac{\pi}{3^k} = \sum_{k=1}^{\infty} \frac{\pi}{3} \cdot \left(\frac{1}{3}\right)^{k-1}$ has the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{\pi}{3}$ and $r = \frac{1}{3}$. Since $|r| < 1$, this series *converges* to a sum of $\frac{a}{1-r} = \frac{\frac{\pi}{3}}{1-\frac{1}{3}} = \frac{\pi/3}{2/3} = \boxed{\frac{\pi}{2}}$.

55. $\sum_{k=1}^{\infty} \ln \frac{k}{k+1} = \sum_{k=1}^{\infty} (\ln k - \ln(k+1))$. The n^{th} partial sum is

$$\begin{aligned} S_n &= \sum_{k=1}^n (\ln k - \ln(k+1)) = (\ln 1 - \ln 2) + (\ln 2 - \ln 3) + \cdots + (\ln(n-1) - \ln n) + (\ln n - \ln(n+1)) \\ &= \ln 1 - \ln(n+1) = -\ln(n+1). \end{aligned}$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} [-\ln(n+1)] = -\infty.$$

Since the limit of the partial sums diverges, the sequence $\{S_n\}$ is a divergent sequence. This in turn means that the original series is *divergent*.

56. $\sum_{k=1}^{\infty} [e^{2k^{-1}} - e^{2(k+1)^{-1}}]$. The n^{th} partial sum is

$$\begin{aligned} S_n &= \sum_{k=1}^n (e^{2k^{-1}} - e^{2(k+1)^{-1}}) = (e^{2/1} - e^{2/2}) + (e^{2/2} - e^{2/3}) + \cdots + (e^{2/(n-1)} - e^{2/n}) + (e^{2/n} - e^{2/(n+1)}) \\ &= e^2 - e^{2/(n+1)}. \end{aligned}$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n (e^{2k^{-1}} - e^{2(k+1)^{-1}}) = \lim_{n \rightarrow \infty} e^2 - \lim_{n \rightarrow \infty} e^{2/(n+1)} = e^2 - e^{\lim_{n \rightarrow \infty} 2/(n+1)} = e^2 - e^0 = e^2 - 1.$$

Since the limit of partial sums $\{S_n\}$ converges to a limit, the series converges to the same limit $e^2 - 1$.

57. $\sum_{k=1}^{\infty} \left(\sin \frac{1}{k} - \sin \frac{1}{k+1} \right)$. The n^{th} partial sum is

$$\begin{aligned} S_n &= \sum_{k=1}^n \left(\sin \frac{1}{k} - \sin \frac{1}{k+1} \right) \\ &= \left(\sin \frac{1}{1} - \sin \frac{1}{2} \right) + \left(\sin \frac{1}{2} - \sin \frac{1}{3} \right) + \cdots + \left(\sin \frac{1}{n-1} - \sin \frac{1}{n} \right) + \left(\sin \frac{1}{n} - \sin \frac{1}{n+1} \right) \\ &= \sin 1 - \sin \frac{1}{n+1}. \end{aligned}$$

We have

$$\begin{aligned} \lim_{n \rightarrow \infty} S_n &= \lim_{n \rightarrow \infty} \left(\sin 1 - \sin \frac{1}{n+1} \right) = \lim_{n \rightarrow \infty} \sin 1 - \lim_{n \rightarrow \infty} \sin \frac{1}{n+1} = \sin 1 - \sin \left(\lim_{n \rightarrow \infty} \frac{1}{n+1} \right) \\ &= \sin 1 - \sin 0 = \sin 1. \end{aligned}$$

Since the limit of partial sums $\{S_n\}$ converges to a limit, the series converges to the same limit $\sin 1$.

58. $\sum_{k=1}^{\infty} \left(\tan \frac{1}{k} - \tan \frac{1}{k+1} \right)$. The n^{th} partial sum is

$$\begin{aligned} S_n &= \sum_{k=1}^n \left(\tan \frac{1}{k} - \tan \frac{1}{k+1} \right) \\ &= \left(\tan \frac{1}{1} - \tan \frac{1}{2} \right) + \left(\tan \frac{1}{2} - \tan \frac{1}{3} \right) + \cdots + \left(\tan \frac{1}{n-1} - \tan \frac{1}{n} \right) + \left(\tan \frac{1}{n} - \tan \frac{1}{n+1} \right) \\ &= \tan 1 - \tan \frac{1}{n+1}. \end{aligned}$$

We have

$$\begin{aligned} \lim_{n \rightarrow \infty} S_n &= \lim_{n \rightarrow \infty} \left(\tan 1 - \tan \frac{1}{n+1} \right) = \lim_{n \rightarrow \infty} \tan 1 - \lim_{n \rightarrow \infty} \tan \frac{1}{n+1} = \tan 1 - \tan \left(\lim_{n \rightarrow \infty} \frac{1}{n+1} \right) \\ &= \tan 1 - \tan 0 = \tan 1. \end{aligned}$$

Since the limit of partial sums $\{S_n\}$ converges to a limit, the series converges to the same limit $\tan 1$.

59. Write the given decimal as follows:

$$\begin{aligned} 0.5555 \dots &= 0.5 + 0.05 + 0.005 + \dots = \frac{5}{10} + \frac{5}{100} + \frac{5}{1000} + \dots \\ &= \frac{5}{10} \left(1 + \frac{1}{10} + \frac{1}{100} + \dots \right) \\ &= \sum_{k=1}^{\infty} \frac{5}{10} \left(\frac{1}{10} \right)^{k-1}. \end{aligned}$$

This is a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{5}{10}$ and $r = \frac{1}{10}$. Since $|r| < 1$, this series converges to a sum of

$$\frac{a}{1-r} = \frac{\frac{5}{10}}{1-\frac{1}{10}} = \frac{5/10}{9/10} = \frac{5}{9}. \text{ So the decimal written as a rational number is } 0.5555 \dots = \boxed{\frac{5}{9}}.$$

60. Write the given decimal as follows:

$$\begin{aligned} 0.727272 \dots &= 0.72 + 0.0072 + 0.000072 + \dots = \frac{72}{100} + \frac{72}{10000} + \frac{72}{1000000} + \dots \\ &= \frac{72}{100} \left(1 + \frac{1}{100} + \frac{1}{10000} + \dots \right) \\ &= \sum_{k=1}^{\infty} \frac{72}{100} \left(\frac{1}{100} \right)^{k-1}. \end{aligned}$$

This is a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{72}{100}$ and $r = \frac{1}{100}$. Since $|r| < 1$, this series converges to a sum

$$\text{of } \frac{a}{1-r} = \frac{\frac{72}{100}}{1-\frac{1}{100}} = \frac{72/100}{99/100} = \frac{72}{99} = \frac{8}{11}. \text{ So the decimal written as a rational number is } 0.727272 \dots = \boxed{\frac{8}{11}}.$$

61. Write the given decimal as follows:

$$\begin{aligned} 4.28555 \dots &= 4.28 + 0.00555 \dots = 4.28 + 0.005 + 0.0005 + 0.00005 + \dots \\ &= 4.28 + \frac{5}{1000} + \frac{5}{10000} + \frac{5}{100000} + \dots = 4.28 + \frac{5}{1000} \left(1 + \frac{1}{10} + \frac{1}{100} + \dots \right) \\ &= 4.28 + \sum_{k=1}^{\infty} \frac{5}{1000} \left(\frac{1}{10} \right)^{k-1}. \end{aligned}$$

The second term is a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{5}{1000}$ and $r = \frac{1}{10}$. Since $|r| < 1$, this series converges to a sum of $\frac{a}{1-r} = \frac{\frac{5}{1000}}{1-\frac{1}{10}} = \frac{5/1000}{9/10} = \frac{5}{900}$. So the original series sums to the value of the decimal in rational form, which is $4.28 + \frac{5}{900} = \frac{428}{100} + \frac{5}{900} = \boxed{\frac{3857}{900}}.$

62. Write the given decimal as follows:

$$\begin{aligned} 7.162162162 \dots &= 7 + 0.162162162 \dots = 7 + 0.162 + 0.000162 + 0.000000162 + \dots \\ &= 7 + \frac{162}{1,000} + \frac{162}{1,000,000} + \frac{162}{1,000,000,000} + \dots \\ &= 7 + \frac{162}{1000} \left(1 + \frac{1}{1,000} + \frac{1}{1,000,000} + \dots \right) \\ &= 7 + \sum_{k=1}^{\infty} \frac{162}{1000} \left(\frac{1}{1000} \right)^{k-1}. \end{aligned}$$

The second term is a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{162}{1000}$ and $r = \frac{1}{1000}$. Since $|r| < 1$, this series converges to a sum of $\frac{a}{1-r} = \frac{\frac{162}{1000}}{1-\frac{1}{1000}} = \frac{162/1000}{999/1000} = \frac{162}{999}$. So the original series sums to the value of the decimal in rational form, which is $7 + \frac{162}{999} = \boxed{\frac{265}{37}}$.

Applications and Extensions

63. Let the original height from which the ball is dropped be h_0 . The height attained after the first bounce $h_1 = h_0 \cdot r$, where r = fraction of the original height. The height attained after the second bounce $h_2 = h_1 \cdot r = (h_0 r)r = h_0 r^2$. Proceeding in this fashion, we can say that the height attained after the n^{th} bounce will be $h_n = h_0 r^n$.

The total vertical distance traveled by the ball, remembering that each bounce has an upward vertical travel followed by a downward vertical travel, is given by

$$\begin{aligned} H &= h_0 + 2h_1 + 2h_2 + 2h_3 + \cdots + 2h_n + \cdots \\ &= h_0 + 2(h_0 r + h_0 r^2 + h_0 r^3 + \cdots + h_0 r^n + \cdots) \\ &= h_0 + 2h_0 r(1 + r + r^2 + \cdots + r^{n-1} + \cdots) \\ &= h_0 + 2h_0 r \cdot \sum_{k=1}^{\infty} r^{k-1}. \end{aligned}$$

Since the process of bouncing is not an elastic collision for the ball in question, we have $|r| < 1$, so that the second term is a convergent geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$ which sums to $\frac{a}{1-r}$, with $a = 1$, so the sum will be $\frac{1}{1-r}$. So the total vertical distance traversed by the bouncing ball is

$$H = h_0 + 2h_0 r \cdot \frac{1}{1-r} = h_0 \left[1 + \frac{2r}{1-r} \right] = h_0 \left(\frac{1+r}{1-r} \right) = 18\text{ft} \left(\frac{1+\frac{2}{3}}{1-\frac{2}{3}} \right) = \frac{18 \cdot (5/3)}{1/3} \text{ft} = \boxed{90\text{ft.}}$$

64. (a) Let the initial dollar amount on January 1, 2015 be $A_1 = A_0$. The amount on January 2 will be $A_2 = rA_1 = rA_0$, where r = the fraction of the original amount given on January 1. On January 3, the amount received will be $r(A_2) = r^2 A_0$, and so forth. The total amount received

$A = A_0 + rA_0 + r^2 A_0 + \cdots = A_0(1 + r + r^2 + \cdots) = \sum_{k=1}^{\infty} A_0 r^{k-1}$. If $|r| < 1$, this is a convergent geometric series with sum $\frac{A_0}{1-r}$. So the total amount received $A = \frac{A_0}{1-r} = \frac{\$1000}{1-\frac{1}{9}} = \frac{\$1000}{1/10} = \boxed{\$10,000}$.

(b) We want the amount received on the n^{th} day to be less than one cent = \$0.01. So $A_n = r^{n-1} A_0 < \$0.01$ gives $r^{n-1} < \frac{\$0.01}{\$1000} = 10^{-5}$. Taking the $\log_{10}$ of both sides, remembering that $\log_{10} r$ is an increasing function of r , we have

$$\begin{aligned} (n-1) \log_{10} r &< -5 \log_{10} 10 \\ n-1 &> -\frac{5}{\log_{10} r} \\ n-1 &> -\frac{5}{\log_{10} \frac{9}{10}} \\ &= \frac{-5}{-0.04576} \approx 109.27, \end{aligned}$$

(where the inequality has been reversed since $|r| < 1$ gives negative values for $\log_{10} r$), or $n-1 = 110$ days, so $n = 111$ days. Now, 2015 is not a leap year, so February 2015 has 28 days. January has 31 days, March has 31, for a total of $28 + 31 + 31 = 90$ days. So a total time period of 111 days after (and including) January 1 would fall on April 21, 2015. On, and after this day, the amount paid out will be less than 1 cent.

65. (a) The population of rainbow trout in Mirror Lake in year n of the restocking program is

$p_n = 3000r^n + h \sum_{k=1}^n r^{k-1}$. As $n \rightarrow \infty$, the manager can expect the steady rainbow trout population to be

$$p = \lim_{n \rightarrow \infty} p_n = \lim_{n \rightarrow \infty} 3000r^n + h \lim_{n \rightarrow \infty} \sum_{k=1}^n r^{k-1} = 3000 \lim_{n \rightarrow \infty} r^n + h \sum_{k=1}^{\infty} r^{k-1}.$$

Since $|r| < 1$, we have $\lim_{n \rightarrow \infty} r^n = 0$. Also the second term is a convergent geometric series with sum $\frac{h}{1-r}$.

So the steady population of rainbow trout is $p = 3000 \cdot 0 + \frac{h}{1-r} = \boxed{\frac{h}{1-r}}$.

(b) We require $p = 4000$ with $r = 0.5$. This means $h = p(1-r) = 4000(1-0.5) = \boxed{2000}$ is the number of fish to be added annually to obtain the steady population.

66. The multiplier for a marginal propensity to consume of 90% is $\sum_{k=1}^{\infty} (0.90)^{k-1} = \frac{1}{1-0.9} = \frac{1}{0.1} = \boxed{10}$.

67. (a) The expression for stock pricing can be written as

Price = $P + P \frac{1+i}{1+r} + P \left(\frac{1+i}{1+r} \right)^2 + P \left(\frac{1+i}{1+r} \right)^3 + \cdots = \sum_{k=1}^{\infty} P \left(\frac{1+i}{1+r} \right)^{k-1} = \frac{P}{1 - \left(\frac{1+i}{1+r} \right)} = \boxed{\frac{P(1+r)}{r-i}}$. (Here, we have used the fact that in most normal circumstances, the annual rate of return $r\%$ will always be greater than the annual dividend increase $i\%$, which means $\left| \frac{1+i}{1+r} \right| < 1$, and so the geometric series will converge to the sum we found rather than diverge.)

(b) If $r = 9\%$ the annual rate of return on a stock, $P = \$4.00$ what the stock currently pays in annual dividends, and $i = 3\%$ the annual increase in dividend, then the highest stock price the investor should pay will be about $\frac{P(1+r)}{r-i} = \frac{\$4(1+9)}{9-3} = \frac{\$4(10)}{6} = \boxed{\$6.67}$.

68. Area of the Koch snowflake is

$$\begin{aligned} A &= 1 + 3 \left(\frac{1}{9} \right) + 12 \left(\frac{1}{9} \right)^2 + 48 \left(\frac{1}{9} \right)^3 + 192 \left(\frac{1}{9} \right)^4 + \cdots \\ &= 1 + \frac{3}{9} \left[1 + 4 \cdot \frac{1}{9} + 16 \cdot \left(\frac{1}{9} \right)^2 + 64 \cdot \left(\frac{1}{9} \right)^3 + \cdots \right] \\ &= 1 + \frac{1}{3} \left[1 + \frac{4}{9} + \left(\frac{4}{9} \right)^2 + \left(\frac{4}{9} \right)^3 + \cdots \right] \\ &= 1 + \frac{1}{3} \sum_{k=1}^{\infty} \left(\frac{4}{9} \right)^{k-1} \\ &= 1 + \frac{1}{3} \cdot \frac{1}{1 - \frac{4}{9}} = 1 + \frac{1}{3} \cdot \frac{9}{9-4} = 1 + \frac{3}{5} \\ &= \boxed{\frac{8}{5} \text{ square units.}} \end{aligned}$$

69. Let the length of the race track be L . Let the tortoise be given a lead of $d < L$. If Achilles' speed is v_A and the tortoise's speed is v_T , then we are given that $v_A - v_T = v$, a (positive) constant. If the tortoise starts off at $t = 0$, then the time elapsed before Achilles starts is $\Delta t = \frac{d}{v_T}$. The time taken by Achilles to cover half the distance separating them would be $t_1 = \frac{d}{2v_A}$. By this time, the tortoise has moved out further by a distance $= v_T t_1 = \frac{v_T}{2v_A} d$. The new remaining distance between them $= \frac{d}{2} + \frac{v_T}{2v_A} d = \frac{d}{2} + \frac{v_A - v}{v_A} \frac{d}{2} = d - \frac{v}{v_A} \frac{d}{2} = d_1$, say.

The time taken by Achilles to cover half this new distance is $t_2 = \frac{d_1}{2v_A}$. The tortoise will by then have moved out further by a distance $= \frac{v_T}{2v_A}d_1$. The new remaining distance separating them,

$$\begin{aligned} d_2 &= d_1 - \frac{v}{v_A} \frac{d_1}{2} \\ &= d_1 \left(1 - \frac{v}{2v_A}\right) \\ &= d \left(1 - \frac{v}{2v_A}\right) \left(1 - \frac{v}{2v_A}\right) \\ &= d \left(1 - \frac{v}{2v_A}\right)^2. \end{aligned}$$

After n such halvings, the distance separating them $d_n = d \left(1 - \frac{v}{2v_A}\right)^n$. Since $\boxed{r = 1 - \frac{v}{2v_A}} < 1$, we have

$$\lim_{n \rightarrow \infty} d_n = \lim_{n \rightarrow \infty} dr^n = d \lim_{n \rightarrow \infty} r^n = 0.$$

This demonstrates that Achilles will eventually catch up with the tortoise, since the distance separating them tends to 0. In fact, we need to next show that this process takes a *finite* amount of time.

The total time for catching up after a time Δt has elapsed (this is the lead time given to the tortoise) is

$$\begin{aligned} T &= t_1 + t_2 + \cdots + t_n + \cdots \\ &= \frac{d}{2v_A} + \frac{d_1}{2v_A} + \frac{d_2}{2v_A} + \cdots + \frac{d_{n-1}}{2v_A} + \cdots \\ &= \frac{d}{2v_A} + r \frac{d}{2v_A} + r^2 \frac{d}{2v_A} + \cdots \\ &= \frac{d}{2v_A} (1 + r + r^2 + \cdots) \\ &= \frac{d}{2v_A} \sum_{k=1}^{\infty} r^{k-1} = \frac{d}{2v_A} \left(\frac{1}{1-r} \right) \\ &= \frac{d}{2v_A} \left(\frac{1}{1 - \left(1 - \frac{v}{2v_A}\right)} \right) = \frac{d}{2v_A} \left(\frac{1}{\frac{v}{2v_A}} \right) \\ &= \frac{d}{v}. \end{aligned}$$

This is exactly as we would expect, the time taken by Achilles to overtake the tortoise is just the original distance separating them divided by the relative difference in speeds. So we see by using a series argument that Achilles will catch up with the tortoise in a finite time.

Next, we show using a series argument that the total distance covered by Achilles in catching up with the tortoise is also finite. The total distance is

$$\begin{aligned} D &= \frac{d}{2} + \frac{d_1}{2} + \frac{d_2}{2} + \cdots \\ &= \frac{d}{2} + \frac{rd}{2} + \frac{r^2d}{2} + \cdots \\ &= \frac{1}{2}d(1 + r + r^2 + \cdots) \\ &= \frac{1}{2}d \sum_{k=1}^{\infty} r^{k-1} = \frac{1}{2}d \cdot \frac{1}{1-r} = \frac{1}{2}d \cdot \left(\frac{1}{1 - \left(1 - \frac{v}{2v_A}\right)} \right) = \frac{v_A}{v} d \\ &= \frac{v_A}{v_A - v_T} d. \end{aligned}$$

Since $v_T > 0$, this distance is bigger than d , as we would expect. If the speeds are such that $D < L$, then Achilles may even overtake the tortoise and win the race!

70. Probability of winning $= \frac{1}{2} + \frac{1}{8} + \frac{1}{32} + \cdots + \frac{1}{2^{2n-1}} + \cdots = \sum_{k=1}^{\infty} \frac{1}{2^{2k-1}} = \sum_{k=1}^{\infty} \frac{1}{2} \frac{1}{2^{2k-2}} = \sum_{k=1}^{\infty} \frac{1}{2} \left(\frac{1}{4}\right)^{k-1}$. This

is a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{1}{2}$ and $r = \frac{1}{4}$, which, since $|r| < 1$, will converge to a sum of

$$\frac{a}{1-r} = \frac{\frac{1}{2}}{1-\frac{1}{4}} = \frac{1/2}{3/4} = \boxed{\frac{2}{3}}.$$

71. (a) Amount of pig and cattle feces produced prior to cleaning on the first day $T(1) = p$. After the cleaning at the end of the first day, amount of feces left over $= (1-e)T(1) = (1-e)p$. Amount of feces produced on the second day, prior to cleaning, $T(2) = p + (1-e)p$. After the end of the second day's cleaning, amount of feces left over $= (1-e)T(2) = (1-e)[p + (1-e)p] = (1-e)p + (1-e)^2p$. Then, amount of feces produced on the third day, prior to cleaning, $T(3) = p + (1-e)p + (1-e)^2p$. Continuing this way, the total amount of accumulated fecal matter on the n^{th} day prior to cleaning will be

$$T(n) = p + (1-e)p + (1-e)^2p + \cdots + (1-e)^{n-1}p = \boxed{p \sum_{k=1}^n (1-e)^{k-1}}.$$

(b) $T = \lim_{n \rightarrow \infty} T(n) = \lim_{n \rightarrow \infty} p \sum_{k=1}^n (1-e)^{k-1} = \sum_{k=1}^{\infty} (1-e)^{k-1} = p \cdot \frac{1}{1-(1-e)} = \boxed{\frac{p}{e}}$, since the series is a

converging geometric series of the type $\sum_{k=1}^{\infty} r^{k-1}$ with $|r| = |1-e| < 1$.

(c) From part (b) we see that $T = \frac{p}{e}$. If we require that $T \leq L$, then we would have $T(n) \leq L$ for all n , since $n < \infty$ and $T(n)$ is a monotonic increasing function of n . Now the condition $T \leq L$ leads to $\frac{p}{e} \leq L$, or $e \geq \frac{p}{L}$. This shows that the minimum efficiency of cleaning is $e_{\min} = \boxed{\frac{p}{L}}$.

(d) We have $e_{\min} = \frac{p}{L} = \frac{120 \text{ kg}}{180 \text{ kg}} = \boxed{\frac{2}{3}}$. At $e = \frac{4}{5}$, we have $T(365) \approx T(\infty) = \frac{p}{e} = \frac{120 \text{ kg}}{4/5} = \boxed{150 \text{ kg}}$.

72. Write

$$\begin{aligned} 0.9999 \cdots &= 0.9 + 0.09 + 0.009 + 0.0009 + \cdots \\ &= \frac{9}{10} + \frac{9}{100} + \frac{9}{1000} + \frac{9}{10000} + \cdots \\ &= \frac{9}{10} \left(1 + \frac{1}{10} + \frac{1}{100} + \frac{1}{1000} + \cdots \right) \\ &= \frac{9}{10} \sum_{k=1}^{\infty} \left(\frac{1}{10} \right)^{k-1} = \frac{9}{10} \cdot \frac{1}{1-\frac{1}{10}} = \frac{9}{10} \cdot \frac{10}{9} = 1, \end{aligned}$$

that is $0.9999 \cdots = 1$, as was needed to be demonstrated.

73. The right hand side is a geometric series: $\sum_{k=1}^{\infty} \frac{1}{x^{k-1}} = \sum_{k=1}^{\infty} \left(\frac{1}{x}\right)^{k-1}$. If $|x| > 1$, then $\left|\frac{1}{x}\right| < 1$, so this series will converge to a sum of $\frac{1}{1-\frac{1}{x}} = \frac{x}{x-1}$. So we have shown that $\frac{x}{x-1} = \sum_{k=1}^{\infty} \frac{1}{x^{k-1}}$ for $|x| > 1$.

74. The right hand side is a geometric series: $\sum_{k=0}^{\infty} (-1)^k x^k = \sum_{k=1}^{\infty} (-1)^{k-1} x^{k-1} = \sum_{k=1}^{\infty} (-x)^{k-1}$. Since $|r| = |-x| = |x| < 1$, this geometric series will converge to a sum of $\frac{1}{1-r} = \frac{1}{1-(-x)} = \frac{1}{1+x}$. So we have shown that $\frac{1}{1+x} = \sum_{k=0}^{\infty} (-1)^k x^k$ for $|x| < 1$.

75. Since there is no closed form expression for the partial sums of the harmonic series, we have to proceed by trial and error calculating the partial sums. The partial sum $S_n = \sum_{k=1}^n \frac{1}{k}$ for $n = 10$ is 2.929, and for $n = 11$ it is 3.020. So $\boxed{n = 11}$ is the smallest number for which $\sum_{k=1}^n \frac{1}{k} \geq 3$.

76. Since there is no closed form expression for the partial sums of the harmonic series, we have to proceed by trial and error calculating the partial sums. The partial sum $S_n = \sum_{k=1}^n \frac{1}{k}$ for $n = 30$ is 3.995, and for $n = 31$ it is 4.027. So $\boxed{n = 31}$ is the smallest number for which $\sum_{k=1}^n \frac{1}{k} \geq 4$.

77. The given series can be rewritten as follows: $\sum_{k=1}^{\infty} \frac{\sqrt{k+1}-\sqrt{k}}{\sqrt{k(k+1)}} = \sum_{k=1}^{\infty} \left(\frac{1}{\sqrt{k}} - \frac{1}{\sqrt{k+1}} \right)$. Consider the n^{th} partial sum of the series:

$$\begin{aligned} S_n &= \sum_{k=1}^n \left(\frac{1}{\sqrt{k}} - \frac{1}{\sqrt{k+1}} \right) \\ &= \left(\frac{1}{\sqrt{1}} - \frac{1}{\sqrt{2}} \right) + \left(\frac{1}{\sqrt{2}} - \frac{1}{\sqrt{3}} \right) + \cdots + \left(\frac{1}{\sqrt{n-1}} - \frac{1}{\sqrt{n}} \right) + \left(\frac{1}{\sqrt{n}} - \frac{1}{\sqrt{n+1}} \right) \\ &= 1 - \frac{1}{\sqrt{n+1}}. \end{aligned}$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{\sqrt{n+1}} \right) = \lim_{n \rightarrow \infty} 1 - \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n+1}} = 1 - 0 = 1.$$

Since the sequence of partial sums converges, the series $\boxed{\text{converges}}$ as well, and has the sum $\boxed{1}$.

78. The given series can be rewritten as follows: $\sum_{k=1}^{\infty} \frac{1}{k(k+2)} = \sum_{k=1}^{\infty} \left(\frac{1}{2k} - \frac{1}{2(k+2)} \right)$, using partial fractions. Consider the n^{th} partial sum of the series:

$$\begin{aligned} S_n &= \sum_{k=1}^n \left(\frac{1}{2k} - \frac{1}{2(k+2)} \right) = \sum_{k=1}^n \frac{1}{2} \left(\frac{1}{k} - \frac{1}{k+2} \right) \\ &= \frac{1}{2} \left(\frac{1}{1} - \frac{1}{3} \right) + \frac{1}{2} \left(\frac{1}{2} - \frac{1}{4} \right) + \frac{1}{2} \left(\frac{1}{3} - \frac{1}{5} \right) + \cdots + \\ &\quad + \frac{1}{2} \left(\frac{1}{n-2} - \frac{1}{n} \right) + \frac{1}{2} \left(\frac{1}{n-1} - \frac{1}{n+1} \right) + \frac{1}{2} \left(\frac{1}{n} - \frac{1}{n+2} \right) \\ &= \frac{1}{2} \left(1 + \frac{1}{2} - \frac{1}{n+1} - \frac{1}{n+2} \right) \\ &= \frac{1}{2} \left(\frac{3}{2} - \frac{1}{n+1} - \frac{1}{n+2} \right). \end{aligned}$$

We have

$$\begin{aligned} \lim_{n \rightarrow \infty} S_n &= \lim_{n \rightarrow \infty} \frac{1}{2} \left(\frac{3}{2} - \frac{1}{n+1} - \frac{1}{n+2} \right) \\ &= \lim_{n \rightarrow \infty} \frac{3}{4} - \lim_{n \rightarrow \infty} \frac{1}{2(n+1)} - \lim_{n \rightarrow \infty} \frac{1}{2(n+2)} = \frac{3}{4} - 0 - 0 = \frac{3}{4}. \end{aligned}$$

Since the sequence of partial sums converges, the series converges as well, and has the sum $\boxed{\frac{3}{4}}$.

79. The given series can be rewritten using the techniques of partial fraction decomposition as follows:

$$\sum_{k=1}^{\infty} \frac{1}{k(k+1)(k+2)} = \sum_{k=1}^{\infty} \frac{1}{2k} - \frac{1}{k+1} + \frac{1}{2(k+2)} = \sum_{k=1}^{\infty} \frac{1}{2} \left(\frac{1}{k} - \frac{2}{k+1} + \frac{1}{k+2} \right).$$

Consider the n^{th} partial sum of the series:

$$\begin{aligned} S_n &= \sum_{k=1}^n \frac{1}{2} \left(\frac{1}{k} - \frac{2}{k+1} + \frac{1}{k+2} \right) = \sum_{k=1}^n \frac{1}{2} \left(\frac{1}{k} - \frac{1}{k+1} \right) - \sum_{k=1}^n \frac{1}{2} \left(\frac{1}{k+1} - \frac{1}{k+2} \right) \\ &= \left\{ \frac{1}{2} \left(\frac{1}{1} - \frac{1}{2} \right) + \frac{1}{2} \left(\frac{1}{2} - \frac{1}{3} \right) + \cdots + \frac{1}{2} \left(\frac{1}{n-1} - \frac{1}{n} \right) + \frac{1}{2} \left(\frac{1}{n} - \frac{1}{n+1} \right) \right\} \\ &\quad - \left\{ \frac{1}{2} \left(\frac{1}{2} - \frac{1}{3} \right) + \frac{1}{2} \left(\frac{1}{3} - \frac{1}{4} \right) + \cdots + \frac{1}{2} \left(\frac{1}{n} - \frac{1}{n+1} \right) + \frac{1}{2} \left(\frac{1}{n+1} - \frac{1}{n+2} \right) \right\} \\ &= \left\{ \frac{1}{2} \left(\frac{1}{1} \right) - \frac{1}{2} \left(\frac{1}{n+1} \right) \right\} - \left\{ \frac{1}{2} \left(\frac{1}{2} \right) - \frac{1}{2} \left(\frac{1}{n+2} \right) \right\} \\ &= \frac{1}{4} - \frac{1}{2(n+1)} + \frac{1}{2(n+2)}. \end{aligned}$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(\frac{1}{4} - \frac{1}{2(n+1)} + \frac{1}{2(n+2)} \right) = \lim_{n \rightarrow \infty} \frac{1}{4} - \lim_{n \rightarrow \infty} \frac{1}{2(n+1)} + \lim_{n \rightarrow \infty} \frac{1}{2(n+2)} = \frac{1}{4} - 0 + 0 = \frac{1}{4}.$$

Since the sequence of partial sums converges, the series converges as well, and has the sum $\boxed{\frac{1}{4}}.$

80. The given series can be rewritten using the techniques of partial fraction decomposition as follows:

$$\sum_{k=1}^{\infty} \frac{1}{k(k+1)(k+2)(k+3)} = \sum_{k=1}^{\infty} \frac{1}{6k} - \frac{1}{2(k+1)} + \frac{1}{2(k+2)} - \frac{1}{6(k+3)} = \sum_{k=1}^{\infty} \frac{1}{6k} - \frac{3}{6(k+1)} + \frac{3}{6(k+2)} - \frac{1}{6(k+3)}.$$

Consider the n^{th} partial sum of the series:

$$\begin{aligned} S_n &= \sum_{k=1}^n \frac{1}{6} \left(\frac{1}{k} - \frac{1}{k+1} \right) - \frac{1}{3} \left(\frac{1}{k+1} - \frac{1}{k+2} \right) + \frac{1}{6} \left(\frac{1}{k+2} - \frac{1}{k+3} \right) \\ &= \left\{ \frac{1}{6} \left(\frac{1}{1} - \frac{1}{2} \right) + \frac{1}{6} \left(\frac{1}{2} - \frac{1}{3} \right) + \cdots + \frac{1}{6} \left(\frac{1}{n-1} - \frac{1}{n} \right) + \frac{1}{6} \left(\frac{1}{n} - \frac{1}{n+1} \right) \right\} \\ &\quad - \left\{ \frac{1}{3} \left(\frac{1}{2} - \frac{1}{3} \right) + \frac{1}{3} \left(\frac{1}{3} - \frac{1}{4} \right) + \cdots + \frac{1}{3} \left(\frac{1}{n} - \frac{1}{n+1} \right) + \frac{1}{3} \left(\frac{1}{n+1} - \frac{1}{n+2} \right) \right\} \\ &\quad + \left\{ \frac{1}{6} \left(\frac{1}{3} - \frac{1}{4} \right) + \frac{1}{6} \left(\frac{1}{4} - \frac{1}{5} \right) + \cdots + \frac{1}{6} \left(\frac{1}{n+1} - \frac{1}{n+2} \right) + \frac{1}{6} \left(\frac{1}{n+2} - \frac{1}{n+3} \right) \right\} \\ &= \left\{ \frac{1}{6} \left(\frac{1}{1} \right) - \frac{1}{6} \left(\frac{1}{n+1} \right) \right\} - \left\{ \frac{1}{3} \left(\frac{1}{2} \right) - \frac{1}{3} \left(\frac{1}{n+2} \right) \right\} + \left\{ \frac{1}{6} \left(\frac{1}{3} \right) - \frac{1}{6} \left(\frac{1}{n+3} \right) \right\} \\ &= \frac{1}{6} - \frac{1}{6} + \frac{1}{18} - \frac{1}{6(n+1)} + \frac{1}{3(n+2)} - \frac{1}{6(n+3)} \\ &= \frac{1}{18} - \frac{1}{6(n+1)} + \frac{1}{3(n+2)} - \frac{1}{6(n+3)}. \end{aligned}$$

We have

$$\begin{aligned} \lim_{n \rightarrow \infty} S_n &= \lim_{n \rightarrow \infty} \left(\frac{1}{18} - \frac{1}{6(n+1)} + \frac{1}{3(n+2)} - \frac{1}{6(n+3)} \right) \\ &= \lim_{n \rightarrow \infty} \frac{1}{18} - \lim_{n \rightarrow \infty} \frac{1}{6(n+1)} + \lim_{n \rightarrow \infty} \frac{1}{3(n+2)} - \lim_{n \rightarrow \infty} \frac{1}{6(n+3)} \\ &= \frac{1}{18} - 0 + 0 - 0 = \frac{1}{18}. \end{aligned}$$

Since the sequence of partial sums converges, the series converges as well, and has the sum $\boxed{\frac{1}{18}}$.

81. We use the following result from the theory of partial fractions: $F(k) = \frac{1}{\prod_{i=1}^m (k+a_i)} = \sum_{i=1}^m \frac{A_i}{k+a_i}$, where $A_i = (k+a_i)F(k)|_{k=-a_i}$. To prove this, multiply both sides by $\prod_{i=1}^m (k+a_i)$. Then we get

$$\begin{aligned} 1 &= \sum_{i=1}^m \frac{A_i}{(k+a_i)} \prod_{i=1}^m (k+a_i) \\ &= A_1(k+a_2)(k+a_3)\cdots(k+a_m) + A_2(k+a_1)(k+a_3)\cdots(k+a_m) + A_3(k+a_1)(k+a_2)(k+a_4)\cdots(k+a_m) \\ &\quad + \cdots + A_{m-1}(k+a_1)\cdots(k+a_{m-2})(k+a_m) + A_m(k+a_1)\cdots(k+a_{m-1}). \end{aligned}$$

Note that each set of factors multiplying the coefficient A_i is missing the term $(k+a_i)$. So for instance, when we set $k = -a_1$, all terms vanish *except* the term multiplying A_1 :

$$1 = A_1(-a_1+a_2)(-a_1+a_3)\cdots(-a_1+a_m)$$

or,

$$A_1 = \frac{1}{(-a_1+a_2)(-a_1+a_3)\cdots(-a_1+a_m)} = (k+a_1)F(k)|_{k=-a_1}$$

where $F(k) = \frac{1}{\prod_{i=1}^m (k+a_i)}$. Similarly, for $k = -a_2$, we obtain $A_2 = (k+a_2)F(k)|_{k=-a_2}$, etc, and in general, for $k = -a_i$, we have $A_i = (k+a_i)F(k)|_{k=-a_i}$, which proves the stated result.

Let $F(k) = \frac{1}{k(k+1)(k+2)\cdots(k+a)}$. Since $a_1 = 0, a_2 = 1, a_3 = 2, \dots, a_i = i-1, \dots, a_m = a$, we get $A_1 = \frac{1}{a!}$, $A_2 = -\frac{a}{a!}$, $A_3 = (-1)^2 \frac{a(a-1)}{2a!}$, and so on. In general, for $1 \leq i \leq m$, $A_i = \frac{(-1)^{i-1}}{(i-1)!} \frac{a(a-1)\cdots(a-i+2)}{a!}$. For example, in Problem 79, we had the case $a = 2$. We have $A_1 = \frac{1}{2!} = \frac{1}{2}$, $A_2 = -\frac{2}{2!} = -1$, and $A_3 = (-1)^2 \frac{2(2-1)}{2 \cdot 2!} = \frac{1}{2}$. The partial fraction decomposition and the partial sum were:

$$\begin{aligned} \frac{1}{k(k+1)(k+2)} &= \frac{A_1}{k} + \frac{A_2}{k+1} + \frac{A_3}{k+2} \\ &= \frac{1}{2} \cdot \frac{1}{k} - \frac{1}{k+1} + \frac{1}{2} \cdot \frac{1}{k+2} \\ &= \frac{1}{2!} \left(\frac{1}{k} - \frac{2}{k+1} + \frac{1}{k+2} \right) \\ &= \frac{1}{2!} \left(\frac{1}{k} - \frac{1}{k+1} \right) - \frac{1}{2!} \left(\frac{1}{k+1} - \frac{1}{k+2} \right) \\ S_n &= \sum_{k=1}^n \frac{1}{k(k+1)(k+2)} = \frac{1}{2 \cdot 2!} - \frac{1}{2(n+1)} + \frac{1}{2(n+2)}. \end{aligned}$$

In Problem 80, we had the case $a = 3$, so $A_1 = \frac{1}{3!} = \frac{1}{6}$, $A_2 = -\frac{3}{3!} = -\frac{1}{2}$, $A_3 = (-1)^2 \frac{3(3-1)}{2 \cdot 3!} = \frac{1}{2}$, and

$A_4 = (-1)^3 \frac{3(3-1)(3-2)}{3! \cdot 3!} = -\frac{1}{6}$. The partial fraction decomposition and the partial sum were

$$\begin{aligned} \frac{1}{k(k+1)(k+2)(k+3)} &= \frac{A_1}{k} + \frac{A_2}{k+1} + \frac{A_3}{k+2} + \frac{A_4}{k+3} \\ &= \frac{1}{6} \cdot \frac{1}{k} - \frac{1}{2} \cdot \frac{1}{k+1} + \frac{1}{2} \cdot \frac{1}{k+2} - \frac{1}{6} \cdot \frac{1}{k+3} \\ &= \frac{1}{3!} \left(\frac{1}{k} - \frac{3}{k+1} + \frac{3}{k+2} - \frac{1}{k+3} \right) \\ &= \frac{1}{3!} \left(\frac{1}{k} - \frac{1}{k+1} \right) - \frac{1}{3} \left(\frac{1}{k+1} - \frac{1}{k+2} \right) + \frac{1}{6} \left(\frac{1}{k+2} - \frac{1}{k+3} \right) \\ S_n &= \sum_{k=1}^n \frac{1}{k(k+1)(k+2)(k+3)} = \frac{1}{3 \cdot 3!} - \frac{1}{6(n+1)} + \frac{1}{3(n+2)} - \frac{1}{6(n+3)}. \end{aligned}$$

For the general case of a , we get, as in the previous two problems, a series of terms multiplying the coefficients A_i . When they are added as telescoping series of the partial sum S_n , the result will have a term $\frac{1}{a \cdot a!}$ without any n -dependence, while all the surviving terms will have the form $\frac{\alpha_i A_i}{n+a_i}$ where α_i are whole numbers coming from the distribution of terms in the telescoping series. That is, we will obtain:

$$\begin{aligned} \frac{1}{k(k+1)(k+2) \cdots (k+a)} &= \frac{A_1}{k} + \frac{A_2}{k+1} + \frac{A_3}{k+2} + \frac{A_4}{k+3} + \cdots + \frac{A_i}{k+i-1} + \cdots + \frac{A_m}{k+a} \\ &= \frac{1}{a!} \cdot \frac{1}{k} - \frac{a}{a!} \cdot \frac{1}{k+1} + (-1)^2 \frac{a(a-1)}{2!a!} \cdot \frac{1}{k+2} + (-1)^3 \frac{a(a-1)(a-2)}{3!a!} \cdot \frac{1}{k+3} \\ &\quad + \cdots + (-1)^{i-1} \frac{a(a-1) \cdots (a-i)}{(i-1)!a!} \cdot \frac{1}{k+i-1} + \cdots + (-1)^{a-1} \frac{1}{a!} \cdot \frac{1}{k+a} \\ &= \frac{1}{a!} \left(\frac{1}{k} - \frac{a}{k+1} + \frac{a(a-1)}{2!(k+2)} - \frac{a(a-1)(a-2)}{3!(k+3)} + \cdots \right) \\ &\quad + \frac{1}{a!} \left(\cdots + (-1)^{i-1} \frac{a(a-1) \cdots (a-i)}{(i-1)!(k+i-1)} + \cdots + (-1)^{a-1} \frac{1}{k+a} \right) \\ &= \frac{1}{a!} \left(\frac{1}{k} - \frac{1}{k+1} \right) - \frac{a-1}{a!} \left(\frac{1}{k+1} - \frac{1}{k+2} \right) + \cdots + \frac{(-1)^{a-1}}{a!} \left(\frac{1}{k+a-1} - \frac{1}{k+a} \right) \\ S_n &= \sum_{k=1}^n \frac{1}{k(k+1)(k+2) \cdots (k+a)} = \frac{1}{a \cdot a!} + \sum_{k=1}^a \frac{\alpha_i A_i}{n+k}. \end{aligned}$$

In the limit, as $n \rightarrow \infty$, we get $\lim_{n \rightarrow \infty} S_n = \boxed{\frac{1}{a \cdot a!}}$, which is also the sum of the series.

82. The right hand side of $\frac{x}{2+2x} = x + x^2 + x^3 + \cdots$ can be written as $\sum_{k=1}^{\infty} x \cdot x^{k-1}$. This is a geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = x$ and $r = x$. The series has a convergent sum, $\frac{a}{1-r} = \frac{x}{1-x}$ for $|r| = |x| < 1$. So the equation becomes:

$$\begin{aligned} \frac{x}{2(1+x)} &= \frac{x}{1-x} \\ 1-x &= 2+2x \\ 3x &= -1, \end{aligned}$$

or $\boxed{x = -\frac{1}{3}}.$

83. A convergent geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$, $|r| < 1$, has the sum $\frac{a}{1-r}$. If a is rational, then $a = \frac{p}{q}$, where p and q are integers that have no common factors, and $q \neq 0$; similarly, if r is rational, then

$r = \frac{s}{t} < 1$, where s and t are integers with no common factors, and $t \neq 0$. Then, we have

$$\text{Sum} = \frac{a}{1-r} = \frac{\frac{p}{q}}{1-\frac{s}{t}} = \frac{pt}{q(t-s)}.$$

Since pt and $q(t-s)$ are integers, the ratio is a rational number as well, with $q(t-s) \neq 0$, since $\frac{s}{t} < 1$ (possibly with common factors, which can be canceled out to simplify the result).

84. $S_n = a + ar + ar^2 + \cdots + ar^{n-1}$. When $r = 1$, $S_n = a + a + \cdots + a$ (n times) $= na$. On the other hand, since for $r \neq 1$, $S_n = \frac{a(r^n - 1)}{r - 1}$, we have

$$\lim_{r \rightarrow 1} S_n = \lim_{r \rightarrow 1} \frac{a(r^n - 1)}{r - 1} = a \lim_{r \rightarrow 1} \frac{nr^{n-1}}{1} = an = na,$$

by using L'Hôpital's rule. So the results of using either the series directly for $r = 1$, or applying a limiting procedure to the partial sum formula, agree with each other.

Challenge Problems

85. Since $\gamma = \lim_{n \rightarrow \infty} (1 + \frac{1}{2} + \cdots + \frac{1}{n} - \ln n)$ and the harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ diverges very slowly, we would expect the limit above to converge very slowly as well. Using $S_n = \sum_{k=1}^n \frac{1}{k}$ gives $\gamma_n \approx S_n - \ln n$ as an approximation to γ . Using the given values of the partial sums, we have:

$$n = 10 : S_{10} = 2.92897; \gamma_{10} \approx S_{10} - \ln 10 \approx \boxed{0.62638}.$$

$$n = 20 : S_{20} = 3.59744; \gamma_{20} \approx S_{20} - \ln 20 \approx \boxed{0.60171}.$$

$$n = 50 : S_{50} = 4.49921; \gamma_{50} \approx S_{50} - \ln 50 \approx \boxed{0.58719}.$$

$$n = 100 : S_{100} = 5.18738; \gamma_{100} \approx S_{100} - \ln 100 \approx \boxed{0.58221}.$$

As expected, the rate of convergence of the limit defining γ is very slow as well.

86. Using (see solution to Problem 85) $\gamma_n \approx \sum_{k=1}^n \frac{1}{k} - \ln n$, we have $\gamma_{10^9} \approx \sum_{k=1}^{10^9} \frac{1}{k} - \ln 10^9$, or

$$\sum_{k=1}^{10^9} \frac{1}{k} \approx \gamma_{10^9} + \ln 10^9. \text{ Using } \gamma_{10^9} \approx \gamma \approx 0.5772, \text{ we have, to four decimal places, } \sum_{k=1}^{10^9} \frac{1}{k} \approx \boxed{21.3005}.$$

87. If a real number has a repeating decimal, the repeating part can be expressed as a geometric series. Such a real number may be represented as

$$R = x.yz \cdots abc \cdots abc \cdots abc \cdots$$

(x is the whole number part) where, if the repeated units $abc \cdots$ start in (say) the n^{th} decimal place, and have a string length r , we can write:

$$\begin{aligned} R &= x.yz \cdots + abc \cdots \times 10^{-n+1-r} + abc \cdots \times 10^{-n+1-2r} + abc \cdots \times 10^{-n+1-3r} + \cdots \\ &= \frac{xyz \cdots}{10^{n-1}} + abc \cdots \times 10^{-n+1-r} (1 + 10^{-r} + 10^{-2r} + \cdots) \\ &= \frac{xyz \cdots}{10^{n-1}} + \frac{abc \cdots}{10^{n-1+r}} \sum_{k=1}^{\infty} (10^{-r})^{k-1} \\ &= \frac{xyz \cdots}{10^{n-1}} + \frac{abc \cdots}{10^{n-1+r}} \left(\frac{1}{1 - 10^{-r}} \right) \\ &= \frac{xyz \cdots}{10^{n-1}} + \frac{abc \cdots}{10^{n-1}(10^r - 1)}, \end{aligned}$$

which, being a sum of rational numbers, is a rational number.

Conversely, any rational number is of the form $\frac{p}{q}$, where p and q are integers with $q \neq 0$ with no common factors. Then performing long division produces a remainder of with either 0 which will terminate the long division, or result a repeating block of numbers because there can only be at most $q - 1$ different remainders. The moment you get a remainder that is non-zero, the rest of the long division will proceed as it had when the same remainder had earlier occurred, causing a repeating pattern to emerge in the quotient. So we have shown that a real number has a repeating decimal if and only if it is a rational number.

88. (a) Since $s_n \geq 0$ for all $n \geq 1$, the sequence of partial sums $\{S_n\}$ is a nondecreasing sequence, and so if $\{S_n\}$ is bounded, then it converges, because a bounded monotonic sequence converges. This in turn means that the series $\sum_{k=1}^{\infty} s_k$ converges. Conversely, if the original series converges, then the partial sums also converge, so by the theorem on p.547, the sequence $\{S_n\}$ must also be bounded.

(b) Write the harmonic series as $1 + \frac{1}{2} + (\frac{1}{3} + \frac{1}{4}) + (\frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8}) + (\frac{1}{9} + \cdots + \frac{1}{16}) + \cdots$. Each of the bracketed terms is $> \frac{1}{2}$. The partial sums form an unbounded sequence since, for instance, $S_1 = 1$, $S_2 = S_{2^0} = 1 + \frac{1}{2}$; $S_4 = S_{2^2} > 1 + \frac{1}{2} + \frac{1}{2} = 1 + \frac{1}{2} \cdot 2$; $S_8 = S_{2^3} > 1 + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} = 1 + \frac{1}{2} \cdot 3$; $S_{16} = S_{2^4} > 1 + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} = 1 + \frac{1}{2} \cdot 4$; and in general, $S_{2^n} \geq 1 + \sum_{k=0}^n \frac{1}{2} = 1 + \frac{1}{2} \cdot n$. This shows that the partial sums S_{2^n} are unbounded, since $\lim_{n \rightarrow \infty} S_{2^n} \geq \lim_{n \rightarrow \infty} (1 + \frac{1}{2} \cdot n) = \infty$, which means the sequence $\{S_{2^n}\}$ will diverge, so the series will diverge as well.

8.3 Properties of Series; Integral Test

Concepts and Vocabulary

1. **(a)** If the series $\sum_{k=1}^{\infty} a_k$ converges then $\lim_{n \rightarrow \infty} a_n = 0$.
2. **False:** For example, $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$ but $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$ diverges (Harmonic series).
3. **True:** Since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} n^3 = \infty$. The series cannot converge.
4. **True:** Any finite number of terms in a series do not determine convergence.
5. **False:** For example, $\sum_{k=1}^{\infty} \left(\frac{1}{k} - \frac{1}{k+1} \right)$ converges as it is a telescoping series (the sum is 1), whereas $\sum_{k=1}^{\infty} \frac{1}{k}$ and $\sum_{k=1}^{\infty} \frac{1}{k+1} = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots$ both separately diverge, being the harmonic series and the harmonic series from the second term forward, respectively.
6. **True:** If a series is convergent to S then a scalar multiple of each term yields a convergent series of sum cS .
7. **True:** This is the basis of the integral test of convergence.
8. **False:** If the terms are all positive, then the sequence of partial sums will be an increasing sequence, and if this sequence is not bounded, the series will be divergent.
9. The p -series $\sum_{k=1}^{\infty} \frac{1}{k^p}$ converges if $\underline{p > 1}$ and diverges if $\underline{0 < p \leq 1}$.
10. **Converges.** $\sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$ is a p -series $\sum_{k=1}^{\infty} \frac{1}{k^p}$, $p > 1$, which converges.
11. **Diverges.** $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^{-1/2}} = \sum_{k=1}^{\infty} k^{1/2}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} n^{1/2} = \infty \neq 0$. So by the Divergence Test, the series diverges.
12. **False:** The upper bound must be $1 + \frac{1}{p-1}$; the lower bound is correct.

Skill Building

13. The series is $\sum_{k=1}^{\infty} 16$. We have $\lim_{n \rightarrow \infty} a_n = 16 \neq 0$. So by the Divergence Test, the series *diverges.*
14. The series is $\sum_{k=1}^{\infty} \frac{k+9}{k}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left(1 + \frac{9}{n} \right) = 1 \neq 0$. So by the Divergence Test, the series *diverges.*
15. The series is $\sum_{k=1}^{\infty} \ln k$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \ln n = \infty \neq 0$. So by the Divergence Test, the series *diverges.*
16. The series is $\sum_{k=1}^{\infty} e^k$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} e^n = \infty \neq 0$. So by the Divergence Test, the series *diverges.*

17. The series is $\sum_{k=1}^{\infty} \frac{k^2}{k^2+4}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^2}{n^2+4} = \lim_{n \rightarrow \infty} \frac{1}{1+\frac{4}{n^2}} = \frac{1}{1+0} = 1 \neq 0$. So by the Divergence Test, the series *diverges*.

18. The series is $\sum_{k=1}^{\infty} \frac{k^2+3}{\sqrt{k}}$. We have
 $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^2+3}{\sqrt{n}} = \lim_{n \rightarrow \infty} n^{3/2} + 3 \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n}} = \lim_{n \rightarrow \infty} n^{3/2} + 0 = \infty \neq 0$. So by the Divergence Test, the series *diverges*.

19. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^{1.01}}$. The function $f(x) = \frac{1}{x^{1.01}}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 1$. Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the integral test, we find

$$\begin{aligned} I &= \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{dx}{x^{1.01}} = \lim_{b \rightarrow \infty} \left[\frac{x^{-1.01+1}}{-1.01+1} \right]_1^b \\ &= -\frac{1}{0.01} \lim_{b \rightarrow \infty} [b^{-0.01} - 1^{-0.01}] = -\frac{1}{0.01} [0 - 1] \\ &= 100. \end{aligned}$$

Since the improper integral I converges, by the integral test the series *converges* as well.

20. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^{0.9}}$. The function $f(x) = \frac{1}{x^{0.9}}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 1$. Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the integral test, we find

$$I = \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{dx}{x^{0.9}} = \lim_{b \rightarrow \infty} \left[\frac{x^{-0.9+1}}{-0.9+1} \right]_1^b = \frac{1}{0.1} \lim_{b \rightarrow \infty} [b^{0.1} - 1^{0.1}] = \infty.$$

Since the improper integral I diverges, by the integral test the series *diverges* as well.

21. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k}$. The function $f(x) = \frac{\ln x}{x}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 1$, since

$$f'(x) = \frac{x \cdot \frac{1}{x} - \ln x \cdot 1}{x^2} = \frac{1 - \ln x}{x^2} \leq 0 \text{ for } x \geq 1.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the integral test, we find

$$I = \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{\ln x}{x} dx = \lim_{b \rightarrow \infty} \frac{1}{2} (\ln x)^2 \Big|_1^b = \lim_{b \rightarrow \infty} \frac{1}{2} [(\ln b)^2 - 0] = \infty.$$

Since the improper integral I diverges, by the integral test the series *diverges* as well.

22. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k\sqrt{\ln k}}$. The function $f(x) = \frac{1}{x\sqrt{\ln x}}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. To see $f(x)$ is decreasing, consider $g(x) = \frac{1}{f(x)} = x\sqrt{\ln x}$. It suffices to show that $g(x)$ is increasing and has a nonzero derivative on $[2, \infty)$. We have

$$g'(x) = 1 \cdot \sqrt{\ln x} + x \cdot \frac{1}{2\sqrt{\ln x}} \cdot \frac{1}{x} = \sqrt{\ln x} + \frac{1}{\sqrt{\ln x}} > 0 \text{ for } x \geq 2.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 2$. Using the integral test, we find

$I = \int_2^\infty f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x\sqrt{\ln x}}$. Let $u = \ln x$. Then $du = \frac{dx}{x}$. We have

$$I = \int_2^\infty f(x) dx = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{\sqrt{u}} = \lim_{b \rightarrow \infty} \left[\frac{u^{-\frac{1}{2}+1}}{-\frac{1}{2}+1} \right]_{\ln 2}^{\ln b} = 2 \lim_{b \rightarrow \infty} \sqrt{u} \Big|_{\ln 2}^{\ln b} = 2 \lim_{b \rightarrow \infty} (\sqrt{\ln b} - \sqrt{\ln 2}) = \infty.$$

Since the improper integral I diverges, by the integral test the series *diverges* as well.

23. The series is $\sum_{k=1}^\infty a_k = \sum_{k=1}^\infty k e^{-k^2}$. The function $f(x) = x e^{-x^2}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 1$ since

$$f'(x) = 1 \cdot e^{-x^2} + x e^{-x^2} (-2x) = e^{-x^2} (1 - 2x^2) < 0 \text{ for } x \geq 1.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the integral test, we find

$I = \int_1^\infty f(x) dx = \lim_{b \rightarrow \infty} \int_1^b x e^{-x^2} dx$. Let $u = e^{-x^2}$. Then $du = -2x e^{-x^2} dx$. We have

$$I = \int_1^\infty f(x) dx = \lim_{b \rightarrow \infty} \int_{e^{-1}}^{e^{-b^2}} -\frac{1}{2} du = -\frac{1}{2} \lim_{b \rightarrow \infty} u \Big|_{e^{-1}}^{e^{-b^2}} = -\frac{1}{2} \lim_{b \rightarrow \infty} [e^{-b^2} - e^{-1}] = -\frac{1}{2} [0 - e^{-1}] = \frac{e^{-1}}{2}.$$

Since the improper integral I converges, by the integral test the series *converges* as well.

24. The series is $\sum_{k=1}^\infty a_k = \sum_{k=1}^\infty k e^{-k}$. The function $f(x) = x e^{-x}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 1$, since

$$f'(x) = 1 \cdot e^{-x} + x(-e^{-x}) = e^{-x}(1 - x) \leq 0 \text{ for } x \geq 1.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the integral test, we find

$I = \int_1^\infty f(x) dx = \lim_{b \rightarrow \infty} \int_1^b x e^{-x} dx$. Let $u = x$, $dv = e^{-x} dx$. Then, $du = dx$, $v = -e^{-x}$. Integrating by parts, we have

$$\begin{aligned} I &= \lim_{b \rightarrow \infty} \left(-x e^{-x} \Big|_1^b + \int_1^b e^{-x} dx \right) = \lim_{b \rightarrow \infty} (-b e^{-b} + e^{-1}) + \lim_{b \rightarrow \infty} [-e^{-x}]_1^b \\ &= -\lim_{b \rightarrow \infty} \frac{b}{e^b} + \frac{1}{e} - \lim_{b \rightarrow \infty} (e^{-b} - e^{-1}) = -\lim_{b \rightarrow \infty} \frac{1}{e^b} + \frac{1}{e} - 0 + \frac{1}{e} \\ &= 0 + \frac{1}{e} - 0 + \frac{1}{e} = \frac{2}{e}, \end{aligned}$$

using L'Hôpital's rule on the first limit in the second line. Since the improper integral I converges, by the integral test the series *converges* as well.

25. The series is $\sum_{k=1}^\infty a_k = \sum_{k=1}^\infty \frac{1}{k^2+1}$. The function $f(x) = \frac{1}{x^2+1}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 1$, since $f'(x) = -\frac{1}{(x^2+1)^2} \cdot (2x) < 0$ for $x \geq 1$. Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the integral test, we find

$$I = \int_1^\infty f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{dx}{x^2+1} = \lim_{b \rightarrow \infty} \tan^{-1} x \Big|_1^b = \lim_{b \rightarrow \infty} (\tan^{-1} b - \tan^{-1} 1) = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}.$$

Since the improper integral I converges, by the integral test the series *converges* as well.

26. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k\sqrt{k^2-1}}$. The function $f(x) = \frac{1}{x\sqrt{x^2-1}}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. To see that $f(x)$ is decreasing, consider $g(x) = \frac{1}{f(x)} = x\sqrt{x^2-1}$. It suffices to show that $g(x)$ is increasing and has a nonzero derivative on $[2, \infty)$. We have

$$g'(x) = 1 \cdot \sqrt{x^2-1} + x \cdot \frac{1}{2\sqrt{x^2-1}} \cdot (2x) = \frac{x^2-1+x^2}{\sqrt{x^2-1}} = \frac{2x^2-1}{\sqrt{x^2-1}} > 0 \text{ for } x \geq 2.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 2$. Using the integral test, we find

$I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x\sqrt{x^2-1}}$. Let $x = \sec u$. Then $dx = \sec u \tan u du$. We have

$$\begin{aligned} I &= \lim_{b \rightarrow \infty} \int_{\sec^{-1} 2}^{\sec^{-1} b} \frac{\sec u \tan u du}{\sec u \sqrt{\sec^2 u - 1}} = \lim_{b \rightarrow \infty} \int_{\sec^{-1} 2}^{\sec^{-1} b} \frac{\sec u \tan u du}{\sec u \tan u} = \lim_{b \rightarrow \infty} u \Big|_{\sec^{-1} 2}^{\sec^{-1} b} = \lim_{b \rightarrow \infty} (\sec^{-1} b - \sec^{-1} 2) \\ &= \frac{\pi}{2} - \sec^{-1} 2. \end{aligned}$$

Since the improper integral I converges, by the integral test the series *converges* as well.

27. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k \ln k}$. The function $f(x) = \frac{1}{x \ln x}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. To see that $f(x)$ is decreasing, consider $g(x) = \frac{1}{f(x)} = x \ln x$. It suffices to show that $g(x)$ is increasing and has a nonzero derivative on $[2, \infty)$. We have

$$g'(x) = 1 \cdot \ln x + x \cdot \frac{1}{x} = \ln x + 1 > 0 \text{ for } x \geq 2.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 2$. Using the integral test, we find

$I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x \ln x}$. Let $u = \ln x$. Then $du = \frac{dx}{x}$. We have

$$I = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{u} = \lim_{b \rightarrow \infty} [\ln u]_{\ln 2}^{\ln b} = \lim_{b \rightarrow \infty} [\ln(\ln b) - \ln(\ln 2)] = \infty.$$

Since the improper integral I diverges, by the integral test the series *diverges* as well.

28. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k(\ln k)^3}$. The function $f(x) = \frac{1}{x(\ln x)^3}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. To see that $f(x)$ is decreasing, consider $g(x) = \frac{1}{f(x)} = x(\ln x)^3$. It suffices to show that $g(x)$ is increasing and has a nonzero derivative on $[2, \infty)$. We have

$$g'(x) = 1 \cdot (\ln x)^3 + x \cdot 3(\ln x)^2 \cdot \frac{1}{x} = (\ln x)^3 + 3(\ln x)^2 > 0 \text{ for } x \geq 2.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 2$. Using the integral test, we find

$I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x(\ln x)^3}$. Let $u = \ln x$. Then $du = \frac{dx}{x}$. We have

$$I = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{u^3} = \lim_{b \rightarrow \infty} \left[\frac{u^{-3+1}}{-3+1} \right]_{\ln 2}^{\ln b} = -\frac{1}{2} \lim_{b \rightarrow \infty} \left[\frac{1}{(\ln b)^2} - \frac{1}{(\ln 2)^2} \right] = \frac{1}{2} \frac{1}{(\ln 2)^2}.$$

Since the improper integral I converges, by the integral test the series *converges* as well.

29. The series $\sum_{k=1}^{\infty} \frac{1}{k^2}$ is a p -series with $p = 2 > 1$. So it *converges*.

30. The series $\sum_{k=1}^{\infty} \frac{1}{k^4}$ is a p -series with $p = 4 > 1$. So it *converges*.

- 31.** The series $\sum_{k=1}^{\infty} \frac{1}{k^{1/3}}$ is a p -series with $0 < p = \frac{1}{3} < 1$. So it *diverges.*
- 32.** The series $\sum_{k=1}^{\infty} \frac{1}{k^{2/3}}$ is a p -series with $0 < p = \frac{2}{3} < 1$. So it *diverges.*
- 33.** The series $\sum_{k=1}^{\infty} \frac{1}{k^e}$ is a p -series with $p = e > 1$. So it *converges.*
- 34.** The series $\sum_{k=1}^{\infty} \frac{1}{k^\pi}$ is a p -series with $p = \pi > 1$. So it *converges.*
- 35.** $1 + \frac{1}{2\sqrt{3}} + \frac{1}{3\sqrt{3}} + \frac{1}{4\sqrt{4}} + \cdots = \sum_{k=1}^{\infty} \frac{1}{k\sqrt{k}} = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$ is a p -series with $p = \frac{3}{2} > 1$. So it *converges.*
- 36.** $1 + \frac{1}{\sqrt[3]{2}} + \frac{1}{\sqrt[3]{3}} + \frac{1}{\sqrt[3]{4}} + \cdots = \sum_{k=1}^{\infty} \frac{1}{\sqrt[3]{k}} = \sum_{k=1}^{\infty} \frac{1}{k^{1/3}}$ is a p -series with $0 < p = \frac{1}{3} < 1$ and so *diverges.*
- 37.** $1 + \frac{1}{4\sqrt{2}} + \frac{1}{9\sqrt{3}} + \frac{1}{16\sqrt{4}} + \cdots = \sum_{k=1}^{\infty} \frac{1}{k^2\sqrt{k}} = \sum_{k=1}^{\infty} \frac{1}{k^{5/2}}$ is a p -series with $p = \frac{5}{2} > 1$ and so *converges.*
- 38.** $1 + \frac{1}{8} + \frac{1}{27} + \frac{1}{64} + \cdots = \sum_{k=1}^{\infty} \frac{1}{k^3}$ is a p -series with $p = 3 > 1$ and so *converges.*
- 39.** The series is $\sum_{k=1}^{\infty} \frac{10}{k}$. Since the harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ diverges, the series $\sum_{k=1}^{\infty} \frac{10}{k}$ *diverges* as well since it is a nonzero constant multiple of a divergent series.
- 40.** The series is $\sum_{k=1}^{\infty} \frac{2}{1+k}$. Since $\sum_{k=1}^{\infty} \frac{1}{1+k}$ is just the harmonic series $\sum_{k=2}^{\infty} \frac{1}{k}$, which diverges, the series $\sum_{k=1}^{\infty} \frac{2}{1+k}$ which is a nonzero constant multiple of a divergent series also *diverges*.
- 41.** The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^2+1}{4k+1}$. Since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^2+1}{4n+1} = \lim_{n \rightarrow \infty} \frac{n+\frac{1}{n}}{4+\frac{1}{n}} = \infty \neq 0$, by the Divergence Test the series *diverges.*
- 42.** The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^3}{k^3+3}$. Since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^3}{n^3+3} = \lim_{n \rightarrow \infty} \frac{1}{1+\frac{3}{n^3}} = 1 \neq 0$, by the Divergence Test, the series *diverges.*
- 43.** The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} (k + \frac{1}{k})$. Since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} (n + \frac{1}{n}) = \lim_{n \rightarrow \infty} n + 0 = \infty \neq 0$, by the Divergence Test, the series *diverges.*
- 44.** The series is $\sum_{k=1}^{\infty} (\frac{1}{3^k} - \frac{1}{4^k}) = \sum_{k=1}^{\infty} \frac{1}{3} (\frac{1}{3})^{k-1} - \sum_{k=1}^{\infty} \frac{1}{4} (\frac{1}{4})^{k-1} = \frac{\frac{1}{3}}{1-\frac{1}{3}} - \frac{\frac{1}{4}}{1-\frac{1}{4}} = \frac{1/3}{2/3} - \frac{1/4}{3/4} = \frac{1}{2} - \frac{1}{3} = \frac{1}{6}$. Here, we used the fact that each term was a convergent geometric series, and the sum and difference property of convergent series to simplify the result. So, the series *converges.*
- 45.** The series is $\sum_{k=1}^{\infty} (\frac{1}{3k} - \frac{1}{4k}) = \sum_{k=1}^{\infty} \frac{1}{12k}$ is a constant multiple of the harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ which diverges. So the given series also *diverges.*

46. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(k - \frac{10}{k}\right)$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left(n - \frac{10}{n}\right) = \lim_{n \rightarrow \infty} n - 0 = \infty \neq 0$. So by the Divergence Test the series *diverges*.

47. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \sin\left(\frac{\pi}{2}k\right)$. Since $\sin\left(\frac{\pi}{2}k\right)$ is $+1$ for $k = 1, 5, 9, \dots$; 0 for $k = 2, 4, 6, \dots$; and -1 for $k = 3, 7, 11, \dots$, the partial sums $S_n = \sum_{k=1}^n a_k$ will oscillate between 0 and 1 for all n . The sequence of partial sums $\{S_n\} = \{1, 1, 0, 0, 1, 1, 0, 0, \dots\}$ does not converge to a limit, so the series will *diverge*.

48. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \sec \pi k$. Since $\sec \pi k$ is -1 for $k = 1, 3, 5, \dots$, and $+1$ for $k = 2, 4, 6, \dots$, the partial sums $S_n = \sum_{k=1}^n a_k$ will oscillate between -1 and 0 . The series will *diverge* because the sequence of partial sums $\{S_n\} = \{-1, 0, -1, 0, \dots\}$ does not converge to a limit.

49. The series is $\sum_{k=3}^{\infty} a_k = \sum_{k=3}^{\infty} \frac{k+1}{k-2}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n+1}{n-2} = \lim_{n \rightarrow \infty} \frac{1+\frac{1}{n}}{1-\frac{2}{n}} = \frac{1+0}{1-0} = 1 \neq 0$. So the series *diverges*.

50. The series is $\sum_{k=5}^{\infty} a_k = \sum_{k=5}^{\infty} \frac{2k^5+3}{k^5-4k^4}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{2n^5+3}{n^5-4n^4} = \lim_{n \rightarrow \infty} \frac{2+\frac{3}{n^5}}{1-\frac{4}{n}} = \frac{2+0}{1-0} = 2 \neq 0$. So the series *diverges*.

51. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k(\ln k)^{1/2}}$. The function $f(x) = \frac{1}{x(\ln x)^{1/2}} = \frac{1}{x\sqrt{\ln x}}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. To see that $f(x)$ is decreasing, consider $g(x) = \frac{1}{f(x)} = x\sqrt{\ln x}$. It suffices to show that $g(x)$ is increasing and has a nonzero derivative on $[2, \infty)$. We have

$$g'(x) = 1 \cdot \sqrt{\ln x} + x \cdot \frac{1}{2\sqrt{\ln x}} \cdot \frac{1}{x} = \sqrt{\ln x} + \frac{1}{2\sqrt{\ln x}} > 0 \text{ for } x \geq 2.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 2$. Using the integral test, we find

$$I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x\sqrt{\ln x}}. \text{ Let } u = \ln x. \text{ Then } du = \frac{dx}{x}. \text{ We have}$$

$$I = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{\sqrt{u}} = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} u^{-\frac{1}{2}} du = \lim_{b \rightarrow \infty} \left[\frac{u^{\frac{1}{2}}}{\frac{1}{2}} \right]_{\ln 2}^{\ln b} = 2 \lim_{b \rightarrow \infty} \left(\sqrt{\ln b} - \sqrt{\ln 2} \right) = \infty.$$

Since the improper integral I diverges, by the integral test the series *diverges* as well.

52. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k(\ln k)^2}$. The function $f(x) = \frac{1}{x(\ln x)^2}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. To see that $f(x)$ is decreasing, consider $g(x) = \frac{1}{f(x)} = x(\ln x)^2$. It suffices to show that $g(x)$ is increasing and has a nonzero derivative on $[2, \infty)$. We have

$$g'(x) = 1 \cdot (\ln x)^2 + x \cdot (2 \ln x) \cdot \frac{1}{x} = (\ln x)^2 + 2 \ln x > 0 \text{ for } x \geq 2.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 2$. Using the integral test, we find

$$I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x(\ln x)^2}. \text{ Let } u = \ln x. \text{ Then } du = \frac{dx}{x}. \text{ We have}$$

$$I = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{u^2} = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} u^{-2} du = \lim_{b \rightarrow \infty} \left[\frac{u^{-1}}{-1} \right]_{\ln 2}^{\ln b} = - \lim_{b \rightarrow \infty} \left(\frac{1}{\ln b} - \frac{1}{\ln 2} \right) = - \left(0 - \frac{1}{\ln 2} \right) = \frac{1}{\ln 2}.$$

Since the improper integral I converges, by the integral test the series *converges* as well.

53. The series is $\sum_{k=3}^{\infty} a_k = \sum_{k=3}^{\infty} \frac{2k}{k^2-4}$. The function $f(x) = \frac{2x}{x^2-4}$ is defined on $[3, \infty)$ and is continuous, positive, and decreasing for all $x \geq 3$, since

$$f'(x) = \frac{(x^2-4) \cdot 2 - 2x \cdot (2x)}{(x^2-4)^2} = -\frac{3x^2+8}{(x^2-4)^2} < 0 \text{ for } x \geq 3.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 3$. Using the integral test, we find

$I = \int_3^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_3^b \frac{2x dx}{x^2-4}$. Let $u = x^2 - 4$. Then $du = 2x dx$. We have

$$I = \lim_{b \rightarrow \infty} \int_5^{b^2-4} \frac{du}{u} = \lim_{b \rightarrow \infty} [\ln u]_5^{b^2-4} = \lim_{b \rightarrow \infty} (\ln(b^2-4) - \ln 5) = \infty.$$

Since the improper integral I diverges, by the integral test the series *diverges*.

54. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{(2k-1)(2k)}$. The function $f(x) = \frac{1}{(2x-1)(2x)} = \frac{1}{2x-1} - \frac{1}{2x}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 1$. Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the integral test, we find

$$\begin{aligned} I &= \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \left(\int_1^b \frac{dx}{2x-1} - \frac{dx}{2x} \right) = \lim_{b \rightarrow \infty} \left[\frac{1}{2} \ln |2x-1| - \frac{1}{2} \ln |x| \right]_1^b \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{2} \ln |2b-1| - \frac{1}{2} \ln |b| \right] = \frac{1}{2} \lim_{b \rightarrow \infty} \ln \left| \frac{2b-1}{b} \right| = \frac{1}{2} \lim_{b \rightarrow \infty} \ln \left| \frac{2-\frac{1}{b}}{1} \right| \\ &= \frac{1}{2} \ln \lim_{b \rightarrow \infty} \left| 2 - \frac{1}{b} \right| = \frac{1}{2} \ln 2. \end{aligned}$$

Since the improper integral I converges, by the integral test the series *converges* as well.

55. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k(\ln k)^p}$. The function $f(x) = \frac{1}{x(\ln x)^p}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. To check whether $f(x)$ is decreasing, consider $g(x) = \frac{1}{f(x)} = x(\ln x)^p$. It suffices to show that $g(x)$ is increasing and has a nonzero derivative on $[2, \infty)$. We have

$$g'(x) = 1 \cdot (\ln x)^p + x \cdot p(\ln x)^{p-1} \cdot \frac{1}{x} = (\ln x)^p + p(\ln x)^{p-1} > 0.$$

This final condition is satisfied for all $p > 0$ and for x in the interval $[2, \infty)$, so we conclude that the function $f(x)$ must be decreasing on $[2, \infty)$. Also we have $a_k = f(k)$ for all positive integers $k \geq 2$. To use the Integral Test evaluate $I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x(\ln x)^p}$. Let $u = \ln x$. Then $du = \frac{dx}{x}$. We have, for $p \neq 1$,

$$I = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{u^p} = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} u^{-p} du = \lim_{b \rightarrow \infty} \left[\frac{u^{-p+1}}{-p+1} \right]_{\ln 2}^{\ln b} = \frac{1}{1-p} \lim_{b \rightarrow \infty} \left(\frac{1}{(\ln b)^{p-1}} - \frac{1}{(\ln 2)^{p-1}} \right).$$

This improper integral converges if and only if $p > 1$, and diverges for $p < 1$, so the series converges, by the Integral Test, for $p > 1$, and diverges for $p < 1$.

Next, consider the case $p = 1$. We have

$$I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{u} = \lim_{b \rightarrow \infty} [\ln u]_{\ln 2}^{\ln b} = \lim_{b \rightarrow \infty} [\ln(\ln b) - \ln(\ln 2)] = \infty.$$

Since the improper integral I diverges, by the Integral Test, the series diverges for $p = 1$.

In conclusion, using the integral test, we have shown that the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k(\ln k)^p}$ converges if and only if $p > 1$.

56. The series is $\sum_{k=3}^{\infty} a_k = \sum_{k=3}^{\infty} \frac{1}{k(\ln k)[\ln(\ln k)]^p}$. The function $f(x) = \frac{1}{x(\ln x)[\ln(\ln x)]^p}$ is defined on $[3, \infty)$ and is continuous, positive, and decreasing for all $x \geq 3$. To check whether $f(x)$ is decreasing, consider $g(x) = \frac{1}{f(x)} = x(\ln x)[\ln(\ln x)]^p$. It suffices to show that $g(x)$ is increasing and has a nonzero derivative on $[3, \infty)$. We have

$$\begin{aligned} g'(x) &= \ln x [\ln(\ln x)]^p + x \cdot \frac{1}{x} [\ln(\ln x)]^p + x \ln x \cdot p [\ln(\ln x)]^{p-1} \cdot \frac{1}{\ln x} \cdot \frac{1}{x} \\ &= \ln x [\ln(\ln x)]^p + [\ln(\ln x)]^p + p [\ln(\ln x)]^{p-1} \\ &= [\ln(\ln x)]^{p-1} [(\ln x + 1)(\ln(\ln x) + p)] \\ &> 0. \end{aligned}$$

This final condition is satisfied for all $p > 0$ and for x in the interval $[3, \infty)$, so we can conclude that the function $f(x)$ must be decreasing on $[3, \infty)$. Also we have $a_k = f(k)$ for all positive integers $k \geq 3$. Using the integral test, we find $I = \int_3^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_3^b \frac{dx}{x(\ln x)[\ln(\ln x)]^p}$. Let $u = \ln(\ln x)$. Then $du = \frac{dx}{x \ln x}$. We have for $p \neq 1$,

$$I = \lim_{b \rightarrow \infty} \int_{\ln(\ln 3)}^{\ln(\ln b)} \frac{du}{u^p} = \lim_{b \rightarrow \infty} \int_{\ln(\ln 3)}^{\ln(\ln b)} u^{-p} du = \lim_{b \rightarrow \infty} \left[\frac{u^{-p+1}}{-p+1} \right]_{\ln(\ln 3)}^{\ln(\ln b)} = \frac{1}{1-p} \lim_{b \rightarrow \infty} \left(\frac{1}{[\ln(\ln b)]^{p-1}} - \frac{1}{\ln[(\ln 3)]^{p-1}} \right).$$

This improper integral converges if and only if $p > 1$, and diverges if $p < 1$ so the series converges, by the Integral Test, for $p > 1$ and diverges for $p < 1$.

Next, consider the case $p = 1$. We have

$$I = \lim_{b \rightarrow \infty} \int_{\ln(\ln 3)}^{\ln(\ln b)} \frac{du}{u} = \lim_{b \rightarrow \infty} [\ln u]_{\ln(\ln 3)}^{\ln(\ln b)} = \lim_{b \rightarrow \infty} [\ln(\ln(\ln b)) - \ln(\ln(\ln 3))] = \infty.$$

Since the improper integral I diverges, by the Integral Test, the series diverges for $p = 1$. In conclusion, using the Integral Test, we have shown that the series $\sum_{k=3}^{\infty} a_k = \sum_{k=3}^{\infty} \frac{1}{k(\ln k)[\ln(\ln k)]^p}$ converges if and only if $p > 1$.

57. $S = 1 + 2 + 4 + 8 + \cdots$ is a divergent geometric series, because the sequence of partial sums $S_n = \sum_{k=1}^n 2^{k-1}$ diverges since $|r| = 2 > 1$. Multiplying the series S by a constant nonzero multiple such as 2 again gives a divergent series. The equation $2S = -1 + S$ can be solved for S by the usual operations of arithmetic only if S and $2S$ are finite, which they are not. (Note that since both S and $2S$ are infinite, the equation $2S = -1 + S$ is satisfied identically, that is in the sense of $\infty = \infty$.) This is the reason for the paradox.

58. Let $a_k = 1$ and $b_k = -1$ for all k . Then $\sum_{k=1}^{\infty} a_k$ and $\sum_{k=1}^{\infty} b_k$ diverge, but $\sum_{k=1}^{\infty} (a_k + b_k)$ converges. Let $a_k = b_k = 1$ for all k . Then $\sum_{k=1}^{\infty} a_k$ and $\sum_{k=1}^{\infty} b_k$ diverge, but $\sum_{k=1}^{\infty} (a_k - b_k)$ converges.

For another example, let $a_k = \frac{1}{k}$ and $b_k = \frac{1}{k+1}$ for all k . Then $\sum_{k=1}^{\infty} a_k$ and $\sum_{k=1}^{\infty} b_k$ being harmonic series diverge, but $\sum_{k=1}^{\infty} (a_k - b_k)$ will be a telescoping series and converge. Let $a_k = \frac{1}{k}$ and $b_k = -\frac{1}{k+1}$ for all k .

Then $\sum_{k=1}^{\infty} a_k$ and $\sum_{k=1}^{\infty} b_k$ being harmonic series diverge, but $\sum_{k=1}^{\infty} (a_k + b_k)$ will be a telescoping series and converge.

59. Using a CAS, we find that

(a) $\sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6}.$

(b) We have $\pi^2 \approx 6 \sum_{k=1}^{100} \frac{1}{k^2} = 6(1.63498 \dots) \approx \boxed{9.8099}.$

60. (a) Since $\frac{1}{p-1} < \sum_{k=1}^{\infty} \frac{1}{k^p} < 1 + \frac{1}{p-1}$, an interval of width 1 for the case of $p = 3$ is

$$\left(\frac{1}{p-1}, 1 + \frac{1}{p-1}\right) = \left(\frac{1}{3-1}, 1 + \frac{1}{3-1}\right) = \left(\frac{1}{2}, \frac{3}{2}\right).$$

(b) Using a CAS, $\sum_{k=1}^{100} \frac{1}{k^3} \approx \boxed{1.2020}.$

61. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} k^6 e^{-k}$. The function $f(x) = x^6 e^{-x}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 6$, since

$$f'(x) = 6x^5 e^{-x} - x^6 e^{-x} = x^5(6 - x)e^{-x} \leq 0 \text{ for } x \geq 6.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 6$. Using the integral test, we find

$$I = \int_6^{\infty} f(x) dx = \int_6^{\infty} x^6 e^{-x} dx = \frac{176112}{e},$$

using a CAS. Since the improper integral I converges, by the integral test the series $\sum_{k=6}^{\infty} a_k = \sum_{k=6}^{\infty} k^6 e^{-k}$

converges as well. The original series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} k^6 e^{-k}$ differs from the convergent series

$\sum_{k=6}^{\infty} a_k = \sum_{k=6}^{\infty} k^6 e^{-k}$ by the five terms: $\sum_{k=1}^5 a_k = \sum_{k=1}^5 k^6 e^{-k} \approx 225.625$ using a CAS, so since the two series differ by a finite value, it means that the original series *converges* as well.

62. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k+3}{k^2+6k+7}$. The function $f(x) = \frac{x+3}{x^2+6x+7}$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $x \geq 1$, since

$$f'(x) = \frac{(x^2 + 6x + 7) \cdot 1 - (x + 3) \cdot (2x + 6)}{(x^2 + 6x + 7)^2} = -\frac{x^2 + 6x + 11}{(x^2 + 6x + 7)^2} < 0 \text{ for } x \geq 1.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the integral test, we find

$$I = \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{x+3}{x^2+6x+7} dx = \frac{1}{2} \lim_{b \rightarrow \infty} (\ln(b^2 + 6b + 7) - \ln 14) = \infty,$$

using a CAS. Since the improper integral I diverges, by the integral test the series *diverges* as well.

63. The series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{5k+6}{k^3-1}$. The function $f(x) = \frac{5x+6}{x^3-1}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$, since

$$f'(x) = \frac{(x^3 - 1) \cdot 5 - (5x + 6) \cdot (3x^2)}{(x^3 - 1)^2} = -\frac{10x^3 + 18x^2 + 5}{(x^3 - 1)^2} < 0 \text{ for } x \geq 2.$$

Also, $a_k = f(k)$ for all positive integers $k \geq 2$. Using the integral test, we find using a CAS,

$$I = \int_2^{\infty} f(x) dx = \int_2^{\infty} \frac{5x+6}{x^3-1} dx = \frac{1}{6} \left(-\sqrt{3}\pi + 11 \ln 7 + 2\sqrt{3} \tan^{-1} \left(\frac{5}{\sqrt{3}} \right) \right) \approx 3.375.$$

Since the improper integral I converges, by the integral test the series *converges* as well.

64. (a) For the series $\sum_{k=1}^{\infty} \frac{1}{k^{0.99}}$: $S_{10} \approx 2.9561$ $S_{1000} \approx 7.7290$ $S_{100,000} \approx 12.7783$.

For the series $\sum_{k=1}^{\infty} \frac{1}{k^{1.01}}$: $S_{10} \approx 2.9023$ $S_{1000} \approx 7.2530$ $S_{100,000} \approx 11.4529$.

(b) The partial sums of the convergent series $\sum_{k=1}^{\infty} \frac{1}{k^{1.01}}$ grow slower compared to the partial sums of the divergent series $\sum_{k=1}^{\infty} \frac{1}{k^{0.99}}$, as one might have expected.

65. Since $\sum_{k=1}^{\infty} a_k$ is convergent, let the sequence of partial sums $\{S_n\}$ for $\sum_{k=1}^{\infty} a_k$ converge to L , that is, $\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n a_k = L$. Similarly, since $\sum_{k=1}^{\infty} b_k$ is convergent, let the sequence of partial sums $\{S'_n\}$ for $\sum_{k=1}^{\infty} b_k$ converge to M , which means $\lim_{n \rightarrow \infty} S'_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n b_k = M$. The sequence of partial sums of $\sum_{k=1}^{\infty} (a_k + b_k)$ is $\{S_n + S'_n\}$, and we have

$$\lim_{n \rightarrow \infty} (S_n + S'_n) = \lim_{n \rightarrow \infty} S_n + \lim_{n \rightarrow \infty} S'_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n a_k + \lim_{n \rightarrow \infty} \sum_{k=1}^n b_k = L + M,$$

using the additive property of limits, showing that the series $\sum_{k=1}^{\infty} (a_k + b_k)$ converges.

66. Let $S = \sum_{k=1}^{\infty} a_k$ be a convergent series which converges to S ; this means that the sequence $\{S_n\}$ of partial sums $S_n = \sum_{k=1}^n a_k$ converges to S , or $\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n a_k = S$. Consider the series $\sum_{k=1}^{\infty} ca_k$. The sequence of partial sums $\{S'_n\}$ of this series is $S'_n = \sum_{k=1}^n ca_k$. We have

$$\lim_{n \rightarrow \infty} S'_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n ca_k = c \lim_{n \rightarrow \infty} \sum_{k=1}^n a_k = cS,$$

using the scalar multiple property of limits. Since the sequence of partial sums $\{S'_n\}$ converges to cS , this means that the sum of the series $\sum_{k=1}^{\infty} ca_k = cS$.

67. We have $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^N a_k + \sum_{k=N+1}^{\infty} a_k = K + S = S + K$. This proves that $\sum_{k=1}^{\infty} a_k$ converges with sum $S + K$.

68. Let the series $\sum_{k=1}^{\infty} a_k$ converge to a sum L . This means the limit of the sequence of partial sums $\{S_n\}$ is L , that is $\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n a_k = L$. If the series $\sum_{k=1}^{\infty} b_k$ diverges, then the limit of the sequence of partial

sums $\{S'_n\}$ is either nonexistent or is infinite, in other words, $\lim_{n \rightarrow \infty} S'_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n b_k$ does not exist or is infinite. The sequence of partial sums $\{S''_n\}$ of the series $\sum_{k=1}^{\infty} (a_k + b_k)$ is given by

$$S''_n = \sum_{k=1}^n (a_k + b_k) = \sum_{k=1}^n a_k + \sum_{k=1}^n b_k = S_n + S'_n.$$

Taking the limits on both sides, we have

$$\lim_{n \rightarrow \infty} S''_n = \lim_{n \rightarrow \infty} S_n + \lim_{n \rightarrow \infty} S'_n = L + \lim_{n \rightarrow \infty} S'_n,$$

which does not exist or is infinite because $\lim_{n \rightarrow \infty} S'_n$ does not exist or is infinite. This shows that the sequence of partial sums $\{S''_n\}$ of the series $\sum_{k=1}^{\infty} (a_k + b_k)$ diverges, so the series itself diverges.

69. Since the series $\sum_{k=1}^{\infty} a_k$ with $a_k > 0$ for all k converges, the limit of the sequence $\{S_n\}$ of partial sums with n^{th} term given by $S_n = \sum_{k=1}^n a_k$ is finite, say L . That is, $L = \lim_{n \rightarrow \infty} \sum_{k=1}^n a_k$. The n^{th} term of the sequence $\{S'_n\}$ of partial sums for the series $\sum_{k=1}^{\infty} \frac{a_k}{1+a_k}$ is given by $S'_n = \sum_{k=1}^n \frac{a_k}{1+a_k}$. Since the terms $a_k > 0$ for all k , we have

$$0 < S'_n = \sum_{k=1}^n \frac{a_k}{a_k + 1} < \sum_{k=1}^n a_k < L,$$

which means that the partial sum is bounded from below by 0 and above by L . Also, the terms of the sequence of partial sums is an increasing sequence which can be seen using the Algebraic Difference Test:

$$S'_{n+1} - S'_n = \sum_{k=1}^{n+1} \frac{a_k}{a_k + 1} - \sum_{k=1}^n \frac{a_k}{a_k + 1} = \frac{a_{n+1}}{a_{n+1} + 1} > 0,$$

since $a_{n+1} > 0$ for all n . Since the sequence $\{S'_n\}$ of partial sums is bounded from above and increasing, it converges.

Challenge Problems

70. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k \ln(1 + \frac{1}{k})}$. We have

$$\begin{aligned} \lim_{n \rightarrow \infty} a_n &= \lim_{n \rightarrow \infty} \frac{1}{n \ln(1 + \frac{1}{n})} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n}}{\ln(1 + \frac{1}{n})} \\ &= \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{\ln(1 + \frac{1}{x})} = \lim_{x \rightarrow \infty} \frac{-\frac{1}{x^2}}{\frac{1}{1+\frac{1}{x}} \cdot -\frac{1}{x^2}} = \lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right) = 1 \neq 0, \end{aligned}$$

using L'Hôpital's rule on a related function of the sequence $\{a_k\}$. So the series *diverges*.

71. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{(\ln k)^p}$. The function $f(x) = \frac{1}{(\ln x)^p}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. Also, $a_k = f(k)$ for all positive integers k . Using the integral test, we find $I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{(\ln x)^p}$. Let $u = \frac{1}{(\ln x)^p}$, $dv = dx$. Then, $du = -p(\ln x)^{-p-1} \cdot \frac{1}{x} dx$, and $v = x$. Integrating by parts, we have

$$I = \lim_{b \rightarrow \infty} \left(\left[\frac{x}{(\ln x)^p} \right]_2^b + \int_2^b \frac{dx}{(\ln x)^{p+1}} \right).$$

The first term yields

$$\begin{aligned} \lim_{b \rightarrow \infty} \frac{b}{(\ln b)^p} - \frac{2}{(\ln 2)^p} &= \lim_{b \rightarrow \infty} \frac{1}{p(\ln b)^{p-1} \cdot \frac{1}{b}} - \frac{2}{(\ln 2)^p} = \lim_{b \rightarrow \infty} \frac{b}{p(\ln b)^{p-1}} - \frac{2}{(\ln 2)^p} \\ &= \cdots = \lim_{b \rightarrow \infty} \frac{b}{p! \ln b} - \frac{2}{(\ln 2)^p} = \frac{1}{p!} \lim_{b \rightarrow \infty} \frac{1}{\frac{1}{b}} - \frac{2}{(\ln 2)^p} = \infty, \end{aligned}$$

via a repeated application of L'Hôpital's rule to the first term. This means that the improper integral I diverges, so by the integral test the series *diverges* as well.

72. The series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{(\ln k)^q}{x^p}$. We assume in what follows that $p > 0$ and $q > 0$ are integers. The function $f(x) = \frac{(\ln x)^q}{x^p}$ is defined on $[2, \infty)$ and is continuous, positive, and decreasing for all $x \geq 2$. Also, $a_k = f(k)$ for all positive integers k . To use the integral test, we evaluate

$$I(p, q) = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b x^{-p} (\ln x)^q dx.$$

Let $u = (\ln x)^q$, $dv = x^{-p} dx$. Then $du = \frac{(\ln x)^{q-1}}{x} dx$, $v = \frac{x^{-p+1}}{-p+1}$, assuming $p \neq 1$ (we will consider the case $p = 1$ separately below). Integrating by parts, we have

$$\begin{aligned} I(p, q) &= \lim_{b \rightarrow \infty} \left[\frac{(\ln x)^q \cdot x^{-p+1}}{-p+1} \Big|_2^b - \int_2^b \frac{x^{-p+1}}{-p+1} \cdot \frac{(\ln x)^{q-1}}{x} dx \right] \\ &= \frac{1}{1-p} \lim_{b \rightarrow \infty} \left[(\ln x)^q x^{-p+1} \Big|_2^b - \int_2^b \frac{(\ln x)^{q-1}}{x^p} dx \right] \\ &= \frac{1}{1-p} \lim_{b \rightarrow \infty} \left[\frac{(\ln b)^q}{b^{p-1}} - \frac{(\ln 2)^q}{2^{p-1}} - I(p, q-1) \right] \end{aligned}$$

The first term limit is of an indeterminate form, and can be found by repeated application of L'Hôpital's rule,

$$\lim_{b \rightarrow \infty} \frac{(\ln b)^q}{b^{p-1}} = \lim_{b \rightarrow \infty} \frac{q(\ln b)^{q-1} \cdot \frac{1}{b}}{(p-1)b^{p-2}} = \lim_{b \rightarrow \infty} \frac{q(\ln b)^{q-1}}{(p-1)b^{p-1}} = \cdots = \lim_{b \rightarrow \infty} \frac{q!}{(p-1)!b^{p-1}}.$$

This limit exists if $p > 1$. The other term obtained while integrating $I(p, q)$ by parts, namely $I(p, q-1)$ can again be integrated by parts, and will produce similar limits that are defined only if $p > 1$ —to see this, just replace q by $q-k$ everywhere in the above calculation, to see that

$$I(p, q-k) = \frac{1}{1-p} \lim_{b \rightarrow \infty} \left[\frac{(\ln b)^{q-k}}{b^{p-1}} - \frac{(\ln 2)^{q-k}}{2^{p-1}} - I(p, q-k-1) \right],$$

where $k = 0, 1, 2, \dots, q-1$. In the final step, for $k = q$, we would obtain

$$I(p, 0) = \int_2^b \frac{dx}{x^p} = \frac{1}{1-p} \frac{1}{b^{p-1}},$$

and once again, this term has convergent limit as $b \rightarrow \infty$ only if $p > 1$. We have shown that the series converges for any $q > 0$ if $p > 1$.

If $p = 1$, then we have $dv = \frac{dx}{x}$ so $v = \ln x$. Proceeding with the integration of parts as before, we have

$$\begin{aligned}
 I(p = 1, q) &= \lim_{b \rightarrow \infty} \left[(\ln x)^q \cdot (\ln x)^1 \Big|_2^b - \int_2^b (\ln x)^1 \cdot \frac{(\ln x)^{q-1}}{x} dx \right] \\
 I(1, q) &= \lim_{b \rightarrow \infty} \left[(\ln x)^{q+1} \Big|_2^b \right] - \lim_{b \rightarrow \infty} \int_2^b \frac{(\ln x)^q}{x} dx \\
 &= \lim_{b \rightarrow \infty} [(\ln b)^{q+1} - (\ln 2)^{q+1}] - I(1, q) \\
 \text{or,} \quad 2I(1, q) &= \lim_{b \rightarrow \infty} [(\ln b)^{q+1} - (\ln 2)^{q+1}] \\
 I(1, q) &= \frac{1}{2} \lim_{b \rightarrow \infty} [(\ln b)^{q+1} - (\ln 2)^{q+1}],
 \end{aligned}$$

which exists only if $q + 1 \leq 0$, or $q \leq -1$. Since we assumed that $q > 0$, we conclude that the series does not converge for $p = 1$. So we have shown using the Integral Test that the original series converges for the integers $p > 1$ for any $q > 0$.

73. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} k^x$. The function $f(y) = y^x$ is defined on $[1, \infty)$ and is continuous, positive, and decreasing for all $y \geq 1$, provided $x < 0$, since $f'(x) = xy^{x-1} < 0$ if $x < 0$ for $y \geq 1$. Also, $a_k = f(k)$ for all positive integers $k \geq 1$. Using the Integral Test, we find

$$I = \int_1^{\infty} f(y) dy = \lim_{b \rightarrow \infty} \int_1^b y^x dy = \lim_{b \rightarrow \infty} \frac{y^{x+1}}{x+1} \Big|_1^b = \lim_{b \rightarrow \infty} \frac{1}{(x+1)b^{-1-x}} - \frac{1}{(x+1)} = -\frac{1}{x+1}$$

that is, the limit exists and is finite only if $-1 - x > 0$, or $x < -1$. So for $x \leq 0$ the range of x values that lead to a convergent series is $(-\infty, -1)$. For $x > 0$, the function $f(y) = y^x$ is an increasing function of x , and the Integral Test is not applicable. But for this case, we have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} n^x = \infty \neq 0$, so the series diverges by the Divergence Test.

74. (a) Consider the finite sum $S_n = \sum_{k=1}^n \frac{1}{1+k^2}$. The function $f(x) = \frac{1}{1+x^2}$ is defined on $[0, \infty)$ and is continuous, positive, and decreasing for all $x \geq 0$. Also, $a_k = f(k)$ for all positive integers k . So we have $\int_1^n \frac{1}{1+x^2} dx \leq \sum_{k=1}^n \frac{1}{1+k^2} \leq \int_0^n \frac{dx}{1+x^2}$ or $\tan^{-1} n - \frac{\pi}{4} \leq S_n \leq \tan^{-1} n$. So, $S_n \leq \tan^{-1} n$. See figure below for the case $n = 6$:

(b) Since $S_n < \tan^{-1} n < \frac{\pi}{2}$, the sequence of partial sums $\{S_n\}$ is bounded from above. The terms of the sum S_n are positive, so the sequence $\{S_n\}$ is also increasing, as seen by the Algebraic Difference Test:

$$S_{n+1} - S_n = \sum_{k=1}^{n+1} \frac{1}{1+k^2} - \sum_{k=1}^n \frac{1}{1+k^2} = \frac{1}{1+(n+1)^2} > 0.$$

Since the sequence of partial sums $\{S_n\}$ is bounded from above and is increasing, it converges to a finite limit, which means that the series $\sum_{k=1}^{\infty} \frac{1}{1+k^2}$ also converges.

(c) From part (a), we have since $\tan^{-1} n - \frac{\pi}{4} \leq S_n \leq \tan^{-1} n$. Taking limits on every term of the inequality, we get $\lim_{n \rightarrow \infty} (\tan^{-1} n - \frac{\pi}{4}) \leq \lim_{n \rightarrow \infty} \left(\sum_{k=1}^n \frac{1}{1+k^2} \right) \leq \lim_{n \rightarrow \infty} (\tan^{-1} n)$. So, $\frac{\pi}{2} - \frac{\pi}{4} \leq \sum_{k=1}^{\infty} \frac{1}{1+k^2} \leq \frac{\pi}{2}$, or $\frac{\pi}{4} \leq \sum_{k=1}^{\infty} \frac{1}{1+k^2} \leq \frac{\pi}{2}$, as was required to be proved.

75. (a) $\sum_{k=1}^{10} \frac{1}{k^3} \approx \boxed{1.1975}.$

(b) We have since $\frac{1}{p-1} < \sum_{k=1}^{\infty} \frac{1}{k^p} < 1 + \frac{1}{p-1}$, for the case of $p = 3$, $\frac{1}{3-1} < \sum_{k=1}^{\infty} \frac{1}{k^3} < 1 + \frac{1}{3-1}$, or

$$\boxed{\frac{1}{2} < \sum_{k=1}^{\infty} \frac{1}{k^3} < \frac{3}{2}}.$$

(c) We conclude that $\zeta(3)$ converges to a value between $\frac{1}{2}$ and $\frac{3}{2}$.

76. (a) For the rectangles under the curve $y = f(x)$, as shown in the left figure of the problem, the height of the tallest rectangle of unit width is $f(n+1)$, while the height of the smallest rectangle of unit width is $f(m)$. The area under the curve is larger than the areas of the rectangles of unit width under the curve, so we have $f(n+1) + \cdots + f(m) \leq \int_n^m f(x) dx$.

For the rectangles over the curve $y = f(x)$, as shown in the right figure of the problem, the height of the tallest rectangle of unit width is $f(n)$ while the height of the smallest rectangle of unit width is $f(m-1)$. The area under the curve is now smaller than the areas of all the rectangles of unit width over the curve, so we have $\int_n^m f(x) dx \leq f(n) + \cdots + f(m-1)$. Putting these two geometric results together gives us the desired inequalities,

$$f(n+1) + \cdots + f(m) \leq \int_n^m f(x) dx \leq f(n) + \cdots + f(m-1).$$

(b) We have, since $\sum_{k=1}^{\infty} f(k)$ converges, then $\sum_{k=n+1}^{\infty} f(k)$ and $\sum_{k=n}^{\infty} f(k)$ also converge, since either of these series differs from the convergent series $\sum_{k=1}^{\infty} f(k)$ only by a finite sum of positive terms. Since from part (a), we had $f(n+1) + \cdots + f(m) \leq \int_n^m f(x) dx \leq f(n) + \cdots + f(m-1)$, taking the limits on every term of the inequality as $m \rightarrow \infty$ gives us

$$\lim_{m \rightarrow \infty} \sum_{k=n+1}^m f(k) \leq \lim_{m \rightarrow \infty} \int_n^m f(x) dx \leq \lim_{m \rightarrow \infty} \sum_{k=n}^m f(k)$$

or $\sum_{k=n+1}^{\infty} f(k) \leq \int_n^{\infty} f(x) dx \leq \sum_{k=n+1}^{\infty} f(k)$, as needed to be shown, since the improper integral exists by the Squeeze Theorem.

(c) From the left hand inequality of part (b), we have $\sum_{k=n+1}^{\infty} \frac{1}{k^2} \leq \int_n^{\infty} \frac{1}{x^2} dx$, or

$$\sum_{k=1}^{\infty} \frac{1}{k^2} - \sum_{k=1}^n \frac{1}{k^2} \leq \left[-\frac{1}{x} \right]_n^{\infty}.$$

Now, we use $\zeta(2) = \sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6}$ (see Problem 75). The Error, which refers to the difference between the

full value of the convergent series and its n^{th} partial sum, is given by

$$\text{Error} = \left| \frac{\pi^2}{6} - \sum_{k=1}^n \frac{1}{k^2} \right| \leq \frac{1}{n}.$$

So for an error $\frac{1}{n} < \left(\frac{1}{2}\right) 10^{-2}$, we have $n > 200$. For an error $\frac{1}{n} < \left(\frac{1}{2}\right) 10^{-10}$, we have $n > 2 \times 10^{10}$.

8.4 Comparison Tests

Concepts and Vocabulary

1. (b) The series $\sum_{k=1}^{\infty} a_k$ is divergent by the Comparison Test.
2. **False:** We require $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = L \neq 0$ in order to be able to conclude that $\sum_{k=1}^{\infty} a_k$ and $\sum_{k=1}^{\infty} b_k$ are both convergent or both divergent.
3. **False:** If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = L > 0$, then all that can be concluded is either $\sum_{k=1}^{\infty} a_k$ and $\sum_{k=1}^{\infty} b_k$ both converge or they both diverge.
4. **False:** The limit comparison test merely decides if the unknown series converges or diverges by comparing it with a known convergent or divergent series. It does not tell us what the sum of the series is.

Skill Building

5. Comparing the n^{th} term of $\sum_{k=1}^{\infty} \frac{1}{k(k+1)}$ with the n^{th} term of $\sum_{k=1}^{\infty} \frac{1}{k^2}$ we have

$$\frac{1}{n(n+1)} = \frac{1}{n^2 + n} < \frac{1}{n^2}$$

whenever $n \geq 1$. Since the p -series $\sum_{k=1}^{\infty} \frac{1}{k^p} = \sum_{k=1}^{\infty} \frac{1}{k^2}$ converges for $p = 2 > 1$, by the Comparison Test,

$$\sum_{k=1}^{\infty} \frac{1}{k(k+1)} \text{ also } \boxed{\text{converges.}}$$

6. Comparing the n^{th} term of $\sum_{k=1}^{\infty} \frac{1}{(k+1)^2}$ with the n^{th} term of $\sum_{k=1}^{\infty} \frac{1}{k^2}$ we have

$$\frac{1}{(n+1)^2} = \frac{1}{n^2 + 2n + 1} < \frac{1}{n^2}$$

for $n \geq 1$. By the Comparison Test, since the p -series $\sum_{k=1}^{\infty} \frac{1}{k^p} = \sum_{k=1}^{\infty} \frac{1}{k^2}$ converges for $p = 2 > 1$, the series

$$\sum_{k=1}^{\infty} \frac{1}{(k+1)^2} \text{ also } \boxed{\text{converges.}}$$

7. Comparing the n^{th} term of $\sum_{k=2}^{\infty} \frac{4^k}{7^{k+1}}$ with the n^{th} term of $\sum_{k=2}^{\infty} \left(\frac{4}{7}\right)^k$, we have

$$\frac{4^n}{7^{n+1}} < \frac{4^n}{7^n}$$

for $n \geq 1$. Since the geometric series $\sum_{k=2}^{\infty} \left(\frac{4}{7}\right)^k$ converges since $|r| = \frac{4}{7} < 1$, by the Comparison Test, the

$$\text{series } \sum_{k=2}^{\infty} \frac{4^k}{7^{k+1}} \text{ also } \boxed{\text{converges.}}$$

8. Comparing the n^{th} term of $\sum_{k=1}^{\infty} \frac{1}{(2k-1)(2^k)}$ with the n^{th} term of $\sum_{k=1}^{\infty} \frac{1}{2^k}$ we wish to have

$$\frac{1}{(2n-1)(2^n)} < \frac{1}{(2^n)}$$

or,

$$\frac{1}{2n-1} < 1$$

or,

$$2n-1 > 1,$$

or $n > 1$. So for $n > 1$, by the Comparison test, since $\sum_{k=1}^{\infty} \frac{1}{2^k}$ is a convergent geometric series, since

$|r| = \frac{1}{2} < 1$, the series $\sum_{k=1}^{\infty} \frac{1}{(2k-1)(2^k)}$ also *converges.*

9. Comparing the n^{th} term of $\sum_{k=2}^{\infty} \frac{1}{\sqrt{k(k-1)}}$ with the n^{th} term of $\sum_{k=2}^{\infty} \frac{1}{k}$ we have

$$\frac{1}{\sqrt{n(n-1)}} = \frac{1}{n\sqrt{1-\frac{1}{n}}} > \frac{1}{n}$$

for $n > 1$. Since $\sum_{k=2}^{\infty} \frac{1}{k}$ is the divergent harmonic series, by the Comparison Test, the series $\sum_{k=2}^{\infty} \frac{1}{\sqrt{k(k-1)}}$ also *diverges.*

10. Comparing the n^{th} term of $\sum_{k=2}^{\infty} \frac{\sqrt{k}}{k-1}$ with the n^{th} term of $\sum_{k=2}^{\infty} \frac{1}{\sqrt{k}}$, we wish to have

$$\frac{\sqrt{n}}{n-1} > \frac{1}{\sqrt{n}}$$

or, cross-multiplying,

$$n > n-1,$$

which is true for all $n \geq 1$. Since the p -series $\sum_{k=2}^{\infty} \frac{1}{k^p} = \sum_{k=2}^{\infty} \frac{1}{k^{1/2}}$ diverges since $0 < p < 1$, by the Comparison Test, the series $\sum_{k=2}^{\infty} \frac{\sqrt{k}}{k-1}$ also *diverges.*

11. Comparing the n^{th} term of $\sum_{k=1}^{\infty} \frac{1}{k(k+1)(k+2)}$ with the n^{th} term of the convergent p -series $\sum_{k=1}^{\infty} \frac{1}{k^p} = \sum_{k=1}^{\infty} \frac{1}{k^3}$ (convergent since $p = 3 > 1$) we have

$$\frac{1}{n(n+1)(n+2)} = \frac{1}{n^3 + 3n^2 + 2n} < \frac{1}{n^3}$$

for $n \geq 1$. By the Comparison Test, the series $\sum_{k=1}^{\infty} \frac{1}{k(k+1)(k+2)}$ also *converges.*

12. We compare the n^{th} term of $\sum_{k=1}^{\infty} \frac{6}{5k-2}$ with the n^{th} term of the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$. Since

$$\frac{6}{5n-2} > \frac{1}{n}$$

or

$$6n > 5n-2,$$

for $n > -2$, by the Comparison Test, the series $\sum_{k=1}^{\infty} \frac{6}{5k-2}$ also *diverges.*

13. We compare $\sum_{k=1}^{\infty} \frac{\sin^2 k}{k^\pi}$ with the convergent p -series $\sum_{k=1}^{\infty} \frac{1}{k^\pi}$, which converges since $p = \pi > 1$. We have

$$\frac{\sin^2 n}{n^\pi} \leq \frac{1}{n^\pi}$$

since $\sin^2 n \leq 1$ for all $n \geq 1$, so by the Comparison Test, the series $\sum_{k=1}^{\infty} \frac{\sin^2 k}{k^\pi}$ also *converges.*

14. We compare $\sum_{k=1}^{\infty} \frac{\cos^2 k}{k^2+1}$ with the convergent p -series $\sum_{k=1}^{\infty} \frac{1}{k^2}$, which converges since $p = 2 > 1$. We have

$$\frac{\cos^2 n}{n^2+1} \leq \frac{1}{n^2+1} < \frac{1}{n^2}$$

since $\cos^2 n \leq 1$ for all $n \geq 1$, so by the Comparison Test, the series $\sum_{k=1}^{\infty} \frac{\cos^2 k}{k^2+1}$ also *converges.*

15. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{(k+1)(k+2)}$ behaves like

$$a_n = \frac{1}{(n+1)(n+2)} = \frac{1}{n^2 \left(1 + \frac{1}{n}\right) \left(1 + \frac{2}{n}\right)} \approx \frac{1}{n^2}$$

for large n . So we compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is a convergent p -series since $p = 2 > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{(n+1)(n+2)}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{n^2}{(n+1)(n+2)} = \lim_{n \rightarrow \infty} \frac{n^2}{n^2 + 3n + 2} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{3}{n} + \frac{2}{n^2}} = 1.$$

Since the limit is a positive number, and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{(k+1)(k+2)}$ also *converges.*

16. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2+1}$ behaves like

$$a_n = \frac{1}{n^2+1} = \frac{1}{n^2 \left(1 + \frac{1}{n^2}\right)} \approx \frac{1}{n^2}$$

for large n . So we compare with the convergent p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which converges since $p = 2 > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n^2+1}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{n^2}{n^2+1} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n^2}} = 1.$$

Since the limit is a positive number, and the series $\sum_{k=1}^{\infty} b_k$ converges, then by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2+1}$ also *converges.*

17. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{k^2+1}}$ behaves like

$$a_n = \frac{1}{\sqrt{n^2+1}} = \frac{1}{n\sqrt{1 + \frac{1}{n^2}}} \approx \frac{1}{n}$$

for large n . So we compare with the divergent harmonic series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{\sqrt{n^2+1}}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n}{\sqrt{n^2+1}} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{1+\frac{1}{n^2}}} = 1.$$

Since the limit is a positive number, and the series $\sum_{k=1}^{\infty} b_k$ diverges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{k^2+1}}$ also *diverges.*

18. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sqrt{k}}{k+4}$ behaves like

$$a_n = \frac{\sqrt{n}}{n+4} = \frac{\sqrt{n}}{n(1+\frac{4}{n})} = \frac{1}{\sqrt{n}(1+\frac{4}{n})} \approx \frac{1}{\sqrt{n}}$$

for large n . So we compare with the p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{1/2}}$ which is divergent since $0 < p < 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{\sqrt{n}}{n+4}}{\frac{1}{\sqrt{n}}} = \lim_{n \rightarrow \infty} \frac{n}{n+4} = \lim_{n \rightarrow \infty} \frac{1}{1+\frac{4}{n}} = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ diverges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sqrt{k}}{k+4}$ also *diverges.*

19. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3\sqrt{k}+2}{2k^2+5}$ behaves like

$$a_n = \frac{3\sqrt{n}+2}{2n^2+5} = \frac{\sqrt{n}(3+\frac{2}{\sqrt{n}})}{n^2(2+\frac{5}{n^2})} \approx \frac{1}{n^{3/2}}$$

for large n . So we compare with the p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$ which is convergent since $p = \frac{3}{2} > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{3\sqrt{n}+2}{2n^2+5}}{\frac{1}{n^{3/2}}} = \lim_{n \rightarrow \infty} \frac{n\sqrt{n}(3\sqrt{n}+2)}{2n^2+5} = \lim_{n \rightarrow \infty} \frac{3n^2+2n\sqrt{n}}{2n^2+5} = \lim_{n \rightarrow \infty} \frac{3+\frac{2}{\sqrt{n}}}{2+\frac{5}{n^2}} = \frac{3}{2}.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3\sqrt{k}+2}{2k^2+5}$ also *converges.*

20. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3\sqrt{k}+2}{2k-3}$ behaves like

$$a_n = \frac{3\sqrt{n}+2}{2n-3} = \frac{\sqrt{n}(3+\frac{2}{\sqrt{n}})}{n(2-\frac{3}{n})} \approx \frac{1}{\sqrt{n}}$$

for large n . So we compare with the p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{k}}$, which is divergent since $0 < p = \frac{1}{2} < 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{3\sqrt{n}+2}{2n-3}}{\frac{1}{\sqrt{n}}} = \lim_{n \rightarrow \infty} \frac{3n+2\sqrt{n}}{2n-3} = \lim_{n \rightarrow \infty} \frac{3+\frac{2}{\sqrt{n}}}{2-\frac{3}{n}} = \frac{3}{2}.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ diverges, by the Limit Comparison Test, the series

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3\sqrt{k}+2}{2k-3} \text{ also } \boxed{\text{diverges.}}$$

21. The n^{th} term of the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k\sqrt{k^2-1}}$ behaves like

$$a_n = \frac{1}{n\sqrt{n^2-1}} = \frac{1}{n^2\sqrt{1-\frac{1}{n^2}}} \approx \frac{1}{n^2}$$

for large n . So we compare with the p -series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k^2}$, which converges since $p = 2 > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n\sqrt{n^2-1}}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{n}{\sqrt{n^2-1}} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{1-\frac{1}{n^2}}} = 1.$$

Since the limit is a positive number and the series $\sum_{k=2}^{\infty} b_k$ converges, by the Limit Comparison Test, the

$$\text{series } \sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k\sqrt{k^2-1}} \text{ also } \boxed{\text{converges.}}$$

22. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k}{(2k-1)^2}$ behaves like

$$a_n = \frac{n}{(2n-1)^2} = \frac{n}{n^2\left(2-\frac{1}{n}\right)^2} \approx \frac{1}{n}$$

for large n . So we compare with the divergent harmonic series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n}{(2n-1)^2}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n^2}{(2n-1)^2} = \lim_{n \rightarrow \infty} \frac{1}{\left(2-\frac{1}{n}\right)^2} = \frac{1}{4}.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ diverges, by the Limit Comparison Test, the series

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k}{(2k-1)^2} \text{ also } \boxed{\text{diverges.}}$$

23. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3k+4}{k2^k}$ behaves like

$$a_n = \frac{3n+4}{n2^n} = \left(3+\frac{4}{n}\right) \frac{1}{2^n} \approx \frac{1}{2^n}$$

for large n . So we compare with the convergent geometric series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{2^k}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{3n+4}{n2^n}}{\frac{1}{2^n}} = \lim_{n \rightarrow \infty} \left(3+\frac{4}{n}\right) = 3.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3k+4}{k2^k}$ also *converges.*

24. The n^{th} term of the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{k-1}{k2^k}$ behaves like

$$a_n = \frac{n-1}{n2^n} = \frac{1}{2^n} \left(1 - \frac{1}{n}\right) \approx \frac{1}{2^n}$$

for large n . So we compare with the convergent geometric series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{2^k}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n-1}{n2^n}}{\frac{1}{2^n}} = \lim_{n \rightarrow \infty} \frac{n-1}{n} = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n}\right) = 1.$$

Since the limit is a positive number and the series $\sum_{k=2}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{k-1}{k2^k}$ also *converges.*

25. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{2^{k+1}}$ behaves like $a_n = \frac{1}{2^{n+1}} \approx \frac{1}{2^n}$ for large n . So we compare with the convergent geometric series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{2^n}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{2^{n+1}}}{\frac{1}{2^n}} = \lim_{n \rightarrow \infty} \frac{2^n}{2^{n+1}} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{2^n}} = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{2^{k+1}}$ also *converges.*

26. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{5}{3^{k+2}}$ behaves like $a_n = \frac{5}{3^{n+2}} \approx \frac{5}{3^n}$ for large n . So we compare with the convergent geometric series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{3^n}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{5}{3^{n+2}}}{\frac{1}{3^n}} = \lim_{n \rightarrow \infty} \frac{5 \cdot 3^n}{3^{n+2}} = \lim_{n \rightarrow \infty} \frac{5}{1 + \frac{2}{3^n}} = 5.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{5}{3^{k+2}}$ also *converges.*

27. The n^{th} term of $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k+5}{k^{k+1}}$ behaves like

$$a_n = \frac{n+5}{n^{n+1}} = \frac{n \left(1 + \frac{5}{n}\right)}{n^{n+1}} \approx \frac{1}{n^n}$$

for large n . So we compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^k}$ which was shown (see Example 1, p. 576 of text) to be convergent. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n+5}{n^{n+1}}}{\frac{1}{n^n}} = \lim_{n \rightarrow \infty} \frac{(n+5)n^n}{n^{n+1}} = \lim_{n \rightarrow \infty} \frac{n+5}{n} = \lim_{n \rightarrow \infty} \left(1 + \frac{5}{n}\right) = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k+5}{k^{k+1}}$ also converges.

28. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{5}{k^{k+1}}$ behaves like $a_n = \frac{5}{n^{n+1}} \approx \frac{5}{n^n}$ for large n . So we compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^k}$ which was shown (see Example 1, p. 576 of text) to be convergent. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{5}{n^{n+1}}}{\frac{1}{n^n}} = \lim_{n \rightarrow \infty} \frac{5n^n}{n^{n+1}} = \lim_{n \rightarrow \infty} \frac{5}{1 + \frac{1}{n^n}} = \frac{5}{1+0} = 5.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{5}{k^{k+1}}$ also converges.

29. Comparing the n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{6k}{5k^2+2}$ with the n^{th} term of the harmonic series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$ gives $\frac{6n}{5n^2+2} > \frac{1}{n}$ since $6n^2 > 5n^2 + 2$ for $n > \sqrt{2}$. This means for $n \geq 2$, the n^{th} terms satisfy $a_n > b_n$. Since the harmonic series $\sum_{k=1}^{\infty} b_k$ diverges, by the Comparison test, the given series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{6k}{5k^2+2}$ also diverges.

30. The n^{th} term of the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{6k+3}{2k^3-2}$ behaves like

$$a_n = \frac{6n+3}{2n^3-2} = \frac{n(6 + \frac{3}{n})}{n^3(2 - \frac{2}{n^3})} \approx \frac{1}{n^2}$$

for large n . So we compare with the series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k^2}$ which is a convergent p -series (since $p = 2 > 1$). We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{6n+3}{2n^3-2}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{6n^3+3n^2}{2n^3-2} = \lim_{n \rightarrow \infty} \frac{6 + \frac{3}{n}}{2 - \frac{2}{n}} = 3.$$

Since the limit is a positive number and the series $\sum_{k=2}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{6k+3}{2k^3-2}$ also converges.

31. The n^{th} term of the series $\sum_{k=1}^{\infty} \frac{7+k}{(1+k^2)^4}$ behaves like

$$a_n = \frac{7+n}{(1+n^2)^4} = \frac{n(\frac{7}{n}+1)}{n^8(\frac{1}{n^2}+1)^4} \approx \frac{1}{n^7}$$

for large n . So we compare with the series $\sum_{k=1}^{\infty} b_k = \frac{1}{k^7}$ which is a convergent p -series (since $p = 7 > 1$). We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{7+n}{(1+n^2)^4}}{\frac{1}{n^7}} = \lim_{n \rightarrow \infty} \frac{7n^7 + n^8}{(1+n^2)^4} = \lim_{n \rightarrow \infty} \frac{\frac{7}{n} + 1}{\left(\frac{1}{n^2} + 1\right)^4} = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{7+k}{(1+k^2)^4}$ also converges.

32. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{7+k}{1+k^2}\right)^4$ behaves like

$$a_n = \left(\frac{7+n}{1+n^2}\right)^4 = \frac{n^4}{n^8} \left(\frac{\frac{7}{n} + 1}{\frac{1}{n^2} + 1}\right)^4 \approx \frac{1}{n^4}$$

for large n . So we compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^4}$ which is a convergent p -series, since $p = 4 > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\left(\frac{7+n}{1+n^2}\right)^4}{\frac{1}{n^4}} = \lim_{n \rightarrow \infty} \left(\frac{7n+n^2}{1+n^2}\right)^4 = \lim_{n \rightarrow \infty} \left(\frac{\frac{7}{n} + 1}{\frac{1}{n^2} + 1}\right)^4 = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{7+k}{1+k^2}\right)^4$ also converges.

33. We compare the series $\sum_{k=1}^{\infty} \frac{e^{1/k}}{k}$ with the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$. Comparing the n^{th} term of each series we have $\frac{e^{1/n}}{n} > \frac{1}{n}$ since $e^{1/n} > 1$ for any $n \geq 1$ (since the n^{th} root of a number bigger than 1 is also bigger than 1; here $e > 1$). By the Comparison Test, the original series also diverges.

34. We compare the series $\sum_{k=1}^{\infty} \frac{1}{1+e^k}$ with the convergent geometric series $\sum_{k=1}^{\infty} \left(\frac{1}{e}\right)^k$, which converges since $|r| = \frac{1}{e} < 1$. Comparing the n^{th} term of each series we have $\frac{1}{1+e^n} < \frac{1}{e^n}$ for all $n \geq 1$, so by the Comparison Test, the original series also converges.

35. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(1+\frac{1}{k})^2}{e^k}$ behaves like $\frac{(1+\frac{1}{n})^2}{e^n} \approx \frac{1}{e^n}$ for large n . So we compare with the convergent geometric series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \left(\frac{1}{e}\right)^k$ which converges since $|r| = \frac{1}{e} < 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{(1+\frac{1}{n})^2}{e^n}}{\frac{1}{e^n}} = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^2 = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(1+\frac{1}{k})^2}{e^k}$ also converges.

36. We compare the series $\sum_{k=1}^{\infty} \frac{1}{k2^k}$ with the convergent geometric series $\sum_{k=1}^{\infty} \frac{1}{2^k}$ which converges since $|r| = \frac{1}{2} < 1$. Comparing the n^{th} term of each series we have $\frac{1}{n2^n} < \frac{1}{2^n}$ for $n > 1$. By the Comparison Test, we see that the original series also converges.

37. We compare the series $\sum_{k=1}^{\infty} \frac{1+\sqrt{k}}{k}$ with the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$. Since the n^{th} terms of the series satisfy $\frac{1+\sqrt{n}}{n} > \frac{1}{n}$ for $n \geq 1$, we see by the Comparison Test that the original series *diverges.*

38. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1+3\sqrt{k}}{k^2}$ behaves like

$$a_n = \frac{1+3\sqrt{n}}{n^2} = \frac{\sqrt{n} \left(\frac{1}{\sqrt{n}} + 3 \right)}{n^2} \approx \frac{1}{n^{3/2}}$$

for large n . So we compare with the p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$, which converges since $p = \frac{3}{2} > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1+3\sqrt{n}}{n^2}}{\frac{1}{n^{3/2}}} = \lim_{n \rightarrow \infty} \frac{n^{3/2} + 3n^2}{n^2} = \lim_{n \rightarrow \infty} \left(\frac{1}{\sqrt{n}} + 3 \right) = 3.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1+3\sqrt{k}}{k^2}$ also *converges.*

39. We compare the series $\sum_{k=1}^{\infty} \left(\frac{1}{2}\right)^k \sin^2 k$ with the convergent geometric series $\sum_{k=1}^{\infty} \frac{1}{2^k}$ which converges since $|r| = \frac{1}{2} < 1$. Comparing the n^{th} term of each series we have $\left(\frac{1}{2}\right)^n \sin^2 n \leq \frac{1}{2^n}$ since $\sin^2 n \leq 1$ for all $n \geq 1$. By the Comparison test, we see that the original series also *converges.*

40. We compare the series $\sum_{k=1}^{\infty} \frac{\tan^{-1} k}{k^3}$ with the p -series $\sum_{k=1}^{\infty} \frac{\pi}{2k^3}$, convergent since $p = 3 > 1$. Since the n^{th} terms of the series satisfy $\frac{\tan^{-1} n}{n^3} < \frac{\pi}{2n^3}$ because $\tan^{-1} n < \frac{\pi}{2}$ for any finite and positive $n \geq 1$, we see that, by the Comparison Test, the original series also *converges.*

Applications and Extensions

41. We compare the series $\sum_{k=2}^{\infty} \frac{2}{k^3 \ln k}$ with the series $\sum_{k=2}^{\infty} \frac{2}{k^3}$, which is a convergent p -series since $p = 3 > 1$. Since the n^{th} terms of the series satisfy $\frac{2}{n^3 \ln n} < \frac{2}{n^3}$ since $\ln n > 1$ when $n \geq 3$ (recall $\ln e = 1$) we see that by the Comparison Test, the original series also *converges.*

42. (Using the result of Problem 51 below) we compare the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{\sqrt{k}(\ln k)^4}$ with the divergent harmonic series $\sum_{k=2}^{\infty} d_k = \sum_{k=2}^{\infty} \frac{1}{k}$. Applying L'Hôpital's rule repeatedly ($\star$) and arranging the fractions after

each application, we have

$$\begin{aligned}
 \lim_{n \rightarrow \infty} \frac{a_n}{d_n} &= \lim_{n \rightarrow \infty} \left[\frac{\frac{1}{\sqrt{n}(\ln n)^4}}{\frac{1}{n}} \right] = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{(\ln n)^4} \\
 &\stackrel{*}{=} \lim_{n \rightarrow \infty} \left[\frac{\frac{1}{2\sqrt{n}}}{\frac{4(\ln n)^3}{n}} \right] = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{8(\ln n)^3} \\
 &\stackrel{*}{=} \lim_{n \rightarrow \infty} \left[\frac{\frac{1}{2\sqrt{n}}}{\frac{24(\ln n)^2}{n}} \right] = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{48(\ln n)^2} \\
 &\stackrel{*}{=} \lim_{n \rightarrow \infty} \left[\frac{\frac{1}{2\sqrt{n}}}{\frac{96 \ln n}{n}} \right] = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{192 \ln n} \\
 &\stackrel{*}{=} \lim_{n \rightarrow \infty} \left[\frac{\frac{1}{2\sqrt{n}}}{\frac{192}{n}} \right] = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{384} \\
 &= \infty.
 \end{aligned}$$

So, by the result of Problem 51, since the series $\sum_{k=2}^{\infty} d_k = \sum_{k=2}^{\infty} \frac{1}{k}$ diverges, the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{\sqrt{k}(\ln k)^4}$ also *diverges*.

43. We compare the series $\sum_{k=2}^{\infty} \frac{\ln k}{k+3}$ with the series $\sum_{k=2}^{\infty} \frac{1}{k+3}$, which is a divergent harmonic series. The n^{th} terms of the series satisfy $\frac{\ln n}{n+3} > \frac{1}{n+3}$ since $\ln n > 1$ if $n \geq 3$ (recall that $\ln e = 1$). By the Comparison test, we see that the original series also *diverges*.

44. We compare the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{(\ln k)^2}{k^{5/2}}$ with the series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k^{3/2}}$, which is a convergent p -series since $p = \frac{3}{2} > 1$. The n^{th} term satisfies

$$a_n = \frac{(\ln n)^2}{n^{5/2}} < \frac{1}{n^{3/2}} = b_n$$

if $\ln n < n^{1/2}$. To find under what conditions $\ln n < n^{1/2}$, let $f(x) = \ln x - x^{1/2}$. We wish to find when this function is decreasing. Since $f'(x) = \frac{1}{x} - \frac{1}{2}x^{-1/2} < 0$ whenever $\sqrt{x} > 2$ or $x > 4$, and $f(4) = \ln 4 - \sqrt{2} < 0$, and we have shown that $f(x)$ is decreasing for $x > 4$, and is negative at $x = 4$, this proves that $f(x) < 0$ for $x > 4$. That is, $\ln n < n^{1/2}$ for $n \geq 4$. Note that the Comparison Test does not care about the relative behavior of series for any initial finite number of terms, but only about the *large* n behavior; due to this, by the Comparison Test, we see that the original series also *converges*.

45. We compare the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \sin \frac{1}{k}$ with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$ which is a divergent harmonic series. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\sin \frac{1}{n}}{\frac{1}{n}} = \lim_{y \rightarrow 0} \frac{\sin y}{y} = 1,$$

where the substitution $y = \frac{1}{n}$ was made and the standard limit result $\lim_{y \rightarrow 0} \frac{\sin y}{y} = 1$ was used. Since the

limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ diverges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k$ also *diverges*.

46. We compare the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \tan \frac{1}{k}$ with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$ which is a divergent harmonic series. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\tan \frac{1}{n}}{\frac{1}{n}} = \lim_{y \rightarrow 0} \frac{\tan y}{y} = \lim_{y \rightarrow 0} \frac{\sec^2 y}{1} = 1,$$

where the substitution $y = \frac{1}{n}$ was made and L'Hôpital's rule was used. Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ diverges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \tan \frac{1}{k}$ also *diverges.*

47. Compare the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k!}$ with the convergent geometric series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{2^k}$. Since

$$n! = n(n-1)(n-2) \cdots 3 \cdot 2 \geq 2 \cdot 2 \cdot 2 \cdots 2 \quad (n \text{ factors of } 2),$$

we have $n! \geq 2^n$ or

$$a_n = \frac{1}{n!} \leq \frac{1}{2^n} = b_n$$

for all $n \geq 2$. So by the Comparison Test that the original series also *converges.*

48. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k!}{k^k}$. We have

$$n! = n(n-1)(n-2) \cdots 3 \cdot 2 \cdot 1 \leq n \cdot n \cdot n \cdots n \cdot 2 \cdot 1 = 2n^{n-2} = 2 \frac{n^n}{n^2}$$

so that

$$a_n = \frac{n!}{n^n} \leq \frac{2}{n^2} = b_n.$$

Comparing with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{2}{k^2}$, which is a constant multiple of a convergent p -series (since

$p = 2 > 1$), we conclude based on the Comparison Test that the original series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k!}{k^k}$ *converges.*

49. (a) The n^{th} term of $\sum_{k=1}^{\infty} \frac{1}{k^2+1}$ satisfies $\frac{1}{n^2+1} < \frac{1}{n^2}$ for all $n \geq 1$. So by the Comparison Test, since the series $\sum_{k=1}^{\infty} \frac{1}{k^2}$ converges (being a p -series for $p = 2 > 1$), the original series also *converges.*

(b) We have the n^{th} term of $\sum_{k=2}^{\infty} \frac{1}{k^2-1}$ satisfy $\frac{1}{n^2-1} > \frac{1}{n^2}$. This however provides no information about the convergence or divergence of the original series, since the n^{th} term of the original series is *greater* and not less than the n^{th} term of a convergent p -series.

(c) Let $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k^2-1}$ and $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k^2}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n^2-1}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{n^2}{n^2-1} = \lim_{n \rightarrow \infty} \frac{1}{1 - \frac{1}{n^2}} = 1.$$

Since the limit is a positive number and the series $\sum_{k=2}^{\infty} b_k$ converges, by the Limit Comparison Test, the

series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k^2-1}$ also *converges.* So, *yes*, the Limit Comparison Test can be used to decide the convergence of the series.

50. Compare the series $\sum_{k=1}^{\infty} \frac{d}{10^k}$ with the geometric series $\sum_{k=1}^{\infty} \frac{1}{10^{k-1}}$, which is convergent since $|r| = \frac{1}{10} < 1$. Since the n^{th} terms of the series satisfy $\frac{d_n}{10^n} < \frac{1}{10^{n-1}}$, since $d_n < 10$, by the Comparison Test, the original series also *converges.*

51. If $\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = \infty$ it follows that we can choose an $M > 0$ such that there exists an $n > N$, such that for $n > N$, we have $\frac{a_n}{d_n} > M$, that is, $a_n > Md_n$. By the Comparison Test, since $\sum_{k=1}^{\infty} d_k$ diverges, so does $\sum_{k=1}^{\infty} a_k$.

52. If $\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = 0$ it follows that we can choose an $\epsilon > 0$ such that there exists $n > N$, such that for $n > N$, we have $\left| \frac{a_n}{d_n} - 0 \right| < \epsilon$, or $a_n < \epsilon d_n$. By the Comparison Test, since $\sum_{k=1}^{\infty} d_k$ converges, so does $\sum_{k=1}^{\infty} a_k$.

53. Let $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{\ln k}$ and $\sum_{k=2}^{\infty} d_k = \sum_{k=2}^{\infty} \frac{1}{k}$. Then

$$\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{\ln n}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n}{\ln n} = \lim_{x \rightarrow \infty} \frac{x}{\ln x} = \lim_{x \rightarrow \infty} \frac{1}{\frac{1}{x}} = \lim_{x \rightarrow \infty} x = \infty,$$

by using L'Hôpital's rule on a related function of the ratio of the n^{th} terms. So by the result of Problem 51, since the harmonic series $\sum_{k=2}^{\infty} d_k$ diverges, the original series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{\ln k}$ also *diverges.*

54. Let $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \left(\frac{1}{\ln k}\right)^2$ and $\sum_{k=2}^{\infty} d_k = \sum_{k=2}^{\infty} \frac{1}{k}$. Then

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{a_n}{d_n} &= \lim_{n \rightarrow \infty} \frac{\left(\frac{1}{\ln n}\right)^2}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n}{(\ln n)^2} = \lim_{x \rightarrow \infty} \frac{x}{(\ln x)^2} \\ &= \lim_{x \rightarrow \infty} \frac{1}{2 \ln x \cdot \frac{1}{x}} = \lim_{x \rightarrow \infty} \frac{x}{2 \ln x} = \frac{1}{2} \lim_{x \rightarrow \infty} \frac{1}{\frac{1}{x}} = \frac{1}{2} \lim_{x \rightarrow \infty} x = \infty, \end{aligned}$$

by using L'Hôpital's rule on a related function of the ratio of the n^{th} terms. So by the result of Problem 51, since the harmonic series $\sum_{k=2}^{\infty} d_k$ diverges, the original series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \left(\frac{1}{\ln k}\right)^2$ also *diverges.*

55. Let $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k^2}$ and $\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$. Then

$$\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = \lim_{n \rightarrow \infty} \frac{\frac{\ln n}{n^2}}{\frac{1}{n^{3/2}}} = \lim_{n \rightarrow \infty} \frac{\ln n}{\sqrt{n}} = \lim_{x \rightarrow \infty} \frac{\ln x}{\sqrt{x}} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{\frac{1}{2}x^{-1/2}} = 2 \lim_{x \rightarrow \infty} \frac{1}{\sqrt{x}} = 0,$$

by using L'Hôpital's rule on a related function of the ratio of the n^{th} terms. So by the result of Problem 52, since the p -series $\sum_{k=2}^{\infty} d_k$ converges (since $p = \frac{3}{2} > 1$), the original series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{\ln k}{k^2}$ also *converges.*

56. Let $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{(k \ln k)^2}$ and $\sum_{k=2}^{\infty} d_k = \sum_{k=2}^{\infty} \frac{1}{k^2}$. Then

$$\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n^2(\ln n)^2}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{1}{(\ln n)^2} = 0.$$

So by the result of Problem 52, since the p -series $\sum_{k=2}^{\infty} d_k$ converges (since $p = 2 > 1$), the original series

$$\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{(k \ln k)^2} \text{ also } \boxed{\text{converges.}}$$

57. If $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{\ln k}$ and $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{e^k}$, then

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{\ln n}}{\frac{1}{e^n}} = \lim_{n \rightarrow \infty} \frac{e^n}{\ln n} = \lim_{x \rightarrow \infty} \frac{e^x}{\ln x} = \lim_{x \rightarrow \infty} \frac{e^x}{\frac{1}{x}} = \lim_{x \rightarrow \infty} x e^x = \infty,$$

by using L'Hôpital's rule on a related function of the ratio of the n^{th} terms. Because the limit in question is not a finite positive number, but infinity, the Limit Comparison test is inconclusive in regards to whether the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{\ln k}$ converges or diverges, even though the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{e^k}$ converges, as it is a geometric series with $|r| = \frac{1}{e} < 1$.

58. (a) Let $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k^p}$ and $\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{1}{k^q}$, where $1 < q < 2$ and $p > 1$. Then we have

$$\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = \lim_{n \rightarrow \infty} \frac{\frac{\ln n}{n^p}}{\frac{1}{n^q}} = \lim_{n \rightarrow \infty} \frac{\ln n}{n^{p-q}} = \lim_{x \rightarrow \infty} \frac{\ln x}{x^{p-q}} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{(p-q)x^{p-q-1}} = \frac{1}{p-q} \lim_{x \rightarrow \infty} \frac{1}{x^{p-q}} = 0,$$

by L'Hôpital's rule, and since from $p > 1$, and $1 < q < 2$, we have $p - q > 0$, since $p > 1$ implies $p \geq 2 > q$. So by the result of Problem 52, since the p -series $\sum_{k=1}^{\infty} d_k$ converges (for $q > 1$), the original series

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k^p} \text{ also } \boxed{\text{converges.}}$$

(b) Let $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(\ln k)^r}{k^p}$ and $\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{1}{k^q}$, where $1 < q < 2$, $p > 1$, and $r > 0$. Then we have

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{a_n}{d_n} &= \lim_{n \rightarrow \infty} \frac{\frac{(\ln n)^r}{n^p}}{\frac{1}{n^q}} = \lim_{n \rightarrow \infty} \frac{(\ln n)^r}{n^{p-q}} = \lim_{x \rightarrow \infty} \frac{(\ln x)^r}{x^{p-q}} \\ &= \lim_{x \rightarrow \infty} \frac{r(\ln x)^{r-1} \cdot \frac{1}{x}}{(p-q)x^{p-q-1}} = \frac{r}{p-q} \lim_{x \rightarrow \infty} \frac{(\ln x)^{r-1}}{x^{p-q}} = \dots \\ &= \frac{r!}{(p-q)^r} \lim_{x \rightarrow \infty} \frac{1}{x^{p-q}} = 0 \end{aligned}$$

by repeatedly applying L'Hôpital's rule, and since from $p > 1$, and $1 < q < 2$, we have $p - q > 0$, since $p > 1$ implies $p \geq 2 > q$. So by the result of Problem 52, since the p -series $\sum_{k=1}^{\infty} d_k$ converges (for $q > 1$), the

$$\text{original series } \sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(\ln k)^r}{k^p} \text{ also } \boxed{\text{converges.}}$$

59. (a) Let $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k^p}$ and $\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{1}{k^p}$, where $0 < p \leq 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = \lim_{n \rightarrow \infty} \frac{\frac{\ln n}{n^p}}{\frac{1}{n^p}} = \lim_{n \rightarrow \infty} \ln n = \infty.$$

By the results of exercise 51, since $\sum_{k=1}^{\infty} d_k$ is a divergent p -series (since $0 < p \leq 1$), it follows that

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k^p} \text{ also diverges, as was needed to be shown.}$$

(b) Let $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(\ln k)^r}{k^p}$ and $\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{1}{k^p}$, where $0 < p \leq 1$ and $r > 0$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = \lim_{n \rightarrow \infty} \frac{\frac{(\ln n)^r}{n^p}}{\frac{1}{n^p}} = \lim_{n \rightarrow \infty} (\ln n)^r = \infty,$$

since r is given to be a positive real number. By the results of exercise 51, since $\sum_{k=1}^{\infty} d_k$ is a divergent p -series (since $0 < p \leq 1$), it follows that $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(\ln k)^r}{k^p}$ also diverges, as was needed to be shown.

60. The series $\sum_{k=1}^{\infty} \frac{\ln k}{k}$ diverges since it is of the form $\sum_{k=1}^{\infty} \frac{\ln k}{k^p}$, $p = 1$, which diverges by the results of Problem 59, part (a).

61. The series $\sum_{k=1}^{\infty} \frac{\sqrt{\ln k}}{\sqrt{k}}$ diverges since it is of the form $\sum_{k=1}^{\infty} \frac{(\ln k)^r}{k^p}$, with $0 < p = \frac{1}{2} \leq 1$, and $r = \frac{1}{2} > 0$, which converges by the results of Problem 59, part (b).

62. The series $\sum_{k=2}^{\infty} \frac{\ln k}{k^3}$ converges since it is of the form $\sum_{k=2}^{\infty} \frac{\ln k}{k^p}$, where $p = 3 > 1$, which converges by the results of Problem 58, part (a).

63. The series $\sum_{k=2}^{\infty} \frac{1}{\sqrt{k^3 \ln k}}$ can be compared with the series $\sum_{k=2}^{\infty} \frac{1}{k^{3/2}}$, which is a convergent p -series, since $p = \frac{3}{2} > 1$. The n^{th} terms of the series satisfy $\frac{1}{\sqrt{n^3 \ln n}} < \frac{1}{n^{3/2}}$ if $\ln n > 1$, which is the case if $n \geq 3$ (recall that $\ln e = 1$). By the Comparison Test, the original series also converges. (Note: You cannot apply the results of Problem 58 or 59 to analyze this series as $r < 0$ here.)

64. (a) We first show that the p -series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^p}$ converges for $p > 1$ and diverges for $p = 1$ using the Integral Test. Let $f(x) = \frac{1}{x^p}$ be a related function of the n^{th} term of the series. $f(x)$ is continuous and decreasing on $[1, \infty)$, and $f(k) = a_k$ for all $k \geq 1$. To apply the Integral Test, we evaluate

$$I = \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{1}{x^p} dx = \lim_{b \rightarrow \infty} \left[\frac{x^{-p+1}}{-p+1} \right]_1^b = -\frac{1}{p+1} \lim_{b \rightarrow \infty} [b^{-p-1} - 1^{-p-1}] = -\frac{1}{p+1} [0-1] = \frac{1}{p+1}.$$

Since the limit is a finite real number, the improper integral converges, so by the Integral Test, the series converges for $p > 1$. At $p = 1$, the integral in question evaluates to

$$I = \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{1}{x} dx = \lim_{b \rightarrow \infty} [\ln x]_1^b = \lim_{b \rightarrow \infty} [\ln b - \ln 1] = \infty,$$

so by the Integral Test, since the improper integral diverges, so does the series for $p = 1$.

(b) For $0 < p < 1$, $n^p < n$ for $n \geq 1$, or

$$a_n = \frac{1}{n^p} < \frac{1}{n} = b_n$$

for $n \geq 1$. Since we have shown in part (a) that the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$ diverges, by the Comparison Test,

so does the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^p}$ for $0 < p < 1$.

If $p = 0$, the series becomes $\sum_{k=1}^{\infty} 1$. Since $\lim_{n \rightarrow \infty} a_n = 1 \neq 0$, the series diverges by the Divergence Test.

Finally, let $p < 0$. Then $p = -q$, with $q > 0$. Since

$$a_n = \frac{1}{n^p} = n^q \geq 1$$

for $n \geq 1$, and the series $\sum_{k=1}^{\infty} 1$ diverges (see above), by the Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^p}$ is divergent for $p < 0$.

65. If the series $\sum_{k=1}^{\infty} a_k$ converges, then by the Comparison Test the series $\sum_{k=1}^{\infty} \frac{a_k}{k}$ also converges since the n^{th} terms satisfy $\frac{a_n}{n} < a_n$ for $n > 1$, provided that a_n are all positive (and they are given to be positive).

66. The series $\sum_{k=1}^{\infty} \frac{1}{1+2^k}$ is convergent as can be seen by comparing it with the (convergent) geometric series $\sum_{k=1}^{\infty} \frac{1}{2^k}$. The n^{th} terms satisfy $\frac{1}{1+2^n} < \frac{1}{2^n}$ for all $n \geq 1$, so by the Comparison Test, the original series also converges.

67. We are given that the harmonic series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$ diverges. Choose $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ which is a convergent p -series (since $p = 2 > 1$). Then

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n^2}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{1}{n} = 0.$$

On the other hand, choose $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k \ln(k+1)}$. Since $\frac{1}{n \ln(n+1)} > \frac{1}{(n+1) \ln(n+1)}$, it suffices to show that

$\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{1}{(k+1) \ln(k+1)}$ is divergent, for then the divergence of $\sum_{k=1}^{\infty} a_k$ would follow from the Comparison Test. That $\sum_{k=1}^{\infty} c_k$ is a divergent series is seen by using Integral Test. In fact, this was done in Problem 27,

of Section 8.3, where it is shown that $\sum_{k=2}^{\infty} \frac{1}{k \ln k} = \sum_{k=1}^{\infty} \frac{1}{(k+1) \ln(k+1)}$ is divergent. Now we have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n \ln(n+1)}}{\frac{1}{n}} = \frac{1}{\ln(n+1)} = 0.$$

This shows that the Limit Comparison test gives no guidance as to the convergence or divergence of a given $\sum_{k=1}^{\infty} a_k$ series if $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = 0$.

Challenge Problems

68. The n^{th} term of the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{\ln(2k+1)}{\sqrt{k^2-2}\sqrt{k^3-2k-3}}$ behaves like

$$a_n = \frac{\ln(2n+1)}{\sqrt{n^2-2}\sqrt{n^3-2n-3}} = \frac{\ln(2n+1)}{n \cdot n^{3/2} \sqrt{1-\frac{2}{n^2}} \sqrt{1-\frac{2}{n^2}-\frac{3}{n^3}}} \approx \frac{\ln(2n+1)}{n^{5/2}}$$

for large n . We compare with the series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{\ln(2k+1)}{k^{5/2}}$. To see that this series converges, examine the n^{th} term

$$b_n = \frac{\ln(2n+1)}{n^{5/2}} \leq \frac{\ln(2n+n)}{n^{5/2}} = \frac{\ln(3n)}{n^{5/2}} = \frac{\ln 3 + \ln n}{n^{5/2}} = \frac{\ln 3}{n^{5/2}} + \frac{\ln n}{n^{5/2}} = c_n + d_n$$

for $n \geq 2$. The series $\sum_{k=2}^{\infty} c_k = \sum_{k=2}^{\infty} \frac{\ln 3}{k^{5/2}}$ is a constant multiple of a convergent p -series (since $p = \frac{5}{2} > 1$), while the series $\sum_{k=2}^{\infty} d_k = \sum_{k=2}^{\infty} \frac{\ln k}{k^{5/2}}$ converges by the result of Problem 58. (In the terminology of that problem, $p = \frac{5}{2} > 1$.) So we have shown that the series $\sum_{k=2}^{\infty} b_k$ converges. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{\ln(2n+1)}{\sqrt{n^2-2\sqrt{n^3-2n-3}}}}{\frac{\ln(2n+1)}{n^{5/2}}} = \lim_{n \rightarrow \infty} \frac{n^{5/2}}{\sqrt{n^2-2\sqrt{n^3-2n-3}}} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{1-\frac{2}{n^2}}\sqrt{1-\frac{2}{n^2}-\frac{3}{n^3}}} = 1.$$

Since the limit is a positive number and the series $\sum_{k=2}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{\ln(2k+1)}{\sqrt{k^2-2\sqrt{k^3-2k-3}}}$ also *converges.*

69. The n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sqrt{k}}{\sqrt{(k^3-k+1)\ln(2k+1)}}$ behaves like

$$a_n = \frac{\sqrt{n}}{\sqrt{(n^3-n+1)\ln(2n+1)}} = \frac{\sqrt{n}}{n^{3/2}\sqrt{1-\frac{1}{n^2}+\frac{1}{n^3}}} \cdot \frac{1}{\sqrt{\ln(2n+1)}} \approx \frac{1}{n} \cdot \frac{1}{\sqrt{\ln(2n+1)}}$$

for large n . We compare with $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k\sqrt{\ln(2k+1)}}$. This series diverges, and this is seen as follows: Let

$\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{1}{k\ln(2k+1)}$. This series diverges by comparing with the series $\sum_{k=2}^{\infty} c_k = \sum_{k=2}^{\infty} \frac{1}{k\ln k}$ (which itself diverges by the Integral Test since $\lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x \ln x} = \lim_{b \rightarrow \infty} \ln(\ln b) - \ln(\ln 2) = \infty$) and applying the Limit Comparison Test: $\lim_{n \rightarrow \infty} \frac{d_n}{c_n} = \lim_{n \rightarrow \infty} \frac{\frac{n \ln n}{n \ln(2n+1)}}{\frac{1}{n \ln(2n+1)}} = \lim_{x \rightarrow \infty} \frac{\ln x}{\ln(2x+1)} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{\frac{2}{2x+1}} = \lim_{x \rightarrow \infty} \left(2 + \frac{1}{x}\right) = 2$. Compare now the n^{th} terms of the series $\sum_{k=1}^{\infty} b_k$ and $\sum_{k=1}^{\infty} d_k$:

$$\lim_{n \rightarrow \infty} \frac{b_n}{d_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n} \frac{1}{\sqrt{\ln(2n+1)}}}{\frac{1}{n \ln(2n+1)}} = \lim_{n \rightarrow \infty} \sqrt{\ln(2n+1)} = \infty.$$

So, by the result of Problem 51, the series $\sum_{k=1}^{\infty} b_k$ indeed diverges. Now, finally, we compare the series

$\sum_{k=1}^{\infty} a_k$ with the series $\sum_{k=1}^{\infty} b_k$:

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n\sqrt{1-\frac{1}{n^2}+\frac{1}{n^3}}} \cdot \frac{1}{\sqrt{\ln(2n+1)}}}{\frac{1}{n} \cdot \frac{1}{\sqrt{\ln(2n+1)}}} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{1-\frac{1}{n^2}+\frac{1}{n^3}}} = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ diverges, by the Limit Comparison Test, the series

$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sqrt{k}}{\sqrt{(k^3-k+1)\ln(2k+1)}}$ also *diverges.*

70. The n^{th} term of the series $\sum_{k=1}^{\infty} \frac{1+\sin k}{4^k}$ satisfies $0 < \frac{1+\sin n}{4^n} \leq \frac{2}{4^n} < \frac{3}{4^n}$, since $\sin n > 0$ for $n \geq 1$. So,

comparing with the convergent geometric series $\sum_{k=1}^{\infty} \frac{3}{4} \left(\frac{1}{4}\right)^{k-1}$ we see by the Comparison Test that the given series also *converges.*

71. We compare the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^{1+1/k}}$ with the divergent harmonic series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n^{1+1/n}}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n}{n^{1+1/n}} = \lim_{n \rightarrow \infty} \frac{n}{n \cdot n^{1/n}} = \lim_{n \rightarrow \infty} \frac{1}{n^{1/n}} = \frac{1}{\lim_{n \rightarrow \infty} n^{1/n}}.$$

To evaluate $\lim_{n \rightarrow \infty} n^{1/n}$, let $y = n^{1/n}$. Then $\ln y = \frac{1}{n} \ln n = \frac{\ln n}{n}$. We have

$$\lim_{n \rightarrow \infty} y = \lim_{n \rightarrow \infty} e^{\ln y} = \lim_{n \rightarrow \infty} e^{\frac{\ln n}{n}} = e^{\lim_{n \rightarrow \infty} \frac{\ln n}{n}} = e^{\lim_{x \rightarrow \infty} \frac{\ln x}{x}} = e^{\lim_{x \rightarrow \infty} \frac{1/x}{1}} = e^{\lim_{x \rightarrow \infty} \frac{1}{x}} = e^0 = 1,$$

using L'Hôpital's rule on a related function of $\frac{\ln n}{n}$. Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ diverges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^{1+1/k}}$ also diverges.

72. (a) For large n , the n^{th} term of the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^2-3k-2}{k^2(k+1)^2}$ behaves like

$$a_n = \frac{n^2 - 3n - 2}{n^2(n+1)^2} = \frac{n^2(1 - \frac{3}{n} - \frac{2}{n^2})}{n^2 \cdot n^2(1 + \frac{1}{n})^2} \approx \frac{1}{n^2}.$$

So we compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is a convergent p -series (since $p = 2 > 1$). We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{(1 - \frac{3}{n} - \frac{2}{n^2})}{n^2(1 + \frac{1}{n})^2}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{(1 - \frac{3}{n} - \frac{2}{n^2})}{(1 + \frac{1}{n})^2} = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ converges, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^2-3k-2}{k^2(k+1)^2}$ also converges.

(b) We use a partial fraction decomposition on the k^{th} term of the series $\sum_{k=1}^{\infty} a_k$ as follows:

$$\frac{k^2 - 3k - 2}{k^2(k+1)^2} = \frac{A}{k^2} + \frac{B}{(k+1)^2} + \frac{C}{k} + \frac{D}{(k+1)}.$$

Comparing coefficients after taking the common denominator on the right hand side, we obtain $A = -2$; $B = 2$; $C = 1$; $D = -1$. So,

$$\begin{aligned} \sum_{k=1}^{\infty} \frac{k^2 - 3k - 2}{k^2(k+1)^2} &= \sum_{k=1}^{\infty} -\frac{2}{k^2} + \sum_{k=1}^{\infty} \frac{2}{(k+1)^2} + \sum_{k=1}^{\infty} \left(\frac{1}{k} - \frac{1}{(k+1)} \right) \\ &= -2 \cdot \frac{\pi^2}{6} + 2 \left(\frac{\pi^2}{6} - 1 \right) + \lim_{n \rightarrow \infty} \left[\left(\frac{1}{1} - \frac{1}{2} \right) + \left(\frac{1}{2} - \frac{1}{3} \right) + \cdots + \left(\frac{1}{n-1} - \frac{1}{n} \right) \right] \\ &= -2 + \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n} \right) = -2 + 1 = -1, \end{aligned}$$

where we have used the result $\sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6}$ (see p.572), and the fact that

$$\sum_{k=1}^{\infty} \frac{1}{(k+1)^2} = \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \cdots = \sum_{k=1}^{\infty} \frac{1}{k^2} - 1. \text{ So the required sum of the series is } \boxed{-1}.$$

8.5 Alternating Series; Absolute Convergence

Concepts and Vocabulary

- 1. False:** For odd k , $(-1)^k = -1$ and $\cos k\pi = -1$. So $(-1)^k \cos(k\pi) = (-1)(-1) = +1$. For even k , $(-1)^k = +1$ and $\cos k\pi = +1$. So $(-1)^k \cos(k\pi) = (+1)(+1) = +1$. This means that the terms of the series are all positive for every k and so the series is not an alternating series.
- 2. False:** For odd k , $(-1)^k = -1$, so $[1 + (-1)^k] = 1 - 1 = 0$. For even k , $(-1)^k = +1$, so $[1 + (-1)^k] = 1 + 1 = 2$. So the terms of the series are alternately either 0 or positive, but that does not make it an alternating series, which by definition alternates *positive and negative* terms.
- 3. False:** It is not sufficient that $\lim_{n \rightarrow \infty} a_n = 0$ for the alternating series $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$ to be convergent. We also need to require that the a_k are nonincreasing, that is $a_k \geq a_{k+1}$ for all k .
- 4. False:** The correct conclusion under the stated conditions is that the error in using the sum of n terms S_n in order to approximate the sum S of the series is given by $|E_n| \leq a_{n+1}$ and not $|E_n| \leq a_n$.
- 5. False:** It is possible for an alternating series to be convergent even if it is not absolutely convergent. For example, the alternating harmonic series is convergent but not absolutely convergent (as it would then become a divergent harmonic series).
- 6. True:** This follows from the statement of the theorem on p. 586.

Skill Building

- 7.** The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k^2}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n^2} = 0$. By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{(n+1)^2}}{\frac{1}{n^2}} = \frac{n^2}{(n+1)^2} < 1, \text{ for } n \geq 1.$$

So the a_n are nonincreasing. By the Alternating Series Test, the series *converges*.

- 8.** The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{2\sqrt{k}}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{2\sqrt{n}} = 0$. By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{2\sqrt{n+1}}}{\frac{1}{2\sqrt{n}}} = \frac{\sqrt{n}}{\sqrt{n+1}} < 1, \text{ for } n \geq 1.$$

So the a_n are nonincreasing. By the Alternating Series Test, the series *converges*.

- 9.** The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k}{2k+1}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n}{2n+1} = \frac{1}{2} \neq 0$. Since the limit is nonzero, by the Divergence Test, the series will *diverge*.

- 10.** The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+1}{k}$. We have $\lim_{n \rightarrow \infty} \frac{n+1}{n} = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right) = 1 \neq 0$. Since the limit is nonzero, by the Divergence Test, the series *diverges*.

- 11.** The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k^2}{5k^2+2}$. We have $\lim_{n \rightarrow \infty} \frac{n^2}{5n^2+2} = \lim_{n \rightarrow \infty} \frac{1}{5+\frac{2}{n^2}} = \frac{1}{5} \neq 0$. Since the limit is nonzero, by the Divergence Test, the series will *diverge*.

12. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+1}{k^2}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n+1}{n^2} = \lim_{n \rightarrow \infty} \left(\frac{1}{n} + \frac{1}{n^2} \right) = 0 + 0 = 0.$$

By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{n+2}{(n+1)^2}}{\frac{n+1}{n^2}} = \lim_{n \rightarrow \infty} \frac{(n+2)n^2}{(n+1)^3} = \frac{n^3 + 2n^2}{n^3 + 3n^2 + 3n + 1} < 1 \text{ for } n \geq 1.$$

So the a_n are nonincreasing. By the Alternating Series Test, the series *converges.*

13. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{(k+1)2^k}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{(n+1)2^n} = 0$. By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{(n+2)2^{n+1}}}{\frac{1}{(n+1)2^n}} = \frac{1}{2} \frac{n+1}{n+2} < 1, \text{ for } n \geq 1.$$

So the a_n are nonincreasing. By the Alternating Series Test, the series *converges.*

14. The series is $\sum_{k=2}^{\infty} (-1)^{k+1} a_k = \sum_{k=2}^{\infty} (-1)^{k+1} \frac{1}{k \ln k}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n \ln n} = 0$. By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{(n+1) \ln(n+1)}}{\frac{1}{n \ln n}} = \frac{n}{n+1} \cdot \frac{\ln n}{\ln(n+1)} < 1, \text{ for } n \geq 2,$$

since both n and $\ln n$ are monotonically increasing functions of n for $n \geq 2$. So the terms of the series are nonincreasing. By the Alternating Series Test, the series *converges.*

15. The series is $\sum_{k=2}^{\infty} (-1)^{k+1} a_k = \sum_{k=2}^{\infty} (-1)^{k+1} \frac{1}{1+2^{-k}}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{1+2^{-n}} = \frac{1}{1+0} = 1 \neq 0$. Since the limit is nonzero, by the Divergence Test, the series *diverges.*

16. The series is $\sum_{k=0}^{\infty} (-1)^k a_k = \sum_{k=0}^{\infty} (-1)^k \frac{1}{k!}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n!} = 0$. By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{(n+1)!}}{\frac{1}{n!}} = \frac{n!}{(n+1)!} = \frac{n!}{(n+1)n!} = \frac{1}{n+1} \leq 1, \text{ for } n \geq 0.$$

So the a_n are nonincreasing. By the Alternating Series Test, the series *converges.*

17. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \left(\frac{k}{k+1} \right)^k$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right)^n = \lim_{n \rightarrow \infty} \left(\frac{1}{1 + \frac{1}{n}} \right)^n = \frac{1}{\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n} = \frac{1}{e} \neq 0,$$

using the standard limit definition of e . Since the limit is nonzero, by the Divergence Test, the series *diverges.*

18. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k^2}{(k+1)^3}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^2}{(n+1)^3} = \lim_{n \rightarrow \infty} \frac{n^2}{n^3 \left(1 + \frac{1}{n} \right)^3} = \lim_{n \rightarrow \infty} \frac{1}{n \left(1 + \frac{1}{n} \right)^3} = 0.$$

Let $f(x) = \frac{x^2}{(x+1)^3}$ be a related function of the n^{th} term of the series. Examine the derivative:

$$f'(x) = \frac{(x+1)^3 \cdot 2x - x^2 \cdot 3(x+1)^2}{(x+1)^6} = \frac{(x+1)^2 x}{(x+1)^6} [2(x+1) - 3x] = \frac{(x+1)^2 x(2-x)}{(x+1)^6}.$$

So for $x > 2$, $f'(x) < 0$, which means that for $n \geq 2$, the a_n are nonincreasing. By the Alternating Series Test, the series converges.

19. We have $S_3 = \sum_{k=1}^3 (-1)^{k+1} \frac{1}{k^2} = (-1)^2 \frac{1}{1^2} + (-1)^3 \frac{1}{2^2} + (-1)^4 \frac{1}{3^2} = 1 - \frac{1}{4} + \frac{1}{9} \approx \text{0.8611.}$ The upper estimate to the error is $|E_3| \leq a_4 = \frac{1}{4^2} = \frac{1}{16} = \text{0.0625.}$

20. We have $S_2 = \sum_{k=0}^2 (-1)^k \frac{1}{k!} = (-1)^0 \frac{1}{0!} + (-1)^1 \frac{1}{1!} + (-1)^2 \frac{1}{2!} = 1 - 1 + \frac{1}{2} = \text{0.5000.}$ The upper estimate to the error is $|E_2| \leq a_3 = \frac{1}{3!} = \frac{1}{6} \approx \text{0.1667.}$

21. We have $S_3 = \sum_{k=1}^3 (-1)^{k+1} \frac{1}{k^4} = (-1)^2 \frac{1}{1^4} + (-1)^3 \frac{1}{2^4} + (-1)^4 \frac{1}{3^4} = 1 - \frac{1}{16} + \frac{1}{81} \approx \text{0.9498.}$ The upper estimate to the error is $|E_3| \leq a_4 = \frac{1}{4^4} = \frac{1}{256} \approx \text{0.0039.}$

22. We have $S_3 = \sum_{k=1}^3 (-1)^{k+1} \left(\frac{1}{\sqrt{k}}\right)^k = (-1)^2 \left(\frac{1}{\sqrt{1}}\right)^1 + (-1)^3 \left(\frac{1}{\sqrt{2}}\right)^2 + (-1)^4 \left(\frac{1}{\sqrt{3}}\right)^3 = 1 - \frac{1}{2} + \frac{1}{3\sqrt{3}} \approx \text{0.6925.}$ The upper estimate to the error is $|E_3| \leq a_4 = \left(\frac{1}{\sqrt{4}}\right)^4 = \text{0.0625.}$

23. We have $S_2 = \sum_{k=0}^2 (-1)^k \frac{1}{k!} \left(\frac{1}{3}\right)^k = (-1)^0 \frac{1}{0!} \left(\frac{1}{3}\right)^0 + (-1)^1 \frac{1}{1!} \left(\frac{1}{3}\right)^1 + (-1)^2 \frac{1}{2!} \left(\frac{1}{3}\right)^2 = 1 - \frac{1}{3} + \frac{1}{18} \approx \text{0.7222.}$ The upper estimate to the error is $|E_2| \leq a_3 = \frac{1}{3!} \left(\frac{1}{3}\right)^3 = \frac{1}{6} \cdot \frac{1}{27} \approx \text{0.00617.}$

24. We have $S_2 = \sum_{k=0}^2 (-1)^k \frac{1}{k!} \left(\frac{1}{2}\right)^k = (-1)^0 \frac{1}{0!} \left(\frac{1}{2}\right)^0 + (-1)^1 \frac{1}{1!} \left(\frac{1}{2}\right)^1 + (-1)^2 \frac{1}{2!} \left(\frac{1}{2}\right)^2 = 1 - \frac{1}{2} + \frac{1}{8} = \text{0.6250.}$ The upper estimate to the error is $|E_2| \leq a_3 = \frac{1}{3!} \left(\frac{1}{2}\right)^3 = \frac{1}{6} \cdot \frac{1}{8} \approx \text{0.0208.}$

25. We have

$$\begin{aligned} S_2 &= \sum_{k=0}^2 (-1)^k \frac{1}{2k+1} \left(\frac{1}{3}\right)^{2k+1} = (-1)^0 \frac{1}{2 \cdot 0 + 1} \left(\frac{1}{3}\right)^{2 \cdot 0 + 1} + (-1)^1 \frac{1}{2 \cdot 1 + 1} \left(\frac{1}{3}\right)^{2 \cdot 1 + 1} + (-1)^2 \frac{1}{2 \cdot 2 + 1} \left(\frac{1}{3}\right)^{2 \cdot 2 + 1} \\ &= \frac{1}{3} - \frac{1}{3} \left(\frac{1}{3}\right)^3 + \frac{1}{5} \left(\frac{1}{3}\right)^5 = \frac{1}{3} - \frac{1}{81} + \frac{1}{1215} \approx \text{0.3218.} \end{aligned}$$

The upper estimate to the error is $|E_2| \leq a_3 = \frac{1}{2 \cdot 3 + 1} \left(\frac{1}{3}\right)^{2 \cdot 3 + 1} = \frac{1}{7} \left(\frac{1}{3}\right)^7 = \frac{1}{15309} \approx \text{6.53} \times 10^{-5}.$

26. We have $S_3 = \sum_{k=1}^3 (-1)^{k+1} \frac{1}{k^k} = (-1)^2 \frac{1}{1^1} + (-1)^3 \frac{1}{2^2} + (-1)^4 \frac{1}{3^3} = 1 - \frac{1}{4} + \frac{1}{27} \approx \text{0.7870.}$ The upper estimate to the error is $|E_3| \leq a_4 = \frac{1}{4^4} \approx \text{0.0039.}$

27. Since $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{2^k}$ is a constant multiple of an alternating harmonic series which converges, the given series also converges. Further $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{2^k}$, the series of absolute values, is a

constant multiple of the harmonic series which diverges, so it diverges too. Since the original series converges, but does not converge absolutely, it is *conditionally convergent*.

28. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{3k-4}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{3n-4} = 0$. Further, by the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{3(n+1)-4}}{\frac{1}{3n-4}} = \frac{3n-4}{3n-1} < 1 \text{ for } n \geq 1.$$

So the a_n are nonincreasing. By the Alternating Series Test, the original series converges. Consider now the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{3k-4}$. We compare the n^{th} term of this series with that of the harmonic series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{3n-4}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n}{3n-4} = \lim_{n \rightarrow \infty} \frac{1}{3 - \frac{4}{n}} = \frac{1}{3}.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ diverges, the series $\sum_{k=1}^{\infty} a_k$ also diverges by the Limit Comparison Test. This means that the original series is convergent but not absolutely convergent. So in other words it is *conditionally convergent*.

29. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{\sin k}{k^2+1}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sin k}{k^2+1}$. We have $\left| \frac{\sin n}{n^2+1} \right| \leq \frac{1}{n^2+1} < \frac{1}{n^2}$. So, by the Comparison Test, comparing with the p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ which (since $p = 2 > 1$) is convergent, we see that the series of absolute values $\sum_{k=1}^{\infty} a_k$ is convergent. This means that the original series is *absolutely convergent*.

30. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{\cos k}{k^2}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\cos k}{k^2}$. We have $\left| \frac{\cos n}{n^2} \right| \leq \frac{1}{n^2}$. So, by the Comparison Test, comparing with the p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ which (since $p = 2 > 1$) is convergent, we see that the series of absolute values $\sum_{k=1}^{\infty} a_k$ is convergent. This means that the original series is *absolutely convergent*.

31. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \left(\frac{1}{5}\right)^k$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{1}{5}\right)^k$. It converges since it is a geometric series with $|r| = \frac{1}{5} < 1$. This means that the original series is *absolutely convergent*.

32. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{5^k}{k!}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{5^k}{k!}$.

Consider the following estimate, for $n \geq 6$:

$$\begin{aligned} n! &= n \cdot (n-1) \cdot (n-2) \cdots 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 \\ &\geq 6 \cdot 6 \cdot 6 \cdots 6 \cdot 5 \cdot 4 \cdot 2 \cdot 2 \cdot 1 \\ &= 6^{n-5} \cdot 5! \\ &= 6^n \cdot \left(\frac{5!}{6^5}\right) \\ &= \frac{5}{324} \cdot 6^n. \end{aligned}$$

That is,

$$\frac{n!}{6^n} \geq \frac{5}{324} \quad \text{if } n \geq 6.$$

The n^{th} term of the series of absolute values satisfies

$$a_n = \frac{5^n}{n!} = \frac{6^n}{n!} \cdot \frac{5^n}{6^n} \leq \left(\frac{324}{5}\right) \left(\frac{5}{6}\right)^n = \left(\frac{324}{5}\right) b_n$$

for $n \geq 6$. Since the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \left(\frac{5}{6}\right)^k$ is a convergent geometric series with $|r| = \frac{5}{6} < 1$, and a constant multiple of this series is also convergent, and also since the omission of the first 5 terms (since $n \geq 6$) will not affect a series' convergence or divergence properties, this means that the series of absolute values converges by the Comparison Test, so the original series is *absolutely convergent*.

33. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{e^k}{k}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{e^n}{n} = \lim_{x \rightarrow \infty} \frac{e^x}{x} = \lim_{x \rightarrow \infty} \frac{e^x}{1} = \infty \neq 0,$$

using L'Hôpital's rule on a related function of a_n . Since the limit is nonzero, by the Divergence Test, the series *diverges*.

34. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1} 2^k}{k^2}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{2^n}{n^2} = \lim_{x \rightarrow \infty} \frac{2^x}{x^2} = \lim_{x \rightarrow \infty} \frac{2^x \ln 2}{2x} = \lim_{x \rightarrow \infty} \frac{2^x (\ln 2)^2}{2} = \infty \neq 0,$$

using L'Hôpital's rule on a related function of a_n . Since the limit is nonzero, by the Divergence Test, the series *diverges*.

35. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k(k+1)}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k(k+1)}$.

The n^{th} term of this series satisfies $a_n = \frac{1}{n(n+1)} < \frac{1}{n^2}$ for all $n \geq 1$. Now the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ converges being a convergent p -series (since $p = 2 > 1$), so by the Comparison Test, the series of absolute values converges. This means that the original series is *absolutely convergent*.

36. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k\sqrt{k+3}}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k\sqrt{k+3}}$.

The n^{th} term of this series satisfies $a_n = \frac{1}{n\sqrt{n+3}} < \frac{1}{n\sqrt{n}} = \frac{1}{n^{3/2}}$ for all $n \geq 1$. Now the series

$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$ converges being a convergent p -series (since $p = \frac{3}{2} > 1$), so by the Comparison Test, the series of absolute values converges. This means that the original series is *absolutely convergent*.

37. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1} \sqrt{k}}{k^2+1}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sqrt{k}}{k^2+1}$. The n^{th} term of this series behaves like $a_n = \frac{\sqrt{n}}{n^2+1} = \frac{n^{1/2}}{n^2(1+\frac{1}{n^2})} \approx \frac{1}{n^{3/2}}$ for large n . We compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{\sqrt{n}}{n^2+1}}{\frac{1}{n^{3/2}}} = \lim_{n \rightarrow \infty} \frac{n^2}{n^2+1} = \lim_{n \rightarrow \infty} \frac{1}{1+\frac{1}{n^2}} = 1.$$

Since the limit is a positive number, and the series $\sum_{k=1}^{\infty} b_k$ is convergent (it is a convergent p -series with $p = \frac{3}{2} > 1$), by the Limit Comparison Test, the series of absolute values $\sum_{k=1}^{\infty} a_k$ is also convergent. This means that the original series is *absolutely convergent.*

38. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1} \sqrt{k}}{k+1}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sqrt{k}}{k+1}$. The n^{th} term of this series behaves like $a_n = \frac{\sqrt{n}}{n+1} = \frac{n^{1/2}}{n(1+\frac{1}{n})} \approx \frac{1}{n^{1/2}}$ for large n . We compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{1/2}}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{\sqrt{n}}{n+1}}{\frac{1}{\sqrt{n}}} = \lim_{n \rightarrow \infty} \frac{n}{n+1} = \lim_{n \rightarrow \infty} \frac{1}{1+\frac{1}{n}} = 1.$$

Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ is a divergent p -series (since $0 < p = \frac{1}{2} < 1$), by the Limit Comparison Test, the series of absolute values is divergent as well. Next we need to examine the original series for convergence. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{n+1} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n} + \frac{1}{\sqrt{n}}} = 0$. Consider a related function of a_n , $f(x) = \frac{\sqrt{x}}{x+1}$. We examine the derivative:

$$f'(x) = \frac{(x+1) \cdot \frac{1}{2\sqrt{x}} - \sqrt{x} \cdot 1}{(x+1)^2} = \frac{x+1-2x}{2\sqrt{x}(x+1)^2} = \frac{1-x}{2\sqrt{x}(x+1)^2} \leq 0, \text{ for } x \geq 1.$$

The function is a nonincreasing one for $x \geq 1$, which means that the terms of the original series are nonincreasing for $n \geq 1$. By the Alternating Series Test, we see that the original series must be convergent. However, since the series of absolute values is divergent, this means that the original series must be *conditionally convergent.*

39. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{\ln k}{k}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k}$. This series diverges by the Integral Test. Using $f(x) = \frac{\ln x}{x}$ which is a continuous, positive and decreasing function (since $f'(x) = \frac{x \cdot \frac{1}{x} - \ln x \cdot 1}{x^2} = \frac{1-\ln x}{x^2} \leq 0$) on $[e, \infty)$, and for which $a_k = f(k)$ for all values of $k \geq 3$, we have

$$I = \int_3^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_3^b \frac{\ln x dx}{x} = \lim_{b \rightarrow \infty} \frac{1}{2} [\ln x^2] \Big|_3^b = \lim_{b \rightarrow \infty} \frac{1}{2} (\ln b^2 - \ln 3^2) = \infty.$$

So the improper integral I diverges, showing that the series of absolute values also diverges. Since the series of absolute values diverges, we must continue to see if the original series is convergent. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{\ln n}{n} = \lim_{x \rightarrow \infty} \frac{\ln x}{x} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{1} = 0,$$

using L'Hôpital's rule on a related function of a_n . Next we examine the derivative of the related function:

$$f'(x) = \frac{x \cdot \frac{1}{x} - \ln x \cdot 1}{x^2} = \frac{1 - \ln x}{x^2} < 0, \text{ for } x \geq 3,$$

recalling that $\ln e = 1$. This means that for $n \geq 3$, the a_n are nonincreasing. So by the Alternating Series Test, the original series converges. However, since the series of absolute values is divergent, this means that the original series is *conditionally convergent*.

40. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1} \ln k}{k^3}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k^3}$.

The series $\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$ is a convergent p -series since $p = \frac{3}{2} > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{d_n} = \lim_{n \rightarrow \infty} \frac{\frac{\ln n}{n^3}}{\frac{1}{n^{3/2}}} = \lim_{n \rightarrow \infty} \frac{\ln n}{n^{3/2}} = \lim_{x \rightarrow \infty} \frac{\ln x}{x^{3/2}} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{\frac{3}{2}x^{1/2}} = \lim_{x \rightarrow \infty} \frac{2}{3x^{3/2}} = 0,$$

using L'Hôpital's rule on a related function of the ratio of n^{th} terms of the two series. By the result of Problem 52, in end of chapter exercises of Section 4, we conclude that the series of absolute values is convergent. But this means that the original series is *absolutely convergent*.

41. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{ke^k}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{ke^k}$.

We compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ which is a convergent p -series (since $p = 2 > 1$). We have

$a_n = \frac{1}{ne^n} < \frac{1}{n^2}$ if $e^n > n$. (To see that this is true for all n , let $f(x) = e^x - x$. Then $f'(x) = e^x - 1 > 0$ for $x > 0$. This means the function $f(x)$ is an increasing one for $x > 0$, and in turn this shows $e^x > x$ for $x > 0$.) We see that the series of absolute values is convergent by the Comparison Test, so the original series must be *absolutely convergent*.

42. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{e^k}$. Consider the series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{e^k}$. This is a geometric series that converges because $|r| = \frac{1}{e} < 1$, since $e > 1$. Since the series of absolute values converges, the original series must be *absolutely convergent*.

Applications and Extensions

43. The series is $\sum_{k=2}^{\infty} (-1)^k a_k = \sum_{k=2}^{\infty} \frac{(-1)^k}{k \ln k}$. The series of absolute values is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k \ln k}$. Consider the function $f(x) = \frac{1}{x \ln x}$, which is defined, positive, and decreasing on $[2, \infty)$, and such that $a_k = f(k)$ for all $k \geq 2$. We have $I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x \ln x}$. Let $u = \ln x$, then $du = \frac{dx}{x}$. Continuing,

$$I = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{u} = \lim_{b \rightarrow \infty} [\ln u]_{\ln 2}^{\ln b} = \lim_{b \rightarrow \infty} [\ln(\ln b) - \ln(\ln 2)] = \infty.$$

Since the improper integral I diverges, by the Integral Test, the series of absolute values also diverges. Next, we examine the original series for convergence. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n \ln n} = 0$. Also, consider the derivative of the related function of a_n :

$$f'(x) = -\frac{1}{x^2 \ln x} - \frac{1}{x^2 (\ln x)^2} < 0 \text{ for } x \geq 2.$$

So the a_n are nonincreasing. By the Alternating Series Test, the original series converges. But since it is not absolutely convergent, it is *conditionally convergent*.

44. The series is $\sum_{k=2}^{\infty} (-1)^k a_k = \sum_{k=2}^{\infty} \frac{(-1)^k}{k(\ln k)^2}$. The series of absolute values is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k(\ln k)^2}$. Consider the function $f(x) = \frac{1}{x(\ln x)^2}$, which is defined, positive, and decreasing on $[2, \infty)$, and such that $a_k = f(k)$ for all $k \geq 2$. We have $I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x(\ln x)^2}$. Let $u = \ln x$, then $du = \frac{dx}{x}$. Continuing,

$$I = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{u^2} = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} u^{-2} du = \lim_{b \rightarrow \infty} \left[\frac{u^{-2+1}}{-2+1} \right]_{\ln 2}^{\ln b} = - \lim_{b \rightarrow \infty} \left(\frac{1}{\ln b} - \frac{1}{\ln 2} \right) = 0.$$

Since the improper integral I converges, by the Integral Test, the series of absolute values also converges. But this means that the original series is *absolutely convergent*.

45. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sin k}{k^2}$. The series of absolute values is $\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{|\sin k|}{k^2}$. We have $\frac{|\sin n|}{n^2} \leq \frac{1}{n^2}$, for all $n \geq 1$, since $|\sin n| \leq 1$ for all $n \geq 1$. Since the p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ is convergent (since $p = 2 > 1$), by the Comparison Test, we see that the series of absolute values is convergent. This means that the original series $\sum_{k=1}^{\infty} a_k$ is *absolutely convergent*.

46. The series is $\sum_{k=1}^{\infty} \frac{(-1)^{k+1} \tan^{-1} k}{k}$. The series of absolute values is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\tan^{-1} k}{k}$. Its terms are all nonzero since $\tan^{-1} n > 0$ for $n \geq 1$. Comparing this series with $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$ we have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{\tan^{-1} n}{n}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \tan^{-1} n = \frac{\pi}{2}.$$

Since the limit is a positive real number and the series $\sum_{k=1}^{\infty} b_k$ diverges because it is a harmonic series, we conclude that the series of absolute values $\sum_{k=1}^{\infty} a_k$ also diverges by the Limit Comparison Test. Next, we check to see if the original series converges or not. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{\tan^{-1} n}{n} = \lim_{x \rightarrow \infty} \frac{\tan^{-1} x}{x} = \lim_{x \rightarrow \infty} \frac{\frac{1}{1+x^2}}{1} = 0,$$

by using L'Hôpital's rule on a related function of a_n , $f(x) = \frac{\tan^{-1} x}{x}$. We have, examining its derivative:

$$f'(x) = \frac{x \cdot \frac{1}{1+x^2} - \tan^{-1} x \cdot 1}{x^2} = \frac{x - (1+x^2) \tan^{-1} x}{x^2(1+x^2)} \leq 0$$

whenever $x \leq (1+x^2) \tan^{-1} x$, or equivalently, whenever $\tan^{-1} x \geq \frac{x}{1+x^2}$. We prove that this is true for all $x \geq 0$. Let $x_0 \geq 0$. The value of the function $\tan^{-1} x$ at $x = x_0$ can be represented as a definite integral:

$$\tan^{-1} x_0 = \int_0^{x_0} \frac{dx}{1+x^2}$$

since $\tan^{-1} 0 = 0$. The function $g(x) = \frac{1}{1+x^2}$ is a nonincreasing function of x for $x \geq 0$ since

$$g'(x) = -\frac{2x}{(1+x^2)^2} \leq 0$$

for $x \geq 0$. So the smallest value of $g(x) = \frac{1}{1+x^2}$ on the interval $[0, x_0]$ is $g(x_0) = \frac{1}{1+x_0^2}$. So we have

$$\tan^{-1} x_0 = \int_0^{x_0} \frac{dx}{1+x^2} \geq \int_0^{x_0} \frac{dx}{1+x_0^2} = \frac{1}{1+x_0^2} \int_0^{x_0} dx = \frac{x_0}{1+x_0^2}.$$

That is, $\frac{x_0}{1+x_0^2} \leq \tan^{-1} x_0$, or $x_0 \leq (1+x_0^2) \tan^{-1} x_0$. Since $x_0 \geq 0$ was an arbitrary point, it follows that $x \leq (1+x^2) \tan^{-1} x$ for all $x \geq 0$, i.e., $f'(x) \leq 0$ for all $x \geq 0$. This means in the original series the a_n are nonincreasing for $n \geq 1$ and so the original series is convergent by the Alternating Series Test. However, the series of absolute values has been shown above to be divergent, so the original series is

conditionally convergent.

47. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^{1/k}}$. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n^{1/n}} = \frac{1}{\lim_{n \rightarrow \infty} n^{1/n}}$. To evaluate $\lim_{n \rightarrow \infty} n^{1/n}$, set $y = n^{1/n}$. Then $\ln y = \frac{1}{n} \ln n$. We have

$$\lim_{n \rightarrow \infty} \ln y = \lim_{n \rightarrow \infty} \frac{\ln n}{n} = \lim_{x \rightarrow \infty} \frac{\ln x}{x} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{1} = \lim_{x \rightarrow \infty} \frac{1}{x} = 0,$$

using L'Hôpital's rule on a related function of the ratio. So $\lim_{n \rightarrow \infty} \ln y = \ln \lim_{n \rightarrow \infty} y = 0$ gives

$$\lim_{n \rightarrow \infty} y = \lim_{n \rightarrow \infty} n^{1/n} = 1.$$

Since $\lim_{n \rightarrow \infty} a_n = 1 \neq 0$, by the Divergence Test, the series will be *divergent*.

48. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \left(\frac{k}{k+1} \right)^k$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right)^n = \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{1}{n}\right)^n} = \frac{1}{\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n} = \frac{1}{e} \neq 0,$$

using the limit definition of e . Since the limit is nonzero, by the Divergence Test, the series will be

divergent.

49. The series is $1 - \frac{1}{2!} + \frac{1}{3!} - \frac{1}{4!} + \frac{1}{5!} - \cdots = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k!}$. The series of absolute values is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k!}$. the n^{th} term of this series satisfies $a_n = \frac{1}{n!} \leq \frac{1}{n^2}$ when $n! \geq n^2$. Let $n \geq 4$. We estimate as follows:

$$\begin{aligned} n! &= n \cdot (n-1) \cdot (n-2)(n-3) \cdots 3 \cdot 2 \cdot 1 \\ &\geq n \cdot (n-1) \cdot (n-2) \cdot 1 \cdot 1 \cdot 1 \cdots 1 \cdot 1 \cdot 1 \\ &= n(n-1)(n-2). \end{aligned}$$

Next, we demonstrate (for $n \geq 4$) that $n(n-1)(n-2) \geq n^2$:

$$\begin{aligned} n(n-1)(n-2) &\geq n^2 \\ n(n^2 - 3n + 2) &\geq n^2 \\ n^2 - 3n + 2 &\geq n \\ n^2 - 4n + 2 &\geq 0 \\ n^2 - 4n + 4 - 2 &\geq 0 \\ (n-2)^2 - 2 &\geq 0 \\ (n-2)^2 &\geq 2. \end{aligned}$$

That is, $n-2 \leq -\sqrt{2}$ or $n-2 \geq \sqrt{2}$. Keeping the positive root solution, we have $n \geq 2 + \sqrt{2} \approx 3.414$ which concurs with our initial assumption that $n \geq 4$. So we have shown the desired inequality, that is $n! > n^2$

for $n \geq 4$. Since the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ is a convergent p -series (since $p = 2 > 1$), by the Comparison

Test, the series of absolute values converges, which means the original series is *absolutely convergent*.

50. The series is $1 - \frac{1}{3^2} + \frac{1}{5^2} - \frac{1}{7^2} + \cdots = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{(2k-1)^2}$. The series of absolute values is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{(2k-1)^2}$. The n^{th} term of this series satisfies $a_n = \frac{1}{(2n-1)^2} < \frac{1}{n^2}$, since $2n-1 > n$ for $n > 1$. Since the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ is a convergent p -series (since $p = 2 > 1$), by the Comparison Test, the series of absolute values converges, which means the original series is *absolutely convergent*.

51. The series expands as $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots$. So positive terms are of the form $\sum_{k=1}^{\infty} \frac{1}{2k-1}$. Since the n^{th} term of this series satisfies $\frac{1}{2n-1} > \frac{1}{2n}$ for $n \geq 1$, and the series $\sum_{k=1}^{\infty} \frac{1}{2k}$, being a constant multiple of the divergent harmonic series is divergent, the series of positive terms also diverges by the Comparison Test, as was needed to be proved.

52. The series expands as $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots$. So negative terms are of the form $-\frac{1}{2} \sum_{k=1}^{\infty} \frac{1}{k}$, which, being a constant multiple of the divergent harmonic series is divergent. So the series of negative terms diverges as was needed to be proved.

53. We group terms of the alternating harmonic series as follows: $S_1 = 1$;
 $S_2 = 1 + \left(-\frac{1}{2} - \frac{1}{4} - \frac{1}{6} - \frac{1}{8}\right) \approx -0.0416667$; $S_3 = S_1 + S_2 + \left(\frac{1}{3}\right) \approx +0.2916663$;
 $S_4 = S_1 + S_2 + S_3 + \left(-\frac{1}{10} - \frac{1}{12} - \frac{1}{14} - \frac{1}{16}\right) \approx 0.02559557$, and so on. That is, for odd and even indices,

$$S_{2n-1} = S_1 + S_2 + \cdots + S_{2n-2} + \left(\frac{1}{2n-1}\right)$$

and

$$S_{2n} = S_1 + S_2 + \cdots + S_{2n-1} + \left(-\frac{1}{8n-6} - \frac{1}{8n-4} - \frac{1}{8n-2} - \frac{1}{8n}\right).$$

We show that the terms of the sequence $\{S_n\}$ are decreasing and bounded from below by 0. Using the Algebraic Difference Test,

$$S_{2n} - S_{2n-1} = S_{2n-1} - \frac{1}{8n-6} - \frac{1}{8n-4} - \frac{1}{8n-2} - \frac{1}{8n} - \frac{1}{2n-1}. \quad (1)$$

Examining equation (1), that the quantity on the right side will be negative for $n \geq 1$, proving that the sequence is a decreasing one. By its construction, the sequence is bounded from below by 0, so it converges. The sum to which the series $\sum_{k=1}^{\infty} S_k$ it converges is 0 since the limit of the sequence $\{S_n\}$ of partial sums is 0. So we have managed to find a way to group the terms of the alternating harmonic series to produce a series whose sum is 0.

54. By trial and error, we find that $1 + \frac{1}{3} + \frac{1}{5} + \cdots + \frac{1}{13} < 2 < 1 + \frac{1}{3} + \frac{1}{5} + \cdots + \frac{1}{15}$. This means we can come close to 2 using the first 7 terms of the positive odd denominator numbers. Subsequently, we form sum groupings as in Problem 53, starting from $n = 15$. This way, we will be able to form groupings whose eventual sum will be 2.

55. We create blocks of numbers that sum to a little above 1, and then blocks that sum to a little under 1, and so on; adding these blocks up, one gets the sum to be infinite. This can be done because the sum of the positive terms of the conditionally convergent alternating harmonic series diverges, and the sum of the negative terms of the conditionally convergent alternating harmonic series diverges as well.

56. We have the series of absolute values of $e^{-x} \cos x + e^{-2x} \cos 2x + e^{-3x} \cos 3x + \cdots$ satisfy (since $|\cos \theta| \leq 1$),

$|e^{-x} \cos x| + |e^{-2x} \cos 2x| + |e^{-3x} \cos 3x| + \cdots \leq e^{-x} + e^{-2x} + e^{-3x} + \cdots = \sum_{k=1}^{\infty} \left(\frac{1}{e}\right)^{kx} = \sum_{k=1}^{\infty} \left[\left(\frac{1}{e}\right)^x\right]^k$. This last is a geometric series that converges since $0 < |r| = \left(\frac{1}{e}\right)^x < 1$ for all $x > 0$ (since $e^x > 1$ for $x > 0$). By the Comparison Test, the series of absolute values converges, so the original series converges absolutely, as was needed to be shown.

57. The n^{th} term of the series of absolute values of the series $1 + r \cos \theta + r^2 \cos(2\theta) + r^3 \cos(3\theta) + \cdots$ satisfies $|r^n \cos n\theta| \leq |r|^n$. Since $\sum_{k=1}^{\infty} |r|^k$ is a geometric series that is convergent when $0 < |r| < 1$, or $-1 < r < 1$, we find that the series of absolute values converges, and the original series *absolutely converges* for $-1 < r < 1$. Also, since the geometric series diverges when $|r| \geq 1$, we conclude that the given series *diverges* for $|r| \geq 1$.

58. The alternating harmonic series is conditionally convergent, so its terms can be rearranged to obtain different kinds of sums, as illustrated in the statement of the problem.

59. $N = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots$, and $N - 1$ are both divergent harmonic series. They can be added and the sums rearranged to produce any number one wishes. (See for example the Problems 53-55 where we rearranged the alternating harmonic series, whose series of absolute values is the harmonic series. We were able to rearrange terms to obtain any sum we wanted.) Only series which are absolutely convergent can be added together and rearranged at will to produce a convergent series with a unique sum. (See p.588 for the list of properties of absolutely convergent series.)

60. The series will either converge or diverge. For instance consider the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ and the divergent (constant term) series $\sum_{k=1}^{\infty} 1$. The sum will diverge, since the partial sum $S_n = n + 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n}$, and $\lim_{n \rightarrow \infty} S_n = \infty$. Their difference will diverge as well, since the partial sum will be $S_n = (1 - 1) + (1 - \frac{1}{2}) + (1 - \frac{1}{3}) + (1 - \frac{1}{4}) + \cdots + (1 - \frac{1}{n}) = 0 + \frac{1}{2} + \frac{3}{4} + \cdots + \frac{n-1}{n} = \sum_{k=1}^n \frac{k}{k+1}$. Since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n}{n+1} = 1 \neq 0$, by the Divergence Test, the difference series also diverges.

Now consider the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ and the series $\sum_{k=1}^{\infty} \frac{1}{k+1}$ which, being the harmonic series from the second term forward, also diverges. Then their difference will converge, and this is seen as follows. The n^{th} partial sum of the difference of these series will be

$$\begin{aligned} S_n &= \left(\frac{1}{1} - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \cdots + \left(\frac{1}{n-1} - \frac{1}{n}\right) + \left(\frac{1}{n} - \frac{1}{n+1}\right) \\ &= 1 - \frac{1}{n+1} \end{aligned}$$

which converges to 1, since

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n+1}\right) = 1 - 0 = 1.$$

So the series which is the term by term difference of the two series also converges.

These examples demonstrate that nothing conclusive can be said about the convergence or divergence when two divergent series are added or subtracted term by term from each other.

61. The summand in the series $\sum_{k=1}^{\infty} \frac{1}{k(k+1)}$ can be split up into partial fractions as $\sum_{k=1}^{\infty} \left(\frac{1}{k} - \frac{1}{k+1}\right)$. The n^{th} partial sum has the form $S_n = \left(\frac{1}{1} - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \cdots + \left(\frac{1}{n-2} - \frac{1}{n-1}\right) + \left(\frac{1}{n-1} - \frac{1}{n}\right) = 1 - \frac{1}{n}$, due to

the telescoping. We have $\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} (1 - \frac{1}{n}) = 1$. Since the limit of the sequence $\{S_n\}$ of partial sums is 1, it means the series sums to 1.

62. To show the series $\sum_{k=1}^{\infty} (a_k + b_k)$ converges absolutely, consider the absolute value of the n^{th} term. We have $|a_n + b_n| \leq |a_n| + |b_n|$, by the Triangle Inequality. Let the sequence of partial sums of $\sum_{k=1}^{\infty} |a_k|$ be $\{S_n\}$ and the sequence of partial sums of $\sum_{k=1}^{\infty} |b_k|$ be $\{S'_n\}$, and the sequence of partial sums of $\sum_{k=1}^{\infty} |a_k + b_k|$ be $\{S''_n\}$. Then, since we have

$$0 \leq S''_n = \sum_{k=1}^n |a_k + b_k| \leq \sum_{k=1}^n |a_k| + |b_k| = \sum_{k=1}^n |a_k| + \sum_{k=1}^n |b_k| = S_n + S'_n$$

and (by assumption) the sequences $\{S_n\}$ and $\{S'_n\}$ converge, it follows that the sequence $\{S''_n\}$ is also convergent. Since absolutely convergent series can be rearranged and regrouped at will without changing the sum, it follows that $\sum_{k=1}^{\infty} (a_k + b_k) = \sum_{k=1}^{\infty} a_k + \sum_{k=1}^{\infty} b_k$.

63. An absolutely convergent series can be rearranged at will (see Problem 66 below), so one may group all positive terms together, and all the negative terms together, and the sum of the series will not be affected. Since the entire series has a finite sum, it means that each of the component series will also have a finite sum, and so will converge separately.

64. Let the conditionally convergent series be $\sum_{k=1}^{\infty} a_k$. We assume the terms are nonzero; none of the arguments below will be affected by a few zero terms. Note that $b_n = \frac{a_n + |a_n|}{2}$ are all the positive n^{th} terms, and $c_n = \frac{a_n - |a_n|}{2}$ are all the negative n^{th} terms. Also note that $a_n = b_n + c_n$. Suppose that the series of positive terms is convergent. Then, because its terms are all positive, it is also absolutely convergent. Since $\sum_{k=1}^{\infty} a_k$ converges conditionally and $\sum_{k=1}^{\infty} b_k$ converges absolutely, then $\sum_{k=1}^{\infty} c_k$ converges absolutely, because $|c_n| = \frac{1}{2}(|a_n - |a_n||) \leq \frac{1}{2}(a_n + |a_n|) = b_n$ so by the Comparison Test, if $\sum_{k=1}^{\infty} b_k$ converges absolutely, then so must $\sum_{k=1}^{\infty} c_k$. But since $a_n = b_n + c_n$ this must mean that $\sum_{k=1}^{\infty} a_k$ converges absolutely (by the result of Problem 62) which contradicts its conditional convergence. This contradiction was a result of assuming that $\sum_{k=1}^{\infty} b_k$ was convergent, so that must be false. This means that the series of positive terms diverges. But since $c_n = a_n - b_n$ it means that $\sum_{k=1}^{\infty} c_k$ must also be divergent. So, finally, we have shown that the series of positive terms and the series of negative terms both diverge separately.

65. The n^{th} term of the series $\sum_{k=1}^{\infty} c_k$ is

$$|c_n| = \begin{cases} \frac{1}{a^n}, & n \text{ even} \\ \frac{1}{b^n}, & n \text{ odd} \end{cases}$$

Let $d = \min\{a, b\}$. Since $a > 1$ and $b > 1$, we have $\frac{1}{d} < 1$ and thus $|c_n| \leq \frac{1}{d^n}$. Since $\frac{1}{d} < 1$, the series $\sum_{k=1}^{\infty} \frac{1}{d^k}$ is a convergent geometric series, so $\sum_{k=1}^{\infty} |c_k|$ converges. This means that $\sum_{k=1}^{\infty} c_k$ *converges absolutely.*

66. If the series $\sum_{k=1}^{\infty} a_k$ is absolutely convergent, then the series of absolute values $\sum_{k=1}^{\infty} |a_k| = L$ must be convergent to a finite number (say) L . Since the sequence of partial sums $\{S_n\}$ is also convergent to the

limit L , this means for every $\epsilon > 0$, there must be an N_1 such that for $n > N_1$ we have

$$|S_n - L| = \left| S_n - \sum_{k=1}^{\infty} |a_k| \right| = \left| \sum_{k \geq N_1+1}^{\infty} |a_k| \right| < \frac{\epsilon}{2}.$$

That is, for any $\epsilon > 0$, there exists an N_1 such that $\sum_{k=N_1+1}^{\infty} |a_k| < \frac{\epsilon}{2}$. Let $f: \mathbb{N} \rightarrow \mathbb{N}$ be a permutation on the indices of the series, that is a one to one and onto map defined on the positive integers. This achieves the rearrangement of the series from $\sum_{k=1}^{\infty} a_k$ to $\sum_{k=1}^{\infty} a_{f(k)}$. Since the series of absolute values is convergent, it means that the sequence of partial sums $S_n = |a_1| + |a_2| + \cdots + |a_n|$ is bounded from above by some real number, say K . Then the sequence of partial sums of the rearrangements $S'_n = |a_{f(1)}| + |a_{f(2)}| + \cdots + |a_{f(n)}|$ is also bounded from above by the same number K' . Since $\{S'_n\}$ is a bounded from above and monotonically increasing sequence (since all its terms are positive), it will converge.

To show that the limits are the same, we use the fact that there exists some $N_2 \geq N_1$ such that among the terms $a_{f(1)}, a_{f(2)}, \dots, a_{f(N_2)}$ we shall find all of the terms $a_1, a_2, \dots, a_{N_1}$. For $n > N_2$, let $\mathcal{D}$ be the (finite) set of subscripts $k \in \{f(1), f(2), f(3), \dots, f(n)\}$ that do not match up with any of the $\{1, 2, \dots, N_1\}$. Then for $n > N_2 \geq N_1$, we have

$$\left| \sum_{k=1}^n |a_{f(k)}| - \sum_{k=1}^{N_1} |a_k| \right| = \left| \sum_{\mathcal{D}} |a_{f(k)}| \right| \leq \sum_{\mathcal{D}} |a_{f(k)}| \leq \sum_{k=N_1+1}^{\infty} |a_k| < \frac{\epsilon}{2},$$

where the final inequality follows from the fact that all the terms $|a_{f(k)}|$ with $k \in \mathcal{D}$ are to be found among the set $\{|a_{N_1+1}|, |a_{N_1+2}|, \dots\}$, since $N_1 \leq N_2 < n$ and $\mathcal{D}$, which is a finite set, only contains elements not in the set $\{1, 2, 3, \dots, N_1\}$. Now, we compute:

$$\left| \sum_{k=1}^n |a_{f(k)}| - L \right| = \left| \sum_{k=1}^n |a_{f(k)}| - \sum_{k=1}^{N_1} |a_k| + \sum_{k=1}^{N_1} |a_k| - L \right| \leq \left| \sum_{k=1}^n |a_{f(k)}| - \sum_{k=1}^{N_1} |a_k| \right| + \left| \sum_{k=1}^{N_1} |a_k| - L \right| < \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon.$$

This shows that the series of absolute values obtained by a rearrangement of the original series converges to L . So we have shown that a rearrangement of the original absolutely convergent series will result in a series which itself is absolutely convergent to the same limit as the original series.

67. The proof of this result is identical in every respect to the proof carried out in the textbook, pages 582-583 (Alternating Series Test); the only change is that instead of writing the alternating series as $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$ with $a_k > 0$ in the textbook, it is written as $\sum_{k=1}^{\infty} a_k$ in this problem. (That is, the minus signs are now included in the terms a_k themselves.) So, we have to be careful about putting absolute value signs around the terms while importing the proof from the book to this problem. For instance, in the text, the hypothesis for nondecreasing terms is written as $a_{k+1} \leq a_k$ while in the problem the hypothesis for nondecreasing terms applies to the absolute values: $|a_{k+1}| \leq |a_k|$ for all $k \geq 1$. As in the book, form the series $\{S_{2n}\}$ of partial sums and show that it is nondecreasing; form the series $\{S_{2n+1}\}$ of partial sums and show that it is nonincreasing; finally show that both these series tend to the same limit as $n \rightarrow \infty$.

Challenge Problems

68. The series can be written as $\sum_{k=1}^{\infty} (-1)^k a_k = \sum_{k=1}^{\infty} \sin\left(\frac{(-1)^k}{k}\right) = \sum_{k=1}^{\infty} (-1)^k \sin\left(\frac{1}{k}\right)$, since $\sin(-\theta) = -\sin \theta$.

The series of absolute values is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \sin\left(\frac{1}{k}\right)$. Note that the terms of the series are nonzero because

$\sin\left(\frac{1}{n}\right) > 0$ for $n \geq 1$. Comparing this series to the divergent harmonic series, $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$, we have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\sin\left(\frac{1}{n}\right)}{\frac{1}{n}} = \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1,$$

employing the substitution $x = \frac{1}{n}$, and using the standard limit result at the end. Since the limit is a positive number and the series $\sum_{k=1}^{\infty} b_k$ is divergent, by the Limit Comparison Test, we see that the series $\sum_{k=1}^{\infty} a_k$ must be divergent. So the series of absolute values diverges. Next, we need to see if the original series itself converges. The n^{th} term satisfies $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \sin \frac{1}{n} = 0$. Also, if $f(x) = \sin \frac{1}{x}$ is a related function of the n^{th} term of the series, examining its derivative yields $f'(x) = -\frac{1}{x^2} \cos \frac{1}{x} < 0$ for $x > 1$ (recall that for θ between 0 and 1 radians, $\cos \theta$ is a positive function). This shows that the related function, and the sequence it is related to, are nonincreasing. So by the Alternating Series Test, the original series converges. But since the series of absolute values has been shown above to be divergent, this means that the original series is *conditionally convergent*.

69. The series is $\sum_{k=2}^{\infty} (-1)^k a_k = \sum_{k=2}^{\infty} \frac{(-1)^k}{\sqrt[p]{k^3+1}}$. The absolute value series is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{(n^3+1)^{1/p}}$. The n^{th} term of the series behaves like

$$a_n = \frac{1}{(n^3+1)^{1/p}} = \frac{1}{n^{3/p} (1 + \frac{1}{n^3})^{1/p}} \approx \frac{1}{n^{3/p}}$$

for large n . So we compare with the series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k^{3/p}}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{(n^3+1)^{3/p}}}{\frac{1}{n^{3/p}}} = \lim_{n \rightarrow \infty} \left(\frac{n^3}{n^3+1} \right)^{1/p} = \lim_{n \rightarrow \infty} \frac{1}{(1 + \frac{1}{n^3})^{1/p}} = 1.$$

Since the limit is a positive number and the series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k^q}$ is a convergent “ q -series” since for $2 < p < 3$, we have $q = \frac{3}{p} > 1$, it means that the absolute value series is also convergent by the Limit Comparison Test. This in turn implies that the original series is *absolutely convergent* if $2 < p < 3$.

If $p \geq 3$, then the large n behavior of the n^{th} term is $\frac{1}{n^{3/p}} = \frac{1}{n^q}$ where $q \leq 1$. We compare with the divergent series $\sum_{k=2}^{\infty} b_k = \frac{1}{k^q}$ for $q \leq 1$; the computation is identical to the one shown above, except the conclusion is that the original series *diverges* if $p \geq 3$.

70. The series is $\sum_{k=2}^{\infty} (-1)^k a_k = \sum_{k=2}^{\infty} (-1)^k k^{(1-k)/k}$. The series of absolute values is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} k^{(1-k)/k} = \sum_{k=2}^{\infty} \frac{k^{1/k}}{k}$. Comparing with the divergent harmonic series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k}$ we have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n^{1/n}}{n}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} n^{1/n} = 1,$$

where the reader is referred to Problem 47 for the evaluation of the final limit. Since the limit is a positive number, and the series $\sum_{k=2}^{\infty} b_k$ diverges, by the comparison test, the series of absolute values diverges as well. Next, we check to see if the original series is convergent. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^{1/n}}{n} = 0$. Let $f(x) = \frac{x^{1/x}}{x}$ be a related function of the a_n . Let $y = x^{1/x}$. Then $\ln y = \frac{1}{x} \ln x$. Differentiating, we have

$$\frac{y'}{y} = \frac{x \cdot \frac{1}{x} - \ln x \cdot 1}{x^2} = \frac{1 - \ln x}{x^2}.$$

Next, examine the derivative of $f(x) = \frac{x^{1/x}}{x} = \frac{y}{x}$:

$$f'(x) = \frac{y'}{x} - \frac{y}{x^2} = \frac{x^{1/x}}{x^2}(1 - \ln x) - \frac{x^{1/x}}{x^2} = \frac{x^{1/x}}{x^2}(-\ln x) < 0,$$

whenever $x > 1$. Since the related function is decreasing the series is nonincreasing for $n \geq 1$. By the Alternating Series Test, the original series converges. However, since the series of absolute values diverges as seen above, the original series is *conditionally convergent*.

71. The series is $\sum_{k=2}^{\infty} \frac{(-1)^k}{(\ln k)^{\ln k}}$. The series of absolute values is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{(\ln k)^{\ln k}}$. We have

$$(\ln n)^{\ln n} = \left(e^{\ln(\ln n)}\right)^{\ln n} = (e^{\ln n})^{\ln(\ln n)} = n^{\ln(\ln n)},$$

since $(e^a)^b = (e^b)^a$. Since $\ln n$ is an increasing function, so is $\ln(\ln n)$. So there will exist some $n > 2$ for which $\ln(\ln n) \geq 2$. Solving, we find that $n \geq e^{e^2} \approx 1618.18$. So we see that the n^{th} term of this series satisfies $\frac{1}{(\ln n)^{\ln n}} < \frac{1}{n^2}$ for $n \geq 1619$. Since the p -series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k^2}$ converges ($p = 2 > 1$), we see by the Comparison Test that the series of absolute values also converges. (We note that convergence does not depend on the omission of a finite number of terms from the comparison, in this instance the first 1618 terms, recalling the series starts with $n = 2$.) But this means that the original series is *absolutely convergent*.

72. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{\sqrt{k}}{k+1}$. We have $\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{n+1} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n} + \frac{1}{\sqrt{n}}} = 0$. Let $f(x) = \frac{\sqrt{x}}{x+1}$ be a related function of the absolute value of the n^{th} term of the series. Then, examining the derivative, we have

$$f'(x) = \frac{(x+1) \cdot \frac{1}{2\sqrt{x}} - \sqrt{x} \cdot 1}{(x+1)^2} = \frac{x+1-2x}{2\sqrt{x}(x+1)^2} = \frac{1-x}{2\sqrt{x}(x+1)^2} \leq 0$$

for $x \geq 1$. Since the function is nonincreasing, this means the sequence $\{|a_k|\}$ is nonincreasing, or $|a_{k+1}| \leq |a_k|$ for $k \geq 1$. By the result of Problem 67, we see that the series *converges*.

73. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k}{(k+1)^2}$. We have $\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{n}{(n+1)^2} = \lim_{n \rightarrow \infty} \frac{1}{\left(\sqrt{n} + \frac{1}{\sqrt{n}}\right)^2} = 0$. Let $f(x) = \frac{x}{(x+1)^2}$ be a related function of the absolute value of the n^{th} term of the series. Then, examining the derivative, we have

$$f'(x) = \frac{(x+1)^2 \cdot 1 - x \cdot 2(x+1) \cdot 1}{(x+1)^4} = \frac{(x+1)}{(x+1)^4} [x+1-2x] = \frac{1-x}{(1+x)^3} \leq 0$$

for $x \geq 1$. Since the function is nonincreasing, this means the sequence $\{|a_k|\}$ is nonincreasing or $|a_{k+1}| \leq |a_k|$ for $k \geq 1$. By the result of Problem 67, we see that the series *converges*.

74. The series is $\sum_{k=2}^{\infty} (-1)^k a_k = \sum_{k=2}^{\infty} (-1)^k \ln \frac{k+1}{k}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \ln \frac{n+1}{n} = \ln \lim_{n \rightarrow \infty} \frac{n+1}{n} = \ln \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right) = \ln(1+0) = 0.$$

Let $f(x) = \ln \frac{x+1}{x}$ be a related function of the absolute value of the n^{th} term of the series. Then, examining the derivative, we have

$$f'(x) = \frac{x}{x+1} \cdot \frac{x \cdot 1 - (x+1) \cdot 1}{x^2} = -\frac{1}{x(x+1)} \leq 0$$

for $x \geq 1$. Since the function is nonincreasing, this means the sequence $\{|a_k|\}$ is nonincreasing or $|a_{k+1}| \leq |a_k|$ for $k \geq 1$. By the result of Problem 67, we see that the series *converges.*

75. (a) Since $\lim_{n \rightarrow \infty} a_n = 0$, we have $\lim_{n \rightarrow \infty} \Delta a_n = \lim_{n \rightarrow \infty} (a_n - a_{n+1}) = 0$. We are given that the sequence $\{\Delta a_n\}$ decreases. Therefore, by the Alternating Series Test, $\sum_{k=1}^{\infty} (-1)^{k+1} \Delta a_k$ is a convergent alternating series.

(b) Let $R_n = \sum_{k=n+1}^{\infty} (-1)^{k+1} a_k$. R_n is a well defined value since $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$ is a convergent alternating series. Expanding R_n , we have

$$\begin{aligned} R_n &= (-1)^{n+2} a_{n+1} + (-1)^{n+3} a_{n+2} + (-1)^{n+4} a_{n+3} + (-1)^{n+5} a_{n+4} + \cdots \\ &= (-1)^{n+2} [a_{n+1} - a_{n+2} + a_{n+3} - a_{n+4} + \cdots] \\ &= (-1)^{n+2} [(a_{n+1} - a_{n+2}) + (a_{n+3} - a_{n+4}) + \cdots]. \end{aligned}$$

Since the sequence $\{a_n\}$ decreases, each of the pairs grouped in this last expression is positive, so the absolute value of R_n is given by

$$|R_n| = a_{n+1} - a_{n+2} + a_{n+3} - a_{n+4} + \cdots.$$

Rewriting this produces

$$|R_n| = \frac{a_n}{2} + \frac{1}{2} [-a_n + 2a_{n+1} - 2a_{n+2} + 2a_{n+3} - 2a_{n+4} + \cdots] \quad (1)$$

$$\begin{aligned} &= \frac{a_n}{2} + \frac{1}{2} [(-a_n + a_{n+1}) + (a_{n+1} - a_{n+2}) + (-a_{n+2} + a_{n+3}) + \cdots] \\ &= \frac{a_n}{2} + \frac{1}{2} [-(a_n - a_{n+1}) + (a_{n+1} - a_{n+2}) - (a_{n+2} - a_{n+3}) + \cdots] \\ &= \frac{a_n}{2} + \frac{1}{2} [-\Delta a_n + \Delta a_{n+1} - \Delta a_{n+2} + \Delta a_{n+3} - \cdots] \\ &= \frac{a_n}{2} + \frac{1}{2} \sum_{k=1}^{\infty} (-1)^k \Delta a_{k+n-1}, \end{aligned} \quad (2)$$

as was required to be shown. Rewriting equation (2) produces

$$|R_n| = \frac{a_n}{2} + \frac{1}{2} [(-\Delta a_n + \Delta a_{n+1}) + (-\Delta a_{n+2} + \Delta a_{n+3}) + \cdots].$$

Since $\{\Delta a_n\}$ is a decreasing sequence, each of the pairs grouped in this last expression is negative, so we have

$$|R_n| < \frac{a_n}{2}.$$

(c) Use equation (1) from part (b) to rewrite the absolute value of R_n as follows:

$$\begin{aligned} |R_n| &= \frac{a_{n+1}}{2} + \frac{1}{2} [a_{n+1} - 2a_{n+2} + 2a_{n+3} - 2a_{n+4} + \cdots] \\ &= \frac{a_{n+1}}{2} + \frac{1}{2} [(a_{n+1} - a_{n+2}) + (-a_{n+2} + a_{n+3}) + (a_{n+3} - a_{n+4}) + \cdots] \\ &= \frac{a_{n+1}}{2} + \frac{1}{2} [\Delta a_{n+1} - \Delta a_{n+2} + \Delta a_{n+3} - \cdots] \\ &= \frac{a_{n+1}}{2} + \frac{1}{2} \sum_{k=1}^{\infty} (-1)^{k+1} \Delta a_{k+n}, \end{aligned} \quad (3)$$

as was required to be shown. Rewriting equation (3) produces

$$|R_n| = \frac{a_{n+1}}{2} + \frac{1}{2} [(\Delta a_{n+1} - \Delta a_{n+2}) + (\Delta a_{n+3} - \Delta a_{n+4}) + \cdots].$$

Since $\{\Delta a_n\}$ is a decreasing sequence, each of the pairs grouped in this last expression is positive, so we have

$$|R_n| > \frac{a_{n+1}}{2}.$$

8.6 Ratio Test; Root Test

Concepts and Vocabulary

1. False: We have $\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{\cos(n+1)\pi}{\cos n\pi} \right| = 1$ for all n , so $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$. This means the Ratio Test is inconclusive, and you cannot conclude divergence as claimed.

2. False: For a counterexample, consider the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$. We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{1}{(n+1)^2}}{\frac{1}{n^2}} \right| = \lim_{n \rightarrow \infty} \left| \frac{n^2}{(n+1)^2} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{1 + \frac{1}{n}} \right|^2 = 1,$$

whereas (see p.572) $\sum_{k=1}^{\infty} \frac{1}{k^2} = \frac{\pi^2}{6}$. So the value of $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right|$ has no relation to the actual value of the sum

$$\sum_{k=1}^{\infty} a_k.$$

3. False: If $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$, then the Ratio Test is inconclusive. For a counterexample, consider the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$. We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{1}{n+1}}{\frac{1}{n}} \right| = \lim_{n \rightarrow \infty} \left| \frac{n}{n+1} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{1 + \frac{1}{n}} \right| = 1.$$

However, $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$ being the harmonic series, diverges.

4. False: Since the Root Test works by extracting the n^{th} root, a series that has an n^{th} power in its n^{th} term (as opposed to one that has an n^{th} root in its n^{th} term) works well with the Root Test (providing, of course, the Root Test is applicable in the first place).

Skill Building

5. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{4k^2-1}{2^k}$ is a series of nonzero terms. The ratio of the $n+1^{\text{st}}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{4(n+1)^2-1}{2^{n+1}}}{\frac{4n^2-1}{2^n}} = \frac{2^n}{2^{n+1}} \cdot \left[\frac{4(n^2+2n+1)-1}{4n^2-1} \right] = \frac{1}{2} \left(\frac{4n^2+8n+3}{4n^2-1} \right).$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{1}{2} \left| \frac{4n^2+8n+3}{4n^2-1} \right| = \frac{1}{2} \lim_{n \rightarrow \infty} \left| \frac{4 + \frac{8}{n} + \frac{3}{n^2}}{4 - \frac{1}{n^2}} \right| = \frac{1}{2} \cdot \left| \frac{4+0+0}{4-0} \right| = \frac{1}{2} < 1.$$

Since the limit is less than 1, the series converges by the Ratio Test.

6. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{(2k+1)2^k}$ is a series of nonzero terms. The ratio of the $n+1^{\text{st}}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{(2(n+1)+1)2^{n+1}}}{\frac{1}{(2n+1)2^n}} = \frac{(2n+1)2^n}{(2n+3)2^{n+1}} = \frac{1}{2} \left(\frac{2n+1}{2n+3} \right).$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{1}{2} \left| \frac{2n+1}{2n+3} \right| = \frac{1}{2} \lim_{n \rightarrow \infty} \left| \frac{2 + \frac{1}{n}}{2 + \frac{3}{n}} \right| = \frac{1}{2} \cdot \left| \frac{2+0}{2+0} \right| = \frac{1}{2} < 1.$$

Since the limit is less than 1, the series *converges* by the Ratio Test.

7. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} k \left(\frac{2}{3}\right)^k$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{(n+1) \left(\frac{2}{3}\right)^{n+1}}{n \left(\frac{2}{3}\right)^n} = \left(\frac{2}{3}\right) \frac{n+1}{n}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left(\frac{2}{3}\right) \left| \frac{n+1}{n} \right| = \lim_{n \rightarrow \infty} \frac{2}{3} \cdot \left| 1 + \frac{1}{n} \right| = \frac{2}{3} \cdot |1+0| = \frac{2}{3} < 1.$$

Since the limit is less than 1, the series *converges* by the Ratio Test.

8. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{5^k}{k^2}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{5^{n+1}}{(n+1)^2}}{\frac{5^n}{n^2}} = \frac{n^2}{(n+1)^2} \cdot \frac{5^{n+1}}{5^n} = 5 \frac{n^2}{(n+1)^2}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} 5 \left| \frac{n^2}{(n+1)^2} \right| = 5 \lim_{n \rightarrow \infty} \left| \frac{1}{\left(1 + \frac{1}{n}\right)^2} \right| = 5 \cdot \left| \frac{1}{(1+0)^2} \right| = 5 > 1.$$

By the Ratio Test, since the limit is greater than 1, the series *diverges*.

9. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{10^k}{(2k)!}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{10^{n+1}}{(2(n+1))!}}{\frac{10^n}{(2n)!}} = \frac{10^{n+1}}{10^n} \cdot \frac{(2n)!}{(2n+2)!} = 10 \cdot \frac{(2n)!}{(2n+2)(2n+1)(2n)!} = \frac{10}{(2n+2)(2n+1)}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{10}{(2n+2)(2n+1)} \right| = 0.$$

Since the limit is less than 1, the series *converges* by the Ratio Test.

10. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(2k)!}{5^k 3^{k-1}}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(2(n+1))!}{5^{n+1} 3^{n+1-1}}}{\frac{(2n)!}{5^n 3^{n-1}}} = \frac{5^n}{5^{n+1}} \cdot \frac{3^{n-1}}{3^n} \cdot \frac{(2n+2)!}{(2n)!} = \frac{1}{5} \cdot \frac{1}{3} \cdot \frac{(2n+2)(2n+1)(2n)!}{(2n)!} = \frac{1}{15} (2n+2)(2n+1).$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{15} (2n+2)(2n+1) \right| = \infty.$$

Since the limit is ∞ , the series *diverges* by the Ratio Test.

11. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k}{(2k-2)!}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{n+1}{(2(n+1)-2)!}}{\frac{n}{(2n-2)!}} = \frac{n+1}{n} \cdot \frac{(2n-2)!}{(2n)!} = \frac{n+1}{n} \cdot \frac{(2n-2)!}{2n(2n-1)(2n-2)!} = \frac{n+1}{n} \cdot \frac{1}{2n(2n-1)}.$$

Compute the limit of the absolute value of the ratio found above:

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{n+1}{n} \cdot \frac{1}{2n(2n-1)} \right| = \lim_{n \rightarrow \infty} \left| \frac{n+1}{n} \right| \cdot \lim_{n \rightarrow \infty} \left| \frac{1}{2n(2n-1)} \right| \\ &= \lim_{n \rightarrow \infty} \left| 1 + \frac{1}{n} \right| \cdot 0 = |1+0| \cdot 0 = 1 \cdot 0 = 0. \end{aligned}$$

Since the limit is less than 1, the series *converges* by the Ratio Test.

12. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(k+1)!}{3^k}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(n+2)!}{3^{n+1}}}{\frac{(n+1)!}{3^n}} = \frac{3^n}{3^{n+1}} \cdot \frac{(n+2)!}{(n+1)!} = \frac{1}{3} \frac{(n+2)(n+1)!}{(n+1)!} = \frac{1}{3}(n+2).$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{3}(n+2) \right| = \infty.$$

By the Ratio Test, since the limit is ∞ , the series *diverges*.

13. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{2^k}{k(k+1)}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{2^{n+1}}{(n+1)(n+2)}}{\frac{2^n}{n(n+1)}} = \frac{2^{n+1}}{2^n} \cdot \frac{n(n+1)}{(n+1)(n+2)} = 2 \cdot \frac{n}{n+2}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{2n}{n+2} \right| = \lim_{n \rightarrow \infty} \left| \frac{2}{1 + \frac{2}{n}} \right| = 2 > 1.$$

Since the limit is greater than 1, the series *diverges* by the Ratio Test.

14. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k!}{k^2(k+1)^2}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(n+1)!}{(n+1)^2(n+2)^2}}{\frac{n!}{n^2(n+1)^2}} = \frac{(n+1)!}{n!} \cdot \frac{n^2(n+1)^2}{(n+1)^2(n+2)^2} = \frac{(n+1)n!}{n!} \cdot \frac{n^2}{(n+2)^2} = \frac{(n+1)n^2}{(n+2)^2}.$$

Compute the limit of the absolute value of the ratio found above:

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{(n+1)n^2}{(n+2)^2} \right| = \lim_{n \rightarrow \infty} \left| (n+1) \cdot \frac{1}{\left(1 + \frac{2}{n}\right)^2} \right| \\ &= \infty. \end{aligned}$$

By the Ratio Test, since the limit is ∞ , the series *diverges.*

15. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^3}{k!}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(n+1)^3}{(n+1)!}}{\frac{n^3}{n!}} = \frac{n!}{(n+1)!} \cdot \frac{(n+1)^3}{n^3} = \frac{n!}{(n+1)n!} \cdot \frac{(n+1)^3}{n^3} = \frac{1}{n+1} \cdot \frac{(n+1)^3}{n^3}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{n+1} \cdot \frac{(n+1)^3}{n^3} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{n+1} \right| \cdot \lim_{n \rightarrow \infty} \left| \left(1 + \frac{1}{n}\right)^3 \right| = |0| \cdot |1| = 0.$$

By the Ratio Test, since the limit is less than 1, the series *converges.*

16. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k!}{k^{k+1}}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(n+1)!}{(n+1)^{n+2}}}{\frac{n!}{n^{n+1}}} = \frac{(n+1)!}{n!} \cdot \frac{n^{n+1}}{(n+1)^{n+2}} = \frac{(n+1)n!}{n!} \cdot \frac{n^{n+1}}{(n+1)^{n+2}} = \left(\frac{n}{n+1} \right)^{n+1}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{n}{n+1} \cdot \left(\frac{n}{n+1} \right)^n \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{1 + \frac{1}{n}} \right| \cdot \lim_{n \rightarrow \infty} \left| \frac{1}{\left(1 + \frac{1}{n}\right)^n} \right| = |1| \cdot \left| \frac{1}{e} \right| = \frac{1}{e} < 1.$$

By the Ratio Test, since the limit is less than 1, the series *converges.*

17. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3^{k-1}}{k \cdot 2^k}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{3^n}{(n+1) \cdot 2^{n+1}}}{\frac{3^{n-1}}{n \cdot 2^n}} = \frac{3^n}{3^{n-1}} \cdot \frac{2^n}{2^{n+1}} \cdot \frac{n}{n+1} = 3 \cdot \frac{1}{2} \cdot \frac{n}{n+1}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{3}{2} \cdot \frac{n}{n+1} \right| = \frac{3}{2} \lim_{n \rightarrow \infty} \left| \frac{1}{1 + \frac{1}{n}} \right| = \frac{3}{2} \cdot |1| = \frac{3}{2} > 1.$$

By the Ratio Test, since the limit is greater than 1, the series *diverges.*

18. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k(k+2)}{3^k}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(n+1)(n+3)}{3^{n+1}}}{\frac{n(n+2)}{3^n}} = \frac{3^n}{3^{n+1}} \cdot \frac{(n+1)(n+3)}{n(n+2)} = \frac{1}{3} \cdot \frac{(n+1)(n+3)}{n(n+2)}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{3} \cdot \frac{(n+1)(n+3)}{n(n+2)} \right| = \frac{1}{3} \lim_{n \rightarrow \infty} \left| \frac{\left(1 + \frac{1}{n}\right) \left(1 + \frac{3}{n}\right)}{\left(1 + \frac{2}{n}\right)} \right| = \frac{1}{3} \cdot |1| = \frac{1}{3} < 1.$$

By the Ratio Test, since the limit is less than 1, the series *converges.*

19. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k}{e^k}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{n+1}{e^{n+1}}}{\frac{n}{e^n}} = \frac{e^n}{e^{n+1}} \cdot \frac{n+1}{n} = \frac{1}{e} \cdot \frac{n+1}{n}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{e} \cdot \frac{n+1}{n} \right| = \frac{1}{e} \lim_{n \rightarrow \infty} \left| 1 + \frac{1}{n} \right| = \frac{1}{e} \cdot |1| = \frac{1}{e} < 1.$$

By the Ratio Test, since the limit is less than 1, the series *converges.*

20. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{e^k}{k^3}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{e^{n+1}}{(n+1)^3}}{\frac{e^n}{n^3}} = \frac{e^{n+1}}{e^n} \cdot \frac{n^3}{(n+1)^3} = e \cdot \frac{n^3}{(n+1)^3}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| e \cdot \frac{n^3}{(n+1)^3} \right| = e \lim_{n \rightarrow \infty} \left| \frac{1}{\left(1 + \frac{1}{n}\right)^3} \right| = e \cdot |1| = e > 1.$$

By the Ratio Test, since the limit is greater than 1, the series *diverges.*

21. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} k \cdot 2^k$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{(n+1) \cdot 2^{n+1}}{n \cdot 2^n} = 2 \cdot \frac{n+1}{n}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| 2 \cdot \frac{n+1}{n} \right| = 2 \lim_{n \rightarrow \infty} \left| 1 + \frac{1}{n} \right| = 2 \cdot |1| = 2 > 1.$$

Since the limit is greater than 1, by the Ratio Test, the series *diverges.*

22. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{4^k}{k}$ is a series of nonzero terms. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{4^{n+1}}{n+1}}{\frac{4^n}{n}} = \frac{4^{n+1}}{4^n} \cdot \frac{n}{n+1} = 4 \cdot \frac{n}{n+1}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| 4 \cdot \frac{n}{n+1} \right| = 4 \lim_{n \rightarrow \infty} \left| \frac{1}{1 + \frac{1}{n}} \right| = 4 \cdot |1| = 4 > 1.$$

Since the limit is greater than 1, by the Ratio Test, the series *diverges.*

23. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{2k+1}{5k+1} \right)^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \left(\frac{2n+1}{5n+1} \right)^n \right|} = \lim_{n \rightarrow \infty} \left| \frac{2n+1}{5n+1} \right| = \lim_{n \rightarrow \infty} \left| \frac{2 + \frac{1}{n}}{5 + \frac{1}{n}} \right| = \left| \frac{2}{5} \right| = \frac{2}{5} < 1.$$

Since the limit is less than 1, by the Root Test, the series *converges.*

24. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{3k-1}{2k+1}\right)^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left|\left(\frac{3n-1}{2n+1}\right)^n\right|} = \lim_{n \rightarrow \infty} \left|\frac{3n-1}{2n+1}\right| = \lim_{n \rightarrow \infty} \left|\frac{3 - \frac{1}{n}}{2 + \frac{1}{n}}\right| = \left|\frac{3}{2}\right| = \frac{3}{2} > 1.$$

Since the limit is greater than 1, by the Root Test, the series *diverges.*

25. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{k}{5}\right)^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left|\left(\frac{n}{5}\right)^n\right|} = \lim_{n \rightarrow \infty} \left|\frac{n}{5}\right| = \infty.$$

Since the limit is greater than 1, by the Root Test, the series *diverges.*

26. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\pi^{2k}}{k^k}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left|\frac{\pi^{2n}}{n^n}\right|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left|\frac{\pi^2}{n}\right|^n} = \lim_{n \rightarrow \infty} \left|\frac{\pi^2}{n}\right| = 0.$$

Since the limit is less than 1, by the Root Test, the series *converges.*

27. $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \left(\frac{\ln k}{k}\right)^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left|\left(\frac{\ln n}{n}\right)^n\right|} = \lim_{n \rightarrow \infty} \left|\frac{\ln n}{n}\right| = \lim_{x \rightarrow \infty} \left|\frac{\ln x}{x}\right| = \lim_{x \rightarrow \infty} \left|\frac{\frac{1}{x}}{1}\right| = \lim_{x \rightarrow \infty} \left|\frac{1}{x}\right| = 0,$$

using L'Hôpital's rule on a related function of the n^{th} root of the n^{th} term of the series. Since the limit is less than 1, by the Root Test, the series *converges.*

28. $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \left(\frac{1}{\ln k}\right)^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left|\left(\frac{1}{\ln n}\right)^n\right|} = \lim_{n \rightarrow \infty} \left|\frac{1}{\ln n}\right| = 0.$$

Since the limit is less than 1, by the Root Test, the series *converges.*

29. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{\sqrt{k^2+1}}{3k}\right)^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left|\left(\frac{\sqrt{n^2+1}}{3n}\right)^n\right|} = \lim_{n \rightarrow \infty} \left|\frac{\sqrt{n^2+1}}{3n}\right| = \lim_{n \rightarrow \infty} \left|\sqrt{\frac{1}{9} + \frac{1}{9n^2}}\right| = \left|\sqrt{\frac{1}{9}}\right| = \frac{1}{\sqrt{9}} = \frac{1}{3} < 1.$$

Since the limit is less than 1, by the Root Test, the series *converges.*

30. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{\sqrt{4k^2+1}}{k} \right)^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \left(\frac{\sqrt{4n^2+1}}{n} \right)^n \right|} = \lim_{n \rightarrow \infty} \left| \frac{\sqrt{4n^2+1}}{n} \right| = \lim_{n \rightarrow \infty} \left| \sqrt{4 + \frac{1}{n^2}} \right| = |\sqrt{4}| = 2 > 1.$$

Since the limit is greater than 1, by the Root Test, the series *diverges.*

31. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^2}{2^k}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n^2}{2^n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{n^{2/n}}{2} \right| = \frac{1}{2} \lim_{n \rightarrow \infty} \left(n^{1/n} \right)^2 = \frac{1}{2} \left(\lim_{n \rightarrow \infty} n^{1/n} \right)^2 = \frac{1}{2} \cdot 1^2 = \frac{1}{2} < 1.$$

(Here, and in the next three problems numbered 32, 33, and 34, and elsewhere below, we use the following result: $\lim_{n \rightarrow \infty} n^{1/n} = 1$. We can derive this as follows. Let $y = n^{1/n}$. Then $\ln y = \frac{1}{n} \ln n = \frac{\ln n}{n}$. We have

$$\lim_{n \rightarrow \infty} y = \lim_{n \rightarrow \infty} e^{\ln y} = \lim_{n \rightarrow \infty} e^{\frac{\ln n}{n}} = e^{\lim_{n \rightarrow \infty} \frac{\ln n}{n}} = e^{\lim_{x \rightarrow \infty} \frac{\ln x}{x}} = e^{\lim_{x \rightarrow \infty} \frac{1/x}{1}} = e^{\lim_{x \rightarrow \infty} \frac{1}{x}} = e^0 = 1,$$

using L'Hôpital's rule on a related function of $\frac{\ln n}{n}$. This proves the claimed result.)

Since the limit is less than 1, by the Root Test, the series *converges.*

32. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^3}{3^k}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n^3}{3^n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{n^{3/n}}{3} \right| = \frac{1}{3} \lim_{n \rightarrow \infty} \left(n^{1/n} \right)^3 = \frac{1}{3} \left(\lim_{n \rightarrow \infty} n^{1/n} \right)^3 = \frac{1}{3} \cdot 1^3 = \frac{1}{3} < 1,$$

where we used the result (see Problem 31) $\lim_{n \rightarrow \infty} n^{1/n} = 1$. Since the limit is less than 1, by the Root Test, the series *converges.*

33. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^4}{5^k}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n^4}{5^n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{n^{4/n}}{5} \right| = \frac{1}{5} \lim_{n \rightarrow \infty} \left(n^{1/n} \right)^4 = \frac{1}{5} \left(\lim_{n \rightarrow \infty} n^{1/n} \right)^4 = \frac{1}{5} \cdot 1^4 = \frac{1}{5} < 1,$$

where we used the result (see Problem 31) $\lim_{n \rightarrow \infty} n^{1/n} = 1$. Since the limit is less than 1, by the Root Test, the series *converges.*

34. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k}{3^k}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n}{3^n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{n^{1/n}}{3} \right| = \frac{1}{3} \lim_{n \rightarrow \infty} n^{1/n} = \frac{1}{3} \cdot 1 = \frac{1}{3} < 1,$$

where we used the result (see Problem 31) $\lim_{n \rightarrow \infty} n^{1/n} = 1$. Since the limit is less than 1, by the Root Test, the series *converges.*

35. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{10}{(3k+1)^k}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{10}{(3n+1)^n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{10^{1/n}}{3n+1} \right| = \lim_{n \rightarrow \infty} 10^{1/n} \cdot \lim_{n \rightarrow \infty} \frac{1}{3n+1} = 10^0 \cdot 0 = 0.$$

Since the limit is less than 1, by the Root Test, the series *converges.*

36. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(1 + \frac{1}{k}\right)^{k^2}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \left(1 + \frac{1}{n}\right)^{n^2} \right|} = \lim_{n \rightarrow \infty} \left| \left(1 + \frac{1}{n}\right)^n \right| = e > 1.$$

Since the limit is greater than 1, by the Root Test, the series *diverges.*

37. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(k+1)(k+2)}{k!}$ is a series of nonzero terms. Since the n^{th} term involves the factorial, we could try the Ratio Test. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(n+2)(n+3)}{(n+1)!}}{\frac{(n+1)(n+2)}{n!}} = \frac{n!}{(n+1)!} \cdot \frac{(n+3)}{(n+1)} = \frac{n!}{(n+1)n!} \cdot \frac{(n+3)}{(n+1)} = \frac{(n+3)}{(n+1)^2}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+3)}{(n+1)^2} \right| = \lim_{n \rightarrow \infty} \left| \frac{n \left(1 + \frac{3}{n}\right)}{n^2 \left(1 + \frac{1}{n}\right)^2} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{n} \right| \cdot \lim_{n \rightarrow \infty} \left| \frac{\left(1 + \frac{3}{n}\right)}{\left(1 + \frac{1}{n}\right)^2} \right| = 0 \cdot 1 = 0.$$

Since the limit is less than 1, by the Ratio Test, the series *converges.*

38. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k!}{(3k+1)!}$ is a series of nonzero terms. Since the n^{th} term involves the factorial, we could try the Ratio Test. The ratio of the $n+1^{st}$ and the n^{th} term is

$$\begin{aligned} \frac{a_{n+1}}{a_n} &= \frac{\frac{(n+1)!}{(3(n+1)+1)!}}{\frac{n!}{(3n+1)!}} = \frac{(3n+1)!}{(3n+4)!} \cdot \frac{(n+1)!}{n!} \\ &= \frac{(3n+1)!}{(3n+4)(3n+3)(3n+2)(3n+1)!} \cdot \frac{(n+1)n!}{n!} \\ &= \frac{(n+1)}{(3n+4)(3n+3)(3n+2)}. \end{aligned}$$

Compute the limit of the absolute value of the ratio found above:

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{(n+1)}{(3n+4)(3n+3)(3n+2)} \right| = \lim_{n \rightarrow \infty} \left| \frac{n \left(1 + \frac{1}{n}\right)}{n^3 \left(3 + \frac{4}{n}\right) \left(3 + \frac{3}{n}\right) \left(3 + \frac{2}{n}\right)} \right| \\ &= \lim_{n \rightarrow \infty} \left| \frac{1}{n^2} \right| \cdot \lim_{n \rightarrow \infty} \left| \frac{\left(1 + \frac{1}{n}\right)}{\left(3 + \frac{4}{n}\right) \left(3 + \frac{3}{n}\right) \left(3 + \frac{2}{n}\right)} \right| \\ &= 0 \cdot \frac{1}{27} = 0. \end{aligned}$$

Since the limit is less than 1, by the Ratio Test, the series *converges.*

39. The given series can be written as $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k \ln k}{2^k} = 0 + \sum_{k=2}^{\infty} \frac{k \ln k}{2^k} = \sum_{k=2}^{\infty} \frac{k \ln k}{2^k}$ which is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we could apply the Root Test. Let us first establish a limit result: $\lim_{n \rightarrow \infty} (\ln n)^{1/n} = 1$. To prove this, set $y = (\ln n)^{1/n}$. Then, $\ln y = \frac{1}{n} \ln(\ln n) = \frac{\ln(\ln n)}{n}$. We have

$$\lim_{n \rightarrow \infty} y = \lim_{n \rightarrow \infty} e^{\ln y} = \lim_{n \rightarrow \infty} e^{\frac{\ln(\ln n)}{n}} = e^{\lim_{n \rightarrow \infty} \frac{\ln(\ln n)}{n}} = e^{\lim_{x \rightarrow \infty} \frac{\ln(\ln x)}{x}} = e^{\lim_{x \rightarrow \infty} \frac{\frac{1}{\ln x} \cdot \frac{1}{x}}{1}} = e^{\lim_{x \rightarrow \infty} \frac{1}{x \ln x}} = e^0 = 1,$$

using L'Hôpital's rule on a related function of $\frac{\ln(\ln n)}{n}$. This proves the required result. Applying the Root Test, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n \ln n}{2^n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{n^{1/n} (\ln n)^{1/n}}{2} \right| = \frac{1}{2} \lim_{n \rightarrow \infty} n^{1/n} \cdot \lim_{n \rightarrow \infty} (\ln n)^{1/n} = \frac{1}{2} \cdot 1 \cdot 1 = \frac{1}{2} < 1.$$

(Here, we also used the result, proved in Problem 31, that $\lim_{n \rightarrow \infty} n^{1/n} = 1$, in addition to the limit result proved above.) Since the limit is less than 1, by the Root Test, the series converges.

The series $\sum_{k=2}^{\infty} \frac{k \ln k}{2^k}$ which is a series of nonzero terms, can also be seen to converge using the Ratio Test.

The ratio of the $n+1^{\text{st}}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(n+1) \ln(n+1)}{2^{n+1}}}{\frac{n \ln n}{2^n}} = \frac{2^n}{2^{n+1}} \cdot \frac{n+1}{n} \cdot \frac{\ln(n+1)}{\ln n} = \frac{1}{2} \cdot \frac{n+1}{n} \cdot \frac{\ln(n+1)}{\ln n}.$$

Compute the limit of the absolute value of the ratio found above:

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{1}{2} \cdot \frac{n+1}{n} \cdot \frac{\ln(n+1)}{\ln n} \right| = \frac{1}{2} \lim_{n \rightarrow \infty} \left| 1 + \frac{1}{n} \right| \cdot \lim_{n \rightarrow \infty} \left| \frac{\ln(n+1)}{\ln n} \right| \\ &= \frac{1}{2} \cdot 1 \cdot \lim_{x \rightarrow \infty} \left| \frac{\ln(x+1)}{\ln x} \right| = \frac{1}{2} \lim_{x \rightarrow \infty} \left| \frac{\frac{1}{x+1}}{1} \right| \\ &= \frac{1}{2} \lim_{x \rightarrow \infty} \left| \frac{1}{x+1} \right| = \frac{1}{2} \cdot 0 = 0, \end{aligned}$$

using L'Hôpital's rule on a related function of the last ratio. Since the limit is less than 1, by the Ratio Test, the series converges, in agreement with the Root Test above.

40. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left[\ln \left(e^3 + \frac{1}{k} \right) \right]^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\begin{aligned} \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} &= \lim_{n \rightarrow \infty} \sqrt[n]{\left| \left[\ln \left(e^3 + \frac{1}{n} \right) \right]^n \right|} = \lim_{n \rightarrow \infty} \left| \ln \left(e^3 + \frac{1}{n} \right) \right| \\ &= \ln \left[\lim_{n \rightarrow \infty} e^3 + \lim_{n \rightarrow \infty} \frac{1}{n} \right] \\ &= \ln [e^3 + 0] = 3 > 1. \end{aligned}$$

Since the limit is greater than 1, by the Root Test, the series diverges.

41. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \sin^k \left(\frac{1}{k} \right)$ is a series of nonzero terms (since $\sin \theta$ is nonvanishing on the interval $0 < \theta \leq 1$ rad). Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \sin^n \left(\frac{1}{n} \right) \right|} = \lim_{n \rightarrow \infty} \left| \sin \left(\frac{1}{n} \right) \right| = \left| \sin \left\{ \lim_{n \rightarrow \infty} \left(\frac{1}{n} \right) \right\} \right| = |\sin 0| = 0.$$

Since the limit is less than 1, by the Root Test, the series *converges.*

42. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^k}{2^{k^2}}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n^n}{2^{n^2}} \right|} = \lim_{n \rightarrow \infty} \left| \frac{n^{n/n}}{2^{n^2/n}} \right| = \lim_{n \rightarrow \infty} \left| \frac{n}{2^n} \right| = \lim_{x \rightarrow \infty} \left| \frac{x}{2^x} \right| = \lim_{x \rightarrow \infty} \left| \frac{1}{2^x(\ln 2)} \right| = 0,$$

applying L'Hôpital's rule to a related function of the n^{th} root of the n^{th} term of the series. Since the limit is less than 1, by the Root Test, the series *converges.*

43. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(1+\frac{1}{k})^{2k}}{e^k}$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we apply the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{\left(1 + \frac{1}{n}\right)^{2n}}{e^n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{\left(1 + \frac{1}{n}\right)^2}{e} \right| = \frac{1}{e} \left[\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right) \right]^2 = \frac{1}{e} \cdot 1^2 = \frac{1}{e} < 1.$$

Since the limit is less than 1, by the Root Test, the series *converges.*

44. $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{2^k(k+1)}{k^2(k+2)}$ is a series of nonzero terms. It is not clear which test is the better one. The presence of an n^{th} power in the n^{th} term indicates the Root Test; however the linear factors might be easier to handle with the Ratio Test. Let us try the problem both ways.

Ratio Test: The ratio of the $n+1^{\text{st}}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{2^{n+1}(n+2)}{(n+1)^2(n+3)}}{\frac{2^n(n+1)}{n^2(n+2)}} = \frac{2^{n+1}}{2^n} \cdot \frac{n^2(n+2)^2}{(n+1)^3(n+3)} = 2 \cdot \frac{n^2(n+2)^2}{(n+1)^3(n+3)}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| 2 \cdot \frac{n^2(n+2)^2}{(n+1)^3(n+3)} \right| = 2 \lim_{n \rightarrow \infty} \left| \frac{\left(1 + \frac{2}{n}\right)^2}{\left(1 + \frac{1}{n}\right)^3 \left(1 + \frac{3}{n}\right)} \right| = 2 \cdot 1 = 2 > 1.$$

Since the limit is greater than 1, the series *diverges* by the Ratio Test.

Root Test: Examine the limit of the absolute value of the n^{th} root of the n^{th} term:

$$\begin{aligned} \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} &= \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{2^n(n+1)}{n^2(n+2)} \right|} = \lim_{n \rightarrow \infty} \left| \frac{2}{n^{2/n}} \cdot \frac{(n+1)^{1/n}}{(n+2)^{1/n}} \right| \\ &= 2 \lim_{n \rightarrow \infty} \left(\frac{1}{n^{1/n}} \right)^2 \cdot \lim_{n \rightarrow \infty} \left| \frac{n^{1/n} \cdot \left(1 + \frac{1}{n}\right)^{1/n}}{n^{1/n} \cdot \left(1 + \frac{2}{n}\right)^{1/n}} \right| \\ &= 2 \cdot 1^2 \cdot \left| \frac{\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^{1/n}}{\lim_{n \rightarrow \infty} \left(1 + \frac{2}{n}\right)^{1/n}} \right| \\ &= 2 \cdot 1^2 \cdot \frac{1}{1} = 2 > 1, \end{aligned} \tag{8.1}$$

where the limit result from Problem 31 has been used to address the first factor's limit (in equation 8.1). Since the limit is greater than 1, the series *diverges* by the Root test, in agreement with the analysis by the Ratio Test.

Applications and Extensions

45. For $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$, the divergent harmonic series (whose divergence can be established using the Integral Test), we have applying the Ratio Test,

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{1}{n+1}}{\frac{1}{n}} \right| = \lim_{n \rightarrow \infty} \left| \frac{n}{n+1} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{1 + \frac{1}{n}} \right| = \left| \frac{1}{1} \right| = 1.$$

So the Ratio Test is inconclusive, even though we know by other means that the series diverges.

46. For $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, a convergent p -series (since $p = 2 > 1$), we have applying the Ratio Test,

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{1}{(n+1)^2}}{\frac{1}{n^2}} \right| = \lim_{n \rightarrow \infty} \left| \frac{n^2}{(n+1)^2} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{(1 + \frac{1}{n})^2} \right| = \left| \frac{1}{1^2} \right| = 1.$$

So the Ratio Test is inconclusive, even though we know by other means that the series converges.

47. Consider the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{|\sin k|}{2^k}$. This series converges, because the n^{th} term satisfies

$$a_n = \frac{|\sin n|}{2^n} \leq \frac{1}{2^n}.$$

Comparing with the convergent geometric series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{2^k}$ (convergent since $|r| = \frac{1}{2} < 1$), we see by the Comparison Test that the series $\sum_{k=1}^{\infty} a_k$ indeed converges. However, computing the limit of the ratio of the absolute value of the $n+1^{\text{st}}$ and the n^{th} term gives:

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{|\sin(n+1)|}{2^{n+1}}}{\frac{|\sin n|}{2^n}} \right| = \lim_{n \rightarrow \infty} \left| \frac{2^n}{2^{n+1}} \cdot \frac{\sin(n+1)}{\sin n} \right| \\ &= \frac{1}{2} \lim_{n \rightarrow \infty} \left| \frac{\sin n \cos 1 + \cos n \sin 1}{\sin n} \right| \\ &= \frac{1}{2} \lim_{n \rightarrow \infty} |\cos 1 + \cot n \sin 1|, \end{aligned}$$

where the addition formula $\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$ has been used to simplify the limit. As $n \rightarrow \infty$, the limit of $\cot n$ does not exist, as on any interval $[n, n + \pi]$, $\cot n$ takes values ranging from $-\infty$ to $+\infty$. So, we have an example of a series $\sum_{k=1}^{\infty} a_k$ where $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \neq \infty$ does not exist despite its being a convergent series.

48. A slight modification of the convergent series in Problem 47 produces an example of a divergent series without a well-defined limit. Consider the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} |\sin k|$. That this series is divergent is seen examining the limit of the n^{th} term: $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} |\sin n|$, which does not exist as on any interval $[n, n + 2\pi]$, the function $\sin n$ takes all values from -1 to $+1$. Since $\lim_{n \rightarrow \infty} a_n \neq 0$, the series $\sum_{k=1}^{\infty} a_k$ is divergent as claimed, using the Divergence Test. Computing the ratio of the absolute value of the $n+1^{\text{st}}$ and the n^{th} term gives:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\sin(n+1)}{\sin n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\sin n \cos 1 + \cos n \sin 1}{\sin n} \right| = \lim_{n \rightarrow \infty} |\cos 1 + \cot n \sin 1|,$$

where the addition formula $\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$ has been used to simplify the limit. As $n \rightarrow \infty$, the limit of $\cot n$ does not exist, as on any interval $[n, n + \pi]$, $\cot n$ takes values ranging from $-\infty$ to $+\infty$. So, we have an example of a series $\sum_{k=1}^{\infty} a_k$ where $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \neq \infty$ does not exist despite its being a divergent series.

49. (a) To apply the Ratio Test to the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k 3^k}{k!}$ (note that the series has nonzero terms) we find the ratio of the $n+1^{st}$ and the n^{th} term to be

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(-1)^{n+1} 3^{n+1}}{(n+1)!}}{\frac{(-1)^n 3^n}{n!}} = \frac{(-1)^{n+1}(-1)^n}{(-1)^n} \cdot \frac{3^{n+1}}{3^n} \cdot \frac{n!}{(n+1)n!} = (-1) \cdot 3 \cdot \frac{1}{n+1} = -\frac{3}{n+1}.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| -\frac{3}{n+1} \right| = |-3| \cdot \lim_{n \rightarrow \infty} \left| \frac{1}{n+1} \right| = 3 \cdot 0 = 0.$$

Since the limit is less than 1, the series converges by the Ratio Test.

(b) Using a CAS, we directly evaluate the sum to be $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k 3^k}{k!} = \boxed{\frac{1 - e^3}{e^3}}.$

50. The n^{th} term of the series $\frac{1}{3} - \frac{2^3}{3^2} + \frac{3^3}{3^3} - \frac{4^3}{3^4} + \cdots + \frac{(-1)^{n-1} n^3}{3^n} + \cdots$ is $a_n = \frac{(-1)^{n-1} n^3}{3^n}$. The ratio of the $n+1^{st}$ and the n^{th} term of the series is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(-1)^{n+1-1} (n+1)^3}{3^{n+1}}}{\frac{(-1)^{n-1} n^3}{3^n}} = \frac{(-1)^n}{(-1)^{n-1}} \cdot \frac{(n+1)^3}{n^3} \cdot \frac{3^n}{3^{n+1}} = (-1) \cdot \frac{1}{3} \cdot \left(\frac{n+1}{n} \right)^3.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(-1)}{3} \left(\frac{n+1}{n} \right)^3 \right| = \frac{1}{3} \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^3 = \frac{1}{3} \cdot 1 = \frac{1}{3} < 1.$$

Since the limit is less than 1, by the Ratio Test, we see that the series $\sum_{k=1}^{\infty} \frac{(-1)^{k+1} k^3}{3^k}$ converges.

51. Observe that for a fixed positive integer n , $a_n = \frac{n!}{n^n} = \frac{1 \cdot 2 \cdot 3 \cdots n}{n \cdot n \cdot n \cdots n} = \left(\frac{1}{n} \right) \left(\frac{2}{n} \right) \left(\frac{3}{n} \right) \cdots \left(\frac{n}{n} \right) \leq \left(\frac{1}{n} \right) \cdot 1 \cdot 1 \cdots 1 = \frac{1}{n}$, which is convergent since $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$. Also, $0 < \frac{n!}{n^n}$, for all $n \geq 1$. By the Squeeze Theorem, since $\lim_{n \rightarrow \infty} 0 \leq \lim_{n \rightarrow \infty} \frac{n!}{n^n} \leq \lim_{n \rightarrow \infty} \frac{1}{n}$, we have $\lim_{n \rightarrow \infty} \frac{n!}{n^n} = 0$.

52. For $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$, since the terms are nonzero, the Root Test gives

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{1}{n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{1}{n^{1/n}} \right| = 1,$$

using the limit result from Problem 31. Likewise, for $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, since the terms are nonzero, the Root Test gives

$$\lim_{n \rightarrow \infty} \sqrt[n]{|b_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{1}{n^2} \right|} = \lim_{n \rightarrow \infty} \left| \frac{1}{n^{2/n}} \right| = \lim_{n \rightarrow \infty} \left(\frac{1}{n^{1/n}} \right)^2 = \left(\lim_{n \rightarrow \infty} \frac{1}{n^{1/n}} \right)^2 = 1^2 = 1,$$

using, again, the limit result from Problem 31. So we find that the Root Test is inconclusive for the limit value of 1, because it cannot distinguish between the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ and the convergent p -series (convergent since $p = 2 > 1$) $\sum_{k=1}^{\infty} \frac{1}{k^2}$.

53. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{x^k}{k^2}$ is a series of nonzero terms if $x \neq 0$ (If $x = 0$, then the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} 0 = 0$, so the series converges for $x = 0$.) The ratio of the $n+1^{\text{st}}$ and the n^{th} term is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{x^{n+1}}{(n+1)^2}}{\frac{x^n}{n^2}} = \frac{n^2}{(n+1)^2} \cdot \frac{x^{n+1}}{x^n} = \frac{n^2}{(n+1)^2} \cdot x.$$

Compute the limit of the absolute value of the ratio found above:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{n^2}{(n+1)^2} \cdot x \right| = |x| \cdot \lim_{n \rightarrow \infty} \left| \frac{n^2}{(n+1)^2} \right| = |x| \cdot \lim_{n \rightarrow \infty} \left| \frac{1}{(1 + \frac{1}{n})^2} \right| = |x| \cdot |1| = |x|.$$

If $|x| < 1$, then the series converges by the Ratio Test, if $|x| > 1$, the series diverges by the Ratio Test, while when $|x| = 1$, the Ratio Test is inconclusive. However, when $|x| = 1$, that is, $x = \pm 1$, the series becomes either the p -series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is known to converge since $p = 2 > 1$, or the alternating series $\sum_{k=1}^{\infty} (-1)^k a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{k^2}$ which converges by the Alternating Series Test (since we have the n^{th} term satisfy $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n^2} = 0$, and also $\frac{a_{n+1}}{a_n} = \frac{\frac{1}{(n+1)^2}}{\frac{1}{n^2}} = \frac{n^2}{(n+1)^2} < 1$ for $n \geq 1$). So finally, the range of values of x for which there will be convergence is $\boxed{|x| \leq 1}$, or, equivalently, $\boxed{-1 \leq x \leq 1}$.

54. For the series $\sum_{k=1}^{\infty} a_k$, with the property that $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \infty$, let $\left| \frac{a_{n+1}}{a_n} \right| = f(n)$. Then we have

$$|a_{n+1}| = \left| \frac{a_{n+1}}{a_n} \cdot \frac{a_n}{a_{n-1}} \cdots \frac{a_2}{a_1} \cdot a_1 \right| = f(n)f(n-1) \cdots f(1)|a_1|.$$

We examine the limit of the sequence of partial sums $\{S_{n+1}\} = \sum_{k=1}^{n+1} a_k$ of the series $\sum_{k=1}^{\infty} a_k$. We have

$$\lim_{n \rightarrow \infty} |S_{n+1}| = \lim_{n \rightarrow \infty} \left| \sum_{k=1}^{n+1} a_k \right| > \lim_{n \rightarrow \infty} |a_{n+1}| = \lim_{n \rightarrow \infty} f(n)f(n-1) \cdots f(1)|a_1| = \infty,$$

since by hypothesis $\lim_{n \rightarrow \infty} f(n) = \infty$. This implies the sequence of partial sums $\{S_{n+1}\}$ diverges, so the series itself will diverge.

55. To prove the root test, let $\sum_{k=1}^{\infty} a_k$ be a series with nonzero terms. Let $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = L \neq \infty$ exist. We consider three cases: $0 \leq L < 1$, $L > 1$ and $L = 1$.

$0 \leq L < 1$: Let $0 \leq L < r < 1$. Let $\epsilon = r - L > 0$. Since $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} |a_n|^{1/n} = L < \infty$, there exists some $N > 0$, such that if $n > N$, we have

$$\begin{aligned} \left| |a_n|^{1/n} - L \right| &< \epsilon = r - L \\ L - r &< |a_n|^{1/n} - L < r - L \\ 2L - r &< |a_n|^{1/n} < r, \end{aligned}$$

or $|a_n| < r^n$. Now, $\sum_{k=0}^{\infty} r^k$ is a geometric series and since $0 < r < 1$, it is convergent to a sum of $\frac{1}{1-r}$. Also, since $|a_n| < r^n$ for $n > N$, by the Comparison Test, the series $\sum_{k=N}^{\infty} |a_n|$ is convergent as well. The series $\sum_{k=1}^{\infty} |a_n|$ differs from the series $\sum_{k=N}^{\infty} |a_n|$ by a finite number of terms, namely $\sum_{k=1}^{N-1} |a_n|$. Also, $\sum_{k=1}^{N-1} |a_n| < \infty$, since the a_n are finite for $n < N$. So, since the convergence or divergence property of a series is not affected by the omission or addition of a finite number of terms whose sum is finite, we conclude that the series $\sum_{k=1}^{\infty} |a_k|$ converges absolutely, and so converges.

$L > 1$: Since $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = L > 1$, we can find some $n \geq N$ such that $|a_n|^{1/n} > 1$. This means $|a_n| > 1^n = 1$ for $n \geq N$, and $\lim_{n \rightarrow \infty} |a_n| \geq 1 \neq 0$, so the series diverges by the Divergence Test. This shows that when $L > 1$, the Root Test indicates that the series for which $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = L$ is a divergent series.

$L = 1$: To show that the Root Test for this case is inconclusive, we exhibit a convergent, divergent, and a conditionally convergent series, all of which produce the limit 1. From Problem 52, we saw that the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ and the convergent p -series (with $p = 2 > 1$) $\sum_{k=1}^{\infty} \frac{1}{k^2}$ both yielded $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = 1$, so the Root Test cannot distinguish between them as far as convergence or divergence is concerned. Consider the conditionally convergent alternating harmonic series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k}$. The terms are nonzero, so the Root Test can be applied. We have $|a_n| = \left| \frac{(-1)^{n+1}}{n} \right| = \frac{1}{n}$ for $n \geq 1$, which brings us back to the same calculation as for the harmonic series in Problem 52. So the Root Test gives the limit of 1 for this conditionally convergent series as well.

56. (a) Let $n = 2m$ be even, where $m \geq 1$ is any positive integer. Then $n + 1 = 2m + 1$ is odd. Since $a_{2k} = \frac{1}{2^k}$, we have $a_n = a_{2m} = \frac{1}{2^m}$. Since $a_{2k-1} = \frac{1}{2^{k+1}}$, we have

$$a_{n+1} = a_{2m+1} = a_{2(m+1)-1} = \frac{1}{2^{(m+1)+1}} = \frac{1}{2^{m+2}}.$$

By the Ratio Test, which is applicable since the terms of the series are nonzero, we have for even n ,

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{2m \rightarrow \infty} \left| \frac{a_{2m+1}}{a_{2m}} \right| = \lim_{m \rightarrow \infty} \left| \frac{\frac{1}{2^{m+2}}}{\frac{1}{2^m}} \right| = \lim_{m \rightarrow \infty} \left| \frac{2^m}{2^{m+2}} \right| = \lim_{m \rightarrow \infty} \left| \frac{2^m}{2^m \cdot 2^2} \right| = \frac{1}{4}.$$

Let $n = 2m + 1$ be odd, where $m \geq 0$ is zero or any positive integer. Then $n + 1 = 2m + 2 = 2(m + 1)$ is even. Since $a_{2k-1} = \frac{1}{2^{k+1}}$, we have $a_n = a_{2m+1} = a_{2(m+1)-1} = \frac{1}{2^{(m+1)+1}} = \frac{1}{2^{m+2}}$. Since $a_{2k} = \frac{1}{2^k}$, we have $a_{n+1} = a_{2(m+1)} = \frac{1}{2^{m+1}}$. By the Ratio Test, which is applicable since the terms of the series are nonzero, we have for odd n ,

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{2m+1 \rightarrow \infty} \left| \frac{a_{2(m+1)}}{a_{2m+1}} \right| = \lim_{m \rightarrow \infty} \left| \frac{\frac{1}{2^{m+1}}}{\frac{1}{2^{m+2}}} \right| = \lim_{m \rightarrow \infty} \left| \frac{2^{m+2}}{2^{m+1}} \right| = \lim_{m \rightarrow \infty} \left| \frac{2^m \cdot 2^2}{2^m \cdot 2} \right| = 2.$$

We see that the Ratio Test produces two different limits for the case of n even or n odd. In other words, $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \neq \infty$ does not exist, so the Ratio Test is not conclusive as to whether the series converges or diverges.

(b) We consider the cases of n even and n odd with the root test. If n is even, then $n = 2m$ for any positive integer m , and as in part (a), $a_n = a_{2m} = \frac{1}{2^m}$. Applying the Root Test, which is applicable since the terms of the series are nonzero, we have for even n

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{2m \rightarrow \infty} \sqrt[2m]{|a_{2m}|} = \lim_{m \rightarrow \infty} \left(\frac{1}{2^m} \right)^{\frac{1}{2m}} = \left(\frac{1}{2} \right)^{\frac{1}{2}} = \frac{1}{\sqrt{2}}.$$

If n is odd, then $n = 2m + 1$ for any positive integer (or zero) m , and as in part (a), $a_n = a_{2m+1} = \frac{1}{2^{m+2}}$. Applying the Root Test, which is applicable since the terms of the series are nonzero, we have for odd n ,

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{2m+1 \rightarrow \infty} \sqrt[2m+1]{|a_{2m+1}|} = \lim_{m \rightarrow \infty} \left(\frac{1}{2^{m+2}} \right)^{\frac{1}{(2m+1)}} = \lim_{m \rightarrow \infty} \frac{1}{2^{\frac{m+2}{2m+1}}} = \lim_{m \rightarrow \infty} 2^{-\frac{1+\frac{2}{m}}{2+\frac{1}{m}}} = 2^{-\frac{1}{2}} = \frac{1}{\sqrt{2}}.$$

Since the limits are the same for both even and odd n , and since the even and the odd cases together comprise the entire series, we see that the Root Test gives us a limit which exists.

(c) Since the limit found by applying the Root Test in part (b) is less than 1, by the Root Test, the series in question converges.

Challenge Problems

57. We have

$$\sum_{k=1}^{\infty} a_k = 1 + \frac{2}{2^2} + \frac{3}{3^3} + \frac{1}{4^4} + \frac{2}{5^5} + \frac{3}{6^6} + \cdots < \sum_{k=1}^{\infty} b_k = 1 + \frac{2}{2^2} + \frac{3}{3^3} + \frac{4}{4^4} + \frac{5}{5^5} + \frac{6}{6^6} + \cdots + \frac{n}{n^n} + \cdots.$$

The n^{th} term of the series to the right of the inequality is $b_n = \frac{n}{n^n}$. By the Root Test, which applies since the terms of that series are nonzero, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|b_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n}{n^n} \right|} = \lim_{n \rightarrow \infty} \frac{n^{1/n}}{n} = \lim_{n \rightarrow \infty} n^{1/n} \cdot \lim_{n \rightarrow \infty} \frac{1}{n} = 1 \cdot 0 = 0,$$

where we have used the limit result established in Problem 31. Since the limit is less than 1, by the Root Test, the series $\sum_{k=1}^{\infty} b_k$ converges, and then by the Comparison Test, we see that the original series $\sum_{k=1}^{\infty} a_k$ converges as well.

58. We have

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(k+1)^2}{(k+2)!} = \sum_{k=1}^{\infty} \frac{(k+1)(k+1)}{(k+2)(k+1)(k!)} = \sum_{k=1}^{\infty} \left(\frac{k+1}{k+2} \right) \left(\frac{1}{k!} \right) < \sum_{k=1}^{\infty} \frac{1}{k!},$$

since $\frac{k+1}{k+2} < 1$ for $k \geq 1$. Now, $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k!}$ is convergent since by the Ratio Test,

$$\lim_{n \rightarrow \infty} \left| \frac{b_{n+1}}{b_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{1}{(n+1)!}}{\frac{1}{n!}} \right| = \lim_{n \rightarrow \infty} \left| \frac{n!}{(n+1)!} \right| = \lim_{n \rightarrow \infty} \frac{n!}{(n+1)n!} = \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0.$$

Since the limit is less than 1, by the Ratio Test, the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k!}$ converges, and by the

Comparison Test, so does the series $\sum_{k=1}^{\infty} a_k$.

Alternately, using the suggested hint, the Limit Comparison test may be used. The n^{th} term of the original series behaves like

$$a_n = \frac{(n+1)^2}{(n+2)!} = \frac{(n+1)(n+1)}{(n+2)(n+1)(n!)} = \frac{n+1}{n+2} \cdot \frac{1}{n!} \approx \frac{1}{n!} = b_n$$

for large values of n . Comparing the series of positive terms $\sum_{k=1}^{\infty} a_k$ with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k!}$, which is convergent as noted earlier, and also has positive terms, we have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n+1}{n+2} \cdot \frac{1}{n!}}{\frac{1}{n!}} = \lim_{n \rightarrow \infty} \frac{n+1}{n+2} = \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} = \frac{1+0}{1+0} = 1.$$

Since the limit is a positive real number, by the Limit Comparison Test, the original series $\sum_{k=1}^{\infty} a_k$ converges.

59. The n^{th} term of the series $\sum_{k=1}^{\infty} c_k = a + b + a^2 + b^2 + a^3 + b^3 + \cdots$ is $c_n = a^n + b^n$. Since $0 < a < b$, the terms of the series are all nonzero, and the Root Test may be applied. We have

$$\begin{aligned}\lim_{n \rightarrow \infty} \sqrt[n]{|c_n|} &= \sqrt[n]{a^n + b^n} = b \sqrt[n]{1 + \left(\frac{a^n}{b^n}\right)} = b \lim_{n \rightarrow \infty} \left[1 + \left(\frac{a}{b}\right)^n\right]^{1/n} \\ &= b \left[1 + \lim_{n \rightarrow \infty} \left(\frac{a}{b}\right)^n\right]^{\lim_{n \rightarrow \infty} \frac{1}{n}} \\ &= b(1 + 0)^0 = b < 1,\end{aligned}$$

where, in order to obtain $\lim_{n \rightarrow \infty} \left(\frac{a}{b}\right)^n = 0$, we used the fact that $a < b$, so that $\frac{a}{b} < 1$, and to obtain the final inequality we used $b < 1$. Since the limit is less than 1, by the Root Test, the series converges.

60. Since the Ratio Test indicates the series $\sum_{k=1}^{\infty} a_k$ converges, it means $\lim_{n \rightarrow \infty} \left|\frac{a_{n+1}}{a_n}\right| = L < 1$. This means for any $\epsilon > 0$ there exists an N such that if $n \geq N$, then $\left|\frac{a_{n+1}}{a_n} - L\right| < \epsilon$, that is, $L - \epsilon < \frac{a_{n+1}}{a_n} < L + \epsilon$. We have

$$|a_n| = \frac{|a_n|}{|a_{n-1}|} \cdot \frac{|a_{n-1}|}{|a_{n-2}|} \cdots \frac{|a_{N+1}|}{|a_N|} \cdot |a_N|.$$

Applying the inequality above to each of the fractional terms, we get

$$\begin{aligned}(L - \epsilon)^{n-N} \cdot |a_N| &< |a_n| < (L + \epsilon)^{n-N} \cdot |a_N| \\ \text{or, taking the } n^{\text{th}} \text{ root, } & (L - \epsilon)^{1 - \frac{N}{n}} \cdot |a_N|^{\frac{1}{n}} < \sqrt[n]{|a_n|} < (L + \epsilon)^{1 - \frac{N}{n}} |a_N|^{\frac{1}{n}}.\end{aligned}$$

Taking the limit as $n \rightarrow \infty$ on this string of inequalities, we have

$$\begin{aligned}\lim_{n \rightarrow \infty} (L - \epsilon)^{1 - \frac{N}{n}} \cdot \lim_{n \rightarrow \infty} |a_N|^{\frac{1}{n}} &\leq \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} \leq \lim_{n \rightarrow \infty} (L + \epsilon)^{1 - \frac{N}{n}} \cdot \lim_{n \rightarrow \infty} |a_N|^{\frac{1}{n}} \\ (L - \epsilon)^{\lim_{n \rightarrow \infty} (1 - \frac{N}{n})} \cdot |a_N|^{\lim_{n \rightarrow \infty} \frac{1}{n}} &\leq \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} \leq (L + \epsilon)^{\lim_{n \rightarrow \infty} (1 - \frac{N}{n})} \cdot |a_N|^{\lim_{n \rightarrow \infty} \frac{1}{n}} \\ (L - \epsilon)^1 |a_N|^0 &\leq \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} \leq (L + \epsilon)^1 |a_N|^0 \\ L - \epsilon &\leq \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} \leq L + \epsilon.\end{aligned}$$

Since this is valid for any $\epsilon > 0$, in the limit, as $\epsilon \rightarrow 0^+$, since $\lim_{\epsilon \rightarrow 0^+} (L - \epsilon) = L$ and $\lim_{\epsilon \rightarrow 0^+} (L + \epsilon) = L$, by the Squeeze Theorem, we have $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = L < 1$ since $L < 1$ by assumption. So by the Root Test, the series converges.

We have shown that if the Ratio Test indicates a series converges, then so will the Root Test. That the converse is not true can be seen from Problem 56, where a series is seen to converge by the Root Test, but the Ratio Test is inconclusive.

8.7 Summary of Tests

Concepts and Vocabulary

- False:** The series $\sum_{k=1}^{\infty} \frac{1}{k^p}$ converges if $p > 1$ but diverges if $p = 1$ (it then becomes the divergent harmonic series).
- False:** According to the Test for Divergence, $\sum_{k=1}^{\infty} a_k$ diverges if $\lim_{n \rightarrow \infty} a_n \neq 0$. The test says nothing if $\lim_{n \rightarrow \infty} a_n = 0$. For instance, the convergent p -series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ (convergent because $p = 2 > 1$), and the divergent harmonic series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$ both satisfy $\lim_{n \rightarrow \infty} a_n = 0$.
- True:** This is the statement of the theorem on Absolute Convergence Test, see Chapter 8, Section 8.5, p.586.
- False:** For a counterexample, consider the alternating harmonic series, $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k}$. Then the absolute value series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$ is divergent as it is the harmonic series. However, since $\lim_{n \rightarrow \infty} a_n = 0$ and by the Algebraic Ratio test $\frac{a_{n+1}}{a_n} < 1$ for $n \geq 1$ means the terms of the series are nonincreasing, by the Alternating Series Test, we see that the series $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$ converges. (This is called conditional convergence.)
- False:** For deciding convergence via the Ratio Test, it is not important that $\left| \frac{a_{n+1}}{a_n} \right| < 1$; we need to require that $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| < 1$. For example the divergent harmonic series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$ satisfies $\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{n}{n+1} \right| < 1$ for $n \geq 1$, while $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{n}{n+1} \right| = \lim_{n \rightarrow \infty} \left| \frac{1}{1+\frac{1}{n}} \right| = 1$ means that the Ratio Test is in fact inconclusive in regards to the harmonic series' convergence or divergence (rather the Integral Test can be used to show the harmonic series diverges).
- $0 < a_k \leq b_k$: This follows from the statement of the Comparison Test for Convergence, see Section 8.4, p. 576.

Skill Building

- The series is $\sum_{k=1}^{\infty} \frac{9k^3 + 5k^2}{k^{5/2} + 4}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{9n^3 + 5n^2}{n^{5/2} + 4} = \lim_{n \rightarrow \infty} \frac{n^3 \left(9 + \frac{5}{n}\right)}{n^{5/2} \left(1 + \frac{4}{n^{5/2}}\right)} = \lim_{n \rightarrow \infty} \left[n^{1/2} \cdot \frac{9 + \frac{5}{n}}{1 + \frac{4}{n^{5/2}}} \right] = \infty.$$

Since the limit of the n^{th} term is nonzero, the series *diverges* by the Divergence Test.

- The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{\sqrt{2k+1}}$. The series of absolute values is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{2k+1}}$. The n^{th} term behaves like

$$a_n = \frac{1}{\sqrt{2n+1}} = \frac{1}{n^{1/2} \sqrt{2 + \frac{1}{n^{1/2}}}} \approx \frac{1}{n^{1/2}}$$

for large values of n . So we compare with the divergent p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{1/2}}$, which is divergent since $0 < p = \frac{1}{2} < 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n^{1/2} \sqrt{2 + \frac{1}{n^{1/2}}}}}{\frac{1}{n^{1/2}}} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{2 + \frac{1}{n^{1/2}}}} = \frac{1}{\sqrt{2}}.$$

Since the limit is a positive real number, by the Limit Comparison Test, the series of absolute values $\sum_{k=1}^{\infty} a_k$ diverges.

Let's investigate whether the original series converges. We have $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{2n+1}} = 0$. Also by the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{\sqrt{2(n+1)+1}}}{\frac{1}{\sqrt{2n+1}}} = \frac{\sqrt{2n+1}}{\sqrt{2n+3}} < 1$$

for all $n \geq 1$. So the terms of the series are nonincreasing as well. By the Alternating Series Test, the original series converges. But since the series of absolute values diverges, the original series is

conditionally convergent.

9. The series is $6 + 2 + \frac{2}{3} + \frac{2}{9} + \frac{2}{27} + \cdots = 6 + 2 + \sum_{k=1}^{\infty} \frac{2}{3^k} = 8 + \sum_{k=1}^{\infty} \frac{2}{3} \cdot \left(\frac{1}{3}\right)^{k-1}$. The latter term is a geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{2}{3}$ and $r = \frac{1}{3}$. Since $|r| < 1$, it converges to a sum of $\frac{a}{1-r} = \frac{2/3}{1-1/3} = \frac{2/3}{2/3} = 1$. The original series converges to a sum of $8 + 1 = 9$, which is finite, so the series is convergent. Since all terms of the original series are positive, the series is also

absolutely convergent.

10. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2} \sin \frac{\pi}{k}$. The series of absolute values is $\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{1}{k^2} \left| \sin \frac{\pi}{k} \right|$. We have

$$|a_n| = \frac{1}{n^2} \left| \sin \frac{\pi}{n} \right| \leq \frac{1}{n^2} = b_n$$

since $|\sin \theta| \leq 1$ for $0 < \theta = \frac{\pi}{n} \leq \pi$. By comparing with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is a convergent p -series (since $p = 2 > 1$), the series of absolute values converges by the Comparison Test, which means the original series

converges absolutely.

11. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3k+1}{k^3+1}$. The n^{th} term behaves like

$$a_n = \frac{3n+2}{n^3+1} = \frac{n(3 + \frac{2}{n})}{n^3(1 + \frac{1}{n^3})} \approx \frac{1}{n^2}$$

for large values of n . We compare with the convergent p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is convergent since $p = 2 > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{3n+2}{n^3+1}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{3n^3 + 2n^2}{n^3 + 1} = \lim_{n \rightarrow \infty} \frac{3 + \frac{2}{n}}{1 + \frac{1}{n^3}} = 3.$$

Since the limit is a positive real number, the series is convergent by the Limit Comparison Test. And since all the terms of the series are positive, it is also

absolutely convergent.

12. The series is $1 + \frac{2^2+1}{2^3+1} + \frac{3^2+1}{3^3+1} + \frac{4^2+1}{4^3+1} + \cdots = \sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^2+1}{k^3+1}$. The n^{th} term behaves like

$$a_n = \frac{n^2+1}{n^3+1} = \frac{n^2 \left(1 + \frac{1}{n^2}\right)}{n^3 \left(1 + \frac{1}{n^3}\right)} \approx \frac{1}{n}$$

for large values of n . We compare with the divergent harmonic series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n^2+1}{n^3+1}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n^3+n}{n^3+1} = \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{n^2}}{1 + \frac{1}{n^3}} = 1.$$

Since the limit is a positive real number, by the Limit Comparison Test, the series *diverges.*

13. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k+4}{k\sqrt{3k-2}}$. The n^{th} term behaves like

$$a_n = \frac{n+4}{n\sqrt{3n-2}} = \frac{n \left(1 + \frac{4}{n}\right)}{n^{3/2} \sqrt{3 - \frac{2}{n}}} \approx \frac{1}{n^{1/2}}$$

for large values of n . We compare with the divergent p -series (divergent since $0 < p = \frac{1}{2} < 1$)

$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{1/2}}$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n+4}{n\sqrt{3n-2}}}{\frac{1}{\sqrt{n}}} = \lim_{n \rightarrow \infty} \frac{n+4}{\sqrt{n}\sqrt{3n-2}} = \lim_{n \rightarrow \infty} \frac{1 + \frac{4}{n}}{\sqrt{3 - \frac{2}{n}}} = \frac{1}{\sqrt{3}}.$$

Since the limit is a positive real number, by the Limit Comparison Test, the series *diverges.*

14. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sin k}{k^3}$. The series of absolute values is $\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{|\sin k|}{k^3}$. We have

$$|a_n| = \frac{|\sin n|}{n^3} \leq \frac{1}{n^3} = b_n,$$

since $|\sin n| \leq 1$ for $n \geq 1$. Comparing with the convergent p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^3}$, which is convergent since $p = 3 > 1$, we see by the Comparison Test that the series of absolute values converges. This means the original series is *absolutely convergent.*

15. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3^{2k-1}}{k^2+2k}$ is a series of nonzero terms. We apply the Ratio Test. The ratio of the $n+1^{\text{st}}$ and the n^{th} term of the series is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{3^{2(n+1)-1}}{(n+1)^2+2(n+1)}}{\frac{3^{2n-1}}{n^2+2n}} = \frac{3^{2n+1}}{3^{2n-1}} \cdot \frac{n^2+2n}{(n^2+2n+1)+2n+1} = \frac{9n^2+18n}{n^2+4n+2}.$$

The limit of the absolute value of the ratio found above is

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{9n^2+18n}{n^2+4n+2} = \lim_{n \rightarrow \infty} \frac{9 + \frac{18}{n}}{1 + \frac{4}{n} + \frac{2}{n^2}} = 9 > 1.$$

Since the limit is greater than 1, by the Ratio Test, the series *diverges.*

16. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{5^k}{k!}$ is a series of nonzero terms. By the Ratio Test, we have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{5^{n+1}}{(n+1)!}}{\frac{5^n}{n!}} \right| = \lim_{n \rightarrow \infty} \left| \frac{5^{n+1}}{5^n} \cdot \frac{n!}{(n+1)!} \right| = 5 \lim_{n \rightarrow \infty} \left| \frac{n!}{(n+1)n!} \right| = 0.$$

Since the limit is less than 1, by the Ratio Test, the series converges. Since all the terms are positive, the series is also *absolutely convergent*.

17. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(1 + \frac{2}{k}\right)^k$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left(1 + \frac{2}{n}\right)^n = \lim_{n' \rightarrow \infty} \left(1 + \frac{1}{n'}\right)^{2n'} = \lim_{n' \rightarrow \infty} \left[\left(1 + \frac{1}{n'}\right)^{n'} \right]^2 = \left[\lim_{n' \rightarrow \infty} \left(1 + \frac{1}{n'}\right)^{n'} \right]^2 = e^2 \neq 0$$

where $n' = \frac{n}{2}$. Since the limit of the n^{th} term is nonzero, the series *diverges* by the Divergence Test.

18. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^2+4}{e^k}$ is a series of nonzero terms. By the Ratio Test, we have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)^2+4}{e^{n+1}}}{\frac{n^2+4}{e^n}} \right| = \lim_{n \rightarrow \infty} \left| \frac{e^n}{e^{n+1}} \cdot \frac{(n+1)^2+4}{n^2+4} \right| = \frac{1}{e} \lim_{n \rightarrow \infty} \left| \frac{\left(1 + \frac{1}{n}\right)^2 + \frac{4}{n^2}}{1 + \frac{4}{n^2}} \right| = \frac{1}{e} \cdot |1| < 1.$$

Since the limit is less than 1, by the Ratio Test, the series converges. Also, since the terms of the series are all positive, this means the series is *absolutely convergent*.

19. The series is $\frac{2}{3} - \frac{3}{4} \cdot \frac{1}{2} + \frac{4}{5} \cdot \frac{1}{3} - \frac{5}{6} \cdot \frac{1}{4} + \dots = \sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+1}{k+2} \cdot \frac{1}{k}$. The series of absolute values is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k+1}{k+2} \cdot \frac{1}{k}$. Comparing with the divergent harmonic series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k}$, we have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n+1}{n+2} \cdot \frac{1}{n}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n+1}{n+2} = \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} = 1.$$

Since the limit is a positive real number, by the Limit Comparison Test, the absolute value series diverges.

Next, we examine the original series $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$ for convergence. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n+1}{n+2} \cdot \frac{1}{n} = \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} \cdot \lim_{n \rightarrow \infty} \frac{1}{n} = 1 \cdot 0 = 0.$$

By the Algebraic Ratio Test, we have

$$\frac{a_{n+1}}{a_n} = \frac{\frac{n+2}{n+3} \cdot \frac{1}{n+1}}{\frac{n+1}{n+2} \cdot \frac{1}{n}} = \frac{n(n+2)^2}{(n+1)^2(n+3)} < 1$$

provided the following holds:

$$\begin{aligned} n(n+2)^2 &< (n+1)^2(n+3) \\ n(n^2+4n+4) &< (n^2+2n+1)(n+3) \\ n^3+4n^2+4n &< n^3+2n^2+n+3n^2+6n+3 \\ 4n^2+4n &< 5n^2+7n+3 \end{aligned}$$

$$\text{that is, } n^2+3n+3 > 0,$$

which is the case for $n \geq 1$. So the terms of the series are nonincreasing. By the Alternating series Test, the original series converges. Since the series of absolute values diverges, the original series is

conditionally convergent.

20. The series is $2 + \frac{3}{2} \cdot \frac{1}{4} + \frac{4}{3} \cdot \frac{1}{4^2} + \frac{5}{4} \cdot \frac{1}{4^3} + \cdots = \sum_{k=1}^{\infty} \frac{k+1}{k} \cdot \frac{1}{4^{k-1}} = \sum_{k=1}^{\infty} \frac{k+1}{k 4^{k-1}} = \sum_{k=1}^{\infty} a_k$. Since the n^{th} term behaves like

$$a_n = \frac{n+1}{n 4^{n-1}} = \frac{1}{4^{n-1}} \left(1 + \frac{1}{n}\right) \approx \frac{1}{4^{n-1}}$$

for large n , we compare with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{3}{4^{k-1}} = \sum_{k=1}^{\infty} 3 \left(\frac{1}{4}\right)^{k-1}$ which is a convergent geometric series since $|r| = \frac{1}{4} < 1$. Now, we have

$$a_n = \frac{n+1}{n} \left(\frac{1}{4^{n-1}}\right) = \frac{n+1}{3n} \left(\frac{3}{4^{n-1}}\right) = \frac{n+1}{3n} b_n < \frac{n+n}{3n} b_n = \frac{2}{3} b_n < b_n$$

for all $n \geq 1$. So by the Comparison Test, the series $\sum_{k=1}^{\infty} a_k$ converges. The terms of the series are positive, so this means that the series also *converges absolutely.*

21. The series is $1 + \frac{1 \cdot 3}{2!} + \frac{1 \cdot 3 \cdot 5}{3!} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{4!} + \cdots$. Note that

$$\frac{1 \cdot 3 \cdot 5 \cdot 7}{4!} = \frac{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8}{(2 \cdot 4 \cdot 6 \cdot 8)4!} = \frac{8!}{2^4 [1 \cdot 2 \cdot 3 \cdot 4]4!} = \frac{8!}{2^4 \cdot (4!)(4!)},$$

so the n^{th} term of the series can be written as $a_n = \frac{(2n)!}{2^n \cdot (n!)(n!)}$. By the Ratio Test, which is indicated since factorials are involved, and the terms of the series are nonzero, we have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(2(n+1))!}{2^{n+1} \cdot (n+1)!(n+1)!}}{\frac{(2n)!}{2^n \cdot (n!)(n!)}} \right| = \lim_{n \rightarrow \infty} \left| \frac{2^n}{2^{n+1}} \cdot \frac{n!}{(n+1)!} \cdot \frac{n!}{(n+1)!} \cdot \frac{(2(n+1))!}{(2n)!} \right| \\ &= \frac{1}{2} \lim_{n \rightarrow \infty} \left| \frac{n!}{(n+1)n!} \cdot \frac{n!}{(n+1)n!} \cdot \frac{(2n+2)(2n+1)(2n)!}{(2n)!} \right| \\ &= \frac{1}{2} \lim_{n \rightarrow \infty} \left| \frac{(2n+2)(2n+1)}{(n+1)(n+1)} \right| = \frac{1}{2} \lim_{n \rightarrow \infty} \left| \frac{\left(2 + \frac{2}{n}\right) \left(2 + \frac{1}{n}\right)}{\left(1 + \frac{1}{n}\right) \left(1 + \frac{1}{n}\right)} \right| \\ &= \frac{1}{2} \cdot 4 = 2 > 1. \end{aligned}$$

Since the limit is greater than 1, by the Ratio Test, the series $\sum_{k=1}^{\infty} a_k$ *diverges.*

22. The series is $\frac{1}{\sqrt{1 \cdot 2 \cdot 3}} + \frac{1}{\sqrt{2 \cdot 3 \cdot 4}} + \frac{1}{\sqrt{3 \cdot 4 \cdot 5}} + \cdots = \sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{k(k+1)(k+2)}}$. The n^{th} term satisfies

$$a_n = \frac{1}{\sqrt{n(n+1)(n+2)}} = \frac{1}{n^{3/2} \sqrt{\left(1 + \frac{1}{n}\right) \left(1 + \frac{2}{n}\right)}} < \frac{1}{n^{3/2}} = b_n$$

for $n \geq 1$. By comparing with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$, which is a convergent p -series (since $p = \frac{3}{2} > 1$),

by the Comparison Test, we see that the original series $\sum_{k=1}^{\infty} a_k$ converges. Since the terms of the series

$\sum_{k=1}^{\infty} a_k$ are all positive, this series is also *absolutely convergent.*

23. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k!}{(2k)!}$ is a series of nonzero terms and has factorials, so the use of the Ratio Test is indicated. The ratio of the $n+1^{st}$ and n^{th} term of the series is

$$\frac{a_{n+1}}{a_n} = \frac{\frac{(n+1)!}{(2(n+1))!}}{\frac{n!}{(2n)!}} = \frac{(n+1)!}{n!} \cdot \frac{(2n)!}{(2(n+1))!} = \frac{(n+1)n!}{n!} \cdot \frac{(2n)!}{(2n+2)(2n+1)(2n)!} = \frac{(n+1)}{(2n+2)(2n+1)}.$$

Taking the limit of the absolute value of the ratio found above gives

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{n+1}{(2n+2)(2n+1)} \right| = \lim_{n \rightarrow \infty} \frac{1}{2n+2} \cdot \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{n}}{2 + \frac{1}{n}} = 0 \cdot \frac{1}{2} = 0.$$

Since the limit is less than 1, by the Ratio Test, the series is convergent. Additionally, the terms of the series are all positive, so this means that the series is also *absolutely convergent*.

24. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} k^3 e^{-k^4}$. Now the function $f(x) = x^3 e^{-x^4}$ is defined on $[1, \infty)$, is continuous, and decreasing for all $x \geq 1$, since

$$f'(x) = 3x^2 e^{-x^4} + x^3(-4x^3)e^{-x^4} = (3x^2 - 4x^6)e^{-x^4} < 0$$

when $3x^2 - 4x^6 < 0$, or $3 < 4x^4$, or $x > \sqrt[4]{\frac{3}{4}}$, but $\sqrt[4]{\frac{3}{4}} < 1$. So, for $x \geq 1$, the series decreases, as claimed. Also, $f(k) = a_k$ for all integers $k \geq 1$. By the Integral Test, we have

$$I = \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b x^3 e^{-x^4} dx.$$

Let $u = e^{-x^4}$. Then $du = -4x^3 e^{-x^4} dx$. Continuing, we have

$$I = -\frac{1}{4} \lim_{b \rightarrow \infty} \int_{e^{-1}}^{e^{-b^4}} du = -\frac{1}{4} \lim_{b \rightarrow \infty} [u]_{e^{-1}}^{e^{-b^4}} = -\frac{1}{4} \lim_{b \rightarrow \infty} (e^{-b^4} - e^{-1}) = -\frac{1}{4} (0 - e^{-1}) = \frac{1}{4e}.$$

Since the improper integral I converges, by the Integral Test, the series converges as well. Since the terms of the series are all positive, the series is *absolutely convergent*.

25. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{k+100}}$. Comparing with the divergent p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{k}}$, which diverges since $0 < p = \frac{1}{2} < 1$, we have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{\sqrt{n+100}}}{\frac{1}{\sqrt{n}}} = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\sqrt{n+100}} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{100}{\sqrt{n}}} = 1.$$

Since the limit is a positive real number, the series *diverges* by the Limit Comparison Test.

26. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^2+5k}{3+5k^2}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^2+5n}{3+5n^2} = \lim_{n \rightarrow \infty} \frac{1 + \frac{5}{n}}{\frac{3}{n^2} + 5} = \frac{1}{5} \neq 0.$$

Since the limit of the n^{th} term is nonzero, the series *diverges* by the Divergence Test.

27. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt[3]{k^4+4}}$. We have

$$a_n = \frac{1}{\sqrt[3]{n^4+4}} < \frac{1}{\sqrt[3]{n^4}} = \frac{1}{n^{4/3}} = b_n.$$

Comparing the series with the convergent p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{4/3}}$, which is convergent since $p = \frac{4}{3} > 1$, we see that the original series $\sum_{k=1}^{\infty} a_k$ is convergent by the Comparison Test. Further, since all the terms of $\sum_{k=1}^{\infty} a_k$ are positive, the series is *absolutely convergent*.

28. The series can be written as $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{11} \left(-\frac{3}{2}\right)^k = \sum_{k=1}^{\infty} (-1)^k \frac{1}{11} \left(\frac{3}{2}\right)^k$. We have

$$\lim_{n \rightarrow \infty} |a_n| = \frac{1}{11} \lim_{n \rightarrow \infty} \left(\frac{3}{2}\right)^n = \infty \neq 0,$$

using the result stated in Section 8.1, p. 546, and proved in Section 8.1, Problem 134, that $\lim_{n \rightarrow \infty} r^n = \infty$ if $|r| > 1$. Since the limit of the absolute value of the n^{th} term is nonzero, the series *diverges* by the Divergence Test.

29. The series is $\frac{1}{3} - \frac{2}{4} + \frac{3}{5} - \frac{4}{6} + \cdots = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k}{k+2}$. We have

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{n}{n+2} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{2}{n}} = 1 \neq 0.$$

Since the limit of the absolute value of the n^{th} term is nonzero, the series *diverges* by the Divergence Test.

30. The series can be written

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k(-4)^{3k}}{5^k} = \sum_{k=1}^{\infty} (-1)^{3k} \frac{k(4)^{3k}}{5^k} = \sum_{k=1}^{\infty} [(-1)^3]^k \frac{k(4^3)^k}{5^k} = \sum_{k=1}^{\infty} (-1)^k k \left(\frac{64}{5}\right)^k.$$

We have

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} n \cdot \left(\frac{64}{5}\right)^n = \lim_{n \rightarrow \infty} n \cdot \lim_{n \rightarrow \infty} \left(\frac{64}{5}\right)^n = \infty,$$

since both limits are separately ∞ (for the second limit, we use the result quoted in Problem 28 above). Since the limit of the absolute value of the n^{th} term is nonzero, the series *diverges* by the Divergence Test.

31. The series is $\sum_{k=1}^{\infty} (-1)^k a_k = \sum_{k=1}^{\infty} \left(-\frac{1}{k}\right)^k = \sum_{k=1}^{\infty} (-1)^k \frac{1}{k^k}$. The series of absolute values is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^k}$, the “ k to the k series”. You could use the Table 6, p.598 to assert convergence. However, that this is convergent can be directly deduced using the root test (note that the terms of the series of absolute values are nonzero, and the n^{th} term has an n^{th} power, so the Root Test is applicable) :

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left|\frac{1}{n^n}\right|} = \lim_{n \rightarrow \infty} \left|\frac{1}{n}\right| = 0 < 1.$$

Since the limit is less than 1, by the Root Test, the series of absolute values converges, which means the original series is *absolutely convergent*.

32. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{5}{2^k+1}$. We have

$$a_n = \frac{5}{2^n+1} < \frac{5}{2^n} = b_n.$$

Comparing with the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{5}{2^k} = \sum_{k=1}^{\infty} \frac{5}{2} \left(\frac{1}{2}\right)^{k-1}$, which is a convergent geometric series (since $|r| = \frac{1}{2} < 1$), we see that the original series converges by the Comparison Test. Since the terms of the original series are all positive, we conclude that series must be *absolutely convergent.*

33. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} e^{-k^2}$ is a series of nonzero terms. Since the n^{th} term has an n^{th} power, the Root Test would be ideal to use:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \left(|e^{-n^2}| \right)^{1/n} = \lim_{n \rightarrow \infty} |e^{-n}| = 0 < 1.$$

Since the limit is less than 1, by the Root Test, the series converges. Since its terms are all positive, the series also *converges absolutely.*

34. The series is $\frac{\sin \sqrt{1}}{1^{3/2}} + \frac{\sin \sqrt{2}}{2^{3/2}} + \frac{\sin \sqrt{3}}{3^{3/2}} + \cdots = \sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\sin \sqrt{k}}{k^{3/2}}$. The series of absolute values is

$\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{|\sin \sqrt{k}|}{k^{3/2}}$. We have

$$|a_n| = \frac{|\sin \sqrt{n}|}{n^{3/2}} \leq \frac{1}{n^{3/2}} = b_n,$$

since $|\sin \sqrt{n}| \leq 1$ for all $n \geq 1$. Comparing with the convergent (since $p = \frac{3}{2} > 1$) p -series

$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^{3/2}}$, by the Comparison Test, we see the series of absolute values is convergent, which means that the original series must be *absolutely convergent.*

35. The series is $\sum_{k=2}^{\infty} (-1)^{k+1} a_k = \sum_{k=2}^{\infty} \frac{(-1)^{k+1}}{k(\ln k)^3}$. The series of absolute values is $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{k(\ln k)^3}$.

Consider the function $f(x) = \frac{1}{x(\ln x)^3}$ which is defined, decreasing and continuous on $[2, \infty)$, and for which $a_k = f(k)$ for all $k \geq 2$. Applying the Integral Test, we have

$$I = \int_2^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_2^b \frac{dx}{x(\ln x)^3}.$$

Let $u = \ln x$. Then $du = \frac{dx}{x}$. Continuing,

$$\begin{aligned} I &= \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} \frac{du}{u^3} = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln b} u^{-3} du = \lim_{b \rightarrow \infty} \left[\frac{u^{-3+1}}{-3+1} \right]_{\ln 2}^{\ln b} \\ &= -\frac{1}{2} \lim_{b \rightarrow \infty} \left[\frac{1}{u^2} \right]_{\ln 2}^{\ln b} = -\frac{1}{2} \lim_{b \rightarrow \infty} \left[\frac{1}{(\ln b)^2} - \frac{1}{(\ln 2)^2} \right] \\ &= -\frac{1}{2} \left[0 - \frac{1}{(\ln 2)^2} \right] = \frac{1}{2(\ln 2)^2} \end{aligned}$$

Since the improper integral I converges, by the Integral Test, the series also converges. Moreover, the terms of the series are all positive, so that the original series is *absolutely convergent.*

36. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{(2k)^k}$ is a series of nonzero terms. Since its n^{th} term involves an n^{th} power, the Root Test is the best choice:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{1}{(2n)^n} \right|} = \lim_{n \rightarrow \infty} \left| \frac{1}{2n} \right| = 0.$$

Since the limit is less than 1, by the Root Test, the series converges. The terms of the series are all positive, so this series also is *absolutely convergent*.

37. The series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \left(\frac{\ln k}{1000} \right)^k$ is a series of nonzero terms. Since the n^{th} term involves an n^{th} power, we use the Root Test:

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \left(\frac{\ln n}{1000} \right)^n \right|} = \lim_{n \rightarrow \infty} \left| \frac{\ln n}{1000} \right| = \infty.$$

By the Root Test, since the limit is greater than 1, the series *diverges*.

38. The series is

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\cosh^2 k} = \sum_{k=1}^{\infty} \frac{1}{\left(\frac{e^k + e^{-k}}{2} \right)^2} = \sum_{k=1}^{\infty} \frac{4}{e^{2k} + e^{-2k} + 2}.$$

Here the standard definition $\cosh k = \frac{e^k + e^{-k}}{2}$ was used. We have

$$a_n = \frac{4}{e^{2n} + e^{-2n} + 2} < \frac{4}{e^{2n}} = b_n$$

since $e^{-2n} + 2 > 0$ for $n \geq 1$. Now, we can write the series $\sum_{k=1}^{\infty} b_k$ as follows:

$$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{4}{e^{2k}} = \sum_{k=1}^{\infty} \frac{4}{(e^2)^k} = \sum_{k=1}^{\infty} \frac{4}{e^2} \cdot \left(\frac{1}{e^2} \right)^{k-1}.$$

We see that it is a geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{4}{e^2}$ and $|r| = \frac{1}{e^2} < 1$ so it converges. By the Comparison Test, the original series also converges. Since the terms of the original series are positive, it is *absolutely convergent*.

39. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\tan^{-1} k}{k^2}$. The n^{th} term satisfies

$$a_n = \frac{\tan^{-1} n}{n^2} < \frac{\pi}{2n^2} = b_n$$

since $\tan^{-1} n < \frac{\pi}{2}$ for any $n \geq 1$. Since the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{\pi}{2k^2}$ is a constant multiple of a convergent p -series (convergent since $p = 2 > 1$), the original series also converges by the Comparison Test. Since $\tan^{-1} n > 0$ for all $n \geq 1$, the terms of the original series are all positive, which in turn means that the original series is also *absolutely convergent*.

40. The n^{th} partial sum of the series $\sum_{k=1}^{\infty} (\sqrt{k+1} - \sqrt{k})$ is

$$\begin{aligned} S_n &= \sum_{k=1}^n (\sqrt{k+1} - \sqrt{k}) \\ &= (\sqrt{2} - \sqrt{1}) + (\sqrt{3} - \sqrt{2}) + \cdots + (\sqrt{n} - \sqrt{n-1}) + (\sqrt{n+1} - \sqrt{n}) \\ &= \sqrt{n+1} - \sqrt{1}. \end{aligned}$$

Since $\lim_{n \rightarrow \infty} S_n = \infty$, the sequence $\{S_n\}$ of partial sums diverges, which means that the series diverges as well.

41. The n^{th} partial sum of the series $\sum_{k=4}^{\infty} \left(\frac{1}{k-3} - \frac{1}{k} \right)$ is

$$\begin{aligned} S_n &= \sum_{k=4}^n \left(\frac{1}{k-3} - \frac{1}{k} \right) \\ &= \left(\frac{1}{1} - \frac{1}{4} \right) + \left(\frac{1}{2} - \frac{1}{5} \right) + \left(\frac{1}{3} - \frac{1}{6} \right) + \left(\frac{1}{4} - \frac{1}{7} \right) + \left(\frac{1}{5} - \frac{1}{8} \right) + \\ &\quad + \cdots + \left(\frac{1}{n-7} - \frac{1}{n-4} \right) + \left(\frac{1}{n-6} - \frac{1}{n-3} \right) + \left(\frac{1}{n-5} - \frac{1}{n-2} \right) + \\ &\quad + \left(\frac{1}{n-4} - \frac{1}{n-1} \right) + \left(\frac{1}{n-3} - \frac{1}{n} \right) \\ &= 1 + \frac{1}{2} + \frac{1}{3} - \frac{1}{n-2} - \frac{1}{n-1} - \frac{1}{n}. \end{aligned}$$

The limit of the sequence $\{S_n\}$ is:

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{2} + \frac{1}{3} - \frac{1}{n-2} - \frac{1}{n-1} - \frac{1}{n} \right) = 1 + \frac{1}{2} + \frac{1}{3} = \frac{6+3+2}{6} = \frac{11}{6}.$$

Since the sequence of partial sums $\{S_n\}$ converges, the series converges as well, and the limit of the sequence of partial sums is also the sum of the series, which is $\frac{11}{6}$.

42. The series is $\sum_{k=2}^{\infty} \ln \left(\frac{k}{k+1} \right) = \sum_{k=2}^{\infty} (\ln k - \ln(k+1))$. The n^{th} partial sum of the series is

$$\begin{aligned} S_n &= \sum_{k=2}^n (\ln k - \ln(k+1)) \\ &= (\ln 1 - \ln 2) + (\ln 2 - \ln 3) + \cdots + (\ln(n-1) - \ln n) + (\ln n - \ln(n+1)) \\ &= \ln 1 - \ln(n+1) = -\ln(n+1). \end{aligned}$$

Since $\lim_{n \rightarrow \infty} S_n = -\infty$, the sequence of partial sums $\{S_n\}$ diverges, which in turn means that the series diverges.

43. The series is

$$1 + \frac{1 \cdot 2}{1 \cdot 3} + \frac{1 \cdot 2 \cdot 3}{1 \cdot 3 \cdot 5} + \frac{1 \cdot 2 \cdot 3 \cdot 4}{1 \cdot 3 \cdot 5 \cdot 7} + \cdots = \sum_{k=1}^{\infty} \frac{2^k \cdot (k!)(k!)}{(2k)!},$$

where we use the fact that

$$\frac{1}{1 \cdot 3 \cdot 5 \cdot 7 \cdots (2k-1)} = \frac{2 \cdot 4 \cdot 6 \cdot 8 \cdots (2k)}{1 \cdot 2 \cdot 3 \cdot 4 \cdots (2k)} = \frac{2^k \cdot [1 \cdot 2 \cdot 3 \cdot 4 \cdots k]}{(2k)!} = \frac{2^k \cdot (k!)}{(2k)!}.$$

Since the terms of the series are nonzero, and factorials are involved in the n^{th} term, the Ratio Test suggests itself to be used. The ratio of the $n+1^{\text{st}}$ and the n^{th} term of the series is

$$\begin{aligned} \frac{a_{n+1}}{a_n} &= \frac{\frac{2^{n+1} \cdot (n+1)!(n+1)!}{(2(n+1))!}}{\frac{2^n \cdot (n!)(n!)}{(2n)!}} = \frac{2^{n+1}}{2^n} \cdot \frac{(n+1)!}{n!} \cdot \frac{(n+1)!}{n!} \cdot \frac{(2n)!}{(2(n+1))!} \\ &= 2 \cdot \frac{(n+1)n!}{n!} \cdot \frac{(n+1)n!}{n!} \cdot \frac{(2n)!}{(2n+2)(2n+1)(2n)!} \\ &= 2 \cdot \frac{(n+1)(n+1)}{(2n+2)(2n+1)}. \end{aligned}$$

The limit of the absolute value of the ratio found above is

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 2 \lim_{n \rightarrow \infty} \left| \frac{(n+1)(n+1)}{(2n+2)(2n+1)} \right| = 2 \lim_{n \rightarrow \infty} \left| \frac{\left(1 + \frac{1}{n}\right) \left(1 + \frac{1}{n}\right)}{\left(2 + \frac{1}{n}\right) \left(2 + \frac{1}{n}\right)} \right| = 2 \left| \frac{1 \cdot 1}{2 \cdot 2} \right| = 2 \cdot \frac{1}{4} = \frac{1}{2} < 1.$$

Since the limit is less than 1, by the Ratio Test, the series *converges.*

44. (a) The series

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left[\left(\frac{2}{3} \right)^k - \frac{2}{k^2 + 2k} \right] = \sum_{k=1}^{\infty} \left(\frac{2}{3} \right)^k - \sum_{k=1}^{\infty} \frac{2}{k^2 + 2k}$$

is the difference between two series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \left(\frac{2}{3} \right)^k$ and $\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{2}{k^2 + 2k}$. We show below that each of these series converges, so the original series must converge, which in turn justifies our splitting the series into two parts (which is allowed only for absolutely convergent series). The series

$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \left(\frac{2}{3} \right)^k = \sum_{k=1}^{\infty} \left(\frac{2}{3} \right) \left(\frac{2}{3} \right)^{k-1}$ is a geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$, with $a = \frac{2}{3}$, and $r = \frac{2}{3}$.

Since $|r| < 1$, this series converges to a sum of

$$\frac{a}{1-r} = \frac{2/3}{1-2/3} = \frac{2/3}{1/3} = 2.$$

The n^{th} term of the series $\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{2}{k^2 + 2k}$ satisfies

$$c_n = \frac{2}{n^2 + 2n} < \frac{2}{n^2} = d_n$$

for $n \geq 1$. Since the series $\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{2}{k^2}$ is a constant multiple of a convergent p -series (since $p = 2 > 1$),

by the Comparison Test, we see that the series $\sum_{k=1}^{\infty} c_k$ converges. These calculations show that the original

series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} b_k - \sum_{k=1}^{\infty} c_k$ converges.

(b) We have already summed the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \left(\frac{2}{3} \right)^k = 2$ above. To sum the series $\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{2}{k^2 + 2k}$, consider its n^{th} partial sum, which can be simplified using partial fractions and the telescoping nature of the terms as follows:

$$\begin{aligned} S_n &= \sum_{k=1}^n \frac{2}{k^2 + 2k} = \sum_{k=1}^n \frac{2}{k(k+2)} = \sum_{k=1}^n \left(\frac{1}{k} - \frac{1}{k+2} \right) \\ &= \left(\frac{1}{1} - \frac{1}{3} \right) + \left(\frac{1}{2} - \frac{1}{4} \right) + \left(\frac{1}{3} - \frac{1}{5} \right) + \cdots + \\ &\quad + \left(\frac{1}{n-2} - \frac{1}{n} \right) + \left(\frac{1}{n-1} - \frac{1}{n+1} \right) + \left(\frac{1}{n} - \frac{1}{n+2} \right) \\ &= 1 + \frac{1}{2} - \frac{1}{n+1} - \frac{1}{n+2}. \end{aligned}$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{2} - \frac{1}{n+1} - \frac{1}{n+2} \right) = \frac{3}{2}.$$

Since the sequence $\{S_n\}$ of partial sums converges to a sum, the series converges to the same sum, that is,

$\sum_{k=1}^{\infty} c_k = \frac{3}{2}$. Finally, the required sum of the original series is

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} b_k - \sum_{k=1}^{\infty} c_k = 2 - \frac{3}{2} = \boxed{\frac{1}{2}}.$$

45. (a) The series

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left[\left(-\frac{1}{4}\right)^k + \frac{3}{k(k+1)} \right] = \sum_{k=1}^{\infty} \left(-\frac{1}{4}\right)^k + \sum_{k=1}^{\infty} \frac{3}{k(k+1)}$$

is the sum of two series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \left(-\frac{1}{4}\right)^k$ and $\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{3}{k(k+1)}$. We show below that each of these series converges, so the original series converges as well, which justifies our splitting the series into two parts (which is allowed only for absolutely convergent series). The series

$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \left(-\frac{1}{4}\right)^k = \sum_{k=1}^{\infty} \left(-\frac{1}{4}\right) \left(-\frac{1}{4}\right)^{k-1}$ is a geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$, with $a = -\frac{1}{4}$ and $r = -\frac{1}{4}$. Since $|r| < 1$, the series converges to a sum of

$$\frac{a}{1-r} = \frac{-\frac{1}{4}}{1 - \left(-\frac{1}{4}\right)} = \frac{-\frac{1}{4}}{1 + \frac{1}{4}} = \frac{-\frac{1}{4}}{\frac{5}{4}} = -\frac{1}{5}.$$

The n^{th} term of the series $\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{3}{k(k+1)}$ satisfies

$$c_n = \frac{3}{n(n+1)} < \frac{3}{n^2} = d_n$$

for $n \geq 1$. Since the series $\sum_{k=1}^{\infty} d_k = \sum_{k=1}^{\infty} \frac{3}{k^2}$ is a constant multiple of a convergent p -series (since $p = 2 > 1$),

by the Comparison Test, we see that the series $\sum_{k=1}^{\infty} c_k$ converges. These calculations demonstrate that the

original series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} b_k + \sum_{k=1}^{\infty} c_k$ converges.

(b) We have already summed the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \left(-\frac{1}{4}\right)^k = -\frac{1}{5}$ above. To sum the series

$\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{3}{k(k+1)}$ consider its n^{th} partial sum, which can be simplified using partial fractions and the telescoping nature of the terms as follows:

$$\begin{aligned} S_n &= \sum_{k=1}^n \frac{3}{k(k+1)} = \sum_{k=1}^n 3 \left(\frac{1}{k} - \frac{1}{k+1} \right) \\ &= 3 \left(\frac{1}{1} - \frac{1}{2} \right) + 3 \left(\frac{1}{2} - \frac{1}{3} \right) + \cdots + 3 \left(\frac{1}{n-1} - \frac{1}{n} \right) + 3 \left(\frac{1}{n} - \frac{1}{n+1} \right) \\ &= 3 - \frac{3}{n+1}. \end{aligned}$$

We have

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(3 - \frac{3}{n+1} \right) = 3.$$

Since the sequence $\{S_n\}$ of partial sums converges to a sum, the series converges to the same sum, that is

$\sum_{k=1}^{\infty} c_k = 3$. Finally, the required sum of the original series is

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} b_k + \sum_{k=1}^{\infty} c_k = -\frac{1}{5} + 3 = \boxed{\frac{14}{5}}.$$

Challenge Problems

46. (a) The series is

$$1 - 1 - \frac{1}{2} + \frac{1}{3} + \frac{1}{3} - \frac{1}{9} - \frac{1}{4} + \frac{1}{27} + \frac{1}{5} - \frac{1}{81} - \cdots.$$

The n^{th} term of this series is

$$a_n = \left[(-1)^{n+1} \frac{1}{n} + (-1)^n \frac{1}{3^{n-1}} \right] = (-1)^{n-1} \left[\frac{1}{n} - \frac{1}{3^n} \right].$$

To show the series converges, we apply the Alternating Series Test. We have

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \left(\frac{1}{n} - \frac{1}{3^n} \right) = 0 - 0 = 0.$$

Also, by the Algebraic Difference Test,

$$|a_{n+1}| - |a_n| = \frac{1}{n+1} - \frac{1}{3^{n+1}} - \frac{1}{n} + \frac{1}{3^n} = \frac{1}{n+1} - \frac{1}{n} - \frac{1}{3} \cdot \frac{1}{3^n} + \frac{1}{3^n} = \frac{n-n-1}{n(n+1)} + \frac{2}{3} \cdot \frac{1}{3^n} = -\frac{1}{n(n+1)} + \frac{2}{3^{n+1}} < 0$$

provided

$$\frac{2}{3^{n+1}} < \frac{1}{n(n+1)}$$

or, $2n(n+1) < 3^{n+1}.$

The left side of the inequality is a polynomial whose terms are $\{4, 12, 24, \dots\}$ for $n = 1, 2, 3, \dots$, while the right side of the inequality is an exponential series with terms $\{9, 27, 81, \dots\}$ for $n = 1, 2, 3, \dots$. So we see that the inequality is satisfied for $n \geq 1$, so by the Alternating Series Test, the series converges.

(b) Since the series converges to a sum, we can split up the n^{th} term as two terms and sum them separately, so that the sum of the series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} b_k + \sum_{k=1}^{\infty} c_k$. Here, the first sum

$$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \cdots$$

is the alternating harmonic series, which we know to be a convergent series (using, for example, the Alternating Series Test, or consulting the Table 6 on p.598). The alternating harmonic series has a sum

$$\sum_{k=1}^{\infty} b_k = \ln 2 \text{ (see the note on p.583).}$$

The second sum is

$$\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{3^{k-1}} = \frac{-1}{3^0} + \frac{1}{3^1} + \frac{-1}{3^2} + \frac{1}{3^3} + \frac{-1}{3^4} \cdots = -1 + \frac{1}{3} - \frac{1}{9} + \frac{1}{27} - \frac{1}{81} + \cdots,$$

is a geometric series $\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{3^{k-1}} = \sum_{k=1}^{\infty} \left(-\frac{(-1)^{k-1}}{3^{k-1}} \right) = \sum_{k=1}^{\infty} -\left(-\frac{1}{3}\right)^{k-1}$ of the form $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = -1$ and $r = -\frac{1}{3}$. Since $|r| < 1$, the geometric series also converges to a sum

$$\frac{a}{1-r} = \frac{-1}{1 - \left(-\frac{1}{3}\right)} = \frac{-1}{1 + 1/3} = -\frac{3}{4}.$$

So the sum of the original series is

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} b_k + \sum_{k=1}^{\infty} c_k = \boxed{\ln 2 - \frac{3}{4}}.$$

47. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{2k^3-1}$. The n^{th} term of this series satisfies

$$a_n = \frac{\ln n}{2n^3-1} < \frac{n}{2n^3-1} = b_n$$

since $\ln n < n$ for $n \geq 1$. (To see this, let $f(x) = \ln x - x$ be a related function of $\ln n - n$. Then $f'(x) = \frac{1}{x} - 1 \leq 0$ when $x \geq 1$. So the function is decreasing for $x \geq 1$. Since $f(1) = \ln 1 - 1 = 0 - 1 = -1 < 0$, and the function is decreasing for $x \geq 1$, it means that $f(x) < 0$ for all $x \geq 1$, that is, $\ln x < x$ for all $x \geq 1$. So, we have $\ln n < n$ for $n \geq 1$ as well.) Now the series $\sum_{k=1}^{\infty} b_k$ converges by comparing it with the convergent p -series $\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is convergent since $p = 2 > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{b_n}{c_n} = \lim_{n \rightarrow \infty} \frac{\frac{n}{2n^3-1}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{n^3}{2n^3-1} = \lim_{n \rightarrow \infty} \frac{1}{2-\frac{1}{n}} = \frac{1}{2}.$$

Since the limit is a positive real number, by the Limit Comparison Test, the series $\sum_{k=1}^{\infty} b_k$ converges; and this in turn, via the Comparison Test, means that the original series $\sum_{k=1}^{\infty} a_k$ converges as well.

48. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \sin^3\left(\frac{1}{k}\right)$. Note that the terms of the series are positive, since $0 < \frac{1}{n} \leq 1$ for $1 \leq n < \infty$, and $\sin \theta$ is positive for $\theta = \frac{1}{n}$ that satisfies $0 < \theta \leq 1$ (radians). We compare the series to $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^3}$, which is a convergent p -series since $p = 3 > 1$. We have

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\sin^3\left(\frac{1}{n}\right)}{\frac{1}{n^3}} = \lim_{n \rightarrow \infty} \left[\frac{\sin\left(\frac{1}{n}\right)}{\frac{1}{n}} \right]^3 = \left[\lim_{n \rightarrow \infty} \frac{\sin\left(\frac{1}{n}\right)}{\frac{1}{n}} \right]^3 = \left[\lim_{x \rightarrow 0} \frac{\sin x}{x} \right]^3 = 1^3 = 1,$$

where we made the substitution $x = \frac{1}{n}$ and used the standard limits result $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$. Since the limit is a positive real number, by the Limit Comparison Test, the original series $\sum_{k=1}^{\infty} a_k$ is seen to converge.

Note: We could instead have used the Comparison Test for convergence using the series $\sum_{k=1}^{\infty} b_k$, since the n^{th} term of the absolute value series $\sum_{k=1}^{\infty} |a_k|$ satisfies

$$|a_n| = \left| \sin\left(\frac{1}{n}\right) \right|^3 \leq \frac{1}{n^3}$$

for all $n \geq 1$, since $|\sin \theta| < \theta$ for $\theta = \frac{1}{n}$ in the interval $(0, 1]$. Since the absolute value series converges by the Comparison Test, the original series converges absolutely, and therefore converges.

8.8 Power Series

Concepts and Vocabulary

1. **True:** The theorem regarding a power series in the form $\sum_{k=0}^{\infty} a_k(x-c)^k$ states that the series converges either at $x=c$, or converges absolutely for all x , or converges absolutely on $|x-c| < R$, where R is a positive number. (For a full statement, see p.602.)

2. **True:** This follows from the Ratio Test for convergence of a series.

3. **True:** This follows from the theorem concerning a power series in the form $\sum_{k=0}^{\infty} a_k(x-c)^k$ with $c=0$; see Problem 1 for the reasoning.

4. **False:** There is no reason that this happen. For example, the power series $\sum_{k=1}^{\infty} \frac{x^k}{k}$ converges absolutely if $|x| < 1$ since

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{n+1}}{\frac{x^n}{n}} \right| = \lim_{n \rightarrow \infty} \left| \frac{x^{n+1}}{x^n} \cdot \frac{n}{n+1} \right| = |x| \lim_{n \rightarrow \infty} \left| \frac{n}{n+1} \right| = |x| \lim_{n \rightarrow \infty} \left| \frac{1}{1 + \frac{1}{n}} \right| = |x| < 1$$

for convergence by the Ratio Test, as claimed. This means the interval of convergence is $(-1, 1)$.

At $x=1$, the series becomes $\sum_{k=1}^{\infty} \frac{1}{k}$ which, being the harmonic series, diverges.

At $x=-1$, the series becomes $-\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$ which, being a constant multiple of the convergent alternating harmonic series also converges. So the power series is convergent on the interval $[-1, 1)$: that is, it is convergent at the one endpoint of its interval of convergence but not at the other endpoint.

5. **True:** This follows from the theorem on the radius of convergence of a power series, which says the power series $\sum_{k=0}^{\infty} a_k(x-c)^k$ converges absolutely for all $|x-c| < R$. The radius R here is a property of the series and not of the value of c , which means that the power series will have the same radius of convergence for any value of c .

6. **False:** If R is the radius of convergence of the power series $\sum_{k=0}^{\infty} a_k(x-c)^k$, then $\sum_{k=0}^{\infty} a_k x^k$ converges in the interval $-R < x < R$, while $\sum_{k=0}^{\infty} a_k(x-3)^k$ converges in the interval $-R < x-3 < R$, or simplifying, $-R+3 < x < R+3$. This shows that the two series have different intervals of convergence.

7. **False:** This follows from the theorem on convergence and divergence of a power series, which says that if a power series $\sum_{k=0}^{\infty} a_k x^k$ converges for $x_0 \neq 0$, then it converges absolutely for all numbers x for which $|x| < |x_0|$, or $-|x_0| < x < |x_0|$. The endpoints $-|x_0|$ and $|x_0|$ have to be examined separately, and if the series converges at $|x_0| = 8$, then it does not follow that the series also converges at $-|x_0| = -8$.

8. **True:** From the theorem quoted in Problem 7, if $|x_0|=3$, then the power series converges in the interval $-3 < x < 3$, so it also converges for $x=1$.

9. **True:** As in Problems 7 and 8, if the series converges for $x=-4$, this means $|x_0|=4$, so since the series converges in the interval $-4 < x < 4$, it converges for $x=3$ as well.

10. False: If the series converges for $x = 3$, then it may converge or diverge at $x = 5$ because the radius of convergence of the series $\sum_{k=0}^{\infty} a_k x^k$ is not given or known. For instance, if the radius of convergence is 4, then the series will diverge at $x = 5$, but if the radius of convergence is 7, then the series will converge at $x = 5$.

11. False: Intervals of convergence for the power series $\sum_{k=0}^{\infty} a_k x^k$ could be of the form $|x| \leq R$, or $[-R, R]$, if convergence at the endpoints can be demonstrated. So we can have intervals of the form $[-2, 2]$ or $[-4, 4]$, but not $[-2, 4]$. This is because if the interval of convergence were $[-2, 4]$ it would mean the power series diverges for $x < -2$, but by the theorem on convergence and divergence of a power series, it would then mean that the series also diverges for $x > 2$, which would contradict the statement that it converges in the interval $[-2, 4]$.

12. False: All that can be said is that if a power series diverges for $x = x_1$, then it diverges for all $x > x_1$. It may or may not converge for $x < x_1$. As an illustration, the power series considered in Problem 4 above, $\sum_{k=1}^{\infty} \frac{x^k}{k}$ diverges for $x_1 = 3$, but it also diverges for $x = 2$, and $2 < 3$. On the other hand, it converges at $x = \frac{1}{2}$, (since the radius of convergence of the power series is 1), and $\frac{1}{2} < 3$ as well. So this shows that a series can either converge or diverge for x values less than a certain value x_1 that leads to divergence of the series.

Skill Building

13. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} kx^k$ is a series of nonzero terms for $k \geq 1$ if $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1)x^{n+1}}{nx^n} \right| = |x| \lim_{n \rightarrow \infty} \left(\frac{n+1}{n} \right) = |x| \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right) = |x| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 1$ or $-1 < x < 1$. For $x = -1$, the series becomes

$$\sum_{k=0}^{\infty} kx^k = \sum_{k=0}^{\infty} (-1)^k k = 0 + -1 + 2 - 3 + 4 - \dots$$

which diverges since the sequence of partial sums is $\{S_n\} = \{0, -1, 1, -2, 2, -3, 3, \dots\}$, and it oscillates between growing positive and negative numbers as n grows large. Since the sequence of partial sums is not convergent, the series is not convergent.

For $x = 1$, the series becomes

$$\sum_{k=0}^{\infty} kx^k = \sum_{k=0}^{\infty} k(1)^k = \sum_{k=0}^{\infty} k = \infty,$$

so it diverges.

Concluding, the power series $\sum_{k=0}^{\infty} kx^k$ converges for $\boxed{-1 < x < 1}$.

14. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{kx^k}{3^k}$ is a series of nonzero terms for $k \geq 1$ if $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)x^{n+1}}{3^{n+1}}}{\frac{nx^n}{3^n}} \right| = \frac{|x|}{3} \lim_{n \rightarrow \infty} \frac{n+1}{n} = \frac{|x|}{3} \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right) = \frac{|x|}{3} < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 3$, or $-3 < x < 3$.

For $x = -3$, the series becomes

$$\sum_{k=0}^{\infty} \frac{kx^k}{3^k} = \sum_{k=0}^{\infty} \frac{(-k)(-3)^k}{3^k} = \sum_{k=0}^{\infty} (-1)^{k+1} k = 0 + 1 - 2 + 3 - 4 + \cdots$$

The sequence of partial sums of the series is $\{S_n\} = \{0, 1, -1, 2, -2, \dots\}$ which oscillates between growing positive and negative values as n grows large. Since the sequence of partial sums does not converge, neither does the series.

For $x = 3$, the series becomes

$$\sum_{k=0}^{\infty} \frac{kx^k}{3^k} = \sum_{k=0}^{\infty} \frac{k3^k}{3^k} = \sum_{k=0}^{\infty} k = \infty,$$

so this series diverges.

Concluding, the power series $\sum_{k=0}^{\infty} \frac{kx^k}{3^k}$ converges for $\boxed{-3 < x < 3}$.

15. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(x+1)^k}{3^k} = 1 + \sum_{k=1}^{\infty} \frac{(x+1)^k}{3^k}$ is a series of nonzero terms if $x \neq -1$. (At $x = -1$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(x+1)^{n+1}}{3^{n+1}}}{\frac{(x+1)^n}{3^n}} \right| = \frac{1}{3} |x+1| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x+1| < 3$, or $-3 < x+1 < 3$, or $-4 < x < 2$.

At $x = -4$, the series becomes

$$\sum_{k=0}^{\infty} \frac{(x+1)^k}{3^k} = \sum_{k=0}^{\infty} \frac{(-4+1)^k}{3^k} = \sum_{k=0}^{\infty} \frac{(-3)^k}{3^k} = \sum_{k=0}^{\infty} (-1)^k = 1 - 1 + 1 - 1 + \cdots$$

The sequence of partial sums of the series is $\{S_n\} = \{1, 0, 1, 0, \dots\}$ which oscillates between 1 and 0 for all n . Since the sequence of partial sums does not converge, neither does the series.

At $x = 2$, the series becomes

$$\sum_{k=0}^{\infty} \frac{(x+1)^k}{3^k} = \sum_{k=0}^{\infty} \frac{(2+1)^k}{3^k} = \sum_{k=0}^{\infty} \frac{3^k}{3^k} = \sum_{k=0}^{\infty} 1 = \infty,$$

so this series diverges.

Concluding, the power series $\sum_{k=0}^{\infty} \frac{(x+1)^k}{3^k}$ converges for $\boxed{-4 < x < 2}$.

16. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x-2)^k}{k^2}$ is a series of nonzero terms for $x \neq 2$. (At $x = 2$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(x-2)^{n+1}}{(n+1)^2}}{\frac{(x-2)^n}{n^2}} \right| = |x-2| \lim_{n \rightarrow \infty} \frac{n^2}{(n+1)^2} = |x-2| \lim_{n \rightarrow \infty} \frac{1}{(1 + \frac{1}{n})^2} = |x-2| \frac{1}{(1+0)^2} = |x-2| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $-1 < x-2 < 1$, or $1 < x < 3$.

At $x = 1$, the series becomes

$$\sum_{k=1}^{\infty} \frac{(x-2)^k}{k^2} = \sum_{k=1}^{\infty} \frac{(1-2)^k}{k^2} = \sum_{k=1}^{\infty} \frac{(-1)^k}{k^2}$$

which is an alternating series whose n^{th} term goes to zero as $n \rightarrow \infty$; also the terms of the series are nonincreasing, because by the Algebraic Ratio Test $\left| \frac{a_{n+1}}{a_n} \right| = \frac{n^2}{(n+1)^2} < 1$ for $n \geq 1$. By the Alternating Series Test, the power series converges for $x = 1$.

At $x = 3$, the series becomes

$$\sum_{k=1}^{\infty} \frac{(x-2)^k}{k^2} = \sum_{k=1}^{\infty} \frac{(3-2)^k}{k^2} = \sum_{k=1}^{\infty} \frac{1}{k^2}$$

which is a convergent p -series (since $p = 2 > 1$), so the power series converges for $x = 3$.

Concluding, the power series $\sum_{k=1}^{\infty} \frac{(x-2)^k}{k^2}$ converges for $\boxed{1 \leq x \leq 3}$.

17. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{x^k}{2^k(k+1)} = 1 + \sum_{k=1}^{\infty} \frac{x^k}{2^k(k+1)}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{2^{n+1}(n+2)}}{\frac{x^n}{2^n(n+1)}} \right| = \frac{|x|}{2} \lim_{n \rightarrow \infty} \frac{n+1}{n+2} = \frac{|x|}{2} \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} = \frac{|x|}{2} < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 2$, which means the radius of convergence $\boxed{R = 2}$.

At $x = -2$, the series becomes

$$\sum_{k=0}^{\infty} \frac{x^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{(-2)^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{(-1)^k}{k+1} = \sum_{k'=1}^{\infty} \frac{(-1)^{k'-1}}{k'} = \sum_{k'=1}^{\infty} \frac{(-1)^{k'+1}}{(-1)^2 k'} = \sum_{k'=1}^{\infty} \frac{(-1)^{k'+1}}{k'}$$

where $k' = k + 1$; the series is the alternating harmonic series which converges. So the power series converges for $x = -2$.

At $x = 2$, the series becomes

$$\sum_{k=0}^{\infty} \frac{x^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{2^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{1}{k+1} = \sum_{k'=1}^{\infty} \frac{1}{k'}$$

where $k' = k + 1$; the series is the harmonic series which diverges. So the power series diverges for $x = 2$.

Concluding, the interval of convergence of the power series is $\boxed{-2 \leq x < 2}$.

(b) Before we do the root test, it would be useful to prove the following result which shall be used in several problems below: $\lim_{n \rightarrow \infty} (n+a)^{1/n} = 1$. To prove this, set $y = (n+a)^{1/n}$. Then

$\ln y = \frac{1}{n} \ln(n+a) = \frac{\ln(n+a)}{n}$. We have, using L'Hôpital's rule on a related function of the ratio:

$$\lim_{n \rightarrow \infty} y = \lim_{n \rightarrow \infty} e^{\ln y} = \lim_{n \rightarrow \infty} e^{\ln(n+a)/n} = \lim_{x \rightarrow \infty} e^{\ln(x+a)/x} = e^{\lim_{x \rightarrow \infty} \frac{\ln(x+a)}{x}} = e^{\lim_{x \rightarrow \infty} \frac{1/x}{1} / 1} = e^{\lim_{x \rightarrow \infty} \frac{1}{x+a}} = e^0 = 1.$$

This proves the claimed result. (Note that this formula holds for any value of a , as the proof does not restrict the value of a . For $a < 0$, we require $a > -n$, which for any fixed a occurs as $n \rightarrow \infty$.)

By the Root Test, using the limit result above for $a = 1$,

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{x^n}{2^n(n+1)} \right|} = \lim_{n \rightarrow \infty} \frac{|x|}{2(n+1)^{1/n}} = \frac{|x|}{2} \lim_{n \rightarrow \infty} \frac{1}{(n+1)^{1/n}} = \frac{|x|}{2} < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also, the endpoint computations remain the same, so the radius of convergence of the power series is $\boxed{R = 2}$ and the interval of convergence is $\boxed{-2 \leq x < 2}$.

(c) Answers will vary.

18. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1)^k \frac{x^k}{2^k(k+1)} = 1 + \sum_{k=1}^{\infty} (-1)^k \frac{x^k}{2^k(k+1)}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1} x^{n+1}}{2^{n+1}(n+2)}}{\frac{(-1)^n x^n}{2^n(n+1)}} \right| = \frac{|x|}{2} |(-1)| \lim_{n \rightarrow \infty} \frac{n+1}{n+2} = \frac{|x|}{2} \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} = \frac{|x|}{2} < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 2$, which means the radius of convergence is $\boxed{R = 2}$.

At $x = -2$, the series becomes

$$\sum_{k=0}^{\infty} (-1)^k \frac{x^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{(-1)^k (-2)^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{(-1)^k (-1)^k 2^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{(-1)^{2k}}{k+1} = \sum_{k=0}^{\infty} \frac{1}{k+1} = \sum_{k'=1}^{\infty} \frac{1}{k'}$$

using $k' = k + 1$; the series is the harmonic series which diverges, so the power series diverges for $x = -2$.

At $x = 2$, the series becomes

$$\sum_{k=0}^{\infty} (-1)^k \frac{x^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{(-1)^k 2^k}{2^k(k+1)} = \sum_{k=0}^{\infty} \frac{(-1)^k}{k+1} = \sum_{k'=1}^{\infty} \frac{(-1)^{k'-1}}{k'} = \sum_{k'=1}^{\infty} \frac{(-1)^{k'+1}}{(-1)^2 k'} = \sum_{k'=1}^{\infty} \frac{(-1)^{k'+1}}{k'}$$

where $k' = k + 1$; the series is the alternative harmonic series, which converges. So the power series converges for $x = 2$. Concluding, the interval of convergence of the power series is $\boxed{-2 < x \leq 2}$.

(b) By the Root Test, using the limit result proved in Problem 17 (b) for $a = 1$, that is,

$\lim_{n \rightarrow \infty} (n+1)^{1/n} = 1$, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{|(-1)^n \frac{x^n}{2^n(n+1)}|} = \frac{|x|}{2} \lim_{n \rightarrow \infty} \frac{1}{(n+1)^{1/n}} = \frac{|x|}{2} < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also, the endpoint computations remain the same, so the radius of convergence of the power series is $\boxed{R = 2}$ and the interval of convergence is $\boxed{-2 < x \leq 2}$.

(c) Answers will vary.

19. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{x^k}{k+5} = \frac{1}{5} + \sum_{k=1}^{\infty} \frac{x^k}{k+5}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to $\frac{1}{5}$.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{n+6}}{\frac{x^n}{n+5}} \right| = |x| \lim_{n \rightarrow \infty} \frac{n+5}{n+6} = |x| \lim_{n \rightarrow \infty} \frac{1 + \frac{5}{n}}{1 + \frac{6}{n}} = |x| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 1$, which means the radius of convergence is $\boxed{R = 1}$.

At $x = -1$, the power series becomes

$$\sum_{k=0}^{\infty} \frac{x^k}{k+5} = \sum_{k=0}^{\infty} \frac{(-1)^k}{k+5} = \sum_{k'=5}^{\infty} \frac{(-1)^{k'-5}}{k'} = \sum_{k'=5}^{\infty} \frac{(-1)^{k'+1}}{(-1)^6 k'} = \sum_{k'=5}^{\infty} \frac{(-1)^{k'+1}}{k'}$$

where $k' = k + 5$; this is an alternating harmonic series from the fifth term onward. Since the alternating harmonic series $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$ converges, and its convergence property is unaffected by the removal of a finite number of terms, the power series converges for $x = -1$.

At $x = 1$, the power series becomes

$$\sum_{k=0}^{\infty} \frac{x^k}{k+5} = \sum_{k=0}^{\infty} \frac{(1)^k}{k+5} = \sum_{k=0}^{\infty} \frac{1}{k+5} = \sum_{k'=5}^{\infty} \frac{1}{k'}$$

using $k' = k + 5$; this is the harmonic series from the fifth term forward. Since the harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ diverges, and the divergence property remains unaffected by the removal of a finite number of terms, the power series diverges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x < 1}$.

(b) By the Root Test, using the limit result proved in Problem 17 (b) for $a = 5$, that is,

$\lim_{n \rightarrow \infty} (n+5)^{1/n} = 1$, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{x^n}{n+5} \right|} = |x| \lim_{n \rightarrow \infty} \frac{1}{(n+5)^{1/n}} = |x| < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also, the endpoint computations remain the same, so the radius of convergence of the power series is $\boxed{R = 1}$ and the interval of convergence is $\boxed{-1 \leq x < 1}$.

(c) Answers will vary.

20. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{x^k}{1+k^2} = 1 + \sum_{k=1}^{\infty} \frac{x^k}{1+k^2}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{1+(n+1)^2}}{\frac{x^n}{1+n^2}} \right| = |x| \lim_{n \rightarrow \infty} \frac{1+n^2}{1+(n+1)^2} \\ &= |x| \lim_{n \rightarrow \infty} \frac{\frac{1}{n^2} + 1}{\frac{1}{n^2} + \left(1 + \frac{1}{n}\right)^2} = |x| \frac{0+1}{0+(1+0)^2} \\ &= |x| < 1 \end{aligned}$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 1$, which means the radius of convergence is $\boxed{R = 1}$.

At $x = -1$, the power series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{x^k}{1+k^2} = \sum_{k=0}^{\infty} \frac{(-1)^k}{1+k^2}.$$

This is an alternating series. The n^{th} term satisfies

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{1}{1+n^2} = 0.$$

Also, by the Algebraic Ratio Test,

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{\frac{1}{1+(n+1)^2}}{\frac{1}{1+n^2}} = \frac{1+n^2}{1+(n+1)^2} < 1 \text{ for } n \geq 0.$$

So the terms are nonincreasing. By the Alternating Series Test, the power series converges for $x = -1$.

At $x = 1$, the power series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{x^k}{1+k^2} = \sum_{k=0}^{\infty} \frac{1}{1+k^2}.$$

The n^{th} term of the series satisfies

$$a_n = \frac{1}{1+n^2} < \frac{1}{n^2} = b_n \text{ for } n \geq 1.$$

Comparing with the convergent p -series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is convergent since $p = 2 > 1$, the series $\sum_{k=1}^{\infty} \frac{1}{1+k^2}$ converges. This means the series

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{1}{1+k^2} = 1 + \sum_{k=1}^{\infty} \frac{1}{1+k^2}$$

also converges, which means the power series converges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x \leq 1}$.

(b) By the Root Test, using the limit result proved in Problem 17 (b) for $a = 0$, that is, $\lim_{n \rightarrow \infty} n^{1/n} = 1$, we have

$$\begin{aligned} \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} &= \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{x^n}{1+n^2} \right|} = |x| \lim_{n \rightarrow \infty} \frac{1}{(1+n^2)^{1/n}} = |x| \lim_{n \rightarrow \infty} \frac{1}{(n^2)^{1/n} \left(\frac{1}{n^2} + 1 \right)^{1/n}} \\ &= |x| \lim_{n \rightarrow \infty} \left(\frac{1}{n^{1/n}} \right)^2 \cdot \frac{1}{\left[\lim_{n \rightarrow \infty} \left(\frac{1}{n^2} + 1 \right) \right]^{\lim_{n \rightarrow \infty} \frac{1}{n}}} \\ &= |x| \cdot 1^2 \cdot \frac{1}{[0+1]^0} = |x| < 1 \end{aligned}$$

for convergence of the series. So we get the same result as with the Ratio Test. Also, the endpoint computations remain the same, so the radius of convergence of the power series is $\boxed{R = 1}$ and the interval of convergence is $\boxed{-1 \leq x \leq 1}$.

(c) Answers will vary.

21. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k^2 x^k}{3^k}$ is a series of nonzero terms for $k \geq 1$ if $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)^2 x^{n+1}}{3^{n+1}}}{\frac{n^2 x^n}{3^n}} \right| = \frac{|x|}{3} \lim_{n \rightarrow \infty} \frac{(n+1)^2}{n^2} = \frac{|x|}{3} \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^2 = \frac{|x|}{3} < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 3$, which means the radius of convergence is $\boxed{R = 3}$.

At $x = -3$, the power series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k^2 x^k}{3^k} = \sum_{k=0}^{\infty} \frac{k^2 (-3)^k}{3^k} = \sum_{k=0}^{\infty} (-1)^k k^2.$$

We have

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} n^2 = \infty,$$

so the series diverges by the Divergence Test. This means the power series diverges for $x = -3$.

At $x = 3$, the power series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k^2 3^k}{3^k} = \sum_{k=0}^{\infty} k^2.$$

Since

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} n^2 = \infty,$$

the series diverges by the Divergence Test. So the power series diverges at $x = 3$.

Concluding, the interval of convergence of the power series is $\boxed{-3 < x < 3}$.

(b) By the Root Test, using the limit result proved in Problem 17 (b) for $a = 0$, that is, $\lim_{n \rightarrow \infty} n^{1/n} = 1$, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n^2 x^n}{3^n} \right|} = \frac{|x|}{3} \lim_{n \rightarrow \infty} \left(n^{1/n} \right)^2 = \frac{|x|}{3} \left(\lim_{n \rightarrow \infty} n^{1/n} \right)^2 = \frac{|x|}{3} \cdot 1^2 = \frac{|x|}{3} < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also the endpoint computations remain the same, so the radius of convergence of the power series is $\boxed{R = 3}$ and the interval of convergence is $\boxed{-3 < x < 3}$.

(c) Answers will vary.

22. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{2^k x^k}{3^k} = 1 + \sum_{k=1}^{\infty} \frac{2^k x^k}{3^k}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{2^{n+1} x^{n+1}}{3^{n+1}}}{\frac{2^n x^n}{3^n}} \right| = \frac{2}{3} |x| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < \frac{3}{2}$, which means the radius of convergence is $\boxed{R = \frac{3}{2}}$.

At $x = -\frac{3}{2}$, the power series becomes

$$\sum_{k=0}^{\infty} \frac{2^k x^k}{3^k} = \sum_{k=0}^{\infty} \frac{2^k \left(-\frac{3}{2}\right)^k}{3^k} = \sum_{k=0}^{\infty} (-1)^k$$

which diverges since the sequence of partial sums $\{S_n\} = \{1, 0, 1, 0, \dots\}$ has no limit, because its terms oscillate between 1 and 0 for all n . So the power series diverges for $x = -\frac{3}{2}$.

At $x = \frac{3}{2}$, the series becomes

$$\sum_{k=0}^{\infty} \frac{2^k x^k}{3^k} = \sum_{k=0}^{\infty} \frac{2^k \left(\frac{3}{2}\right)^k}{3^k} = \sum_{k=0}^{\infty} 1 = \infty.$$

So the power series diverges at $x = \frac{3}{2}$.

Concluding, the interval of convergence of the power series is $\boxed{-\frac{3}{2} < x < \frac{3}{2}}$.

(b) By the Root Test, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{2^n x^n}{3^n} \right|} = \frac{2}{3} |x| < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also the endpoint

computations remain the same, so the radius of convergence of the power series is $\boxed{R = \frac{3}{2}}$ and the interval

of convergence is $\boxed{-\frac{3}{2} < x < \frac{3}{2}}$.

(c) Answers will vary.

23. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{kx^k}{2k+1}$ is a series of nonzero terms for $k \geq 1$ if $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)x^{n+1}}{2(n+1)+1}}{\frac{nx^n}{2n+1}} \right| = |x| \cdot \lim_{n \rightarrow \infty} \frac{n+1}{n} \cdot \lim_{n \rightarrow \infty} \frac{2n+1}{2n+3} \\ &= |x| \cdot \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right) \cdot \lim_{n \rightarrow \infty} \left(\frac{2 + \frac{1}{n}}{2 + \frac{3}{n}} \right) \\ &= |x| \cdot 1 \cdot 1 < 1 \end{aligned}$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 1$, which means the radius of convergence is $\boxed{R = 1}$.

At $x = -1$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{kx^k}{2k+1} = \sum_{k=0}^{\infty} \frac{k(-1)^k}{2k+1}.$$

We have

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{n}{2n+1} = \lim_{n \rightarrow \infty} \frac{1}{2 + \frac{1}{n}} = \frac{1}{2} \neq 0.$$

By the Divergence Test, the series diverges. So the power series diverges for $x = -1$.

At $x = 1$, the power series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{kx^k}{2k+1} = \sum_{k=0}^{\infty} \frac{k(1)^k}{2k+1} = \sum_{k=0}^{\infty} \frac{k}{2k+1}.$$

We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n}{2n+1} = \frac{1}{2} \neq 0$$

as above. By the Divergence Test, the series diverges. So the power series diverges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 < x < 1}$.

(b) By the Root Test, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{nx^n}{2n+1} \right|} = |x| \cdot \lim_{n \rightarrow \infty} \frac{1}{\left(2 + \frac{1}{n} \right)^{1/n}} = |x| \cdot \frac{1}{\lim_{n \rightarrow \infty} \left(2 + \frac{1}{n} \right)^{\lim_{n \rightarrow \infty} \frac{1}{n}}} = |x| \cdot \frac{1}{2^0} = |x| < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also the endpoint computations remain the same, so the radius of convergence of the power series is $\boxed{R = 1}$ and the interval of convergence is $\boxed{-1 < x < 1}$.

(c) Answers will vary.

24. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (6x)^k = 1 + \sum_{k=1}^{\infty} (6x)^k$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(6x)^{n+1}}{(6x)^n} \right| = |6x| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < \frac{1}{6}$, which means the radius

of convergence is $\boxed{R = \frac{1}{6}}$.

At $x = -\frac{1}{6}$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (6x)^k = \sum_{k=0}^{\infty} \left(6 \cdot \left[-\frac{1}{6}\right]\right)^k = \sum_{k=0}^{\infty} (-1)^k$$

which diverges since the sequence of partial sums of the series, $\{S_n\} = \{1, 0, 1, 0, \dots\}$ diverges because the terms oscillate between 1 and 0 for all n . So the power series diverges when $x = -\frac{1}{6}$.

At $x = \frac{1}{6}$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (6x)^k = \sum_{k=0}^{\infty} \left(6 \cdot \left[\frac{1}{6}\right]\right)^k = \sum_{k=0}^{\infty} (1)^k = \infty.$$

So the series diverges when $x = \frac{1}{6}$.

Concluding, the interval of convergence of the power series is $\boxed{-\frac{1}{6} < x < \frac{1}{6}}$.

(b) By the Root Test, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{|(6x)^n|} = |6x| < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also the endpoint

computations remain the same, so the radius of convergence of the power series is $\boxed{R = \frac{1}{6}}$ and the interval

of convergence is $\boxed{-\frac{1}{6} < x < \frac{1}{6}}$.

(c) Answers will vary.

25. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (x-3)^k = 1 + \sum_{k=1}^{\infty} (x-3)^k$ is a series of nonzero terms for $x \neq 3$. (At $x = 3$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(x-3)^{n+1}}{(x-3)^n} \right| = |x-3| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $-1 < x-3 < 1$, or $2 < x < 4$.

So the radius of convergence of the series is $\boxed{R = 1}$.

At $x = 2$, the power series becomes

$$\sum_{k=0}^{\infty} (x-3)^k = \sum_{k=0}^{\infty} (2-3)^k = \sum_{k=0}^{\infty} (-1)^k$$

which diverges since the sequence of partial sums of the series, $\{S_n\} = \{1, 0, 1, 0, \dots\}$ diverges because the terms oscillate between 1 and 0 for all n . So the power series diverges when $x = 2$.

At $x = 4$, the power series becomes

$$\sum_{k=0}^{\infty} (x-3)^k = \sum_{k=0}^{\infty} (4-3)^k = \sum_{k=0}^{\infty} (1)^k = \sum_{k=0}^{\infty} 1 = \infty.$$

So the series diverges when $x = 4$.

Concluding, the interval of convergence of the power series is $\boxed{2 < x < 4}$.

(b) By the Root Test, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{|(x-3)^n|} = |x-3| < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also the endpoint computations remain the same, so the radius of convergence of the power series is $\boxed{R = 1}$ and the interval of convergence is $\boxed{2 < x < 4}$.

(c) Answers will vary.

26. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(2x)^k}{3^k}$ is a series of nonzero terms for $k \geq 1$ if $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)(2x)^{n+1}}{3^{n+1}}}{\frac{n(2x)^n}{3^n}} \right| = \frac{|2x|}{3} \lim_{n \rightarrow \infty} \frac{n+1}{n} = \frac{|2x|}{3} \cdot \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right) = \frac{|2x|}{3} \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < \frac{3}{2}$ which means that the radius of convergence of the series is $\boxed{R = \frac{3}{2}}$.

At $x = -\frac{3}{2}$, the series reduces to

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(2x)^k}{3^k} = \sum_{k=0}^{\infty} \frac{k \left(2 \left[-\frac{3}{2} \right] \right)^k}{3^k} = \sum_{k=0}^{\infty} (-1)^k k.$$

We have

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} n = \infty.$$

By the Divergence Test, the series diverges. So the power series diverges at $x = -\frac{3}{2}$. At $x = \frac{3}{2}$, the series reduces to

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(2x)^k}{3^k} = \sum_{k=0}^{\infty} \frac{k \left(2 \cdot \frac{3}{2} \right)^k}{3^k} = \sum_{k=0}^{\infty} k = \infty.$$

This means the power series diverges at $x = \frac{3}{2}$.

Concluding, the interval of convergence of the power series is $\boxed{-\frac{3}{2} < x < \frac{3}{2}}$.

(b) By the Root Test, using the limit result proved in Problem 17 (b) for $a = 0$, that is, $\lim_{n \rightarrow \infty} n^{1/n} = 1$, we have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n(2x)^n}{3^n} \right|} = \left| \frac{2x}{3} \right| \cdot \lim_{n \rightarrow \infty} n^{1/n} = \left| \frac{2x}{3} \right| \cdot 1 < 1$$

for convergence of the series. So we get the same result as with the Ratio Test. Also the endpoint computations remain the same, so the radius of convergence of the power series is $\boxed{R = \frac{3}{2}}$ and the interval of convergence is $\boxed{-\frac{3}{2} < x < \frac{3}{2}}$.

(c) Answers will vary.

27. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{x^k}{k^3}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{(n+1)^3}}{\frac{x^n}{n^3}} \right| = |x| \lim_{n \rightarrow \infty} \frac{n^3}{(n+1)^3} = |x| \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{1}{n} \right)} = |x| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x| < 1$, and the radius of convergence is $\boxed{R = 1}$.

At $x = -1$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{k^3}$. The n^{th} term of this series satisfies

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{|(-1)^n|}{n^3} = \lim_{n \rightarrow \infty} \frac{1}{n^3} = 0.$$

By the Algebraic Ratio Test,

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{\frac{1}{(n+1)^3}}{\frac{1}{n^3}} = \frac{n^3}{(n+1)^3} < 1$$

for $n \geq 1$. Since the terms of the series are nonincreasing, and the n^{th} term has 0 limit, the series converges by the Alternating Series Test. So the power series converges for $x = -1$.

At $x = 1$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^3}$. This is a convergent p -series which converges since $p = 3 > 1$, so the power series converges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x \leq 1}$.

28. The power series $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{x^k}{\ln k}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{\ln(n+1)}}{\frac{x^n}{\ln n}} \right| = |x| \lim_{n \rightarrow \infty} \frac{\ln n}{\ln(n+1)} \\ &= |x| \lim_{y \rightarrow \infty} \frac{\ln y}{\ln(y+1)} = |x| \lim_{y \rightarrow \infty} \frac{\frac{1}{y}}{\frac{1}{y+1}} = |x| \lim_{y \rightarrow \infty} \frac{y+1}{y} \\ &= |x| \lim_{y \rightarrow \infty} \left(1 + \frac{1}{y} \right) = |x| < 1, \end{aligned}$$

for convergence of the series by the Ratio Test, where we used a related function of the ratio $\frac{\ln n}{\ln(n+1)}$ in order to apply L'Hôpital's rule. So the series converges for $|x| < 1$, and the radius of convergence is $\boxed{R = 1}$.

At $x = -1$, the series becomes $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{(-1)^k}{\ln k}$. The n^{th} term of this series satisfies

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{|(-1)^n|}{\ln n} = \lim_{n \rightarrow \infty} \frac{1}{\ln n} = 0.$$

By the Algebraic Ratio Test,

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{\frac{1}{\ln(n+1)}}{\frac{1}{\ln n}} = \frac{\ln n}{\ln(n+1)} < 1$$

if $n \geq 2$, since the natural logarithm function is an increasing function. Since the terms of the series are nonincreasing, and the n^{th} term has 0 limit, the series converges by the Alternating Series Test. So the power series converges for $x = -1$.

At $x = 1$, the series becomes $\sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} \frac{1}{\ln k}$. The n^{th} term of this series satisfies

$$a_n = \frac{1}{\ln n} > \frac{1}{n} = b_n$$

for $n \geq 2$ since $\ln n < n$ for $n \geq 2$. (This is proved as follows: $f(x) = \ln x - x$ is a decreasing function of x for $x \geq 1$, since $f'(x) = \frac{1}{x} - 1 \leq 0$ for $x \geq 1$, and since $f(1) = \ln 1 - 1 = 0 - 1 = -1 < 0$, we have, because $f(x)$ is decreasing, $f(x) < 0$ for all $x \geq 1$, that is, $\ln x < x$ for all $x \geq 1$. This in turn means $\ln n < n$ for

$n \geq 1$. We restrict to $n \geq 2$ to ensure the denominator of the n^{th} term stays nonzero.) So, comparing with the series $\sum_{k=2}^{\infty} b_k = \sum_{k=2}^{\infty} \frac{1}{k}$, which diverges being the harmonic series from the second term onward, we see by the Comparison Test that the original series diverges. So the power series is divergent for $x = 1$. Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x < 1}$.

29. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x-2)^k}{k^3}$ is a series of nonzero terms for $x \neq 2$. (At $x = 2$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(x-2)^{n+1}}{(n+1)^3}}{\frac{(x-2)^n}{n^3}} \right| = |x-2| \lim_{n \rightarrow \infty} \frac{n^3}{(n+1)^3} = |x-2| \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{1}{n}\right)^3} = |x-2| \frac{1}{(1+0)^3} = |x-2| < 1$$

for convergence of the series by the Ratio Test. So the series converges for $-1 < x - 2 < 1$, or $1 < x < 3$.

The radius of convergence of the series is $\boxed{R = 1}$.

At $x = 1$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x-2)^k}{k^3} = \sum_{k=1}^{\infty} \frac{(1-2)^k}{k^3} = \sum_{k=1}^{\infty} \frac{(-1)^k}{k^3}.$$

This series is convergent because it is absolutely convergent: the series of absolute values is

$\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{1}{k^3}$, which converges as it is a convergent p -series with $p = 3 > 1$. So the power series converges for $x = 1$.

At $x = 3$, the power series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x-2)^k}{k^3} = \sum_{k=1}^{\infty} \frac{(3-2)^k}{k^3} = \sum_{k=1}^{\infty} \frac{(1)^k}{k^3} = \sum_{k=1}^{\infty} \frac{1}{k^3}$$

which converges as it is a convergent p -series with $p = 3 > 1$. So the power series converges for $x = 3$.

Concluding, the interval of convergence of the power series is $\boxed{1 \leq x \leq 3}$.

30. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(x-2)^k}{3^k}$ is a series of nonzero terms for $k \geq 1$ if $x \neq 2$. (At $x = 2$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{n(x-2)^n}{3^n} \right|} = \left| \frac{x-2}{3} \right| \lim_{n \rightarrow \infty} n^{1/n} = \frac{|x-2|}{3} \cdot 1 < 1$$

for convergence of the series by the Root Test (where we have used the result proved in problem 17(b), that $\lim_{n \rightarrow \infty} n^{1/n} = 1$). So the series converges for $|x-2| < 3$, or $-3 < x-2 < 3$, or $-1 < x < 5$. The radius

of convergence of the series is $\boxed{R = 3}$.

At $x = -1$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(x-2)^k}{3^k} = \sum_{k=0}^{\infty} \frac{k(-1-2)^k}{3^k} = \sum_{k=0}^{\infty} \frac{k(-3)^k}{3^k} = \sum_{k=0}^{\infty} (-1)^k k$$

which diverges by the Divergence Test since $\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} n = \infty$. So the power series diverges for $x = -1$.

At $x = 5$, the power series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(x-2)^k}{3^k} = \sum_{k=0}^{\infty} \frac{k(5-2)^k}{3^k} = \sum_{k=0}^{\infty} \frac{k(3^k)}{3^k} = \sum_{k=0}^{\infty} k = \infty$$

since the sum of all the nonnegative integers is infinite. This means the power series diverges for $x = 5$. Concluding, the interval of convergence of the power series is $\boxed{-1 < x < 5}$.

31. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1} x^{2(n+1)+1}}{(2(n+1)+1)!}}{\frac{(-1)^n x^{2n+1}}{(2n+1)!}} \right| = \lim_{n \rightarrow \infty} \left| (-1) \cdot \frac{x^{2n+3}}{x^{2n+1}} \cdot \frac{(2n+1)!}{(2n+3)!} \right| \\ &= |x|^2 \lim_{n \rightarrow \infty} \frac{(2n+1)!}{(2n+3)(2n+2)(2n+1)!} = |x|^2 \lim_{n \rightarrow \infty} \frac{1}{(2n+3)(2n+2)} \\ &= |x|^2 \cdot 0 = 0 \end{aligned}$$

which means the series converges by the Ratio Test regardless of the value of x , that is, for all values of x . So the radius of convergence $\boxed{R = \infty}$, and the interval of convergence is $\boxed{-\infty < x < \infty}$.

32. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} (kx)^k$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{|(nx)^n|} = |x| \lim_{n \rightarrow \infty} n = \infty$$

if $x \neq 0$, so the series diverges by the Root Test if $x \neq 0$. When $x = 0$, the series becomes

$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} 0 = 0$, so the series converges for $x = 0$. Concluding, the radius of convergence of the series $\boxed{R = 0}$ and the series converges for $\boxed{x = 0}$.

33. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{kx^k}{\ln(k+1)}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)x^{n+1}}{\ln(n+2)}}{\frac{nx^n}{\ln(n+1)}} \right| = |x| \lim_{n \rightarrow \infty} \frac{n+1}{n} \cdot \lim_{n \rightarrow \infty} \frac{\ln(n+1)}{\ln(n+2)} \\ &= |x| \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right) \cdot \lim_{y \rightarrow \infty} \frac{\ln(y+1)}{\ln(y+2)} = |x| \cdot 1 \cdot \lim_{y \rightarrow \infty} \frac{\frac{1}{y+1}}{\frac{1}{y+2}} \\ &= |x| \lim_{y \rightarrow \infty} \frac{y+2}{y+1} = |x| \lim_{y \rightarrow \infty} \frac{1 + \frac{2}{y}}{1 + \frac{1}{y}} = |x| \cdot \frac{1+0}{1+0} = |x| \cdot 1 \\ &= |x| < 1 \end{aligned}$$

for convergence of the series by the Ratio Test, where we have used a related function of the ratio in the last factor of the limit, in order to apply L'Hôpital's rule to it. So the series converges for $-1 < x < 1$, or the radius of convergence $\boxed{R = 1}$.

At $x = -1$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k(-1)^k}{\ln(k+1)}$. The absolute value of the n^{th} term satisfies

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{n}{\ln(n+1)} = \lim_{z \rightarrow \infty} \frac{z}{\ln(z+1)} = \lim_{z \rightarrow \infty} \frac{1}{\frac{1}{z+1}} = \lim_{z \rightarrow \infty} (z+1) = \infty$$

where we apply L'Hôpital's rule to a related function of the absolute value of the n^{th} term of the series. By the Divergence Test, the power series diverges for $x = -1$.

At $x = 1$, the power series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k}{\ln(k+1)}$. Since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} |a_n| = \infty$, we see that it diverges too.

Concluding, the interval of convergence of the power series is $\boxed{-1 < x < 1}$.

34. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{x^k}{\ln(k+1)}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{\ln(n+2)}}{\frac{x^n}{\ln(n+1)}} \right| = |x| \lim_{n \rightarrow \infty} \frac{\ln(n+1)}{\ln(n+2)} = |x| \lim_{y \rightarrow \infty} \frac{\ln(y+1)}{\ln(y+2)} \\ &= |x| \lim_{y \rightarrow \infty} \frac{\frac{1}{y+1}}{\frac{1}{y+2}} = |x| \lim_{y \rightarrow \infty} \frac{y+2}{y+1} \\ &= |x| \lim_{y \rightarrow \infty} \frac{1 + \frac{2}{y}}{1 + \frac{1}{y}} = |x| \cdot \frac{1+0}{1+0} = |x| \cdot 1 < 1 \end{aligned}$$

for convergence of the series by the Ratio Test, where we have used a related function of the ratio in the limit in order to apply L'Hôpital's rule to it. So the series converges for $-1 < x < 1$, or the radius of convergence $\boxed{R = 1}$.

At $x = -1$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{\ln(k+1)}$. The n^{th} term of this series satisfies

$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{1}{\ln(n+1)} = 0$. Also by the Algebraic Ratio Test, we have

$$\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{\frac{1}{\ln(n+1)}}{\frac{1}{\ln n}} \right| = \left| \frac{\ln n}{\ln(n+1)} \right| < 1$$

for $n \geq 1$, since the natural logarithm function is an increasing function. So the series is nonincreasing. By the Alternating Series Test, the series converges. So the power series converges for $x = -1$.

At $x = 1$, the series reduces to $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\ln(n+1)}$. The n^{th} term satisfies

$$a_n = \frac{1}{\ln(n+1)} > \frac{1}{n+1} = b_n$$

for $n \geq 1$, where we have invoked the fact that $\ln(n+1) < n+1$ for $n \geq 1$ (see Problem 28 for a proof of a similar fact, $\ln n < n$ for $n \geq 2$; the proof here is analogous). Comparing with the series

$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k+1} = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots$, which is the divergent harmonic series from the second term onward,

by the Comparison Test, the series $\sum_{k=1}^{\infty} a_k$ diverges. So the power series diverges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x < 1}$.

35. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(k+1)x^k}{4^k}$ is a series of nonzero terms for $k \geq 1$ if $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)(n+2)x^{n+1}}{4^{n+1}}}{\frac{n(n+1)x^n}{4^n}} \right| = \frac{|x|}{4} \lim_{n \rightarrow \infty} \left(\frac{n+2}{n} \right) = \frac{|x|}{4} \lim_{n \rightarrow \infty} \left(1 + \frac{2}{n} \right) = \frac{|x|}{4} \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the series converges for $-4 < x < 4$, or the radius of convergence is $\boxed{R = 4}$.

At $x = -4$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(k+1)(-4)^k}{4^k} = \sum_{k=0}^{\infty} (-1)^k k(k+1)$$

which diverges by the Divergence Test since $\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} |n(n+1)| = \infty$, that is, a nonzero limit. So the power series diverges for $x = -4$.

At $x = 4$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{k(k+1)4^k}{4^k} = \sum_{k=0}^{\infty} k(k+1) = \infty$$

because the sum of product of consecutive nonnegative integers is infinite. (Alternately, we could use $\lim_{n \rightarrow \infty} a_n \neq 0$ and conclude divergence based on the Divergence Test.) So the power series diverges for $x = 4$.

Concluding, the interval of convergence of the power series is $\boxed{-4 < x < 4}$.

36. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k (x-5)^k}{k(k+1)}$ is a series of nonzero terms for $x \neq 5$. (At $x = 5$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1} (x-5)^{n+1}}{(n+1)(n+2)}}{\frac{(-1)^n (x-5)^n}{n(n+1)}} \right| = |x-5| \lim_{n \rightarrow \infty} \frac{n}{n+2} = |x-5| \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{2}{n}} = |x-5| \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the series converges if $-1 < x-5 < 1$, or $4 < x < 6$.

The radius of convergence is $\boxed{R = 1}$.

At $x = 4$, the series reduces to

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k (4-5)^k}{k(k+1)} = \sum_{k=1}^{\infty} \frac{(-1)^k (-1)^k}{k(k+1)} = \sum_{k=1}^{\infty} \frac{1}{k(k+1)}.$$

The n^{th} term of this series satisfies

$$a_n = \frac{1}{n(n+1)} < \frac{1}{n^2} = b_n$$

for $n \geq 1$. By the Comparison Test, since $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$ converges, being a p -series for $p = 2 > 1$, the

series $\sum_{k=1}^{\infty} a_k$ converges as well. So the power series converges for $x = 4$.

At $x = 6$, the series reduces to

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k (6-5)^k}{k(k+1)} = \sum_{k=1}^{\infty} \frac{(-1)^k (1)^k}{k(k+1)} = \sum_{k=1}^{\infty} \frac{(-1)^k}{k(k+1)}.$$

We could deduce convergence by noting that the series of absolute values $\sum_{k=1}^{\infty} |a_k|$ is just the series at $x = 4$, which converges from the calculation above; since the series absolutely converges, it converges. Alternately, the Alternating Series Test may be invoked: the n^{th} term of the series satisfies $\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{1}{n(n+1)} = 0$; by the Algebraic Ratio Test,

$$\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{\frac{1}{(n+1)(n+2)}}{\frac{1}{n(n+1)}} \right| = \left| \frac{n}{n+2} \right| < 1$$

for $n \geq 1$, which means the absolute values of the terms of the series are nonincreasing. So it converges by the Alternating Series Test, and the power series converges for $x = 6$.

Concluding, the interval of convergence of the power series is $\boxed{4 \leq x \leq 6}$.

37. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1)^k \frac{(x-3)^{2k}}{9^k} = 1 + \sum_{k=1}^{\infty} (-1)^k \frac{(x-3)^{2k}}{9^k}$ is a series of nonzero terms if $x \neq 3$. (At $x = 3$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1}(x-3)^{2(n+1)}}{9^{n+1}}}{\frac{(-1)^n(x-3)^{2n}}{9^n}} \right| = \frac{|x-3|^2}{9} < 1$$

for convergence of the series by the Ratio Test. So the series converges for $|x-3| < 3$, or $-3 < x-3 < 3$, or $0 < x < 6$. The radius of convergence is $\boxed{R = 3}$.

At $x = 0$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1)^k \frac{(0-3)^{2k}}{9^k} = \sum_{k=0}^{\infty} (-1)^k \frac{(-1)^{2k}(3^2)^k}{9^k} = \sum_{k=0}^{\infty} [(-1)^3]^k = \sum_{k=0}^{\infty} (-1)^k.$$

The sequence of partial sums is $\{S_n\} = \{1, 0, 1, 0, \dots\}$. Since the sequence of partial sums oscillates between 0 and 1 for large n , it does not attain a limit, that is, it diverges, which in turn means the series diverges. So the power series diverges for $x = 0$.

At $x = 6$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1)^k \frac{(6-3)^{2k}}{9^k} = \sum_{k=0}^{\infty} (-1)^k \frac{(3^2)^k}{9^k} = \sum_{k=0}^{\infty} (-1)^k.$$

This is identical to the series at $x = 0$, and since we showed that series diverges, this one does too. So the power series diverges for $x = 6$.

Concluding, the interval of convergence of the power series is $\boxed{0 < x < 6}$.

38. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{x^k}{e^k} = 1 + \sum_{k=1}^{\infty} \frac{x^k}{e^k}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{x^n}{e^n} \right|} = \frac{|x|}{e} < 1$$

for convergence of the series by the Root Test. So the series converges for $|x| < e$, or $-e < x < e$, and the radius of convergence is $\boxed{R = e}$.

At $x = -e$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(-e)^k}{e^k} = \sum_{k=0}^{\infty} (-1)^k.$$

The sequence of partial sums of this series has the form $\{S_n\} = \{1, 0, 1, 0, \dots\}$, which is nonconvergent since the terms of the series oscillate between 0 and 1 for large n . Since the sequence of partial sums diverges, the series diverges. So the power series diverges for $x = -e$.

At $x = e$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{e^k}{e^k} = \sum_{k=0}^{\infty} 1 = \infty$$

since the sum of all the nonnegative integers is infinite. So the power series diverges for $x = e$.

Concluding, the interval of convergence of the power series is $\boxed{-e < x < e}$.

39. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1)^k \frac{(2x)^k}{k!} = 1 + \sum_{k=1}^{\infty} \frac{(2x)^k}{k!}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{(-1)^{n+1} \frac{(2x)^{n+1}}{(n+1)!}}{(-1)^n \frac{(2x)^n}{n!}} \right| \\ &= \lim_{n \rightarrow \infty} \left| (-1) \cdot 2x \cdot \frac{n!}{(n+1)!} \right| = |2x| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)n!} \\ &= |2x| \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0 \end{aligned}$$

for any value of x . Since the limit is less than 1, by the Ratio Test, the series converges for any value of x . This means the radius of convergence $\boxed{R = \infty}$ and the interval of convergence of the power series is $\boxed{-\infty < x < \infty}$.

40. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(x+1)^k}{k!} = 1 + \sum_{k=1}^{\infty} \frac{(x+1)^k}{k!}$ is a series of nonzero terms for $x \neq -1$. (At $x = -1$, the series converges to 1.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(x+1)^{n+1}}{(n+1)!}}{\frac{(x+1)^n}{n!}} \right| = |x+1| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)!} = |x+1| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)n!} = |x+1| \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0$$

for any value of x . Since the limit is less than 1, by the Ratio Test, the series converges for any value of x . This means the radius of convergence $\boxed{R = \infty}$ and the interval of convergence of the power series is $\boxed{-\infty < x < \infty}$.

41. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1)^k \frac{(x-1)^{4k}}{k!} = 1 + \sum_{k=1}^{\infty} (-1)^k \frac{(x-1)^{4k}}{k!}$ is a series of nonzero terms for $x \neq 1$. (At $x = 1$, the series converges to 1.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(x-1)^{4(n+1)}}{(n+1)!}}{\frac{(x-1)^{4n}}{n!}} \right| = |(x-1)^4| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)!} \\ &= |x-1|^4 \lim_{n \rightarrow \infty} \frac{n!}{(n+1)n!} = |x-1|^4 \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0 \end{aligned}$$

for any value of x . Since the limit is less than 1, by the Ratio Test, the series converges for any value of x . This means the radius of convergence $\boxed{R = \infty}$ and the interval of convergence of the power series is $\boxed{-\infty < x < \infty}$.

42. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x+1)^k}{k(k+1)(k+2)}$ is a series of nonzero terms for $x \neq -1$ (At $x = -1$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(x+1)^{n+1}}{(n+1)(n+2)(n+3)}}{\frac{(x+1)^n}{n(n+1)(n+2)}} \right| = |x+1| \lim_{n \rightarrow \infty} \frac{n}{n+3} = |x+1| \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{3}{n}} = |x+1| \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the series converges for $-1 < x+1 < 1$ or $-2 < x < 0$, and the radius of convergence is $\boxed{R = 1}$.

At $x = -2$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{k(k+1)(k+2)}$. The n^{th} term of this series satisfies $\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{1}{n(n+1)(n+2)} = 0$. By the Algebraic Ratio Test,

$$\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{\frac{1}{(n+1)(n+2)(n+3)}}{\frac{1}{n(n+1)(n+2)}} \right| = \left| \frac{n}{n+3} \right| < 1$$

for $n \geq 1$. This means the absolute value of the terms of the series are nonincreasing. By the Alternating Series Test, the series converges. So the power series converges for $x = -2$.

At $x = 0$, the power series reduces to $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k(k+1)(k+2)}$. The n^{th} term of this series satisfies

$$a_n = \frac{1}{n(n+1)(n+2)} < \frac{1}{n^3} = b_n$$

for all $n \geq 1$. Since the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^3}$ is a convergent p -series because $p = 3 > 1$, by the Comparison

Test, the series $\sum_{k=1}^{\infty} a_k$ converges. So the power series converges for $x = 0$.

Concluding, the interval of convergence of the power series is $\boxed{-2 \leq x \leq 0}$.

43. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^k x^k}{k!}$ is a series of nonzero terms for $x \neq 0$ (At $x = 0$, the series converges to 0.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)^{n+1} x^{n+1}}{(n+1)!}}{\frac{n^n x^n}{n!}} \right| = |x| \lim_{n \rightarrow \infty} \left| \frac{(n+1)(n+1)^n}{n^n} \cdot \frac{n!}{(n+1)!} \right| \\ &= |x| \lim_{n \rightarrow \infty} \left| (n+1) \cdot \left(1 + \frac{1}{n}\right)^n \cdot \frac{n!}{(n+1)n!} \right| = |x| \lim_{n \rightarrow \infty} \left| \left(1 + \frac{1}{n}\right)^n \right| \\ &= |x|e < 1 \end{aligned}$$

for convergence of the series by the Ratio Test. So the series converges if $|x| < \frac{1}{e}$, or $-\frac{1}{e} < x < \frac{1}{e}$, and the

radius of convergence is $\boxed{R = \frac{1}{e}}$. In what follows below, we shall use a useful approximation called

Stirling's approximation to help us analyze the various limits, and to put bounds on the n^{th} terms. This states that for large n , the value of $n!$ is given by

$$n! \approx \sqrt{2\pi n} \left(\frac{n}{e}\right)^n \left(1 + \frac{1}{12n}\right) \approx \sqrt{2\pi n} \left(\frac{n}{e}\right)^n.$$

A proof of this approximation is found in most books on analysis, and shall not be given here, as it is not within the scope of the textbook. Without this result, one cannot perform the analyses to follow.

At $x = -\frac{1}{e}$, the series reduces to

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^k \left(-\frac{1}{e}\right)^k}{k!} = \sum_{k=1}^{\infty} (-1)^k \frac{k^k}{k! e^k}.$$

The n^{th} term of this series satisfies

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{n^n}{n! e^n} = \lim_{n \rightarrow \infty} \frac{\left(\frac{n}{e}\right)^n}{n!} = \lim_{n \rightarrow \infty} \frac{\left(\frac{n}{e}\right)^n}{\sqrt{2\pi n} \left(\frac{n}{e}\right)^n} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{2\pi n}} = 0$$

using Stirling's approximation quoted above. By the Algebraic Ratio Test,

$$\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{\frac{n^{n+1}}{(n+1)! e^{n+1}}}{\frac{n^n}{n! e^n}} \right| = \frac{n^n \cdot n}{n^n} \cdot \frac{n!}{(n+1)!} \cdot \frac{1}{e} = \frac{n}{n+1} \cdot \frac{1}{e} < 1$$

if $(n+1)e > n$, which is satisfied for all $n \geq 1$, since $e > 1$. This means the terms of the series are nonincreasing. By the Alternating Series Test, the series converges. So the power series converges for $x = -\frac{1}{e}$.

At $x = \frac{1}{e}$, the power series reduces to

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^k \left(\frac{1}{e}\right)^k}{k!} = \sum_{k=1}^{\infty} \frac{k^k}{k! e^k}.$$

The n^{th} term of this series satisfies

$$a_n = \frac{n^n}{n! e^n} = \frac{\left(\frac{n}{e}\right)^n}{n!} = \frac{\left(\frac{n}{e}\right)^n}{\sqrt{2\pi n} \left(\frac{n}{e}\right)^n} = \frac{1}{\sqrt{2\pi n}} > \frac{1}{\sqrt{3\pi n}} = b_n$$

for large $n > N$, where Stirling's approximation was again used. Since the series

$\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{3\pi k}} = \frac{1}{\sqrt{3\pi}} \sum_{k=1}^{\infty} \frac{1}{k^{1/2}}$ is a constant multiple of a divergent p -series (divergent since

$0 < p = \frac{1}{2} < 1$), by the Comparison Test, the series $\sum_{k=1}^{\infty} a_k$ also diverges. (Note that convergence or divergence of a series is not governed by the first N terms which are finite in number, and the sum of whose terms are finite in value.) So the power series diverges for $x = \frac{1}{e}$.

Concluding, the interval of convergence of the power series is $\boxed{-\frac{1}{e} \leq x < \frac{1}{e}}$.

44. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{3^k (x-2)^k}{k!} = 1 + \sum_{k=1}^{\infty} \frac{3^k (x-2)^k}{k!}$ is a series of nonzero terms for $x \neq 2$. (At $x = 2$, the series converges to 1.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{3^{n+1} (x-2)^{n+1}}{(n+1)!}}{\frac{3^n (x-2)^n}{n!}} \right| = 3|x-2| \lim_{n \rightarrow \infty} \left| \frac{n!}{(n+1)!} \right| \\ &= 3|x-2| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)n!} = 3|x-2| \lim_{n \rightarrow \infty} \frac{1}{n+1} \\ &= 0 \end{aligned}$$

for all values of x . Since the limit is less than 1, by the Ratio Test, the series converges for any value of x . This means the radius of convergence $\boxed{R = \infty}$ and the interval of convergence of the power series is

$$\boxed{-\infty < x < \infty}.$$

45. [In the problems 45-48, we shall extensively use the following result: If $|r| < 1$, then the geometric series $\sum_{k'=0}^{\infty} ar^{k'} = \sum_{k=1}^{\infty} ar^{k-1} = \frac{a}{1-r}$, where $k' = k-1$. This allows us to start a geometric series at $k' = 0$ and use the standard results of Section 8.2.]

(a) The domain of $f(x) = \sum_{k=0}^{\infty} \frac{x^k}{3^k} = \sum_{k=0}^{\infty} \left(\frac{x}{3}\right)^k$ is the interval of convergence of the power series that defines

f . The series is a geometric series of the form $\sum_{k=0}^{\infty} r^k$, so it converges if $|r| = \left|\frac{x}{3}\right| < 1$, or $|x| < 3$, or

$-3 < x < 3$. So the domain of f is $\boxed{-3 < x < 3}$.

(b) $x = 2$ and $x = -1$ are in the domain $-3 < x < 3$ of f . So we evaluate:

$$f(2) = \sum_{k=0}^{\infty} \frac{2^k}{3^k} = \sum_{k=0}^{\infty} \left(\frac{2}{3}\right)^k = \frac{1}{1 - \frac{2}{3}} = \frac{1}{\frac{1}{3}} = \boxed{3}.$$

$$f(-1) = \sum_{k=0}^{\infty} \frac{(-1)^k}{3^k} = \sum_{k=0}^{\infty} \left(-\frac{1}{3}\right)^k = \frac{1}{1 - (-\frac{1}{3})} = \frac{1}{1 + \frac{1}{3}} = \frac{1}{\frac{4}{3}} = \boxed{\frac{3}{4}}.$$

(c) Since f is defined by a geometric series, we can find its sum in its domain of convergence:

$$f(x) = \sum_{k=0}^{\infty} \frac{x^k}{3^k} = \sum_{k=0}^{\infty} \left(\frac{x}{3}\right)^k = \frac{1}{1 - \frac{x}{3}} = \boxed{\frac{3}{3-x} \text{ for } -3 < x < 3}.$$

46. (a) The domain of $f(x) = \sum_{k=0}^{\infty} (-1)^k \left(\frac{x}{2}\right)^k = \sum_{k=0}^{\infty} \left(-\frac{x}{2}\right)^k = 1 + \sum_{k=1}^{\infty} \left(-\frac{x}{2}\right)^k$ is the interval of convergence of the power series that defines f . The series is geometric of the form $\sum_{k=0}^{\infty} r^k$, so it converges if

$|r| = \left|-\frac{x}{2}\right| = \left|\frac{x}{2}\right| < 1$, or $|x| < 2$, or $-2 < x < 2$. So the domain of f is $\boxed{-2 < x < 2}$.

(b) $x = 0$ and $x = 1$ are in the domain $-2 < x < 2$ of f . So we evaluate:

$$f(0) = 1 + \sum_{k=1}^{\infty} \left(-\frac{0}{2}\right)^k = 1 + 0 = \boxed{1}.$$

$$f(1) = \sum_{k=0}^{\infty} (-1)^k \frac{1^k}{2^k} = \sum_{k=0}^{\infty} \left(-\frac{1}{2}\right)^k = \frac{1}{1 - (-\frac{1}{2})} = \frac{1}{1 + \frac{1}{2}} = \frac{1}{\frac{3}{2}} = \boxed{\frac{2}{3}}.$$

(c) Since f is defined by a geometric series, we can find its sum in the domain of convergence:

$$f(x) = \sum_{k=0}^{\infty} (-1)^k \frac{x^k}{2^k} = \sum_{k=0}^{\infty} \left(-\frac{x}{2}\right)^k = \frac{1}{1 - (-\frac{x}{2})} = \frac{1}{1 + \frac{x}{2}} = \boxed{\frac{2}{2+x} \text{ for } -2 < x < 2}.$$

47. (a) The domain of $f(x) = \sum_{k=0}^{\infty} \frac{(x-2)^k}{2^k} = 1 + \sum_{k=1}^{\infty} \frac{(x-2)^k}{2^k}$ is the interval of convergence of the power series that defines f . The series is geometric of the form $\sum_{k=0}^{\infty} r^k$, so it converges if $|r| = \left|\frac{x-2}{2}\right| < 1$, or $|x-2| < 2$, or $-2 < x-2 < 2$, or $0 < x < 4$. So the domain of f is $\boxed{0 < x < 4}$.

(b) $x = 1$ and $x = 2$ are in the domain $0 < x < 4$ of f . So we evaluate:

$$f(1) = \sum_{k=0}^{\infty} \frac{(1-2)^k}{2^k} = \sum_{k=0}^{\infty} \left(-\frac{1}{2}\right)^k = \frac{1}{1 - (-\frac{1}{2})} = \frac{1}{1 + \frac{1}{2}} = \frac{1}{\frac{3}{2}} = \boxed{\frac{2}{3}}.$$

$$f(2) = 1 + \sum_{k=1}^{\infty} \frac{(2-2)^k}{2^k} = 1 + 0 = \boxed{1}.$$

(c) Since f is defined by a geometric series, we can find its sum in the domain of convergence:

$$f(x) = \sum_{k=0}^{\infty} \left(\frac{x-2}{2}\right)^k = \frac{1}{1 - \left(\frac{x-2}{2}\right)} = \frac{2}{2-x+2} = \boxed{\frac{2}{4-x} \text{ for } 0 < x < 4}.$$

48. (a) The domain of $f = \sum_{k=0}^{\infty} (-1)^k (x+3)^k = \sum_{k=0}^{\infty} [-(x+3)]^k = 1 + \sum_{k=1}^{\infty} [-(x+3)]^k$ is the interval of convergence of the power series that defines f . The series is geometric of the form $\sum_{k=0}^{\infty} r^k$, so it converges if $|r| = |-(x+3)| < 1$, or $-1 < x+3 < 1$, or $-4 < x < -2$. So the domain of f is $\boxed{-4 < x < -2}$.

(b) $x = -3$ and $x = -2.5 = -\frac{5}{2}$ are in the domain $-4 < x < 2$ of f . So we evaluate:

$$f(-3) = 1 + \sum_{k=1}^{\infty} [-(-3+3)]^k = \boxed{1}.$$

$$f(-2.5) = f\left(-\frac{5}{2}\right) = \sum_{k=0}^{\infty} \left[-\left(-\frac{5}{2} + 3\right) \right]^k = \sum_{k=0}^{\infty} \left[-\left(\frac{1}{2}\right) \right]^k = \frac{1}{1 - (-\frac{1}{2})} = \frac{1}{\frac{3}{2}} = \boxed{\frac{2}{3}}.$$

(c) Since f is defined by a geometric series, we can find its sum in the domain of convergence:

$$f(x) = \sum_{k=0}^{\infty} [-(x+3)]^k = \frac{1}{1 - [-(x+3)]} = \frac{1}{1+x+3} = \boxed{\frac{1}{x+4} \text{ for } -4 < x < -2}.$$

49. The series $\sum_{k=0}^{\infty} a_k x^k$ is a power series centered at $x = 0$. If the series is convergent for $x = 3$, then by the theorem on the convergence and divergence of power series, it is convergent for any x in a radius of convergence $R = 3 - 0 = 3$ about the point $x = 0$, that is, in the interval $-3 < x < 3$. Since convergence at $x = 3$ is given, we may extend the interval of convergence to $-3 < x \leq 3$. This means it is convergent at $x=2$, since $x = 2$ is found in the interval $-3 < x \leq 3$. However, the series may or may not converge at $x = 5$. So no, nothing can be said about the convergence at $x=5$.

50. The series $\sum_{k=0}^{\infty} a_k (x-2)^k$ is a power series centered at $x = 2$. If the series converges for $x = 6$, then it will necessarily converge for all other x in a radius of $R = 6 - 2 = 4$ about the point $x = 2$, that is, $-4 < x - 2 < 4$, or for all other x such that $-2 < x < 6$.

51. The series $\sum_{k=0}^{\infty} a_k x^k$ is a power series centered at $x = 0$. If it converges for $x = 6$, then the theorem on convergence and divergence of power series ensures that it will converge absolutely for all x in a radius of $R = 6 - 0 = 6$ about the point $x = 0$, that is, $-6 < x < 6$. Since convergence at $x = 6$ is given, we can extend the range of convergence to at least $-6 < x \leq 6$. If the series diverges for $x = -8$, then it diverges for all $x \leq -8$ and also for all $x > 8$. Based on these observations:

(a) TRUE: The series will converge at $x = 2$ since $-6 < 2 \leq 6$.

(b) FALSE: The series is only guaranteed to converge from (and not necessarily including) $x = -6$, up to (and including) $x = 6$. It may or may not converge in the interval $6 < x \leq 8$, so it may or may not converge for $x = 7$.

(c) FALSE: It follows from the statement of the theorem on convergence/divergence of a power series, see p.602, that convergence of the series at $x = 6$ implies absolute convergence for $|x| < 6$. Nothing is known about absolute convergence at $x = 6$.

(d) FALSE: The theorem only guarantees convergence on an open interval. So the series is guaranteed to converge on $-6 < x < 6$. (Convergence at $x = 6$ is given to us, so this range may be extended to $-6 < x \leq 6$.) The series may or may not converge at $x = -6$.

(e) TRUE: The series diverges at $x = 10$ because it will diverge for all $x > 8$.

(f) TRUE: The theorem guarantees absolute convergence at $x = 4$ since it is in the interval $-6 < x \leq 6$.

52. If the radius of convergence of the power series $\sum_{k=0}^{\infty} a_k(x-3)^k$ is 5, it means the series is absolutely convergent for $-5 < x-3 < 5$, or $-2 < x < 8$, and divergent for $x < -2$ and $x > 8$. Based on this:

- (a) *TRUE*: Since $x = 2$ falls in the interval of convergence $-2 < x < 8$.
 (b) *FALSE*: Since $x = 7$ falls within the interval of convergence $-2 < x < 8$, the series will not diverge at $x = 7$.
 (c) *NOT NECESSARILY TRUE*: At $x = 8$, the series may converge or it may diverge.
 (d) *FALSE*: $x = -6$ is in the range $x < -2$, so it will diverge.
 (e) *NOT NECESSARILY TRUE*: At $x = -2$, the series may converge or it may diverge.

53. (a) Using a geometric series we can represent the function as a power series centered at $x = 0$:

$$f(x) = \frac{1}{1+x^3} = \frac{1}{1-(-x^3)} = \sum_{k=0}^{\infty} (-x^3)^k.$$

(b) The geometric series converges if $|r| = |-x^3| < 1$, or $|x| < 1$. So the radius of convergence is $R = 1$ and the interval of convergence is $-1 < x < 1$.

54. (a) Using a geometric series we can represent the function as a power series centered at $x = 0$:

$$f(x) = \frac{1}{1-x^2} = \sum_{k=0}^{\infty} (x^2)^k.$$

(b) The geometric series converges if $|r| = |x^2| < 1$, or $|x| < 1$. So the radius of convergence is $R = 1$ and the interval of convergence is $-1 < x < 1$.

55. (a) Using a geometric series we can represent the function as a power series centered at $x = 0$:

$$f(x) = \frac{1}{6-2x} = \left(\frac{1}{6}\right) \frac{1}{1-\frac{2x}{6}} = \left(\frac{1}{6}\right) \frac{1}{1-\frac{x}{3}} = \sum_{k=0}^{\infty} \frac{1}{6} \left(\frac{x}{3}\right)^k.$$

(b) The geometric series converges if $|r| = \left|\frac{x}{3}\right| < 1$, or $|x| < 3$. So the radius of convergence is $R = 3$ and the interval of convergence is $-3 < x < 3$.

56. (a) Using a geometric series we can represent the function as a power series centered at $x = 0$:

$$f(x) = \frac{4}{x+2} = \frac{4}{2-(-x)} = \frac{2}{1-\left(-\frac{x}{2}\right)} = \sum_{k=0}^{\infty} 2 \left(-\frac{x}{2}\right)^k.$$

(b) The geometric series converges if $|r| = \left|-\frac{x}{2}\right| < 1$, or $|x| < 2$. So the radius of convergence is $R = 2$ and the interval of convergence is $-2 < x < 2$.

57. (a) Using a geometric series we can represent the function as a power series centered at $x = 0$:

$$f(x) = \frac{x}{1+x^3} = \frac{x}{1-(-x^3)} = \sum_{k=0}^{\infty} x \cdot (-x^3)^k = \sum_{k=0}^{\infty} (-1)^{3k} x^{3k+1} = \sum_{k=0}^{\infty} [(-1)^3]^k x^{3k+1} = \sum_{k=0}^{\infty} (-1)^k x^{3k+1}.$$

(b) The geometric series converges if $|r| = |(-x)^3| < 1$. So the radius of convergence is $\boxed{R = 1}$ and the interval of convergence is $\boxed{-1 < x < 1}$.

58. (a) Using a geometric series we can represent the function as a power series centered at $x = 0$:

$$f(x) = \frac{4x^2}{x+2} = \frac{2x^2}{1 - (-\frac{x}{2})} = \sum_{k=0}^{\infty} 2x^2 \left(-\frac{x}{2}\right)^k = \sum_{k=0}^{\infty} 8 \left(-\frac{x}{2}\right)^2 \left(-\frac{x}{2}\right)^k = \boxed{\sum_{k=0}^{\infty} 8 \left(-\frac{x}{2}\right)^{k+2}}.$$

(b) The geometric series converges if $|r| = \left|-\frac{x}{2}\right| < 1$, or $|x| < 2$. So the radius of convergence is $\boxed{R = 2}$ and the interval of convergence is $\boxed{-2 < x < 2}$.

59. First, we check to see if the power series representing the function $f(x) = \sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!}$ has a nonzero radius of convergence:

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1} x^{2(n+1)+1}}{(2(n+1)+1)!}}{\frac{(-1)^n x^{2n+1}}{(2n+1)!}} \right| = |x|^2 \lim_{n \rightarrow \infty} \frac{(2n+1)!}{(2n+3)!} \\ &= |x|^2 \lim_{n \rightarrow \infty} \frac{(2n+1)!}{(2n+3)(2n+2)(2n+1)!} = |x|^2 \lim_{n \rightarrow \infty} \frac{1}{(2n+3)(2n+2)} \\ &= 0 \text{ for any value of } x. \end{aligned}$$

So the radius of convergence is $R = \infty$, and the interval of convergence is $-\infty < x < \infty$.

(a) Using the differentiation property of power series we have

$$\begin{aligned} f(x) &= x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + \frac{(-1)^k x^{2k+1}}{(2k+1)!} + \cdots \\ f'(x) &= 1 - \frac{3x^2}{3 \cdot 2!} + \frac{5x^4}{5 \cdot 4!} - \cdots + \frac{(-1)^k (2k+1)x^{2k+1-1}}{(2k+1)(2k)!} + \cdots \\ &= 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots + \frac{(-1)^k x^{2k}}{(2k)!} + \cdots \\ &= \boxed{\sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!}}. \end{aligned}$$

(b) Using the integration property of power series we have

$$\begin{aligned} f(x) &= x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + \frac{(-1)^k x^{2k+1}}{(2k+1)!} + \cdots \\ \int_0^x f(x) dx &= \frac{x^2}{2} - \frac{x^4}{4 \cdot 3!} + \frac{x^6}{6 \cdot 5!} - \cdots + \frac{(-1)^k x^{2k+2}}{(2k+2)(2k+1)!} + \cdots \\ &= \boxed{\sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+2}}{(2k+2)!}}. \end{aligned}$$

60. First, we check to see if the power series representing the function $f(x) = \sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!}$ has a

nonzero radius of convergence:

$$\begin{aligned}\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1} x^{2(n+1)}}{(2(n+1))!}}{\frac{(-1)^n x^{2n}}{(2n)!}} \right| = |x|^2 \lim_{n \rightarrow \infty} \frac{(2n)!}{(2n+2)!} \\ &= |x|^2 \lim_{n \rightarrow \infty} \frac{(2n)!}{(2n+2)(2n+1)(2n)!} = |x|^2 \lim_{n \rightarrow \infty} \frac{1}{(2n+2)(2n+1)} \\ &= 0, \text{ for any value of } x.\end{aligned}$$

So the radius of convergence $R = \infty$, and the interval of convergence is $-\infty < x < \infty$.

(a) Using the differentiation property of power series we have

$$\begin{aligned}f(x) &= 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots + \frac{(-1)^k x^{2k}}{(2k)!} + \cdots \\ f'(x) &= 0 - \frac{2x}{2 \cdot 1!} + \frac{4x^3}{4 \cdot 3!} - \cdots + \frac{(-1)^k (2k) x^{2k-1}}{(2k)(2k-1)!} + \cdots \\ &= -x + \frac{x^3}{3!} - \cdots + \frac{(-1)^k x^{2k-1}}{(2k-1)!} + \cdots \\ &= \boxed{\sum_{k=1}^{\infty} \frac{(-1)^k x^{2k-1}}{(2k-1)!}}.\end{aligned}$$

(b) Using the integration property of power series we have

$$\begin{aligned}f(x) &= 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots + \frac{(-1)^k x^{2k}}{(2k)!} + \cdots \\ \int_0^x f(x) dx &= x - \frac{x^3}{3 \cdot 2!} + \frac{x^5}{5 \cdot 4!} - \cdots + \frac{(-1)^k x^{2k+1}}{(2k+1)(2k)!} + \cdots \\ &= x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + \frac{(-1)^k x^{2k+1}}{(2k+1)!} + \cdots \\ &= \boxed{\sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!}}.\end{aligned}$$

61. Let's check to see if the power series representing the function $f(x) = \sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{x^k}{k!}$ has a nonzero radius of convergence:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{(n+1)!}}{\frac{x^n}{n!}} \right| = |x| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)!} = |x| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)n!} = |x| \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0$$

for all values of x . So the radius of convergence $R = \infty$, and the interval of convergence is $-\infty < x < \infty$.

(a) Using the differentiation property of power series we have

$$\begin{aligned}f(x) &= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^k}{k!} + \cdots \\ f'(x) &= 0 + 1 + \frac{2x}{2 \cdot 1!} + \frac{3x^2}{3 \cdot 2!} + \cdots + \frac{kx^{k-1}}{k(k-1)!} + \cdots \\ &= 1 + x + \frac{x^2}{2!} + \cdots + \frac{x^{k-1}}{(k-1)!} + \cdots \\ &= \boxed{\sum_{k=1}^{\infty} \frac{x^{k-1}}{(k-1)!} = \sum_{k=0}^{\infty} \frac{x^k}{k!}}.\end{aligned}$$

(b) Using the integration property of power series we have

$$\begin{aligned}
 f(x) &= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^k}{k!} + \cdots \\
 \int_0^x f(x) dx &= x + \frac{x^2}{2 \cdot 1!} + \frac{x^3}{3 \cdot 2!} + \frac{x^4}{4 \cdot 3!} + \cdots + \frac{x^{k+1}}{(k+1)k!} + \cdots \\
 &= x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots + \frac{x^{k+1}}{(k+1)!} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{x^{k+1}}{(k+1)!}}.
 \end{aligned}$$

62. Let's check to see if the power series representing the function $f(x) = \sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(-1)^k x^k}{k!}$ has a nonzero radius of convergence:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1} x^{n+1}}{(n+1)!}}{\frac{(-1)^n x^n}{n!}} \right| = |x| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)!} = |x| \lim_{n \rightarrow \infty} \frac{n!}{(n+1)n!} = |x| \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0$$

for all values of x . So the radius of convergence $R = \infty$, and the interval of convergence is $-\infty < x < \infty$.

(a) Using the differentiation property of power series we have

$$\begin{aligned}
 f(x) &= 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \cdots + \frac{(-1)^k x^k}{k!} + \cdots \\
 f'(x) &= 0 - 1 + \frac{2x}{2 \cdot 1!} - \frac{3x^2}{3 \cdot 2!} + \cdots + \frac{(-1)^k k x^{k-1}}{k(k-1)!} + \cdots \\
 &= -1 + x - \frac{x^2}{2!} + \cdots + \frac{(-1)^k x^{k-1}}{(k-1)!} + \cdots \\
 &= \boxed{\sum_{k=1}^{\infty} \frac{(-1)^k x^{k-1}}{(k-1)!} = \sum_{k=0}^{\infty} \frac{(-1)^{k+1} x^k}{k!}}.
 \end{aligned}$$

(b) Using the integration property of power series we have

$$\begin{aligned}
 f(x) &= 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \cdots + \frac{(-1)^k x^k}{k!} + \cdots \\
 \int_0^x f(x) dx &= x - \frac{x^2}{2 \cdot 1!} + \frac{x^3}{3 \cdot 2!} - \frac{x^4}{4 \cdot 3!} + \cdots + \frac{(-1)^k x^{k+1}}{(k+1)k!} + \cdots \\
 &= x - \frac{x^2}{2!} + \frac{x^3}{3!} - \frac{x^4}{4!} + \cdots + \frac{(-1)^k x^{k+1}}{(k+1)!} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{(-1)^k x^{k+1}}{(k+1)!}}.
 \end{aligned}$$

63. We wish to find a power series representation of $f(x) = \frac{1}{(1+x)^2}$. The function

$g(x) = \frac{1}{1+x} = \frac{1}{1-(-x)} = \sum_{k=0}^{\infty} (-x)^k$ has a geometric power series representation which converges for

$|r| = |-x| = |x| < 1$. Using the differentiation property of power series, we get

$$\begin{aligned}
 f(x) &= -\frac{dg}{dx} = \frac{1}{(1+x)^2} \\
 &= -\frac{d}{dx} \left[\sum_{k=0}^{\infty} (-x)^k \right] \\
 &= -\frac{d}{dx} [(-x)^0 + (-x)^1 + (-x)^2 + (-x)^3 + \cdots + (-x)^k + \cdots] \\
 &= -\frac{d}{dx} [1 - x + x^2 - x^3 + \cdots + (-1)^k x^k + \cdots] \\
 &= -[0 - 1 + 2x - 3x^2 + \cdots + (-1)^k kx^{k-1} + \cdots] \\
 &= 1 - 2x + 3x^2 - \cdots + (-1)^{k+1} kx^{k-1} + \cdots \\
 &= \sum_{k=1}^{\infty} (-1)^{k+1} kx^{k-1} = \sum_{k=0}^{\infty} (-1)^k (k+1)x^k.
 \end{aligned}$$

The interval of convergence of the power series representation is at least $|x| < 1$ or $-1 < x < 1$. Note that at the left endpoint $x = -1$ the series representation reduces to $\sum_{k=0}^{\infty} (-1)^{2k} (k+1)$, which is divergent by the

Divergence Test. At the right endpoint $x = 1$, the series representation reduces to $\sum_{k=0}^{\infty} (-1)^k (k+1)$, which again diverges by the Divergence Test.

So we conclude that the power series representation of the given function $f(x)$ is

$$\boxed{\sum_{k=0}^{\infty} (-1)^k (k+1)x^k, \quad -1 < x < 1.}$$

64. We wish to find a power series representation of $f(x) = \frac{1}{(1-x)^3}$. The function

$$h(x) = \frac{1}{1-x} = \sum_{k=0}^{\infty} x^k = 1 + x + x^2 + x^3 + \cdots + x^k + \cdots$$

has a geometric power series representation which converges for $|r| = |x| < 1$. Using the differentiation property of power series, we have

$$h'(x) = \frac{1}{(1-x)^2} = 0 + 1 + 2x + 3x^2 + \cdots + kx^{k-1} + \cdots = \sum_{k=1}^{\infty} kx^{k-1}.$$

To see that this power series has a nonzero radius of convergence, with $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} kx^{k-1}$ being a series of nonzero terms, we compute

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1)x^n}{nx^{n-1}} \right| = |x| \lim_{n \rightarrow \infty} \frac{n+1}{n} = |x| \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right) = |x| \cdot 1 < 1$$

for convergence by the Ratio Test. Since the condition $|x| < 1$ was already satisfied for the series representation of the function $h(x)$ to be convergent, we see that the series representation of $h'(x)$ is convergent as well. So using the differentiation property of power series again, we have

$$h''(x) = \frac{2}{(1-x)^3} = 2 + 6x + \cdots + k(k-1)x^{k-2} + \cdots = \sum_{k=2}^{\infty} k(k-1)x^{k-2} = \sum_{k'=0}^{\infty} (k'+2)(k'+1)x^{k'},$$

where we set $k' = k - 2$ or $k = k' + 2$. So finally

$$f(x) = \frac{1}{(1-x)^3} = \frac{1}{2} h''(x) = \frac{1}{2} \sum_{k=2}^{\infty} k(k-1)x^{k-2} = \frac{1}{2} \sum_{k=0}^{\infty} (k+2)(k+1)x^k.$$

The interval of convergence is at least $|x| < 1$ or $-1 < x < 1$. At the left endpoint $x = -1$ the series representation reduces to $\frac{1}{2} \sum_{k=0}^{\infty} (-1)^k (k+2)(k+1)$, which is divergent by the Divergence Test. At the right endpoint $x = 1$, the series representation reduces to $\frac{1}{2} \sum_{k=0}^{\infty} (k+2)(k+1)$, which again diverges by the Divergence Test.

So we conclude that the power series representation of the given function $f(x)$ is

$$\boxed{\frac{1}{2} \sum_{k=0}^{\infty} (k+2)(k+1)x^k, \quad -1 < x < 1.}$$

65. We wish to find a power series representation of $f(x) = \frac{2}{3(1-x)^2}$. From the result of Problem 64 above, we have

$$f(x) = \frac{2}{3(1-x)^2} = \frac{2}{3} h'(x) = \frac{2}{3} \sum_{k=1}^{\infty} kx^{k-1}.$$

The interval of convergence of the power series representation is at least $|x| < 1$ or $-1 < x < 1$. At the left endpoint $x = -1$ the series representation reduces to $\frac{2}{3} \sum_{k=1}^{\infty} (-1)^{k-1} k$, which is divergent by the Divergence Test. At the right endpoint $x = 1$, the series representation reduces to $\frac{2}{3} \sum_{k=1}^{\infty} k$ which again diverges by the Divergence Test.

So we conclude that the power series representation of the given function $f(x)$ is

$$\boxed{\frac{2}{3} \sum_{k=1}^{\infty} kx^{k-1}, \quad -1 < x < 1.}$$

66. We wish to find a power series representation of $f(x) = \frac{1}{(1-x)^4}$. From the result of Problem 64 above, we have that $h''(x) = \frac{2}{(1-x)^3} = \sum_{k=2}^{\infty} a_k = \sum_{k=2}^{\infty} k(k-1)x^{k-2}$. Let us compute the radius of convergence of this series:

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1)n x^{n-1}}{n(n-1)x^{n-2}} \right| = |x| \lim_{n \rightarrow \infty} \frac{n+1}{n-1} = |x| \frac{1 + \frac{1}{n}}{1 - \frac{1}{n}} = |x| \cdot 1 < 1$$

for convergence by the Ratio Test. Since the radius of convergence is nonzero, we apply the differentiation property of power series to this function to obtain

$$\begin{aligned} h'''(x) &= \frac{2 \cdot 3}{(1-x)^4} = \frac{d}{dx} [2 + 6x + 12x^2 + \cdots + k(k-1)x^{k-2} + \cdots] \\ &= 0 + 6 + 24x + \cdots + k(k-1)(k-2)x^{k-3} + \cdots \\ &= \sum_{k=3}^{\infty} k(k-1)(k-2)x^{k-3} = \sum_{k=0}^{\infty} (k+3)(k+2)(k+1)x^k. \end{aligned}$$

Finally, we obtain

$$f(x) = \frac{1}{(1-x)^4} = \frac{1}{6} h'''(x) = \frac{1}{6} \sum_{k=3}^{\infty} k(k-1)(k-2)x^{k-3} = \frac{1}{6} \sum_{k=0}^{\infty} (k+3)(k+2)(k+1)x^k.$$

The interval of convergence of the power series representation is at least $|x| < 1$ or $-1 < x < 1$. At the left endpoint $x = -1$ the series representation reduces to $\frac{1}{6} \sum_{k=0}^{\infty} (-1)^k (k+3)(k+2)(k+1)$, which is divergent by the Divergence Test. At the right endpoint $x = 1$, the series representation reduces to $\frac{1}{6} \sum_{k=0}^{\infty} (k+3)(k+2)(k+1)$, which again diverges by the Divergence Test.

So we conclude that the power series representation of the given function $f(x)$ is

$$\boxed{\frac{1}{6} \sum_{k=0}^{\infty} (k+3)(k+2)(k+1)x^k, \quad -1 < x < 1.}$$

67. We wish to find a power series representation of $f(x) = \ln\left(\frac{1}{1+x}\right)$. Since

$$g(x) = \frac{1}{1+x} - \frac{1}{1-(-x)} = \sum_{k=0}^{\infty} (-x)^k = 1 - x + x^2 - x^3 + \cdots + (-1)^k x^k + \cdots$$

is a geometric series that converges if $|r| = |-x| = |x| < 1$, we can use the integration property of power series and integrate term by term:

$$\begin{aligned} \int_0^x g(x) dx &= \int_0^x t \frac{dx}{1+x} = \ln(1+x) \\ &= \int_0^x [1 - x + x^2 - x^3 + \cdots + (-1)^k x^k + \cdots] dx \\ &= x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots + (-1)^k \frac{x^{k+1}}{k+1} + \cdots \\ \text{or,} \quad \ln(1+x) &= \sum_{k=0}^{\infty} \frac{(-1)^k x^{k+1}}{(k+1)}. \end{aligned}$$

The function f can be written:

$$f(x) = \ln\left(\frac{1}{1+x}\right) = \ln 1 - \ln(1+x) = 0 - \ln(1+x).$$

So we have

$$f(x) = - \sum_{k=0}^{\infty} \frac{(-1)^k x^{k+1}}{k+1} = \sum_{k=0}^{\infty} \frac{(-1)^{k+1} x^{k+1}}{k+1}$$

The interval of convergence is at least $|x| < 1$, or $-1 < x < 1$. At the left endpoint $x = -1$, the series representation reduces to $\sum_{k=0}^{\infty} \frac{1}{k+1} = 1 + \frac{1}{2} + \frac{1}{3} + \cdots$ which is the divergent harmonic series. At the right

endpoint $x = 1$, the series representation reduces to $\sum_{k=0}^{\infty} \frac{(-1)^{k+1}}{k+1} = -1 + \frac{1}{2} - \frac{1}{3} + \cdots$ which is a constant multiple of the convergent alternating harmonic series.

So we conclude that the power series representation of the given function $f(x)$ is

$$\boxed{\sum_{k=0}^{\infty} \frac{(-1)^{k+1} x^{k+1}}{k+1}, \quad -1 < x \leq 1.}$$

68. We wish to find a power series representation of $f(x) = \ln(1-2x)$. Consider the function

$$g(x) = \frac{1}{1-2x} = \sum_{k=0}^{\infty} (2x)^k = 1 + 2x + 4x^2 + \cdots + 2^k x^k + \cdots$$

which is a function with a geometric power series representation that converges if $|r| = |2x| < 1$, or $|x| < \frac{1}{2}$. Since the interval of convergence is nonzero, we use the integration property of power series to integrate

term by term:

$$\begin{aligned}
 \int_0^x g(x) dx &= \int_0^x \frac{dx}{1-2x} = \frac{\ln|1-2x|}{-2} \\
 &= \int_0^x [1 + 2x + 4x^2 + \cdots + 2^k x^k + \cdots] dx \\
 &= x + x^2 + \frac{4}{3}x^3 + \cdots + 2^k \frac{x^{k+1}}{k+1} + \cdots \\
 \text{or, } \quad \ln|1-2x| &= -2 \left[x + x^2 + \frac{4}{3}x^3 + \cdots + \frac{2^k x^{k+1}}{k+1} + \cdots \right] = \sum_{k=0}^{\infty} (-1) \frac{2^{k+1} x^{k+1}}{k+1} \\
 &= \sum_{k=0}^{\infty} (-1) \frac{(2x)^{k+1}}{k+1}.
 \end{aligned}$$

The interval of convergence is at least $|x| < \frac{1}{2}$. At the left endpoint $x = -\frac{1}{2}$, the series representation reduces to $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1)^k \frac{1}{k+1}$ which is the convergent alternating harmonic series. At the right endpoint, $x = \frac{1}{2}$, the series representation reduces to $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1) \frac{1}{k+1}$ which is a constant multiple of the divergent harmonic series.

So we conclude that the power series representation of the given function $f(x)$ is

$$\boxed{\sum_{k=0}^{\infty} (-1) \frac{(2x)^{k+1}}{k+1}, \quad -\frac{1}{2} \leq x < \frac{1}{2}.}$$

69. We wish to find a power series representation of $f(x) = \ln(1-x^2)$. Consider the function

$$g(x) = \frac{-2x}{1-x^2} = (-2x) \sum_{k=0}^{\infty} (x^2)^k = (-2x) \sum_{k=0}^{\infty} x^{2k} = \sum_{k=0}^{\infty} (-2)x^{2k+1} = -2x - 2x^3 - \cdots - 2x^{2k+1} - \cdots.$$

This is a geometric series that converges if $|r| = |x^2| < 1$, or $|x| < 1$, so the power series representation of the function g has a nonzero radius of convergence. Using the integration property of power series, we get

$$\begin{aligned}
 \int_0^x g(x) dx &= \int_0^x \frac{-2x dx}{1-x^2} = \ln|1-x^2| \\
 &= \int_0^x [-2x - 2x^3 - \cdots - 2x^{2k+1} - \cdots] dx \\
 &= -x^2 - \frac{2}{4}x^4 - \cdots - \frac{2}{2k+2}x^{2k+2} - \cdots \\
 &= -x^2 - \frac{x^4}{2} - \cdots - \frac{x^{2k+2}}{k+1} - \cdots \\
 \text{or, } \quad \ln|1-x^2| &= -\sum_{k=0}^{\infty} \frac{x^{2k+2}}{k+1}.
 \end{aligned}$$

The interval of convergence of the power series representation is at least $|x| < 1$ or $-1 < x < 1$. At the left endpoint $x = -1$, the series representation reduces to $-\sum_{k=0}^{\infty} \frac{1}{k+1}$, which, being a constant multiple of the harmonic series, diverges. At the right endpoint $x = 1$, the series representation reduces to the same expression as it did at $x = -1$, so once again it diverges.

So we conclude that the power series representation of the given function $f(x)$ is

$$\boxed{-\sum_{k=0}^{\infty} \frac{x^{2k+2}}{k+1}, \quad -1 < x < 1.}$$

70. We wish to find a power series representation of $f(x) = \ln(1 + x^2)$. Consider the function

$$g(x) = \frac{2x}{1+x^2} = \frac{2x}{1-(-x^2)} = 2x \sum_{k=0}^{\infty} (-x^2)^k = \sum_{k=0}^{\infty} 2(-1)^k x^{2k+1} = 2x - 2x^3 + 2x^5 - \cdots + 2(-1)^k x^{2k+1} + \cdots$$

This is a geometric series that converges if $|r| = |x^2| < 1$, or $|x| < 1$, so the power series representation of the function g has a nonzero radius of convergence. Using the integration property of power series, we get

$$\begin{aligned} \int_0^x g(x) dx &= \int_0^x \frac{2x dx}{1+x^2} = \ln|1+x^2| \\ &= \int_0^x [2x - 2x^3 + 2x^5 - \cdots + 2(-1)^k x^{2k+1} + \cdots] dx \\ &= x^2 - \frac{2x^4}{4} + \frac{2x^6}{6} - \cdots + (-1)^k \frac{2x^{2k+2}}{2k+2} + \cdots \\ &= x^2 - \frac{x^4}{2} + \frac{x^6}{3} - \cdots + (-1)^k \frac{x^{2k+2}}{k+1} + \cdots \end{aligned}$$

or, $\ln(1+x^2) = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+2}}{k+1}$.

The interval of convergence of the power series representation is at least $|x| < 1$ or $-1 < x < 1$. At the left endpoint $x = -1$, the power series representation reduces to $\sum_{k=0}^{\infty} \frac{(-1)^k}{k+1}$ which is the convergent alternating harmonic series. At the right endpoint $x = 1$, we obtain the same series as we had for $x = -1$, so once again the series converges.

So we conclude that the power series representation of the given function $f(x)$ is

$$\boxed{\sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+2}}{k+1}, \quad -1 \leq x \leq 1.}$$

Applications and Extensions

71. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{x^k}{k}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to zero.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{n+1}}{\frac{x^n}{n}} \right| = |x| \lim_{n \rightarrow \infty} \frac{n}{n+1} = |x| \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n}} = |x| \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the power series converges for $|x| < 1$, or $-1 < x < 1$.

At $x = -1$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{k}$, which is the convergent alternating harmonic series. So the power series converges for $x = -1$.

At $x = 1$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}$ which is the divergent harmonic series. So the power series diverges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x < 1}$.

72. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x-4)^k}{k}$ is a series of nonzero terms for $x \neq 4$. (At $x = 4$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(x-4)^{n+1}}{n+1}}{\frac{(x-4)^n}{n}} \right| = |x-4| \lim_{n \rightarrow \infty} \frac{n}{n+1} = |x-4| \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n}} = |x-4| \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the series converges for $-1 < x - 4 < 1$, or $3 < x < 5$.

At $x = 3$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(3-4)^k}{k} = \sum_{k=1}^{\infty} \frac{(-1)^k}{k}$, which is the convergent alternating harmonic series. So the power series converges for $x = 3$.

At $x = 5$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(5-4)^k}{k} = \sum_{k=1}^{\infty} \frac{1}{k}$ which is the divergent harmonic series. So the power series diverges for $x = 5$.

Concluding, the interval of convergence of the power series is $\boxed{3 \leq x < 5}$.

73. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{x^k}{2k+1}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{2(n+1)+1}}{\frac{x^n}{2n+1}} \right| = |x| \lim_{n \rightarrow \infty} \frac{2n+1}{2n+3} = |x| \lim_{n \rightarrow \infty} \frac{2 + \frac{1}{n}}{2 + \frac{3}{n}} = |x| \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the power series converges for $|x| < 1$, or $-1 < x < 1$.

At $x = -1$, the series reduces to $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{2k+1}$. The n^{th} term of this series satisfies

$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{2n+1} = 0$. By the Algebraic Ratio Test, we see

$$\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{\frac{1}{2(n+1)+1}}{\frac{1}{2n+1}} \right| = \frac{2n+1}{2n+3} < 1$$

for $n \geq 1$. So the terms of the series are nonincreasing. By the Alternating Series Test, the series converges. So the power series converges for $x = -1$.

At $x = 1$, the series reduces to $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{2k+1}$. The n^{th} term of this series satisfies

$$a_n = \frac{1}{2n+1} > \frac{1}{2n+2} = b_n.$$

Since the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{2(k+1)}$ is a constant multiple of the series $\sum_{k=1}^{\infty} \frac{1}{k+1} = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots$, which is

the divergent harmonic series from the second term forward, by the Comparison Test, the series $\sum_{k=1}^{\infty} a_k$ diverges. So the power series diverges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x < 1}$.

74. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{x^k}{k^2}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{(n+1)^2}}{\frac{x^n}{n^2}} \right| = |x| \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right)^2 = |x| \lim_{n \rightarrow \infty} \left(\frac{1}{1 + \frac{1}{n}} \right)^2 = |x| \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the power series converges for $|x| < 1$ or $-1 < x < 1$.

At $x = -1$, the series reduces to $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{k^2}$. The series of absolute values is $\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is a convergent p -series, since $p = 2 > 1$. Since the original series converges absolutely, it converges. So the power series is convergent for $x = -1$.

At $x = 1$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^2}$, which is again a convergent p -series for $p = 2 > 1$. So the power series converges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x \leq 1}$.

75. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} x^{k^2} = 1 + \sum_{k=1}^{\infty} x^{k^2}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) We have, applying the Root Test,

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{|x^{n^2}|} = \lim_{n \rightarrow \infty} |x^{n^2/n}| = \lim_{n \rightarrow \infty} |x^n|.$$

Now, since $\lim_{n \rightarrow \infty} r^n = \infty$ if $|r| > 1$ and $\lim_{n \rightarrow \infty} r^n = 0$ if $|r| < 1$, we require for convergence by the Root Test, $|x| < 1$, or $-1 < x < 1$.

At $x = -1$, the series becomes $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} (-1)^{k^2} = 1 - 1 + 1 - 1 + \cdots$. Since the sequence of partial sums $\{S_n\} = \{1, 0, 1, 0, \cdots\}$ is not convergent, the power series diverges for $x = -1$.

At $x = 1$, the series becomes $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} 1 = \infty$, so the power series diverges for $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 < x < 1}$.

76. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^a}{a^k} (x-a)^k$. This is a series of nonzero terms when $x \neq a$. (At $x = a$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)^a (x-a)^{n+1}}{a^{n+1}}}{\frac{n^a (x-a)^n}{a^n}} \right| = \left| \frac{x-a}{a} \right| \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^a = \left| \frac{x-a}{a} \right| \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the power series converges for $|x-a| < |a|$, or $-|a| < x-a < |a|$, or $-|a|+a < x < |a|+a$. If we assume $a > 0$, then $|a| = a$, and the power series converges for $0 < x < 2a$. Since $a \neq 0$ has been given, we have an interval of convergence of nonzero length. If we assume $a < 0$, then $|a| = -a$, and the power series converges for $2a < x < 0$.

At $x = 0$, the series reduces to

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^a}{a^k} (-a)^k = \sum_{k=1}^{\infty} (-1)^k k^a.$$

If $a = -1$, the series becomes $\sum_{k=1}^{\infty} \frac{(-1)^k}{k}$, which, being an alternating harmonic series, converges. For $-1 < a < 0$, the series becomes an alternating p -series with $0 < p < 1$, which converges by the alternating series test; with $p = -a$, we have: $\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{1}{k^p} = 0$; also the terms of the series are nonincreasing, as can be seen by the Algebraic Ratio Test, since

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{\frac{1}{n^{p+1}}}{\frac{1}{n^p}} = \frac{n^p}{n^{p+1}} < 1$$

for $n \geq 1$. So by the Alternating Series Test, the series converges for $-1 \leq a < 0$ at $x = 0$. For $a > 0$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} (-1)^k k^a$. By the Divergence Test, $\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} n^a = \infty$, so the series

diverges. Finally, if $a < -1$, then $p = -a > 1$, so the series becomes $\sum_{k=1}^{\infty} (-1)^k \frac{1}{k^p}$, which is a convergent p -series since $p > 1$. Summarizing, at $x = 0$, the power series converges for $a < -1$, $-1 \leq a < 0$, and diverges for $a > 0$.

At $x = 2a$, the series reduces to

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^a}{a^k} (2a-a)^k = \sum_{k=1}^{\infty} k^a.$$

If $a < -1$, then with $p = -a > 1$, the series becomes $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^p}$, which is a convergent p -series since

$p > 1$. If $-1 \leq a < 0$, then using $p = -a$, we have $0 < p \leq 1$, which makes the series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^p}$ a

divergent p -series. For $a > 0$, we use the Divergence Test to see $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} n^a = \infty$, so the series diverges. Summarizing, for $x = 2a$, the series converges when $a < -1$, and diverges for $-1 \leq a < 0$ and $a > 0$.

Concluding, we see the power series converges for the following ranges of the parameter a :

$$\boxed{a < -1 : 2a \leq x \leq 0; \quad -1 \leq a < 0 : 2a < x \leq 0; \quad a > 0 : 0 < x < 2a.}$$

77. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(k!)^2}{(2k)!} (x-1)^k = 1 + \sum_{k=1}^{\infty} \frac{(k!)^2}{(2k)!} (x-1)^k$ is a series of nonzero terms if $x \neq 1$. (At $x = 1$, the series converges to 1.) We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{((n+1)!)^2 (x-1)^{n+1}}{(2(n+1))!}}{\frac{(n!)^2 (x-1)^n}{(2n)!}} \right| = |x-1| \lim_{n \rightarrow \infty} \left\{ \left[\frac{(n+1)!}{n!} \right]^2 \cdot \frac{(2n)!}{(2n+2)!} \right\} \\ &= |x-1| \lim_{n \rightarrow \infty} \left\{ \left[\frac{(n+1)n!}{n!} \right]^2 \cdot \frac{(2n)!}{(2n+2)(2n+1)(2n)!} \right\} \\ &= |x-1| \lim_{n \rightarrow \infty} \frac{(n+1)(n+1)}{(2n+2)(2n+1)} = |x-1| \lim_{n \rightarrow \infty} \frac{(1+\frac{1}{n})(1+\frac{1}{n})}{(2+\frac{2}{n})(2+\frac{1}{n})} \\ &= |x-1| \cdot \frac{1}{4} < 1 \end{aligned}$$

for convergence by the Ratio Test if $|x-1| < 4$, or $-4 < x-1 < 4$, or $-3 < x < 5$.

At $x = -3$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(k!)^2}{(2k)!} (-3-1)^k = \sum_{k=0}^{\infty} \frac{(k!)^2}{(2k)!} (-4)^k = \sum_{k=0}^{\infty} (-1)^k \frac{(k!)^2}{(2k)!} 2^{2k}.$$

As in Problem 43, we have to use Stirling's Approximation,

$$n! \approx \left(\frac{n}{e}\right)^n \sqrt{2\pi n}.$$

We see the absolute value of the n^{th} term of the series is

$$\begin{aligned} |a_n| &= \frac{n! n! 2^{2n}}{(2n)!} \approx \frac{\left(\left(\frac{n}{e}\right)^n \sqrt{2\pi n}\right) \left(\left(\frac{n}{e}\right)^n \sqrt{2\pi n}\right) 2^{2n}}{\left(\frac{2n}{e}\right)^{2n} \sqrt{2\pi \cdot 2n}} \\ &= \frac{n^{2n} \cdot 2^{2n} (2\pi n)}{2^{2n} n^{2n} \sqrt{4\pi n}} = \sqrt{n} \sqrt{\pi} \rightarrow \infty, \text{ as } n \rightarrow \infty \end{aligned}$$

which means the series diverges by the Divergence Test at $x = -3$.

At $x = 5$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(k!)^2}{(2k)!} (5-1)^k = \sum_{k=0}^{\infty} \frac{(k!)^2}{(2k)!} 4^k = \sum_{k=0}^{\infty} \frac{(k!)^2}{(2k)!} 2^{2k}$$

which is identical to the series of absolute values of the series at $x = -3$: as such, it too diverges by the same calculation used to establish the divergence of the absolute value of the n^{th} term above. So the series diverges by the Divergence Test at $x = 5$.

Concluding, the interval of convergence of the power series is $\boxed{-3 < x < 5.}$

78. The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{\sqrt{k!}}{(2k)!} x^k = 1 + \sum_{k=1}^{\infty} \frac{\sqrt{k!}}{(2k)!} x^k$ is a series of nonzero terms for $x \neq 0$. (At

$x = 0$, the series converges to 1.) We have

$$\begin{aligned}
 \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{\sqrt{(n+1)!} x^{n+1}}{(2(n+1))!}}{\frac{\sqrt{n!} x^n}{(2n)!}} \right| = |x| \lim_{n \rightarrow \infty} \left\{ \sqrt{\frac{(n+1)!}{n!}} \cdot \frac{(2n)!}{(2n+2)!} \right\} \\
 &= |x| \lim_{n \rightarrow \infty} \left\{ \sqrt{\frac{(n+1)n!}{n!}} \cdot \frac{(2n)!}{(2n+2)(2n+1)(2n)!} \right\} = |x| \lim_{n \rightarrow \infty} \frac{\sqrt{n+1}}{(2n+2)(2n+1)} \\
 &= |x| \lim_{n \rightarrow \infty} \frac{\sqrt{1 + \frac{1}{n}}}{\left(2\sqrt{n} + \frac{2}{\sqrt{n}}\right) \left(2\sqrt{n} + \frac{1}{\sqrt{n}}\right)} \\
 &= 0
 \end{aligned}$$

for any value of x . So the interval of convergence is $\boxed{-\infty < x < \infty}$.

79. (a) We are given

$$\frac{1}{1-x} = \sum_{k=0}^{\infty} x^k, \quad -1 < x < 1.$$

Replacing x with x^2 , we have

$$\frac{1}{1-x^2} = \sum_{k=0}^{\infty} (x^2)^k = \boxed{\sum_{k=0}^{\infty} x^{2k}}.$$

(b) The interval of convergence is $|x^2| < 1$, as it is a geometric series, so it is $\boxed{-1 < x < 1}$.

80. (a) Using partial fractions, we can write

$$\begin{aligned}
 \frac{1}{1-x^2} &= \frac{1}{2} \left[\frac{1}{1-x} + \frac{1}{1+x} \right] \\
 &= \sum_{k=0}^{\infty} x^{2k} = 1 + x^2 + x^4 + \cdots + x^{2k} + \cdots
 \end{aligned}$$

Since the radius of convergence of the geometric series is $|x| < 1$, it is nonzero, so we may integrate the series term by term to obtain:

$$\begin{aligned}
 \int_0^x \frac{dx}{1-x^2} &= \frac{1}{2} \left[\int_0^x \frac{dx}{1-x} + \int_0^x \frac{dx}{1+x} \right] = \int_0^x [1 + x^2 + x^4 + \cdots + x^{2n} + \cdots] dx \\
 \text{or,} \quad \frac{1}{2} [-\ln|1-x| + \ln|1+x|] &= x + \frac{x^3}{3} + \frac{x^5}{5} + \cdots + \frac{x^{2k+1}}{2k+1} + \cdots \\
 \text{or,} \quad \frac{1}{2} \ln \left| \frac{1+x}{1-x} \right| &= \boxed{\sum_{k=0}^{\infty} \frac{x^{2k+1}}{2k+1}}.
 \end{aligned}$$

(b) Since the series summed is geometric, it converges at least for $|x| < 1$, or $-1 < x < 1$. At $x = -1$, the series becomes $\sum_{k=0}^{\infty} a_n = \sum_{k=0}^{\infty} \frac{(-1)^{2k+1}}{2k+1} = -\sum_{k=0}^{\infty} \frac{1}{2k+1}$. The absolute value of the n^{th} term of the series satisfies

$$|a_n| = \frac{1}{2n+1} > \frac{1}{2n+2} = \frac{1}{2} \cdot \frac{1}{n+1} = b_n.$$

Since $\sum_{k=0}^{\infty} b_k = \sum_{k=0}^{\infty} \frac{1}{2} \cdot \frac{1}{k+1}$ is a constant multiple of the divergent harmonic series, by the Comparison Test,

the series $\sum_{k=0}^{\infty} a_n$ diverges as well. At $x = 1$, the series becomes $\sum_{k=0}^{\infty} a_n = \sum_{k=0}^{\infty} \frac{1}{2k+1}$. We can use the same Comparison Test as above to conclude that the series diverges.

So the interval of convergence of the power series is $\boxed{-1 < x < 1.}$

81. We require $\ln \left| \frac{1+x}{1-x} \right| = \ln 2$, which happens when $\frac{1+x}{1-x} = 2$, or $1+x = 2(1-x)$, or $1+x = 2-2x$, or $3x = 1$, or $x = \frac{1}{3}$. So using the results of Problem 80, we have

$$\begin{aligned} \frac{1}{2} \ln \left| \frac{1+x}{1-x} \right| &= x + \frac{x^3}{3} + \frac{x^5}{5} + \cdots \\ \frac{1}{2} \ln \left| \frac{1+\frac{1}{3}}{1-\frac{1}{3}} \right| &= \frac{1}{2} \ln \left| \frac{\frac{4}{3}}{\frac{2}{3}} \right| = \frac{1}{2} \ln 2 = \frac{1}{3} + \frac{1}{3} \cdot \frac{1}{3^3} + \frac{1}{5} \cdot \frac{1}{3^5} + \cdots \\ \text{or, } \ln 2 &= \frac{2}{3} \left[1 + \frac{1}{3^3} + \frac{1}{5 \cdot 3^5} + \cdots \right] \\ &= \frac{2}{3} \left[1 + \frac{1}{27} + \frac{1}{405} + \cdots \right] \\ &\approx \frac{2}{3} [1 + 0.037 + 0.002 + \cdots] \\ &\approx \frac{2}{3} [1.039] \approx 0.6927 \approx \boxed{0.693.} \end{aligned}$$

82. Gregory's series is (see p.608)

$$\begin{aligned} \tan^{-1} x &= x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots + (-1)^n \frac{x^{2n+1}}{2n+1} + \cdots \\ &= \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{2k+1} \\ \text{So, } \tan^{-1} 1 &= \frac{\pi}{4} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \cdots + (-1)^n \frac{1}{2n+1} + \cdots \\ &\approx \sum_{k=0}^{1000} \frac{(-1)^k}{2k+1} \\ &\approx \boxed{0.7856479} \end{aligned}$$

using a CAS. This means

$$\pi \approx 4(0.7856479) \approx \boxed{3.142592.}$$

83. If R is the radius of convergence of the power series $\sum_{k=1}^{\infty} a_k x^k$, then the power series converges for $|x| < R$. By the Ratio Test, which is applicable if the terms of the series are nonzero (it suffices to assume $a_n \neq 0$ as $n \rightarrow \infty$) for $x \neq 0$ (at $x = 0$, the series converges to 0), we have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1} x^{n+1}}{a_n x^n} \right| = |x| \cdot \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| < R \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$$

for convergence by the Ratio Test. So we have $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \frac{1}{R}$, which was to be shown.

84. If the power series $\sum_{k=1}^{\infty} a_k x^k$ has a radius of convergence R , then the power series

$\sum_{k=1}^{\infty} a_k x^{2k} = \sum_{k=1}^{\infty} a_k (x^2)^k = \sum_{k=1}^{\infty} a_k y^k$ also has a radius of convergence R , where $y = x^2$. That is, the series converges for $|y| < R$, or $|x^2| < R$, or for $|x| < \sqrt{R}$. This means the radius of convergence of the power series $\sum_{k=1}^{\infty} a_k x^{2k}$ is $\sqrt{R}$.

85. Let $\sum_{k=0}^{\infty} a_k x^k$ be a power series centered at $x = 0$, with a radius of convergence R and an interval of convergence $-R < x < R$. If the power series is absolutely convergent at $x = R$, then the series of absolute values $\sum_{k=0}^{\infty} |a_k| |x|^k$ is convergent for all $0 \leq |x| \leq R$, by the theorem on convergence and divergence of a power series. This means it is absolutely convergent for $-R \leq x \leq R$, or, it is also absolutely convergent at $x = -R$, which is the other endpoint of the interval of convergence. Similarly, consider a power series $\sum_{k=0}^{\infty} a_k (x - c)^k$ centered at $x = c$ with a radius of convergence R , and an interval of convergence $-R + c < x < R + c$. If this series is absolutely convergent at, say, the right endpoint $x = R + c$, then it is convergent for all x such that $0 \leq |x - c| \leq R$, or $-R \leq x - c \leq R$, or $-R + c \leq x \leq R + c$. That is, it is convergent at $x = -R + c$, which is the other endpoint of the interval of convergence. Conversely, suppose the series is absolutely convergent at the left endpoint, $x = -R + c$, then it is convergent for all x such that $0 \leq |x - c| \leq R$, or $-R \leq x - c \leq R$, or $-R + c \leq x \leq R + c$. In other words, it is also convergent at $x = R + c$. So we have shown that if a power series is absolutely convergent at one of its endpoints, it is absolutely convergent at the other endpoint.

86. From the result of Problem 83, $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \frac{1}{R}$ if $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right|$ exists for a convergent power series $\sum_{k=0}^{\infty} a_k x^k$, which converges for $|x| < R$. We will use this result in the calculations to follow.

Let series $\sum_{k=1}^{\infty} k a_k x^{k-1}$ be a series of nonzero terms for $x \neq 0$ for at least large values of k . (That is, we assume that $a_n \neq 0$ as $n \rightarrow \infty$.) At $x = 0$, note that the series converges to 0. Taking the limit of the absolute value of the ratio of the $n + 1^{\text{st}}$ and the n^{th} term of the series, we have

$$\lim_{n \rightarrow \infty} \left| \frac{(n+1)a_{n+1}x^n}{n a_n x^{n-1}} \right| = |x| \cdot \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \cdot \lim_{n \rightarrow \infty} \left(\frac{n+1}{n} \right) = |x| \cdot \frac{1}{R} \cdot \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right) = \frac{|x|}{R} \cdot 1 < 1$$

for convergence of the series by the Ratio Test. That is, the series converges for $|x| < R$, as was to be proved.

The series $\sum_{k=0}^{\infty} \frac{a_k}{k+1} x^{k+1} = a_0 + \sum_{k=1}^{\infty} \frac{a_k}{k+1} x^{k+1}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to a_0 .) Taking the limit of the absolute value of the ratio of the $n + 1^{\text{st}}$ and the n^{th} term of the series, we have

$$\lim_{n \rightarrow \infty} \left| \frac{\frac{a_{n+1}x^{n+2}}{n+2}}{\frac{a_n x^{n+1}}{n+1}} \right| = |x| \cdot \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \cdot \lim_{n \rightarrow \infty} \left(\frac{n+1}{n+2} \right) = |x| \cdot \frac{1}{R} \cdot \lim_{n \rightarrow \infty} \left(\frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} \right) = \frac{|x|}{R} \cdot 1 < 1$$

for convergence of the series by the Ratio Test. That is, the series converges for $|x| < R$, as was to be proved.

Challenge Problems

87. The differential equation is $(1 + x^2)y'' - 4xy' + 6y = 0$. Let the solution be represented by a power series of the form $y(x) = \sum_{k=0}^{\infty} a_k x^k$, with $a_0 \neq 0$ and $a_1 \neq 0$. We have then:

$$\begin{aligned} y(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + \cdots + a_n x^n + \cdots \\ y' &= a_1 + 2a_2 x + 3a_3 x^2 + \cdots + n a_n x^{n-1} + \cdots \\ y'' &= 2a_2 + 6a_3 x + \cdots + n(n-1)a_n x^{n-2} + (n+1)n a_{n+1} x^{n-1} + (n+2)(n+1)a_{n+2} x^n + \cdots \\ x^2 y'' &= 2a_2 x^2 + 6a_3 x^3 + \cdots + n(n-1)a_n x^n + \cdots \\ x y' &= a_1 x + 2a_2 x^2 + 3a_3 x^3 + \cdots + n a_n x^n + \cdots \end{aligned}$$

The coefficient of the x^n term of the series $(1+x^2)y'' - 4xy' + 6y = y'' + x^2y'' - 4xy' + 6y$ is given by

$$[(n+2)(n+1)a_{n+2} + n(n-1)a_n] - 4na_n + 6a_n = 0$$

in order that the differential equation $(1+x^2)y'' - 4xy' + 6y = 0$ be satisfied. That is,

$$\begin{aligned}(n+2)(n+1)a_{n+2} + n(n-1)a_n - 4na_n + 6a_n &= 0 \\(n+2)(n+1)a_{n+2} + (n^2 - n - 4n + 6)a_n &= 0 \\(n+2)(n+1)a_{n+2} + (n^2 - 5n + 6)a_n &= 0 \\(n+2)(n+1)a_{n+2} + (n-2)(n-3)a_n &= 0.\end{aligned}$$

Solving for a_{n+2} , we get

$$a_{n+2} = -\frac{(n-2)(n-3)}{(n+2)(n+1)}a_n.$$

We have assumed $a_0 \neq 0$ and $a_1 \neq 0$. Substituting values for n in the recursion relation above, we can determine the coefficients a_n in terms of a_0 and a_1 . So, setting $n = 0, 1, 2, \dots$, we have

$$\begin{aligned}a_2 = a_{0+2} &= -\frac{(0-2)(0-3)}{(0+2)(0+1)}a_0 = -\frac{(-2)(-3)}{2 \cdot 1}a_0 = -\frac{6}{2}a_0 = \boxed{-3a_0} \\a_3 = a_{1+2} &= -\frac{(1-2)(1-3)}{(1+2)(1+1)}a_1 = -\frac{(-1)(-2)}{3 \cdot 2}a_1 = -\frac{2}{6}a_1 = \boxed{-\frac{1}{3}a_1} \\a_4 = a_{2+2} &= -\frac{(2-2)(2-3)}{(2+2)(2+1)}a_2 = 0 \\a_5 = a_{3+2} &= -\frac{(3-2)(3-3)}{(3+2)(3+1)}a_2 = 0.\end{aligned}$$

All the higher even coefficients are 0 because a_{2n} for $n \geq 2$ will be related via the recursion relation to a_{2n-2} , and this to a_{2n-4} , and so forth until $a_4 = 0$ is reached. Similarly, all the higher odd coefficients will be 0 because a_{2n+1} for $n \geq 2$ will be related via the recursion relation to a_{2n-1} and this to a_{2n-3} , and so forth until $a_5 = 0$ is reached.

So the only nonzero coefficients of the series $y(x) = \sum_{k=0}^{\infty} a_k x^k$ are $a_0 \neq 0$, $a_1 \neq 0$ (by assumption) and

$$a_2 = -3a_0 \text{ and } a_3 = -\frac{1}{3}a_1.$$

So finally the solution to the differential equation is

$$\begin{aligned}y(x) &= \sum_{k=0}^{\infty} a_k x^k = a_0 + a_1 x + a_2 x^2 + a_3 x^3 \\&= a_0 + a_1 x - 3a_0 x^2 - \frac{1}{3}a_1 x^3\end{aligned}$$

or, $\boxed{y(x) = a_0(1 - 3x^2) + a_1\left(x - \frac{1}{3}x^3\right)}.$

88. If the power series $\sum_{k=0}^{\infty} a_k 3^k$ converges, we have (if the terms of the series $a_n \neq 0$ as $n \rightarrow \infty$) applying the Ratio Test,

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1} 3^{n+1}}{a_n 3^n} \right| = 3 \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| < 1$$

for convergence of the series. This means

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| < \frac{1}{3}.$$

To check the convergence of $\sum_{k=1}^{\infty} k a_k 2^k$ (which is also a series of nonzero terms), use the Ratio Test again:

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{(n+1)a_{n+1}2^{n+1}}{n a_n 2^n} \right| &= 2 \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \cdot \lim_{n \rightarrow \infty} \left(\frac{n+1}{n} \right) = 1 \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \cdot \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right) \\ &= 2 \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \cdot 1 < 2 \cdot \frac{1}{3} = \frac{2}{3} < 1 \end{aligned}$$

so this series will be convergent.

89. The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x-2)^k}{k 3^k}$ is a series of nonzero terms at $x \neq 2$. (At $x = 2$, the series converges to 0.) We have

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(x-2)^{n+1}}{(n+1) 3^{n+1}}}{\frac{(x-2)^n}{n 3^n}} \right| = \frac{1}{3} |x-2| \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right) = \frac{|x-2|}{3} \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n}} = \frac{|x-2|}{3} \cdot 1 < 1$$

for convergence of the series by the Ratio Test. So the series converges if $|x-2| < 3$, or $-3 < x-2 < 3$, or $-1 < x < 5$.

At $x = -1$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1-2)^k}{k 3^k} = \sum_{k=1}^{\infty} \frac{(-3)^k}{k 3^k} = \sum_{k=1}^{\infty} \frac{(-1)^k}{k}$$

which, being the alternating harmonic series, is convergent. So the power series converges for $x = -1$.

At $x = 5$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(5-2)^k}{k 3^k} = \sum_{k=1}^{\infty} \frac{3^k}{k 3^k} = \sum_{k=1}^{\infty} \frac{1}{k}$$

which, being the harmonic series, is divergent. So the power series diverges for $x = 5$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x < 5}$.

90. Let $-R < x_0 < R$. To prove continuity of $S(x)$ at $x = x_0$, we have to show that for any $\varepsilon > 0$, there exists a $\delta > 0$ such that for all $|x - x_0| < \delta$, $|S(x) - S(x_0)| < \varepsilon$. From the inequality given to us, we know there is a number $N > 0$ such that for $n > N$, $|S(x) - S_n(x)| < \frac{\varepsilon}{3}$ for $|x| < R$. We also have that for $n > N$, $|S(x_0) - S_n(x_0)| < \frac{\varepsilon}{3}$, since $-R < x_0 < R$. Then, for $n = N + 1$, there exists a $\delta > 0$ such that for all $|x - x_0| < \delta$, $|S_{N+1}(x) - S_{N+1}(x_0)| < \frac{\varepsilon}{3}$ due to the continuity of $S_n(x)$ at x_0 , since the $S_n(x)$ being polynomials in x are continuous in the stated interval, $|x| < R$. We have, for $n = N + 1$,

$$\begin{aligned} |S(x) - S(x_0)| &= |S(x) - S_{N+1}(x) + S_{N+1}(x) - S_{N+1}(x_0) + S_{N+1}(x_0) - S(x_0)| \\ &\leq |S(x) - S_{N+1}(x)| + |S_{N+1}(x) - S_{N+1}(x_0)| + |S_{N+1}(x_0) - S(x_0)| \\ &< \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} = \varepsilon, \end{aligned}$$

where we have used the triangle inequality. So we have shown that $\lim_{x \rightarrow x_0} S(x) = S(x_0)$, which means $S(x)$ is continuous at $x = x_0$. Since $x = x_0$ was a general point in $|x| < R$, we have proved that $S(x)$ is continuous on $(-R, R)$.

91. Let the power series solution to the differential equation $f''(x) + f(x) = 0$ with the boundary conditions $f(0) = 0$ and $f'(0) = 1$ be given by the power series

$$f(x) = \sum_{k=0}^{\infty} a_k x^k = a_0 + a_1 x + a_2 x^2 + a_3 x^3 + \cdots + a_n x^n + \cdots$$

Since $f(0) = a_0 = 0$, we have that $\boxed{a_0 = 0}$.

Differentiating the series twice, assuming nonzero radius of convergence each time, we obtain

$$\begin{aligned} f'(x) &= a_1 + 2a_2x + 3a_3x^2 + \cdots + na_nx^{n-1} + \cdots \\ f''(x) &= 2a_2 + 6a_3x + \cdots + n(n-1)x^{n-2} + (n+1)nx^{n-1} + (n+2)(n+1)x^n + \cdots \end{aligned}$$

Since $f'(0) = a_1 = 1$, we have $\boxed{a_1 = 1}$.

The coefficient of the x^n term of the series $f''(x) + f(x)$ must satisfy

$$(n+2)(n+1)a_{n+2} + a_n = 0$$

for the differential equation $f''(x) + f(x) = 0$ to be satisfied. Solving, and substituting various values of n , we have

$$\begin{aligned} a_{n+2} &= -\frac{a_n}{(n+2)(n+1)} \\ a_2 &= a_{0+2} = -\frac{a_0}{(0+2)(0+1)} = 0, \text{ since } a_0 = 0; \\ a_3 &= a_{1+2} = -\frac{a_1}{(1+2)(1+1)} = -\frac{a_1}{3 \cdot 2} = -\frac{a_1}{3!} = -\frac{1}{3!}, \text{ since } a_1 = 1; \\ a_4 &= a_{2+2} = -\frac{a_2}{(2+2)(2+1)} = 0, \text{ since } a_2 = 0; \\ a_5 &= a_{3+2} = -\frac{a_3}{(3+2)(3+1)} = -\frac{a_3}{5 \cdot 4} = (-1)(-1)\frac{a_1}{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} = \frac{a_1}{5!} = \frac{1}{5!} \text{ since } a_1 = 1, \end{aligned}$$

and so on. Only the odd coefficients are nonzero, with the most general term being of the form

$$a_{2k+1} = (-1)^k \frac{a_1}{(2k+1)!} = \frac{(-1)^k}{(2k+1)!}.$$

So, the solution of the differential equation is

$$\boxed{f(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}.$$

To find the radius of convergence of $f(x)$, we use the Ratio Test (noting that the terms of the series are nonzero if $x \neq 0$, and the series converges to 0 if $x = 0$):

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1} x^{2(n+1)+1}}{(2(n+1)+1)!}}{\frac{(-1)^n x^{2n+1}}{(2n+1)!}} \right| &= |x|^2 \lim_{n \rightarrow \infty} \frac{(2n+1)!}{(2n+3)!} = |x|^2 \lim_{n \rightarrow \infty} \frac{(2n+1)!}{(2n+3)(2n+2)(2n+1)!} \\ &= |x|^2 \lim_{n \rightarrow \infty} \frac{1}{(2n+3)(2n+2)} = 0 < 1 \end{aligned}$$

for all values of x . So the radius of convergence of the series $\boxed{R = \infty}$.

92. The Bessel function of the first kind of order $m \geq 0$ is

$$J_m(x) = \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+m)! k!} \left(\frac{x}{2}\right)^{2k+m}.$$

(a) We have, for $m = 0$ and $m = 1$,

$$\begin{aligned} J_0(x) &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{k! k!} \left(\frac{x}{2}\right)^{2k} \\ J_1(x) &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+1)! k!} \left(\frac{x}{2}\right)^{2k+1}. \end{aligned}$$

Using the product rule of differentiation, and noting that the series has a nonzero radius of convergence (seen using the Ratio Test) we get

$$\begin{aligned}
 \frac{d}{dx}(xJ_1(x)) &= J_1(x) + xJ_1'(x) \\
 &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+1)! k!} \left(\frac{x}{2}\right)^{2k+1} + x \cdot \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+1)! k!} (2k+1) \cdot \left(\frac{x}{2}\right)^{2k} \cdot \frac{1}{2} \\
 &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+1)! k!} [1 + (2k+1)] \left(\frac{x}{2}\right)^{2k+1}; \\
 x^{-1} \frac{d}{dx}(xJ_1(x)) &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+1)! k!} \left(\frac{2k+2}{2}\right) \left(\frac{x}{2}\right)^{2k} \\
 &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+1)! k!} (k+1) \left(\frac{x}{2}\right)^{2k} \\
 &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{k! k!} \left(\frac{x}{2}\right)^{2k} \\
 &= J_0(x),
 \end{aligned}$$

that is, $J_0(x) = x^{-1} \frac{d}{dx}(xJ_1(x))$, as was to be shown.

(b) Note that for $m = 2$,

$$J_2(x) = \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)! k!} \left(\frac{x}{2}\right)^{2k+2}.$$

Using the product rule of differentiation, and noting the series has a nonzero radius of convergence (seen using the Ratio Test) we get

$$\begin{aligned}
 \frac{d}{dx}(x^2 J_2(x)) &= 2xJ_2(x) + x^2 J_2'(x) \\
 &= 2x \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)! k!} \left(\frac{x}{2}\right)^{2k+2} + x^2 \cdot \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)! k!} (2k+2) \left(\frac{x}{2}\right)^{2k+1} \cdot \frac{1}{2} \\
 &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)! k!} \left[\frac{x^{2k+3}}{2^{2k+1}}\right] + \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)! k!} (k+1) \left[\frac{x^{2k+3}}{2^{2k+1}}\right]; \\
 x^{-2} \frac{d}{dx}(x^2 J_2(x)) &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)! k!} \left(\frac{x}{2}\right)^{2k+1} + \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)! k!} (k+1) \left(\frac{x}{2}\right)^{2k+1} \\
 &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)! k!} [1 + (k+1)] \left(\frac{x}{2}\right)^{2k+1} \\
 &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+2)(k+1)! k!} (k+2) \left(\frac{x}{2}\right)^{2k+1} \\
 &= \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+1)! k!} \left(\frac{x}{2}\right)^{2k+1} \\
 &= J_1(x),
 \end{aligned}$$

that is, $J_1(x) = x^{-2} \frac{d}{dx}(x^2 J_2(x))$, as was to be shown.

8.9 Infinite Series

Concepts and Vocabulary

1. *Taylor Series*: See p.613 for the full definition.
2. *Maclaurin*: See p.613 for the full definition.

Skill Building

3. To express $f(x) = \ln(1 - x)$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = \ln(1 - x) & f(0) = \ln(1 - 0) = 0 \\
 f'(x) = -\frac{1}{1 - x} & f'(0) = -\frac{1}{1 - 0} = -1 \\
 f''(x) = -\frac{1}{(1 - x)^2} & f''(0) = -\frac{1}{(1 - 0)^2} = -1 \\
 f'''(x) = -\frac{2}{(1 - x)^3} & f'''(0) = -\frac{2}{(1 - 0)^3} = -2 = -2! \\
 f^{(4)}(x) = -\frac{3 \cdot 2}{(1 - x)^4} & f^{(4)}(0) = -\frac{3 \cdot 2}{(1 - 0)^4} = -3! \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= \frac{0}{0!} x^0 + \frac{-1}{1!} x^1 + \frac{-1}{2!} x^2 + \frac{-2!}{3!} x^3 + \frac{-3!}{4!} x^4 + \cdots + \frac{-(n-1)!}{n!} x^n + \cdots \\
 &= 0 - x - \frac{x^2}{2} - \frac{x^3}{3} - \frac{x^4}{4} - \cdots - \frac{x^n}{n} - \cdots \\
 &= -\sum_{k=0}^{\infty} \frac{x^{k+1}}{k+1}.
 \end{aligned}$$

4. To express $f(x) = \ln(1 + x)$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = \ln(1 + x) & f(0) = \ln(1 + 0) = 0 \\
 f'(x) = \frac{1}{1 + x} & f'(0) = \frac{1}{1 + 0} = 1 \\
 f''(x) = -\frac{1}{(1 + x)^2} & f''(0) = -\frac{1}{(1 + 0)^2} = -1 \\
 f'''(x) = \frac{2}{(1 + x)^3} & f'''(0) = \frac{2}{(1 + 0)^3} = 2 = 2! \\
 f^{(4)}(x) = -\frac{3 \cdot 2}{(1 + x)^4} & f^{(4)}(0) = -\frac{3 \cdot 2}{(1 + 0)^4} = -3! \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= \frac{0}{0!} x^0 + \frac{1}{1!} x^1 + \frac{-1}{2!} x^2 + \frac{2!}{3!} x^3 + \frac{-3!}{4!} x^4 + \cdots + \frac{(-1)^{n+1}(n-1)!}{n!} x^n + \cdots \\
 &= 0 + x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots + \frac{(-1)^{n+1}x^n}{n} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} (-1)^k \frac{x^{k+1}}{k+1}}.
 \end{aligned}$$

5. To express $f(x) = \frac{1}{1-x}$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = \frac{1}{1-x} & f(0) = \frac{1}{1-0} = 1 \\
 f'(x) = \frac{1}{(1-x)^2} & f'(0) = \frac{1}{(1-0)^2} = 1 \\
 f''(x) = \frac{2}{(1-x)^3} & f''(0) = \frac{2}{(1-0)^3} = 2 = 2! \\
 f'''(x) = \frac{3 \cdot 2}{(1-x)^4} & f'''(0) = \frac{3 \cdot 2}{(1-0)^4} = 3! \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= \frac{1}{0!} x^0 + \frac{1}{1!} x^1 + \frac{2!}{2!} x^2 + \frac{3!}{3!} x^3 + \cdots + \frac{n!}{n!} x^n + \cdots \\
 &= 1 + x + x^2 + x^3 + \cdots + x^n + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} x^k}.
 \end{aligned}$$

6. To express $f(x) = \frac{1}{1-3x}$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = \frac{1}{1-3x} & f(0) = \frac{1}{1-3 \cdot 0} = 1 \\
 f'(x) = \frac{3 \cdot 1}{(1-3x)^2} & f'(0) = \frac{3 \cdot 1}{(1-3 \cdot 0)^2} = 3 \cdot 1! \\
 f''(x) = \frac{3^2 \cdot 2 \cdot 1}{(1-3x)^3} & f''(0) = \frac{3^2 \cdot 2 \cdot 1}{(1-3 \cdot 0)^3} = 3^2 \cdot 2! \\
 f'''(x) = \frac{3^3 \cdot 3 \cdot 2!}{(1-3x)^4} & f'''(0) = \frac{3^3 \cdot 3 \cdot 2!}{(1-3 \cdot 0)^4} = 3^3 \cdot 3! \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= 1 + \frac{3 \cdot 1!}{1!} x + \frac{3^2 \cdot 2!}{2!} x^2 + \frac{3^3 \cdot 3!}{3!} x^3 + \cdots + \frac{3^n \cdot n!}{n!} x^n + \cdots \\
 &= 1 + 3x + 9x^2 + 27x^3 + \cdots + 3^n x^n + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} 3^k x^k}
 \end{aligned}$$

7. To express $f(x) = \frac{1}{(1+x)^2}$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = \frac{1}{(1+x)^2} & f(0) = \frac{1}{(1+0)^2} = 1 \\
 f'(x) = -\frac{2}{(1+x)^3} & f'(0) = -\frac{2}{(1+0)^3} = -2 = -2! \\
 f''(x) = \frac{3 \cdot 2}{(1+x)^4} & f''(0) = \frac{3 \cdot 2}{(1+0)^4} = 3! \\
 f'''(x) = -\frac{4 \cdot 3 \cdot 2}{(1+x)^5} & f'''(0) = -\frac{4 \cdot 3 \cdot 2}{(1+0)^5} = -4! \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= 1 - \frac{2!}{1!} x + \frac{3!}{2!} x^2 - \frac{4!}{3!} x^3 + \cdots + (-1)^n \frac{(n+1)!}{n!} x^n + \cdots \\
 &= 1 - 2x + 3x^2 - 4x^3 + \cdots + (-1)^n (n+1)x^n + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} (-1)^k (k+1)x^k}
 \end{aligned}$$

8. To express $f(x) = (1+x)^{-3}$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = (1+x)^{-3} & f(0) = (1+0)^{-3} = 1 \\
 f'(x) = (-3)(1+x)^{-4} & f'(0) = (-3)(1+0)^{-4} = -3 \\
 f''(x) = (-3)(-4)(1+x)^{-5} & f''(0) = (-3)(-4)(1+0)^{-5} = 3 \cdot 4 \\
 f'''(x) = (-3)(-4)(-5)(1+x)^{-6} & f'''(0) = (-3)(-4)(-5)(1+0)^{-6} = -3 \cdot 4 \cdot 5 \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= 1 - 3x + \frac{3 \cdot 4}{2!} x^2 - \frac{3 \cdot 4 \cdot 5}{3!} x^3 + \cdots + (-1)^n \frac{3 \cdot 4 \cdot 5 \cdots (n+1)(n+2)}{n!} x^n + \cdots \\
 &= 1 - 3x + \frac{3 \cdot 4}{2} x^2 - \frac{4 \cdot 5}{2} x^3 + \cdots + (-1)^n \frac{(n+1)(n+2)}{2} x^n + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} (-1)^k \frac{(k+1)(k+2)}{2} x^k}.
 \end{aligned}$$

9. To express $f(x) = \frac{1}{1+x^2}$ as a Maclaurin series, first we find the Maclaurin series for the simpler function $g(x) = \frac{1}{1+x}$ by evaluating it and its derivatives at $x = 0$.

$$\begin{array}{ll}
 g(x) = \frac{1}{1+x} & g(0) = \frac{1}{1+0} = 1 \\
 g'(x) = -\frac{1}{(1+x)^2} & g'(0) = -\frac{1}{(1+0)^2} = -1 \\
 g''(x) = \frac{2}{(1+x)^3} & g''(0) = \frac{2}{(1+0)^3} = 2 = 2! \\
 g'''(x) = -\frac{3 \cdot 2}{(1+x)^4} & g'''(0) = -\frac{3 \cdot 2}{(1+0)^4} = -3 \cdot 2 = -3! \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series of $g(x)$ is

$$\begin{aligned}
 g(x) &= \sum_{k=0}^{\infty} \frac{g^{(k)}(0)}{k!} x^k \\
 &= 1 - \frac{1}{1!} x + \frac{2!}{2!} x^2 - \frac{3!}{3!} x^3 + \cdots + (-1)^n \frac{n!}{n!} x^n + \cdots \\
 &= 1 - x + x^2 - x^3 + \cdots + (-1)^n x^n + \cdots
 \end{aligned}$$

Then the Maclaurin expansion of $f(x) = \frac{1}{1+x^2} = g(x^2)$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{g^{(k)}(0)}{k!} (x^2)^k \\
 &= 1 - x^2 + (x^2)^2 - (x^2)^3 + \cdots + (-1)^n (x^2)^n + \cdots \\
 &= 1 - x^2 + x^4 - x^6 + \cdots + (-1)^n x^{2n} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} (-1)^k x^{2k}}.
 \end{aligned}$$

10. To express $f(x) = \frac{1}{1+2x^3}$ as a Maclaurin series, first we find the Maclaurin series for the simpler

function $g(x) = \frac{1}{1+x}$ by evaluating it and its derivatives at $x = 0$.

$$\begin{array}{ll}
 g(x) = \frac{1}{1+x} & g(0) = \frac{1}{1+0} = 1 \\
 g'(x) = -\frac{1}{(1+x)^2} & g'(0) = -\frac{1}{(1+0)^2} = -1 \\
 g''(x) = \frac{2}{(1+x)^3} & g''(0) = \frac{2}{(1+0)^3} = 2 = 2! \\
 g'''(x) = -\frac{3 \cdot 2}{(1+x)^4} & g'''(0) = -\frac{3 \cdot 2}{(1+0)^4} = -3 \cdot 2 = -3! \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series of $g(x)$ is

$$\begin{aligned}
 g(x) &= \sum_{k=0}^{\infty} \frac{g^{(k)}(0)}{k!} x^k \\
 &= 1 - \frac{1}{1!}x + \frac{2!}{2!}x^2 - \frac{3!}{3!}x^3 + \cdots + (-1)^n \frac{n!}{n!}x^n + \cdots \\
 &= 1 - x + x^2 - x^3 + \cdots + (-1)^n x^n + \cdots
 \end{aligned}$$

Then the Maclaurin expansion of $f(x) = \frac{1}{1+2x^3} = g(2x^3)$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{g^{(k)}(0)}{k!} (2x^3)^k \\
 &= 1 - 2x^3 + (2x^3)^2 - (2x^3)^3 + \cdots + (-1)^n (2x^3)^n + \cdots \\
 &= 1 - 2x^3 + 4x^6 - 8x^9 + \cdots + (-1)^n 2^n x^{3n} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} (-1)^k 2^k x^{3k}}.
 \end{aligned}$$

11. To express $f(x) = e^{3x}$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = e^{3x} & f(0) = e^{3 \cdot 0} = e^0 = 1 \\
 f'(x) = 3e^{3x} & f'(0) = 3e^{3 \cdot 0} = 3e^0 = 3 \\
 f''(x) = 3^2 e^{3x} & f''(0) = 3^2 e^{3 \cdot 0} = 3^2 e^0 = 3^2 \\
 f'''(x) = 3^3 e^{3x} & f'''(0) = 3^3 e^{3 \cdot 0} = 3^3 e^0 = 3^3 \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= 1 + \frac{3}{1!}x + \frac{3^2}{2!}x^2 + \frac{3^3}{3!}x^3 + \cdots + \frac{3^n}{n!}x^n + \cdots \\
 &= 1 + 3x + \frac{9}{2}x^2 + \frac{9}{2}x^3 + \cdots + \frac{3^n}{n!}x^n + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{3^k x^k}{k!}}.
 \end{aligned}$$

12. To express $f(x) = e^{x/2}$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = e^{x/2} & f(0) = e^{0/2} = e^0 = 1 \\
 f'(x) = \frac{1}{2}e^{x/2} & f'(0) = \frac{1}{2}e^{0/2} = \frac{1}{2}e^0 = \frac{1}{2} \\
 f''(x) = \left(\frac{1}{2}\right)^2 e^{x/2} & f''(0) = \left(\frac{1}{2}\right)^2 e^{0/2} = \left(\frac{1}{2}\right)^2 e^0 = \left(\frac{1}{2}\right)^2 \\
 f'''(x) = \left(\frac{1}{2}\right)^3 e^{x/2} & f'''(0) = \left(\frac{1}{2}\right)^3 e^{0/2} = \left(\frac{1}{2}\right)^3 e^0 = \left(\frac{1}{2}\right)^3 \\
 \vdots & \vdots
 \end{array}$$

The Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= 1 + \frac{1}{2} \frac{x^1}{1!} + \left(\frac{1}{2}\right)^2 \frac{x^2}{2!} + \left(\frac{1}{2}\right)^3 \frac{x^3}{3!} + \cdots + \left(\frac{1}{2}\right)^n \frac{x^n}{n!} + \cdots \\
 &= 1 + \frac{x}{2} + \frac{x^2}{8} + \frac{x^3}{48} + \cdots + \left(\frac{1}{2}\right)^n \frac{x^n}{n!} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{x^k}{2^k k!}}.
 \end{aligned}$$

13. To express $f(x) = \sin(\pi x)$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = \sin(\pi x) & f(0) = 0 \\
 f'(x) = \pi \cos(\pi x) & f'(0) = \pi \cos(0) = \pi \\
 f''(x) = -\pi^2 \sin(\pi x) & f''(0) = 0 \\
 f'''(x) = -\pi^3 \cos(\pi x) & f'''(0) = -\pi^3 \cos(0) = -\pi^3 \\
 f^{(4)}(x) = \pi^4 \sin(\pi x) & f^{(4)}(0) = 0 \\
 \vdots & \vdots
 \end{array}$$

For derivatives of odd order, $f^{(2n+1)}(0) = (-1)^n \pi^{2n+1}$. For derivatives of even order, $f^{(2n)}(0) = 0$. So the Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= \pi x - \frac{(\pi x)^3}{3!} + \frac{(\pi x)^5}{5!} - \cdots + \frac{(-1)^n (\pi x)^{2n+1}}{(2n+1)!} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{(-1)^k \pi^{2k+1} x^{2k+1}}{(2k+1)!}}.
 \end{aligned}$$

14. To express $f(x) = \cos(2x)$ as a Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at

$x = 0$.

$$\begin{array}{ll}
 f(x) = \cos(2x) & f(0) = 1 \\
 f'(x) = -2\sin(2x) & f'(0) = 0 \\
 f''(x) = -2^2\cos(2x) & f''(0) = -2^2 \\
 f'''(x) = 2^3\sin(2x) & f'''(0) = 0 \\
 f^{(4)}(x) = 2^4\cos(2x) & f^{(4)}(0) = 2^4 \\
 \vdots & \vdots
 \end{array}$$

For derivatives of even order, $f^{(2n)}(0) = (-1)^n 2^{2n}$. For derivatives of odd order, $f^{(2n+1)}(0) = 0$. So the Maclaurin series is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= 1 - \frac{2^2 x^2}{2!} + \frac{2^4 x^4}{4!} - \cdots + \frac{(-1)^n 2^{2n} x^{2n}}{(2n)!} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{(-1)^k 2^{2k} x^{2k}}{(2k)!}}.
 \end{aligned}$$

15. To find the Taylor expansion of $f(x) = e^x$ about $c = 1$, we begin by evaluating $f(x)$ and its derivatives at $x = 1$.

$$\begin{array}{ll}
 f(x) = e^x & f(1) = e \\
 f'(x) = e^x & f'(1) = e \\
 f''(x) = e^x & f''(1) = e \\
 f'''(x) = e^x & f'''(1) = e \\
 \vdots & \vdots
 \end{array}$$

The Taylor expansion about $c = 1$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x - c)^k \\
 &= e + e(x - 1) + \frac{e(x - 1)^2}{2!} + \frac{e(x - 1)^3}{3!} + \cdots + \frac{e(x - 1)^n}{n!} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{e(x - 1)^k}{k!}}.
 \end{aligned}$$

16. To find the Taylor expansion of $f(x) = e^{2x}$ about $c = -1$, we begin by evaluating $f(x)$ and its derivatives at $x = -1$.

$$\begin{array}{ll}
 f(x) = e^{2x} & f(-1) = e^{-2} \\
 f'(x) = 2e^{2x} & f'(-1) = 2e^{-2} \\
 f''(x) = 2^2 e^{2x} & f''(-1) = 2^2 e^{-2} \\
 f'''(x) = 2^3 e^{2x} & f'''(-1) = 2^3 e^{-2} \\
 \vdots & \vdots
 \end{array}$$

The Taylor expansion about $c = -1$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= e^{-2} + 2e^{-2}(x+1) + \frac{2^2 e^{-2}(x+1)^2}{2!} + \frac{2^3 e^{-2}(x+1)^3}{3!} + \cdots + \frac{2^n e^{-2}(x+1)^n}{n!} + \cdots \\
 &= \frac{1}{e^2} + \frac{2}{e^2}(x+1) + \frac{2}{e^2}(x+1)^2 + \frac{4}{3e^2}(x+1)^3 + \cdots + \frac{2^n}{e^2} \frac{(x+1)^n}{n!} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{2^k (x+1)^k}{e^2 k!}}.
 \end{aligned}$$

17. To find the Taylor expansion of $f(x) = \ln x$ about $c = 1$, we begin by evaluating $f(x)$ and its derivatives at $x = 1$.

$$\begin{array}{ll}
 f(x) = \ln x & f(1) = \ln 1 = 0 \\
 f'(x) = \frac{1}{x} & f'(1) = \frac{1}{1} = 1 \\
 f''(x) = -\frac{1}{x^2} & f''(1) = -\frac{1}{1^2} = -1 \\
 f'''(x) = \frac{2}{x^3} & f'''(1) = \frac{2}{1^3} = 2 = 2! \\
 f^{(4)}(x) = -\frac{3 \cdot 2}{x^4} & f^{(4)}(1) = -\frac{3 \cdot 2}{1^4} = -3 \cdot 2 = -3! \\
 \vdots & \vdots
 \end{array}$$

The Taylor expansion about $c = 1$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= \frac{0}{0!}(x-1)^0 + \frac{1}{1!}(x-1)^1 - \frac{1}{2!}(x-1)^2 + \frac{2!}{3!}(x-1)^3 - \frac{3!}{4!}(x-1)^4 + \cdots + (-1)^{n+1} \frac{(n-1)!}{n!}(x-1)^n + \cdots \\
 &= x - 1 - \frac{(x-1)^2}{2} + \frac{(x-1)^3}{3} - \frac{(x-1)^4}{4} + \cdots + (-1)^{n+1} \frac{(x-1)^n}{n} + \cdots \\
 &= \boxed{\sum_{k=1}^{\infty} (-1)^{k+1} \frac{(x-1)^k}{k}}.
 \end{aligned}$$

18. To find the Taylor expansion of $f(x) = \sqrt{x} = x^{1/2}$ about $c = 1$, we begin by evaluating $f(x)$ and its derivatives at $x = 1$.

$$\begin{array}{ll}
 f(x) = x^{1/2} & f(1) = 1 \\
 f'(x) = \frac{1}{2}x^{-1/2} & f'(1) = \frac{1}{2} \\
 f''(x) = \left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)x^{-3/2} & f''(1) = -\frac{1}{2^2} \\
 f'''(x) = \left(\frac{1}{2}\right)^2\left(\frac{3}{2}\right)x^{-5/2} & f'''(1) = \frac{1 \cdot 3}{2^3} \\
 f^{(4)}(x) = \left(\frac{1}{2}\right)^2\left(\frac{3}{2}\right)\left(-\frac{5}{2}\right)x^{-5/2} & f^{(4)}(1) = -\frac{1 \cdot 3 \cdot 5}{2^4} \\
 \vdots & \vdots
 \end{array}$$

The Taylor expansion about $c = 1$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= 1 + \frac{1}{1!}(x-1) + \frac{-\frac{1}{2^2}}{2!}(x-1)^2 + \frac{\frac{1 \cdot 3}{2^3}}{3!}(x-1)^3 + \frac{-\frac{1 \cdot 3 \cdot 5}{2^4}}{4!}(x-1)^4 + \cdots + \frac{(-1)^{n+1} \frac{1 \cdot 3 \cdot 5 \cdots (2n-3)}{2^n}}{n!}(x-1)^n + \cdots \\
 &= \boxed{1 + \frac{1}{2}(x-1) - \frac{1}{8}(x-1)^2 + \frac{1}{16}(x-1)^3 - \frac{5}{128}(x-1)^4 + \cdots}
 \end{aligned}$$

19. To find the Taylor expansion of $f(x) = \frac{1}{x}$ about $c = 1$, we begin by evaluating $f(x)$ and its derivatives at $x = 1$.

$$\begin{array}{ll}
 f(x) = \frac{1}{x} & f(1) = \frac{1}{1} = 1 \\
 f'(x) = -\frac{1}{x^2} & f'(1) = -\frac{1}{1^2} = -1 \\
 f''(x) = \frac{2}{x^3} & f''(1) = \frac{2}{1^3} = 2 = 2! \\
 f'''(x) = -\frac{3 \cdot 2}{x^4} & f'''(1) = -\frac{3 \cdot 2}{1^4} = -3! \\
 \vdots & \vdots
 \end{array}$$

The Taylor expansion about $c = 1$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= 1 - \frac{1}{1!}(x-1)^1 + \frac{2!}{2!}(x-1)^2 - \frac{3!}{3!}(x-1)^3 + \cdots + (-1)^n \frac{n!}{n!}(x-1)^n + \cdots \\
 &= 1 - (x-1) + (x-1)^2 - (x-1)^3 + \cdots + (-1)^n (x-1)^n + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} (-1)^k (x-1)^k}
 \end{aligned}$$

20. To find the Taylor expansion of $f(x) = \frac{1}{\sqrt{x}} = x^{-1/2}$ about $c = 4$, we begin by evaluating $f(x)$ and its derivatives at $x = 4$.

$$\begin{array}{ll}
 f(x) = x^{-1/2} & f(4) = 4^{-1/2} = (2^2)^{-1/2} = 2^{-1} \\
 f'(x) = -\frac{1}{2}x^{-3/2} & f'(4) = -\frac{1}{2}(2^2)^{-3/2} = -\frac{1}{2} \cdot 2^{-3} \\
 f''(x) = \left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)x^{-5/2} & f''(4) = \left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)(2^2)^{-5/2} = \left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)2^{-5} \\
 f'''(x) = \left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)x^{-7/2} & f'''(4) = \left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)(2^2)^{-7/2} = \left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)2^{-7} \\
 \vdots & \vdots
 \end{array}$$

The Taylor expansion about $c = 4$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= 2^{-1} - 1 \frac{(1)(2^{-3})(x-4)}{2 \cdot 1!} + \frac{(1 \cdot 3)(2^{-5})(x-4)^2}{2^2 \cdot 2!} - \frac{(1 \cdot 3 \cdot 5)(2^{-7})(x-4)^3}{2^3 \cdot 3!} + \cdots + \\
 &\quad + (-1)^n \frac{(1 \cdot 3 \cdot 5 \cdots (2n-1))(2^{-(2n+1)})(x-4)^n}{2^n \cdot n!} + \cdots \\
 &= \boxed{\frac{1}{2} - \frac{x-4}{16} + \frac{3(x-4)^2}{256} - \frac{5(x-4)^3}{2048} + \cdots}.
 \end{aligned}$$

21. To find the Taylor expansion of $f(x) = \sin x$ at $c = \frac{\pi}{6}$, we begin by evaluating $f(x)$ and its derivatives at $x = \frac{\pi}{6}$.

$$\begin{array}{ll}
 f(x) = \sin x & f\left(\frac{\pi}{6}\right) = \sin\left(\frac{\pi}{6}\right) = \frac{1}{2} \\
 f'(x) = \cos x & f'\left(\frac{\pi}{6}\right) = \cos\left(\frac{\pi}{6}\right) = \frac{\sqrt{3}}{2} \\
 f''(x) = -\sin x & f''\left(\frac{\pi}{6}\right) = -\sin\left(\frac{\pi}{6}\right) = -\frac{1}{2} \\
 f'''(x) = -\cos x & f'''\left(\frac{\pi}{6}\right) = -\cos\left(\frac{\pi}{6}\right) = -\frac{\sqrt{3}}{2} \\
 f^{(4)}(x) = \sin x & f^{(4)}\left(\frac{\pi}{6}\right) = \sin\left(\frac{\pi}{6}\right) = \frac{1}{2} \\
 \vdots & \vdots
 \end{array}$$

For the even derivatives $f^{(2k)}\left(\frac{\pi}{6}\right) = (-1)^k \frac{1}{2}$. For the odd derivatives, $f^{(2k+1)}\left(\frac{\pi}{6}\right) = (-1)^k \frac{\sqrt{3}}{2}$. The Taylor expansion about $c = \frac{\pi}{6}$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= \frac{1}{2} + \frac{\frac{\sqrt{3}}{2}}{1!} \left(x - \frac{\pi}{6}\right) + \frac{-\frac{1}{2}}{2!} \left(x - \frac{\pi}{6}\right)^2 + \frac{-\frac{\sqrt{3}}{2}}{3!} \left(x - \frac{\pi}{6}\right)^3 + \frac{\frac{1}{2}}{4!} \left(x - \frac{\pi}{6}\right)^4 + \cdots + \\
 &\quad + \frac{(-1)^n \frac{1}{2}}{(2n)!} \left(x - \frac{\pi}{6}\right)^{2n} + \frac{(-1)^n \frac{\sqrt{3}}{2}}{(2n+1)!} \left(x - \frac{\pi}{6}\right)^{2n+1} + \cdots \\
 &= \frac{1}{2} + \frac{\sqrt{3}}{2} \left(x - \frac{\pi}{6}\right) - \frac{1}{4} \left(x - \frac{\pi}{6}\right)^2 - \frac{\sqrt{3}}{12} \left(x - \frac{\pi}{6}\right)^3 + \frac{1}{48} \left(x - \frac{\pi}{6}\right)^4 + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{\sin\left(\frac{1}{6}(\pi + 3k\pi)\right) \left(x - \frac{\pi}{6}\right)^k}{k!}}.
 \end{aligned}$$

22. To find the Taylor expansion of $f(x) = \cos x$ about $c = -\frac{\pi}{2}$, we begin by evaluating $f(x)$ and its

derivatives at $x = -\frac{\pi}{2}$.

$$\begin{array}{ll}
 f(x) = \cos x & f\left(-\frac{\pi}{2}\right) = \cos\left(-\frac{\pi}{2}\right) = 0 \\
 f'(x) = -\sin x & f'\left(-\frac{\pi}{2}\right) = -\sin\left(-\frac{\pi}{2}\right) = \sin\left(\frac{\pi}{2}\right) = 1 \\
 f''(x) = -\cos x & f''\left(-\frac{\pi}{2}\right) = -\cos\left(-\frac{\pi}{2}\right) = 0 \\
 f'''(x) = \sin x & f'''\left(-\frac{\pi}{2}\right) = \sin\left(-\frac{\pi}{2}\right) = -1 \\
 f^{(4)}(x) = \cos x & f^{(4)}\left(-\frac{\pi}{2}\right) = \cos\left(-\frac{\pi}{2}\right) = 0 \\
 \vdots & \vdots
 \end{array}$$

For the even derivatives $f^{(2n)}\left(-\frac{\pi}{2}\right) = 0$. For the odd derivatives $f^{(2n+1)}\left(-\frac{\pi}{2}\right) = (-1)^n$. The Taylor expansion about $c = -\frac{\pi}{2}$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= 0 + \frac{1}{1!} \left(x + \frac{\pi}{2}\right) + \frac{0}{2!} \left(x + \frac{\pi}{2}\right)^2 + \frac{(-1)}{3!} \left(x + \frac{\pi}{2}\right)^3 + \frac{0}{4!} \left(x + \frac{\pi}{2}\right)^4 + \cdots + \frac{(-1)^n}{(2n+1)!} \left(x + \frac{\pi}{2}\right)^{2n+1} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} (-1)^k \frac{\left(x + \frac{\pi}{2}\right)^{2k+1}}{(2k+1)!}}.
 \end{aligned}$$

23. To find the Taylor expansion of $f(x) = 3x^2 + 2x^2 + 5x - 6$ about $c = 0$, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = 3x^2 + 2x^2 + 5x - 6 & f(0) = 3(0)^2 + 2(0)^2 + 5(0) - 6 = -6 \\
 f'(x) = 9x^2 + 4x + 5 & f'(0) = 9(0)^2 + 4(0) + 5 = 5 \\
 f''(x) = 18x + 4 & f''(0) = 18(0) + 4 = 4 \\
 f'''(x) = 18 & f'''(0) = 18 \\
 f^{(4)}(x) = 0 & f^{(4)}(0) = 0.
 \end{array}$$

All the higher order derivatives will be zero, so their evaluation at $x = 0$ will also be zero. The Taylor expansion about $c = 0$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= -6 + \frac{5}{1!}x + \frac{4}{2!}x^2 + \frac{18}{3!}x^3 \\
 &= -6 + 5x + 2x^2 + 3x^3 \\
 &= \boxed{3x^3 + 2x^2 + 5x - 6}.
 \end{aligned}$$

We see that the Taylor expansion of the function about $c = 0$ is identical to the function itself.

24. To find the Taylor expansion of $f(x) = 4x^4 - 2x^3 - x$ about $c = 0$, we begin by evaluating $f(x)$ and its

derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = 4x^4 - 2x^3 - x & f(0) = 4(0)^4 - 2(0)^3 - 0 = 0 \\
 f'(x) = 16x^3 - 6x^2 - 1 & f'(0) = 16(0)^3 - 6(0)^2 - 1 = -1 \\
 f''(x) = 48x^2 - 12x & f''(0) = 48(0)^2 - 12(0) = 0 \\
 f'''(x) = 96x - 12 & f'''(0) = 96(0) - 12 = -12 \\
 f^{(4)}(x) = 96 & f^{(4)}(0) = 96 \\
 f^{(5)}(x) = 0 & f^{(5)}(0) = 0.
 \end{array}$$

All the higher order derivatives will be zero, so their evaluation at $x = 0$ will also be zero. The Taylor expansion about $c = 0$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x - c)^k \\
 &= 0 + \frac{-1}{1!}x + \frac{0}{2!}x^2 + \frac{-12}{3!}x^3 + \frac{96}{4!}x^4 \\
 &= -x - 2x^3 + 4x^4 \\
 &= \boxed{4x^4 - 2x^3 - x}.
 \end{aligned}$$

We see that the Taylor expansion of the function about $c = 0$ is identical to the function itself.

25. To find the Taylor expansion of $f(x) = 3x^3 + 2x^2 + 5x - 6$ about $c = 1$, we begin by evaluating $f(x)$ and its derivatives at $x = 1$.

$$\begin{array}{ll}
 f(x) = 3x^3 + 2x^2 + 5x - 6 & f(1) = 3(1)^3 + 2(1)^2 + 5(1) - 6 = 3 + 2 + 5 - 6 = 4 \\
 f'(x) = 9x^2 + 4x + 5 & f'(1) = 9(1)^2 + 4(1) + 5 = 9 + 4 + 5 = 18 \\
 f''(x) = 18x + 4 & f''(1) = 18(1) + 4 = 22 \\
 f'''(x) = 18 & f'''(1) = 18 \\
 f^{(4)}(x) = 0 & f^{(4)}(1) = 0.
 \end{array}$$

All the higher order derivatives will be zero, so their evaluation at $x = 1$ will also be zero. The Taylor expansion about $c = 1$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x - c)^k \\
 &= 4 + \frac{18}{1!}(x - 1) + \frac{22}{2!}(x - 1)^2 + \frac{18}{3!}(x - 1)^3 \\
 &= \boxed{4 + 18(x - 1) + 11(x - 1)^2 + 3(x - 1)^3} \\
 &= 4 + 18x - 18 + 11(x^2 - 2x + 1) + 3(x^3 - 3x^2 + 3x - 1) \\
 &= 4 + 18x - 18 + 11x^2 - 22x + 11 + 3x^3 - 9x^2 + 9x - 3 \\
 &= (4 - 18 + 11 - 3) + (18x - 22x + 9x) + (11x^2 - 9x^2) + 3x^3 \\
 &= -6 + 5x + 2x^2 + 3x^3 \\
 &= 3x^3 + 2x^2 + 5x - 6.
 \end{aligned}$$

We see that the Taylor expansion of the function about $c = 1$ is identical to the function itself.

26. To find the Taylor expansion of $f(x) = 4x^4 - 2x^3 + x$ about $c = 1$, we begin by evaluating $f(x)$ and its

derivatives at $x = 1$.

$$\begin{array}{ll}
 f(x) = 4x^4 - 2x^3 + x & f(1) = 4(1)^4 - 2(1)^3 + 1 = 4 - 2 + 1 = 3 \\
 f'(x) = 16x^3 - 6x^2 + 1 & f'(1) = 16(1)^3 - 6(1)^2 + 1 = 16 - 6 + 1 = 11 \\
 f''(x) = 48x^2 - 12x & f''(1) = 48(1)^2 - 12(1) = 48 - 12 = 36 \\
 f'''(x) = 96x - 12 & f'''(1) = 96(1) - 12 = 96 - 12 = 84 \\
 f^{(4)}(x) = 96 & f^{(4)}(1) = 96 \\
 f^{(5)}(x) = 0 & f^{(5)}(1) = 0.
 \end{array}$$

All the higher order derivatives will be zero, so their evaluation at $x = 1$ will also be zero. The Taylor expansion about $c = 1$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= 3 + \frac{11}{1!}(x-1) + \frac{36}{2!}(x-1)^2 + \frac{84}{3!}(x-1)^3 + \frac{96}{4!}(x-1)^4 \\
 &= \boxed{3 + 11(x-1) + 18(x-1)^2 + 14(x-1)^3 + 4(x-1)^4} \\
 &= 3 + 11x - 11 + 18(x^2 - 2x + 1) + 14(x^3 - 3x^2 + 3x - 1) + 4(x^4 - 4x^3 + 6x^2 - 4x + 1) \\
 &= (3 - 11 + 18 - 14 + 4) + (11x - 36x + 42x - 16x) + (18x^2 - 42x^2 + 24x^2) + (14x^3 - 16x^3) + 4x^4 \\
 &= 0 + x + 0 - 2x^3 + 4x^4 \\
 &= 4x^4 - 2x^3 + x.
 \end{aligned}$$

We see that the Taylor expansion of the function about $c = 1$ is identical to the function itself.

27. The function $f(x) = \sinh x = \frac{e^x - e^{-x}}{2}$ can be expressed in terms of the the exponential function, $g(x) = e^x$ whose Maclaurin series is

$$e^x = \sum_{k=0}^{\infty} \frac{g^{(k)}(0)}{k!} x^k = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots,$$

since all the derivatives of $g(x) = e^x$ are e^x itself, and when evaluated at $x = 0$, all the derivatives are equal in value to 1. Substituting $-x$ for x , we also have

$$g(-x) = e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \cdots + (-1)^n \frac{x^n}{n!} + \cdots.$$

So we have for the Maclaurin expansion of $\sinh x$,

$$\begin{aligned}
 f(x) &= \frac{e^x - e^{-x}}{2} \\
 &= \frac{1}{2} \left[\left(1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots \right) - \left(1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \cdots + (-1)^n \frac{x^n}{n!} + \cdots \right) \right] \\
 &= x + \frac{x^3}{3!} + \frac{x^5}{5!} + \cdots + \frac{x^{2n+1}}{(2n+1)!} + \cdots \\
 &= \boxed{\sum_{k=0}^{\infty} \frac{x^{2k+1}}{(2k+1)!}}.
 \end{aligned}$$

28. From Problem 27, use the Maclaurin expansion

$$g(x) = e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots.$$

So we get for the Maclaurin expansion of $f(x) = e^{-x^2}$,

$$f(x) = g(-x^2) = e^{-x^2} = 1 - x^2 + \frac{x^4}{2!} - \frac{x^6}{3!} + \cdots + (-1)^n \frac{x^{2n}}{n!} + \cdots = \boxed{\sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{k!}}.$$

29. The Maclaurin expansion of $f(x) = xe^x$ is obtained by multiplying the Maclaurin expansion of x , which is x , and that of $g(x) = e^x$ where (see Problem 27),

$$g(x) = e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots + \frac{x^n}{n!} + \cdots.$$

So the first five terms of the Maclaurin series of $f(x)$ are

$$\begin{aligned} f(x) &= xg(x) \\ &= x \left(1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots + \frac{x^n}{n!} + \cdots \right) \\ &= \boxed{x + x^2 + \frac{x^3}{2!} + \frac{x^4}{3!} + \frac{x^5}{4!} + \cdots}. \end{aligned}$$

30. The Maclaurin expansion of $f(x) = xe^{-x}$ is obtained by multiplying the Maclaurin expansion of x , which is x , and that of $g(-x) = e^{-x}$ where (see problem 27),

$$g(-x) = e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \cdots + (-1)^n \frac{x^n}{n!} + \cdots.$$

So the first five terms of the Maclaurin series of $f(x)$ are

$$\begin{aligned} f(x) &= xg(-x) \\ &= x \left(1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \cdots + (-1)^n \frac{x^n}{n!} + \cdots \right) \\ &= \boxed{x - x^2 + \frac{x^3}{2!} - \frac{x^4}{3!} + \frac{x^5}{4!} - \cdots}. \end{aligned}$$

31. The Maclaurin expansion of $f(x) = e^{-x} \sin x$ is obtained by multiplying the Maclaurin expansions of e^{-x} and $\sin x$ together. From Problem 27, we have

$$g(-x) = e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \cdots + (-1)^n \frac{x^n}{n!} + \cdots.$$

From p.616 of the book, we have

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots.$$

So the first five terms of the Maclaurin series of $f(x)$ are

$$\begin{aligned}
 f(x) &= e^{-x} \sin x \\
 &= \left(1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \frac{x^5}{5!} + \cdots + (-1)^n \frac{x^n}{n!} + \cdots\right) \cdot \left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots\right) \\
 &= \left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + \cdots\right) \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) \\
 &= 1 \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) - x \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \frac{x^2}{2} \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \\
 &\quad - \frac{x^3}{6} \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \frac{x^4}{24} \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) - \frac{x^5}{120} \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \cdots \\
 &= \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \left(-x^2 + \frac{x^4}{6} - \frac{x^6}{120} + \cdots\right) + \left(\frac{x^3}{2} - \frac{x^5}{12} + \frac{x^7}{240} - \cdots\right) + \\
 &\quad + \left(-\frac{x^4}{6} + \frac{x^6}{36} - \frac{x^8}{720} + \cdots\right) + \left(\frac{x^5}{24} - \frac{x^7}{144} + \frac{x^9}{2880} - \cdots\right) + \left(-\frac{x^6}{120} - \cdots\right) + \cdots \\
 &= x - x^2 + x^3 \left(\frac{1}{2} - \frac{1}{6}\right) + x^4 \left(\frac{1}{6} - \frac{1}{6}\right) + x^5 \left(\frac{1}{120} + \frac{1}{24} - \frac{1}{12}\right) + x^6 \left(-\frac{1}{120} + \frac{1}{36} - \frac{1}{120}\right) - \cdots \\
 &= \boxed{x - x^2 + \frac{1}{3}x^3 - \frac{1}{30}x^5 + \frac{1}{90}x^6 - \cdots}
 \end{aligned}$$

32. The Maclaurin expansion of $f(x) = e^{-x} \cos x$ is obtained by multiplying the Maclaurin expansions of e^{-x} and $\cos x$ together. From Problem 27, we have

$$g(-x) = e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \cdots + (-1)^n \frac{x^n}{n!} + \cdots$$

From p.617 of the book, we have

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + \cdots$$

So the first five terms of the Maclaurin series of $f(x)$ are

$$\begin{aligned}
 f(x) &= e^{-x} \cos x \\
 &= \left(1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \frac{x^5}{5!} + \cdots + (-1)^n \frac{x^n}{n!} + \cdots\right) \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + \cdots\right) \\
 &= \left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + \cdots\right) \left(1 - \frac{x^2}{2} + \frac{x^4}{24} - \cdots\right) \\
 &= 1 \cdot \left(1 - \frac{x^2}{2} + \frac{x^4}{24} - \cdots\right) - x \cdot \left(1 - \frac{x^2}{2} + \frac{x^4}{24} - \cdots\right) + \frac{x^2}{2} \cdot \left(1 - \frac{x^2}{2} + \frac{x^4}{24} - \cdots\right) + \\
 &\quad - \frac{x^3}{6} \cdot \left(1 - \frac{x^2}{2} + \frac{x^4}{24} - \cdots\right) + \frac{x^4}{24} \cdot \left(1 - \frac{x^2}{2} + \frac{x^4}{24} - \cdots\right) - \frac{x^5}{120} \cdot \left(1 - \frac{x^2}{2} + \frac{x^4}{24} - \cdots\right) + \cdots \\
 &= \left(1 - \frac{x^2}{2} + \frac{x^4}{24}\right) + \left(-x + \frac{x^3}{2} - \frac{x^5}{24}\right) + \left(\frac{x^2}{2} - \frac{x^4}{4} + \frac{x^6}{48}\right) + \\
 &\quad + \left(-\frac{x^3}{6} + \frac{x^5}{12}\right) + \left(\frac{x^4}{24} - \frac{x^6}{48}\right) + \left(-\frac{x^5}{120}\right) + \cdots \\
 &= 1 - x + x^2 \left(\frac{1}{2} - \frac{1}{2}\right) + x^3 \left(\frac{1}{2} - \frac{1}{6}\right) + x^4 \left(\frac{1}{24} - \frac{1}{4} + \frac{1}{24}\right) + \\
 &\quad + x^5 \left(-\frac{1}{24} + \frac{1}{12} - \frac{1}{120}\right) + \cdots \\
 &= \boxed{1 - x + \frac{x^3}{3} - \frac{x^4}{6} + \frac{x^5}{30} + \cdots}
 \end{aligned}$$

33. To find a Maclaurin expansion for $f(x) = \frac{1}{\sqrt{1-x^2}}$, we first find the Maclaurin expansion for the function $h(x) = \frac{1}{\sqrt{1-x}} = (1-x)^{-1/2}$, by evaluating the function and its derivatives at $x = 0$.

$$\begin{array}{ll}
 h(x) = (1-x)^{-1/2} & h(0) = 1 \\
 h'(x) = -\frac{1}{2}(1-x)^{-3/2} \cdot (-1) = \frac{1}{2}(1-x)^{-3/2} & h'(0) = \frac{1}{2} \\
 h''(x) = \left(\frac{1}{2}\right) \left(-\frac{3}{2}\right) (1-x)^{-5/2} \cdot (-1) = \left(\frac{1 \cdot 3}{2^2}\right) (1-x)^{-5/2} & h''(0) = \frac{3}{4} \\
 h'''(x) = \left(\frac{1 \cdot 3 \cdot 5}{2^3}\right) (1-x)^{-7/2} & h'''(0) = \frac{15}{8} \\
 h^{(4)}(x) = \left(\frac{1 \cdot 3 \cdot 5 \cdot 7}{2^4}\right) (1-x)^{-9/2} & h^{(4)}(0) = \frac{105}{16} \\
 \vdots & \vdots
 \end{array}$$

So the Maclaurin expansion of $h(x) = \frac{1}{\sqrt{1-x}}$ is

$$\begin{aligned}
 h(x) &= \sum_{k=0}^{\infty} \frac{h^{(k)}(0)}{k!} x^k \\
 &= 1 + \frac{1}{2!}x + \frac{3}{4!}x^2 + \frac{15}{8!}x^3 + \frac{105}{16!}x^4 + \cdots \\
 &= 1 + \frac{1}{2}x + \frac{3}{8}x^2 + \frac{5}{16}x^3 + \frac{35}{128}x^4 + \cdots
 \end{aligned}$$

The Maclaurin expansion of $f(x)$ can now be found:

$$f(x) = \frac{1}{\sqrt{1-x^2}} = h(x^2) = 1 + \frac{1}{2}x^2 + \frac{3}{8}x^4 + \frac{5}{16}x^6 + \frac{35}{128}x^8 + \cdots$$

Integrating this series term by term gives us the required first four terms of the Maclaurin expansion for $g(x) = \sin^{-1} x$:

$$\begin{aligned} g(x) &= \sin^{-1} x = \int_0^x \frac{dx}{\sqrt{1-x^2}} = \int_0^x f(x) dx \\ &= \int_0^x \left(1 + \frac{1}{2}x^2 + \frac{3}{8}x^4 + \frac{5}{16}x^6 + \dots \right) dx \\ &= \boxed{x + \frac{x^3}{6} + \frac{3}{40}x^5 + \frac{5}{112}x^7 + \dots} \end{aligned}$$

34. To find the Maclaurin series for $f(x) = \tan x$, we begin by evaluating the function and its derivatives at $x = 0$. Let $y = f(x)$, $y_0 = f(0)$, $y' = f'(x)$, $y'_0 = f'(0)$, etc.

$y = \tan x$	$y_0 = 0$
$y' = \sec^2 x = 1 + \tan^2 x = 1 + y^2$	$y'_0 = 1 + y_0^2 = 1 + 0 = 1$
$y'' = 2yy'$	$y''_0 = 2y_0y'_0 = 2(0)(1) = 0$
$y''' = 2y'^2 + 2yy''$	$y'''_0 = 2y_0'^2 + 2y_0y''_0$ $= 2(1)^2 + 2(0)(0) = 2$
$y^{(4)} = 4y'y'' + 2y'y''' + 2y'y'''$ $= 6y'y'' + 2yy'''$	$y_0^{(4)} = 6y'_0y''_0 + 2y_0y'''_0$ $= 6(1)(0) + 2(0)(2) = 0$
$y^{(5)} = 6y''^2 + 6y'y''' + 2y'y''' + 2yy^{(4)}$ $= 6y''^2 + 8y'y''' + 2yy^{(4)}$	$y_0^{(5)} = 6y_0''^2 + 8y'_0y_0''' + 2y_0y_0^{(4)}$ $= 6(0) + 8(1)(2) + 2(0)(0) = 16$
$y^{(6)} = 12y''y''' + 8y''y''' + 8y'y^{(4)} + 2y'y^{(4)} + 2yy^{(5)}$ $= 20y''y''' + 10y'y^{(4)} + 2yy^{(5)}$	$y_0^{(6)} = 20y_0''y_0''' + 10y'_0y_0^{(4)} + 2y_0y_0^{(5)}$ $= 20(0)(2) + 10(1)(0) + 2(0)(16)$ $= 0$
$y^{(7)} = 20y'''^2 + 20y''y^{(4)} + 10y''y^{(4)} + 10y'y^{(5)} + 2y'y^{(5)} + 2yy^{(6)}$ $= 20y'''^2 + 30y''y^{(4)} + 12y'y^{(5)} + 2yy^{(6)}$	$y_0^{(7)} = 20y_0'''^2 + 30y_0''y_0^{(4)} + 12y'_0y_0^{(5)} + 2y_0y_0^{(6)}$ $= 20(2^2) + 30(0)(0) + 12(1)(16) + 2(0)(0)$ $= 80 + 192 = 272$
$\vdots$	$\vdots$

The Maclaurin series for $f(x) = \tan x$ to four nonzero terms is

$$\begin{aligned} f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\ &= 0 + \frac{1}{1!}x + 0 + \frac{2}{3!}x^3 + 0 + \frac{16}{5!}x^5 + 0 + \frac{272}{7!}x^7 + \dots \\ &= x + \frac{1}{3}x^3 + \frac{2}{15}x^5 + \frac{17}{315}x^7 + \dots \end{aligned}$$

By integrating this term by term, one obtains the first four nonzero terms of the Maclaurin series for $g(x)$

because

$$\begin{aligned}
 g(x) &= \ln(\cos x) = -\ln\left(\frac{1}{\cos x}\right) \\
 &= -\ln(\sec x) \\
 &= -\int_0^x \tan x \, dx \\
 &= -\int_0^x \left(x + \frac{1}{3}x^3 + \frac{2}{15}x^5 + \frac{17}{315}x^7 + \cdots\right) dx \\
 &= -\left(\frac{x^2}{2} + \frac{x^4}{3 \cdot 4} + \frac{2x^6}{15 \cdot 6} + \frac{17x^8}{315 \cdot 8} + \cdots\right) \\
 &= \boxed{-\frac{x^2}{2} - \frac{x^4}{12} - \frac{x^6}{45} - \frac{17x^8}{2520} - \cdots}.
 \end{aligned}$$

35. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial expansion of $f(x) = \sqrt{1+x^2} = (1+x^2)^{1/2}$ is given by

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \binom{\frac{1}{2}}{k} x^{2k} \\
 &= \binom{\frac{1}{2}}{0} x^0 + \binom{\frac{1}{2}}{1} x^2 + \binom{\frac{1}{2}}{2} x^4 + \binom{\frac{1}{2}}{3} x^6 + \cdots \\
 &= 1 + \frac{1}{2}x + \frac{\left(\frac{1}{2}\right)\left(\frac{1}{2}-1\right)}{2!} x^4 + \frac{\left(\frac{1}{2}\right)\left(\frac{1}{2}-1\right)\left(\frac{1}{2}-2\right)}{3!} x^6 + \cdots \\
 &= \boxed{1 + \frac{1}{2}x^2 - \frac{1}{8}x^4 + \frac{1}{16}x^6 - \cdots}.
 \end{aligned}$$

Since $m = \frac{1}{2}$ satisfies $m > 0$ but m is not an integer, by the conditions of the theorem on p.620, the series converges on the closed interval $\boxed{[-1, 1]}$.

36. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial expansion of $f(x) = \frac{1}{\sqrt{1-x}} = (1-x)^{-1/2}$ is given by

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \binom{-\frac{1}{2}}{k} (-1)^k x^k \\
 &= \binom{-\frac{1}{2}}{0} (-1)^0 x^0 + \binom{-\frac{1}{2}}{1} (-1)^1 x^1 + \binom{-\frac{1}{2}}{2} (-1)^2 x^2 + \binom{-\frac{1}{2}}{3} (-1)^3 x^3 + \cdots \\
 &= 1 - \left(-\frac{1}{2}\right)x + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)}{2!} x^2 - \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)}{3!} x^3 + \cdots \\
 &= \boxed{1 + \frac{1}{2}x + \frac{3}{8}x^2 + \frac{5}{16}x^3 + \cdots}.
 \end{aligned}$$

Since $m = -\frac{1}{2}$ satisfies $-1 < m < 0$, by the conditions of the theorem on p.620, the series converges on the half open interval $\boxed{(-1, 1]}$.

37. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial expansion of $f(x) = (1+x)^{1/5}$ is given by

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \binom{\frac{1}{5}}{k} x^k \\
 &= \binom{\frac{1}{5}}{0} x^0 + \binom{\frac{1}{5}}{1} x^1 + \binom{\frac{1}{5}}{2} x^2 + \binom{\frac{1}{5}}{3} x^3 + \cdots \\
 &= 1 + \frac{1}{5}x + \frac{\left(\frac{1}{5}\right)\left(\frac{1}{5}-1\right)}{2!} x^2 + \frac{\left(\frac{1}{5}\right)\left(\frac{1}{5}-1\right)\left(\frac{1}{5}-2\right)}{3!} x^3 + \cdots \\
 &= \boxed{1 + \frac{1}{5}x - \frac{2}{25}x^2 + \frac{6}{125}x^3 - \cdots}
 \end{aligned}$$

Since $m > 0$ but is not an integer, by the conditions of the theorem on p.620, the series converges on the closed interval $\boxed{[-1, 1]}$.

38. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial expansion of $f(x) = (1-x)^{5/3}$ is given by

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \binom{\frac{5}{3}}{k} (-1)^k x^k \\
 &= \binom{\frac{5}{3}}{0} (-1)^0 x^0 + \binom{\frac{5}{3}}{1} (-1)^1 x^1 + \binom{\frac{5}{3}}{2} (-1)^2 x^2 + \binom{\frac{5}{3}}{3} (-1)^3 x^3 + \cdots \\
 &= 1 - \frac{5}{3}x + \frac{\left(\frac{5}{3}\right)\left(\frac{5}{3}-1\right)}{2!} x^2 - \frac{\left(\frac{5}{3}\right)\left(\frac{5}{3}-1\right)\left(\frac{5}{3}-2\right)}{3!} x^3 + \cdots \\
 &= \boxed{1 - \frac{5}{3}x + \frac{5}{9}x^2 - \frac{5}{81}x^3 + \cdots}
 \end{aligned}$$

Since $m > 0$ but is not an integer, by the conditions of the theorem on p.620, the series converges on the closed interval $\boxed{[-1, 1]}$.

39. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial expansion of $f(x) = \frac{1}{(1+x^2)^{1/2}} = (1+x^2)^{-1/2}$ is given by

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \binom{-\frac{1}{2}}{k} x^{2k} \\
 &= \binom{-\frac{1}{2}}{0} x^0 + \binom{-\frac{1}{2}}{1} x^2 + \binom{-\frac{1}{2}}{2} x^4 + \binom{-\frac{1}{2}}{3} x^6 + \cdots \\
 &= 1 + \left(-\frac{1}{2}\right) x^2 + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)}{2!} x^4 + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)}{3!} x^6 + \cdots \\
 &= \boxed{1 - \frac{1}{2}x^2 + \frac{3}{8}x^4 - \frac{5}{16}x^6 + \cdots}
 \end{aligned}$$

Since $m = -\frac{1}{2}$ satisfies $-1 < m < 0$, by the conditions of the theorem on p.620, the series converges on the half open interval $\boxed{(-1, 1]}$.

40. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial expansion of $f(x) = \frac{1}{(1+x)^{3/4}} = (1+x)^{-3/4}$ is given by

$$\begin{aligned} f(x) &= \sum_{k=0}^{\infty} \binom{-\frac{3}{4}}{k} x^k \\ &= \binom{-\frac{3}{4}}{0} x^0 + \binom{-\frac{3}{4}}{1} x^1 + \binom{-\frac{3}{4}}{2} x^2 + \binom{-\frac{3}{4}}{3} x^3 + \dots \\ &= 1 - \frac{3}{4}x + \frac{(-\frac{3}{4})(-\frac{3}{4}-1)}{2!} x^2 + \frac{(-\frac{3}{4})(-\frac{3}{4}-1)(-\frac{3}{4}-2)}{3!} x^3 + \dots \\ &= \boxed{1 - \frac{3}{4}x + \frac{21}{32}x^2 - \frac{77}{128}x^3 + \dots} \end{aligned}$$

Since $m = -\frac{3}{4}$ satisfies $-1 < m < 0$, by the conditions of the theorem on p.620, the series converges on the half open interval $\boxed{(-1, 1]}$.

41. $f(x) = \frac{2x}{\sqrt{1-x}}$. From Problem 36, use the binomial series for

$$\frac{1}{\sqrt{1-x}} = 1 + \frac{1}{2}x + \frac{3}{8}x^2 + \frac{5}{16}x^3 + \dots$$

So the expansion for $f(x)$ is

$$\begin{aligned} f(x) &= \frac{2x}{\sqrt{1-x}} \\ &= 2x \left(1 + \frac{1}{2}x + \frac{3}{8}x^2 + \frac{5}{16}x^3 + \dots \right) \\ &= \boxed{2x + x^2 + \frac{3}{4}x^3 + \frac{5}{8}x^4 + \dots} \end{aligned}$$

Since $m = -\frac{1}{2}$ satisfies $-1 < m < 0$, by the conditions of the theorem on p.620, the binomial series $\frac{1}{\sqrt{x-1}}$ converges on the half open interval $(-1, 1]$. Since multiplying the binomial series $\frac{1}{\sqrt{x-1}}$ by $2x$ to obtain $f(x)$ will not change the interval of convergence, we conclude that the series for $f(x)$ converges in the interval $\boxed{(-1, 1]}$.

42. Write $f(x) = \frac{x}{1+x^3} = x(1+x^3)^{-1}$. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial expansion of $(1+x^3)^{-1}$ is given by

$$\begin{aligned} (1+x^3)^{-1} &= \sum_{k=0}^{\infty} \binom{-1}{k} x^{3k} \\ &= \binom{-1}{0} x^0 + \binom{-1}{1} x^3 + \binom{-1}{2} x^6 + \binom{-1}{3} x^9 + \dots \\ &= 1 - x^3 + \frac{(-1)(-1-1)}{2!} x^6 + \frac{(-1)(-1-1)(-1-2)}{3!} x^9 + \dots \\ &= 1 - x^3 + \frac{2}{2!} x^6 - \frac{2 \cdot 3}{3!} x^9 + \dots \\ &= 1 - x^3 + x^6 - x^9 + \dots \end{aligned}$$

So the expansion of $f(x)$ is

$$\begin{aligned} f(x) &= \frac{x}{1+x^3} \\ &= x(1 - x^3 + x^6 - x^9 + \dots) \\ &= \boxed{x - x^4 + x^7 - x^{10} + \dots} \end{aligned}$$

Since $m = -1$ satisfies $m \leq -1$, by the conditions of the theorem on p.620, the binomial series $\frac{1}{(1+x^3)}$ converges on the open interval $(-1, 1)$. Since multiplying the binomial series $\frac{1}{(1+x^3)}$ by x to obtain $f(x)$ will not change the interval of convergence, we conclude that the series for $f(x)$ converges in the interval $\boxed{(-1, 1)}$.

Applications and Extensions

43. We write $f(x) = \sin^2 x = \frac{1 - \cos(2x)}{2} = \frac{1}{2} - \frac{1}{2} \cos(2x)$. From p.617 of the book, we see that the Maclaurin series for $\cos x$ is given by $\cos x = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!}$. So The Maclaurin series for $f(x)$ is given by

$$\begin{aligned} f(x) = \sin^2 x &= \frac{1}{2} - \frac{1}{2} \sum_{k=0}^{\infty} \frac{(-1)^k (2x)^{2k}}{(2k)!} \\ &= \frac{1}{2} - \frac{1}{2} \left[1 - \frac{(2x)^2}{2!} + \frac{(2x)^4}{4!} - \frac{(2x)^6}{6!} + \frac{(2x)^8}{8!} - \cdots + (-1)^n \frac{(2x)^{2n}}{(2n)!} + \cdots \right] \\ &= \frac{1}{2} - \frac{1}{2} + \frac{2x^2}{2} - \frac{2^3 x^4}{24} + \frac{2^5 x^6}{720} - \frac{2^7 x^8}{40320} + \cdots + (-1)^{n+1} \frac{2^{2n-1} x^{2n}}{(2n)!} + \cdots \\ &= \boxed{x^2 - \frac{x^4}{3} + \frac{2}{45} x^6 - \frac{1}{315} x^8 + \cdots} \end{aligned}$$

44. We write $f(x) = \cos^2 x = \frac{1 + \cos(2x)}{2} = \frac{1}{2} + \frac{1}{2} \cos(2x)$. From p.617 of the book, we see that the Maclaurin series for $\cos x$ is given by $\cos x = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!}$. So The Maclaurin series for $f(x)$ is given by

$$\begin{aligned} f(x) = \cos^2 x &= \frac{1}{2} + \frac{1}{2} \sum_{k=0}^{\infty} \frac{(-1)^k (2x)^{2k}}{(2k)!} \\ &= \frac{1}{2} + \frac{1}{2} \left[1 - \frac{(2x)^2}{2!} + \frac{(2x)^4}{4!} - \frac{(2x)^6}{6!} + \frac{(2x)^8}{8!} - \cdots + (-1)^n \frac{(2x)^{2n}}{(2n)!} + \cdots \right] \\ &= \frac{1}{2} + \frac{1}{2} - \frac{2x^2}{2} + \frac{2^3 x^4}{24} - \frac{2^5 x^6}{720} + \frac{2^7 x^8}{40320} - \cdots + (-1)^n \frac{2^{2n-1} x^{2n}}{(2n)!} + \cdots \\ &= \boxed{1 - x^2 + \frac{x^4}{3} - \frac{2}{45} x^6 + \frac{1}{315} x^8 - \cdots} \end{aligned}$$

Check: Since $\cos^2 x = 1 - \sin^2 x$, we could also get this series directly from Problem 43:

$$\begin{aligned} \cos^2 x &= 1 - \sin^2 x \\ &= 1 - \left(x^2 - \frac{x^4}{3} + \frac{2}{45} x^6 - \frac{1}{315} x^8 + \cdots \right) \\ &= 1 - x^2 + \frac{x^4}{3} - \frac{2}{45} x^6 + \frac{1}{315} x^8 - \cdots \end{aligned}$$

45. The Maclaurin expansion for $\sin x$, from p.616 of the book, is $\sin x = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!}$. Integrating both

sides of this, we have:

$$\begin{aligned}
 \int_0^x \sin t \, dt &= \int_0^x \left[t - \frac{t^3}{3!} + \frac{t^5}{5!} - \frac{t^7}{7!} + \cdots + (-1)^n \frac{t^{2n+1}}{(2n+1)!} + \cdots \right] dt \\
 [\cos t] \Big|_0^x &= \left[\frac{t^2}{2} - \frac{t^4}{4 \cdot 3!} + \frac{t^6}{6 \cdot 5!} - \frac{t^8}{8 \cdot 7!} + \cdots + (-1)^n \frac{t^{2n+2}}{(2n+2) \cdot (2n+1)!} + \cdots \right]_0^x \\
 (\cos x - 1) &= \frac{x^2}{2!} - \frac{x^4}{4!} + \frac{x^6}{6!} - \frac{x^8}{8!} + \cdots + (-1)^n \frac{x^{2n+2}}{(2n+2)!} + \cdots \\
 \cos x &= \boxed{1 + \frac{x^2}{2!} - \frac{x^4}{4!} + \frac{x^6}{6!} - \frac{x^8}{8!} + \cdots + (-1)^n \frac{x^{2n+2}}{(2n+2)!} + \cdots = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{(2k)!}}.
 \end{aligned}$$

46. We write $f(x) = \ln \frac{1}{1-x} = -\ln(1-x)$. To find the Maclaurin series, we begin by evaluating $f(x)$ and its derivatives at $x = 0$.

$$\begin{array}{ll}
 f(x) = -\ln(1-x) & f(0) = -\ln(1-0) = -\ln 1 = 0 \\
 f'(x) = -\frac{1}{1-x} \cdot (-1) = (1-x)^{-1} = \frac{1}{1-x} & f'(0) = \frac{1}{1-0} = 1 \\
 f''(x) = (-1)(1-x)^{-2} \cdot (-1) = (1-x)^{-2} & f''(0) = (1-0)^{-2} = 1! \\
 f'''(x) = (-2)(1-x)^{-3} \cdot (-1) = (2)(1-x)^{-3} & f'''(0) = 2(1-0)^{-3} = 2! \\
 f^{(4)}(x) = (-3)(2)(1-x)^{-4} \cdot (-1) = (3)(2)(1-x)^{-4} & f^{(4)}(0) = 3 \cdot 2(1-0)^{-4} = 3! \\
 \vdots & \vdots \\
 f^{(n)}(x) = (2)(3) \cdots (n-1)(1-x)^{-n} \cdot (-1) = (n-1)!(1-x)^{-n} & f^{(n)}(0) = (n-1)!(1-0)^{-n} = (n-1)! \\
 \vdots & \vdots
 \end{array}$$

So the Maclaurin series of $f(x)$ is

$$\begin{aligned}
 f(x) &= \ln \frac{1}{1-x} \\
 &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= 0 + \frac{1}{1!} x^1 + \frac{1!}{2!} x^2 + \frac{2!}{3!} x^3 + \frac{3!}{4!} x^4 + \cdots + \frac{(n-1)!}{n!} x^n + \cdots \\
 &= \boxed{x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \cdots + \frac{x^n}{n} + \cdots}.
 \end{aligned}$$

Comparing the Maclaurin series with the power series found in Section 8.8, Example 8, p.607, we see they are identical.

47. To find the Maclaurin series for $f(x) = \sec x$, we begin by evaluating $f(x)$ and its derivatives at $x = 0$. To simplify notation, let $y = f(x) = \sec x$. Let $y_0 = f(0)$, $y' = f'(x)$, $y'_0 = f'(0)$, etc. Also note that $\frac{d}{dx} \tan x = \sec^2 x = y^2$. (We'll use this directly for the seventh and eighth derivatives to save writing.) We

compute until we get five nonzero derivatives:

$$\begin{aligned} y &= \sec x \\ y' &= \sec x \tan x \\ &= y \tan x \end{aligned}$$

$$\begin{aligned} y'' &= y' \tan x + y \sec^2 x \\ &= y' \tan x + y y^2 \\ &= y' \tan x + y^3 \end{aligned}$$

$$\begin{aligned} y''' &= y'' \tan x + y' \sec^2 x + 3y^2 y' \\ &= y'' \tan x + y' y^2 + 3y^2 y' \\ &= y'' \tan x + 4y^2 y' \end{aligned}$$

$$\begin{aligned} y^{(4)} &= y''' \tan x + y'' \sec^2 x + 8yy'^2 + 4y^2 y'' \\ &= y''' \tan x + y'' y^2 + 8yy'^2 + 4y^2 y'' \\ &= y''' \tan x + 5y^2 y'' + 8yy'^2 \end{aligned}$$

$$\begin{aligned} y^{(5)} &= y^{(4)} \tan x + y''' \sec^2 x + 10yy' y'' + 5y^2 y''' + 8y'^3 + 16yy' y'' \\ &= y^{(4)} \tan x + y''' y^2 + 10yy' y'' + 5y^2 y''' + 8y'^3 + 16yy' y'' \\ &= y^{(4)} \tan x + 6y^2 y''' + 26yy' y'' + 8y'^3 \end{aligned}$$

$$\begin{aligned} y^{(6)} &= y^{(5)} \tan x + y^{(4)} \sec^2 x + 12yy' y''' + 6y^2 y^{(4)} \\ &\quad + 26y'^2 y'' + 26yy''^2 + 26yy' y''' + 24y'^2 y'' \\ &= y^{(5)} \tan x + y^{(4)} y^2 + 12yy' y''' + 6y^2 y^{(4)} \\ &\quad + 26y'^2 y'' + 26yy''^2 + 26yy' y''' + 24y'^2 y'' \\ &= y^{(5)} \tan x + 7y^{(4)} y^2 + 38yy' y''' + \\ &\quad + 50y'^2 y'' + 26yy''^2 \end{aligned}$$

$$y_0 = \sec 0 = \boxed{1.}$$

$$\begin{aligned} y'_0 &= y_0 \tan 0 \\ &= (1)(0) \\ &= \boxed{0.} \end{aligned}$$

$$\begin{aligned} y''_0 &= y'_0 \tan 0 + y_0^3 \\ &= (0)(0) + (1)^3 \\ &= \boxed{1.} \end{aligned}$$

$$\begin{aligned} y'''_0 &= y''_0 \tan 0 + 4y_0^2 y'_0 \\ &= (1)(0) + 4(1)^2(0) \\ &= \boxed{0.} \end{aligned}$$

$$\begin{aligned} y^{(4)}_0 &= y'''_0 \tan 0 + 5y_0^2 y''_0 + 8y_0 y_0'^2 \\ &= (0)(0) + 5(1)^2(1) + 8(1)(0) \\ &= \boxed{5.} \end{aligned}$$

$$\begin{aligned} y^{(5)}_0 &= y^{(4)}_0 \tan 0 + 6y_0^2 y'''_0 + 26y_0 y'_0 y''_0 + 8y_0'^3 \\ &= (5)(0) + 6(1)^2(0) + 26(1)(0)(1) + 8(0)^3 \\ &= \boxed{0.} \end{aligned}$$

$$\begin{aligned} y^{(6)}_0 &= y^{(5)}_0 \tan 0 + 7y_0^{(4)} y_0^2 + 38y_0 y'_0 y'''_0 + \\ &\quad + 50y_0'^2 y''_0 + 26y_0 y_0''^2 \\ &= (0)(0) + 7(5)(1)^2 + 38(1)(0)(0) + \\ &\quad + 50(0)^2(1) + 26(1)(1)^2 \\ &= 35 + 26 \\ &= \boxed{61.} \end{aligned}$$

$$\begin{aligned}
y^{(7)} &= y^{(6)} \tan x + y^{(5)} y^2 + 7y^{(5)} y^2 + 14y^{(4)} y y' + \\
&\quad + 38y'^2 y''' + 38y y'' y''' + 38y y' y^{(4)} + \\
&\quad + 100y' y''^2 + 50y'^2 y''' + 26y' y''^2 + 52y y'' y''' \\
&= y^{(6)} \tan x + 8y^{(5)} y^2 + 52y^{(4)} y y' + \\
&\quad + 88y''' y'^2 + 90y y'' y''' + 126y' y''^2
\end{aligned}$$

$$\begin{aligned}
y_0^{(7)} &= y_0^{(6)} \tan 0 + 8y_0^{(5)} y_0^2 + 52y_0^{(4)} y_0 y_0' + \\
&\quad + 88y_0''' y_0'^2 + 90y_0 y_0'' y_0''' + 126y_0' y_0''^2 \\
&= (61)(0) + 8(0)(1)^2 + 52(5)(1)(0) + \\
&\quad + 88(0)(0)^2 + 90(1)(1)(0) + 126(0)(1)^2 \\
&= \boxed{0}.
\end{aligned}$$

$$\begin{aligned}
y^{(8)} &= y^{(7)} \tan x + y^{(6)} y^2 + 8y^{(6)} y^2 + 16y^{(5)} y y' + \\
&\quad + 52y^{(5)} y y' + 52y^{(4)} y'^2 + 52y^{(4)} y y'' + \\
&\quad + 88y^{(4)} y'^2 + 176y''' y' y'' + 90y' y'' y''' + \\
&\quad + 90y y'''^2 + 90y y'' y^{(4)} + 126y''^3 + 252y' y'' y''' \\
&= y^{(7)} \tan x + 9y^{(6)} y^2 + 68y^{(5)} y y' + \\
&\quad + 140y^{(4)} y'^2 + 142y^{(4)} y y'' + 518y''' y'' y' + \\
&\quad + 90y y'''^2 + 126y''^3
\end{aligned}$$

$$\begin{aligned}
y_0^{(8)} &= y_0^{(7)} \tan 0 + 9y_0^{(6)} y_0^2 + 68y_0^{(5)} y_0 y_0' + \\
&\quad + 140y_0^{(4)} y_0'^2 + 142y_0^{(4)} y_0 y_0'' + 518y_0''' y_0'' y_0' + \\
&\quad + 90y_0 y_0'''^2 + 126y_0''^3 \\
&= (0)(0) + 9(61)(1) + 68(0)(1)(0) + \\
&\quad + 140(5)(0)^2 + 142(5)(1)(1) + 518(0)(1)(0) + \\
&\quad + 90(1)(0)^2 + 126(1)^3 \\
&= 9 \cdot 61 + 142 \cdot 5 + 126 \cdot 1 \\
&= 549 + 710 + 126 \\
&= \boxed{1385}.
\end{aligned}$$

So the first five nonzero terms of the Maclaurin series are

$$\begin{aligned}
f(x) &= \sec x \\
&= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
&= 1 + \frac{0}{1!} x + \frac{1}{2!} x^2 + \frac{0}{3!} x^3 + \frac{5}{4!} x^4 + \frac{0}{5!} x^5 + \frac{61}{6!} x^6 + \frac{0}{7!} x^7 + \frac{1385}{8!} x^8 + \cdots \\
&= \boxed{1 + \frac{1}{2} x^2 + \frac{5}{24} x^4 + \frac{61}{720} x^6 + \frac{277}{8064} x^8 + \cdots}
\end{aligned}$$

48. (a) The Maclaurin series for $g(x) = e^x$ (see Problem 27) is

$$g(x) = e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots$$

So the Maclaurin expansion of $p(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$ is given by

$$\begin{aligned}\frac{1}{\sqrt{2\pi}}e^{-x^2/2} &= \frac{1}{\sqrt{2\pi}}g\left(-\frac{x^2}{2}\right) \\ &= \frac{1}{\sqrt{2\pi}}\left[1 + \left(-\frac{x^2}{2}\right) + \frac{1}{2!}\left(-\frac{x^2}{2}\right)^2 + \frac{1}{3!}\left(-\frac{x^2}{2}\right)^3 + \cdots + \frac{1}{n!}\left(-\frac{x^2}{2}\right)^n + \cdots\right] \\ &= \frac{1}{\sqrt{2\pi}}\left[1 - \frac{x^2}{2} + \frac{x^4}{2^2 \cdot 2!} - \frac{x^6}{2^3 \cdot 3!} + \cdots + (-1)^n \frac{x^{2n}}{2^n \cdot n!} + \cdots\right] \\ &= \boxed{\frac{1}{\sqrt{2\pi}} \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{2^k \cdot k!}}.\end{aligned}$$

(b) Integrating the series found in part (a) term by term, we obtain

$$\begin{aligned}P(a \leq z \leq b) &= \frac{1}{\sqrt{2\pi}} \int_a^b e^{-x^2/2} dx \\ &= \frac{1}{\sqrt{2\pi}} \int_a^b \left[1 - \frac{x^2}{2} + \frac{x^4}{2^2 \cdot 2!} - \frac{x^6}{2^3 \cdot 3!} + \cdots + (-1)^n \frac{x^{2n}}{2^n \cdot n!} + \cdots\right] dx \\ &= \frac{1}{\sqrt{2\pi}} \left[x - \frac{x^3}{3 \cdot 2} + \frac{x^5}{5 \cdot 2^2 \cdot 2!} - \frac{x^7}{7 \cdot 2^3 \cdot 3!} + \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1) \cdot 2^n \cdot n!} + \cdots\right]_a^b \\ &= \boxed{\frac{1}{\sqrt{2\pi}} \sum_{k=0}^{\infty} (-1)^k \frac{[b^{2k+1} - a^{2k+1}]}{(2k+1)2^k k!}}.\end{aligned}$$

(c) Using the first four terms of the series found in part (b), we get the desired approximation

$$\begin{aligned}P(-0.5 \leq z \leq 0.3) &\approx \frac{1}{\sqrt{2\pi}} \left[x - \frac{x^3}{6} + \frac{x^5}{40} - \frac{x^7}{336}\right]_{-0.5}^{0.3} \\ &= \frac{1}{\sqrt{2\pi}} \left[\left\{(0.3) - \frac{(0.3)^3}{6} + \frac{(0.3)^5}{40} - \frac{(0.3)^7}{336}\right\} - \left\{(-0.5) - \frac{(-0.5)^3}{6} + \frac{(-0.5)^5}{40} - \frac{(-0.5)^7}{336}\right\}\right] \\ &\approx \frac{1}{2.507} [\{0.3 - 0.0045 + 0.000061 - 0.0000006\} - \{-0.5 + 0.02083 - 0.00078 + 0.0000233\}] \\ &\approx \frac{1}{2.507} [0.7755] \\ &\approx \boxed{0.309}.\end{aligned}$$

(d) Using a CAS we find the exact value to be approximately $P(-0.5 \leq z \leq 0.3) \approx \boxed{0.309}$.

49. $\int \frac{1}{1+x^2} dx$. The Maclaurin series of the integrand from Problem 9 is

$$\frac{1}{1+x^2} = 1 - x^2 + x^4 - x^6 + \cdots + (-1)^n x^{2n} + \cdots.$$

Integrating term by term, we get

$$\begin{aligned}\int \frac{1}{1+x^2} dx &= \int [1 - x^2 + x^4 - x^6 + \cdots + (-1)^n x^{2n} + \cdots] dx \\ &= x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots + (-1)^n \frac{x^{2n+1}}{2n+1} + \cdots + C \\ &= \boxed{\sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{2k+1}} + C,\end{aligned}$$

where C is an arbitrary constant of integration.

50. $\int \sec x \, dx$. The Maclaurin series of the integrand was worked out in Problem 47:

$$\sec x = 1 + \frac{1}{2}x^2 + \frac{5}{24}x^4 + \frac{61}{720}x^6 + \frac{277}{8064}x^8 + \cdots.$$

Integrating term by term, we get

$$\begin{aligned} \int \sec x \, dx &= \int \left[1 + \frac{1}{2}x^2 + \frac{5}{24}x^4 + \frac{61}{720}x^6 + \frac{277}{8064}x^8 + \cdots \right] dx \\ &= x + \frac{1}{2} \frac{x^3}{3} + \frac{5}{24} \frac{x^5}{5} + \frac{61}{720} \frac{x^7}{7} + \frac{277}{8064} \frac{x^9}{9} + \cdots + C \\ &= \boxed{x + \frac{1}{6}x^3 + \frac{1}{24}x^5 + \frac{61}{5040}x^7 + \frac{277}{72,576}x^9 + \cdots + C}, \end{aligned}$$

where C is an arbitrary constant of integration.

51. $\int e^{x^{1/3}} \, dx$. The Maclaurin series of $g(x) = e^x$ was worked out in Problem 27:

$$g(x) = e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots + \frac{x^n}{n!} + \cdots.$$

So the integrand can be represented by the Maclaurin series

$$g(x^{1/3}) = e^{x^{1/3}} = 1 + x^{1/3} + \frac{x^{2/3}}{2!} + \frac{x^{3/3}}{3!} + \frac{x^{4/3}}{4!} + \cdots + \frac{x^{n/3}}{n!} + \cdots.$$

Integrating term by term, we get

$$\begin{aligned} \int e^{x^{1/3}} \, dx &= \int \left[1 + x^{1/3} + \frac{x^{2/3}}{2!} + \frac{x^{3/3}}{3!} + \frac{x^{4/3}}{4!} + \cdots + \frac{x^{n/3}}{n!} + \cdots \right] \\ &= x + \frac{x^{1/3+1}}{\frac{1}{3}+1} + \frac{1}{2!} \cdot \frac{x^{2/3+1}}{\frac{2}{3}+1} + \frac{1}{3!} \cdot \frac{x^{3/3+1}}{\frac{3}{3}+1} + \frac{1}{4!} \cdot \frac{x^{4/3+1}}{\frac{4}{3}+1} + \cdots + \frac{1}{n!} \cdot \frac{x^{n/3+1}}{\frac{n}{3}+1} + \cdots + C \\ &= x + \frac{3}{4}x^{4/3} + \frac{1}{2!} \cdot \frac{3}{5}x^{5/3} + \frac{1}{3!} \cdot \frac{3}{6}x^{6/3} + \frac{1}{4!} \cdot \frac{3}{7}x^{7/3} + \cdots + \frac{1}{n!} \cdot \frac{3}{n+3}x^{(n+3)/3} + \cdots + C \\ &= \boxed{\sum_{k=0}^{\infty} \frac{1}{k!} \left(\frac{3}{k+3} \right) x^{(k+3)/3} + C}, \end{aligned}$$

where C is an arbitrary constant of integration.

52. $\int \ln(1+x) \, dx$. From Problem 4, we can represent the integrand as the following Maclaurin series:

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots + \frac{(-1)^{n+1}x^n}{n} + \cdots.$$

Integrating term by term we get

$$\begin{aligned} \int \ln(1+x) \, dx &= \int \left[x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots + \frac{(-1)^{n+1}x^n}{n} + \cdots \right] dx \\ &= \frac{x^2}{2} - \frac{x^3}{2 \cdot 3} + \frac{x^4}{3 \cdot 4} - \frac{x^5}{4 \cdot 5} + \cdots + \frac{(-1)^{n+1}x^{n+1}}{n \cdot (n+1)} + \cdots + C \\ &= \boxed{\sum_{k=1}^{\infty} \frac{(-1)^{k+1}x^{k+1}}{k(k+1)} + C}, \end{aligned}$$

where C is an arbitrary constant of integration.

53. If f is an even function, then $f(x) = f(-x)$. Taking derivatives of both sides with respect to x , $f'(x) = f'(-x) \cdot (-1) = -f'(-x)$, using the Chain Rule. So the first derivative is an odd function of x . At $x = 0$, $f'(0) = -f'(0)$, which means $f'(0) = 0$.

If $g(x)$ is an odd function of x , then $g(x) = -g(-x)$. Taking the derivatives of both sides with respect to x , $g'(x) = -g'(-x) \cdot (-1) = g'(-x)$, using the Chain Rule. So the derivative of an odd function is an even function. This means the second derivative of $f(x)$ will be an even function, and possibly evaluate to a nonzero value at $x = 0$. The third derivative will now be odd, and so forth, leading to $f^{(k)}(0) = 0$ for all odd k . This means the Maclaurin series $f(x) = \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$ will only have even powers of x , because they are multiplied by (possibly nonzero) even order derivatives evaluated at $x = 0$.

54. If f is an odd function, then $f(x) = -f(-x)$. (Note that this rules out the x^0 term of the Maclaurin series for $f(x)$.) Taking derivatives of both sides with respect to x , $f'(x) = -f'(-x) \cdot (-1) = f'(-x)$, using the Chain Rule. So the first derivative is an even function of x . At $x = 0$, the derivative possibly evaluates to a nonzero value.

If $g(x)$ is an even function of x , then $g(x) = g(-x)$. Taking the derivatives of both sides with respect to x , $g'(x) = g'(-x) \cdot (-1) = -g'(-x)$, using the Chain Rule. Since $g(0) = -g(0)$, we have that $g(0) = 0$. So the derivative of an even function is an odd function. This means the second derivative of $f(x)$ will be an odd function, and it evaluates to zero at $x = 0$. The third derivative will now be even, possibly evaluating to a nonzero value, and so forth, leading to $f^{(k)}(0) = 0$ for all even k . This means the Maclaurin series $f(x) = \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k$ will only have odd powers of x , because they are multiplied by (possibly nonzero) odd order derivatives evaluated at $x = 0$.

55. The remainder term is given by

$$R_n(x) = \frac{f^{n+1}(u)}{(n+1)!} (x-c)^{n+1},$$

where u belongs to the interval (x, c) . Since the function $f(x) = (1+x)^m$, we have

$$\begin{aligned} f'(x) &= m(1+x)^{m-1} = 1! \cdot \binom{m}{1} (1+x)^{m-1} \\ f''(x) &= m(m-1)(1+x)^{m-2} = 2! \cdot \binom{m}{2} (1+x)^{m-2} \\ &\vdots \\ f^{(n+1)}(x) &= m(m-1) \cdots (m-n)(1+x)^{m-(n+1)} = (n+1)! \cdot \binom{m}{n+1} (1+x)^{m-(n+1)} \end{aligned}$$

The remainder term becomes

$$\begin{aligned} R_n(x) &= \frac{f^{n+1}(u)}{(n+1)!} (x-c)^{n+1} \\ &= \binom{m}{n+1} (1+u)^{m-(n+1)} (x-c)^{n+1} \\ &= \binom{m}{n+1} (1+u)^m \left(\frac{x-c}{1+u} \right)^{n+1}. \end{aligned}$$

Now, if m is a nonnegative integer,

$$\binom{m}{n+1} = 0 \text{ for } n+1 > m.$$

So we have $R_n(x) = 0$ if $n > m - 1$. So, as $n \rightarrow \infty$, $R_n(x) \rightarrow 0$, as required. So we have shown that $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$ when m is a nonnegative integer.

56. For $m < 0$ the series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \binom{m}{k} x^k$ is a series of nonzero terms if $x \neq 0$. (If $x = 0$, the series converges to 1.) Applying the Ratio Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\binom{m}{n+1} x^{n+1}}{\binom{m}{n} x^n} \right| = |x| \lim_{n \rightarrow \infty} \left| \frac{\frac{m(m-1)(m-2)\cdots(m-n-1+1)}{(n+1)!}}{\frac{m(m-1)(m-2)\cdots(m-n+1)}{n!}} \right| \\ &= |x| \lim_{n \rightarrow \infty} \left[\frac{n!}{(n+1)!} \cdot \left| \frac{m(m-1)(m-2)\cdots(m-n)}{m(m-1)(m-2)\cdots(m-n+1)} \right| \right] \\ &= |x| \lim_{n \rightarrow \infty} \left[\frac{n!}{(n+1)n!} \cdot |m-n| \right] \\ &= |x| \lim_{n \rightarrow \infty} \left| \frac{m-n}{n+1} \right| = |x| \lim_{n \rightarrow \infty} \left| \frac{\frac{m}{n} - 1}{1 + \frac{1}{n}} \right| \\ &= |x| < 1 \end{aligned}$$

for absolute convergence of the series, and $|x| > 1$ for absolute divergence of the series.

57. From p.621, Example 10 of the textbook, the Maclaurin series for $f(x) = \sin^{-1} x$ can be written as

$$f(x) = \sin^{-1} x = x + \frac{1}{2} \cdot \frac{x^3}{3} + \frac{1 \cdot 3}{2 \cdot 4} \cdot \frac{x^5}{5} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} \cdot \frac{x^7}{7} + \cdots + \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2 \cdot 4 \cdot 6 \cdots (2n)} \cdot \frac{x^{2n+1}}{2n+1} + \cdots$$

The fractional factor multiplying the n^{th} term can be expressed as follows:

$$\frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2 \cdot 4 \cdot 6 \cdots (2n)} = \frac{1 \cdot 2 \cdot 3 \cdots (2n-1) \cdot (2n)}{(2 \cdot 4 \cdot 6 \cdots (2n))^2} = \frac{(2n)!}{(2^n n!)^2} = \frac{(2n)!}{4^n (n!)^2}.$$

So the series can be written as

$$\sin^{-1} x = \sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{(2k)!}{4^k (k!)^2} \frac{x^{2k+1}}{(2k+1)}.$$

Since the terms of the series are nonzero for $x \neq 0$, by the Ratio Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(2(n+1))! x^{2(n+1)+1}}{4^{n+1} ((n+1)!)^2 (2(n+1)+1)}}{\frac{(2n)! x^{2n+1}}{4^n (n!)^2 (2n+1)}} \right| \\ &= |x|^2 \lim_{n \rightarrow \infty} \left[\frac{(2n+2)!}{(2n)!} \cdot \frac{4^n}{4^{n+1}} \cdot \frac{2n+1}{2n+3} \cdot \frac{(n!)^2}{((n+1)!)^2} \right] \\ &= \frac{|x|^2}{4} \lim_{n \rightarrow \infty} \left[\frac{(2n+2)(2n+1)(2n)!}{(2n)!} \cdot \frac{2 + \frac{1}{n}}{2 + \frac{3}{n}} \cdot \frac{(n!)^2}{(n+1)^2 (n!)^2} \right] \\ &= \frac{|x|^2}{4} \lim_{n \rightarrow \infty} \frac{(2n+2)(2n+1)}{(n+1)^2} \cdot \lim_{n \rightarrow \infty} \frac{2 + \frac{1}{n}}{2 + \frac{3}{n}} \\ &= \frac{|x|^2}{4} \cdot \lim_{n \rightarrow \infty} \frac{\left(2 + \frac{2}{n}\right) \left(2 + \frac{1}{n}\right)}{\left(1 + \frac{1}{n}\right)^2} \cdot \left(\frac{2+0}{2+0}\right) \\ &= \frac{|x|^2}{4} \cdot \frac{(2+0)(2+0)}{(1+0)^2} \cdot 1 \\ &= \frac{|x|^2}{4} \cdot 4 = |x|^2 < 1 \end{aligned}$$

for convergence of the series. So the series for $\sin^{-1} x$ converges for $-1 < x < 1$. For $x = 1$, the series becomes

$$\begin{aligned}\lim_{x \rightarrow 1} \sin^{-1} x &= 1 + \frac{1}{2} \cdot \frac{1}{3} + \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{1}{5} + \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{5}{6} \cdot \frac{1}{7} + \cdots \\ &< 1 + \frac{1}{2} + \frac{1}{2} \cdot \frac{1}{2} + \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} + \cdots \\ &= \sum_{k=0}^{\infty} \left(\frac{1}{2}\right)^k \\ &= \frac{1}{1 - \frac{1}{2}} = 2,\end{aligned}$$

using the formula for the sum of a geometric series. That is to say, the sum of the series for $\sin^{-1} 1$ is bounded from above by 2; also, since the terms of the series are all positive, the sequence of partial sums is increasing. Since the sequence of partial sums is increasing and bounded from above, it converges, so the series converges as well. (The actual sum is $\sin^{-1} 1 = \frac{\pi}{2} < 2$.)

At $x = -1$, the series becomes an alternating version of the series at $x = 1$, namely

$$\sin^{-1}(-1) = 1 - \frac{1}{2} \cdot \frac{1}{3} + \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{1}{5} - \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{5}{6} \cdot \frac{1}{7} + \cdots.$$

The series of absolute values of this alternating series is precisely the series at $x = 1$, which we have shown converges. Since the alternating series converges absolutely, it converges.

So we have shown that the interval of convergence for the Maclaurin expansion of $f(x) = \sin^{-1} x$ is $[-1, 1]$.

58. (a)

$$\frac{1}{1+x} = \frac{1}{1-(-x)} = \sum_{k=0}^{\infty} (-x)^k = \sum_{k=0}^{\infty} (-1)^k x^k,$$

using the sum of a geometric series of the form $\sum_{k=0}^{\infty} r^k$, with convergent sum $\frac{1}{1-r}$ whenever

$$|r| = |-x| = |x| < 1.$$

(b) Setting $x = 1$ in the above formula, we obtain

$$\frac{1}{1+1} = \frac{1}{2} = \sum_{k=0}^{\infty} (-1)^k = 1 - 1 + 1 - 1 + 1 - 1 + \cdots,$$

which is the erroneous formula arrived at by Euler.

(c) One of the conditions in writing the series representation of $\frac{1}{1+x}$ was that $|x| < 1$. So we cannot put $x = 1$ in the series representation, as it is divergent there.

Challenge Problems

59. The series given to us can be written as

$$\frac{x^3}{1(3)} - \frac{x^5}{3(5)} + \frac{x^7}{5(7)} - \frac{x^9}{7(9)} - \cdots = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{x^{2k+1}}{(2k-1)(2k+1)} = \frac{1}{2} \sum_{k=1}^{\infty} (-1)^{k+1} x^{2k+1} \left(\frac{1}{2k-1} - \frac{1}{2k+1} \right),$$

using partial fractions. At $x = 1$, the series becomes

$$\frac{1}{1(3)} - \frac{1}{3(5)} + \frac{1}{5(7)} - \frac{1}{7(9)} + \cdots = \frac{1}{2} \sum_{k=1}^{\infty} (-1)^{k+1} \left(\frac{1}{2k-1} - \frac{1}{2k+1} \right) = \frac{1}{2} \sum_{k=1}^{\infty} (-1)^k \left(\frac{1}{2k+1} - \frac{1}{2k-1} \right).$$

Before proceeding further, let us prove that the series at $x = 1$ converges absolutely, which would allow us to rearrange the terms at will. Since the series of absolute values of the series at $x = 1$ satisfies

$$\begin{aligned} \frac{1}{1(3)} + \frac{1}{3(5)} + \frac{1}{5(7)} + \frac{1}{7(9)} + \cdots &< \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \frac{1}{7^2} + \cdots \\ &< \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \frac{1}{5^2} + \frac{1}{6^2} + \frac{1}{7^2} + \cdots \\ &= \sum_{k=1}^{\infty} \frac{1}{k^2}, \end{aligned}$$

and the series $\sum_{k=1}^{\infty} \frac{1}{k^2}$ is a convergent p -series (since $p = 2 > 1$), by the Comparison Test for convergence, the series of absolute values at $x = 1$ converges, establishing absolute convergence for the original series at $x = 1$.

Now, Gregory's series for $\tan^{-1} x$ (see p.608, Section 8.8) is given by

$$\tan^{-1} x = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{2k+1}.$$

At $x = 1$, we have

$$\tan^{-1} 1 = \frac{\pi}{4} = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} = 1 + \sum_{k=1}^{\infty} \frac{(-1)^k}{2k+1}.$$

So,

$$\sum_{k=1}^{\infty} \frac{(-1)^k}{2k+1} = \frac{\pi}{4} - 1.$$

Consider now the sum

$$-\sum_{k=1}^{\infty} (-1)^k \frac{1}{2k-1} = -\sum_{k'=0}^{\infty} (-1)^{k'+1} \frac{1}{2k'+1} = \sum_{k'=0}^{\infty} (-1)^{k'} \frac{1}{2k'+1} = \sum_{k=0}^{\infty} (-1)^k \frac{1}{2k+1} = \frac{\pi}{4}.$$

(Here, the index change $k = k' + 1$ was made, and then the index was changed back to k in the final step as it is a dummy summation index.) So, the sum of the original series is

$$\frac{1}{2} \left[\sum_{k=1}^{\infty} (-1)^k \frac{1}{2k+1} - \sum_{k=1}^{\infty} (-1)^k \frac{1}{2k-1} \right] = \frac{1}{2} \left[\frac{\pi}{4} - 1 + \frac{\pi}{4} \right] = \boxed{\frac{\pi}{4} - \frac{1}{2}}.$$

60. From Problem 3, the Maclaurin expansion for $\ln(1-x)$ is

$$\ln(1-x) = -\sum_{k=0}^{\infty} \frac{x^{k+1}}{k+1} = -\sum_{k=1}^{\infty} \frac{x^k}{k}.$$

So $\ln \frac{1}{1-x} = -\ln(1-x)$ has a Maclaurin expansion

$$\ln \frac{1}{1-x} = \sum_{k=1}^{\infty} \frac{x^k}{k} = x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots + \frac{x^n}{n} + \cdots.$$

Integrating term by term gives us

$$\begin{aligned}
 \int_0^x \ln \frac{1}{1-t} dt &= \int_0^x \left(t + \frac{t^2}{2} + \frac{t^3}{3} + \cdots + \frac{t^n}{n} + \cdots \right) dt \\
 - \int_0^x \ln(1-t) dt &= \left[\frac{t^2}{1 \cdot 2} + \frac{t^3}{2 \cdot 3} + \frac{t^4}{3 \cdot 4} + \cdots + \frac{t^n}{n(n+1)} + \cdots \right]_0^x \\
 \int_1^{1-x} \ln y dy &= \frac{x^2}{1 \cdot 2} + \frac{x^3}{2 \cdot 3} + \frac{x^4}{3 \cdot 4} + \cdots + \frac{x^n}{n(n+1)} + \cdots \\
 [y \ln y - y] \Big|_1^{1-x} &= \sum_{k=1}^{\infty} \frac{x^{k+1}}{k(k+1)} \\
 \{(1-x) \ln(1-x) - (1-x)\} - \{1 \ln 1 - 1\} &= \sum_{k=1}^{\infty} \frac{x^{k+1}}{k(k+1)} \\
 \text{or, } \sum_{k=1}^{\infty} \frac{x^{k+1}}{k(k+1)} &= \boxed{(1-x) \ln(1-x) + x}
 \end{aligned}$$

where the substitution $y = 1 - x$ was made, and the result $\int \ln y dy = x \ln y - y + C$ used. (This can be verified by differentiating the result or directly checked using integration by parts. (Use $u = \ln x$ and $dv = dx$.))

61. The partial sums of the series $\sum_{k=1}^{\infty} \frac{k}{(k+1)!}$ are

$$\begin{aligned}
 S_1 &= \frac{1}{2!} = \frac{1}{2} = \frac{2-1}{2} = \frac{2!-1}{2!} \\
 S_2 &= \frac{1}{2} + \frac{2}{3!} = \frac{1}{2} + \frac{2}{6} = \frac{3}{6} + \frac{2}{6} = \frac{5}{6} = \frac{6-1}{6} = \frac{3!-1}{3!} \\
 S_3 &= \frac{5}{6} + \frac{3}{4!} = \frac{5}{6} + \frac{3}{24} = \frac{20}{24} + \frac{3}{24} = \frac{23}{24} = \frac{24-1}{24} = \frac{4!-1}{4!} \\
 S_4 &= \frac{23}{24} + \frac{4}{5!} = \frac{23}{24} + \frac{4}{120} = \frac{115}{120} + \frac{4}{120} = \frac{119}{120} = \frac{120-1}{120} = \frac{5!-1}{5!}, \dots
 \end{aligned}$$

In general, the n^{th} partial sum is

$$S_n = \frac{(n+1)! - 1}{(n+1)!}.$$

The sum of the series is the limit of the n^{th} partial sum:

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{(n+1)! - 1}{(n+1)!} = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{(n+1)!} \right) = \boxed{1}.$$

62. (a) To show $n! \geq 2^{n-1}$, we write

$$n! = n(n-1)(n-2) \cdots 4 \cdot 3 \cdot 2 \cdot 1 = n(n-1)(n-2) \cdots 4 \cdot 3 \cdot 2 \geq 2 \cdot 2 \cdot 2 \cdots 2 \cdot 2 \cdot 2 = 2^{n-1}.$$

(b) From (a), we have

$$\frac{1}{n!} \leq \frac{1}{2^{n-1}}.$$

So

$$\begin{aligned}
 0 < s_n &= \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \cdots + \frac{1}{n!} \leq \frac{1}{2^{1-1}} + \frac{1}{2^{2-1}} + \frac{1}{2^{3-1}} + \cdots + \frac{1}{2^{n-1}} \\
 &= 1 + \frac{1}{2} + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^3 + \cdots + \left(\frac{1}{2}\right)^{n-1}.
 \end{aligned}$$

(c) Since from the definition of s_n we have

$$s_{n+1} = s_n + \frac{1}{(n+1)!},$$

we can write $0 < s_n < s_{n+1}$. Now, following the inequality used in part (b), we have

$$\begin{aligned} s_{n+1} &= \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \cdots + \frac{1}{(n+1)!} \\ &\leq 1 + \frac{1}{2} + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^3 + \cdots + \left(\frac{1}{2}\right)^n \\ \text{so that } \frac{1}{2}s_{n+1} &\leq \frac{1}{2} + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^3 + \cdots + \left(\frac{1}{2}\right)^{n+1}. \end{aligned}$$

$$\begin{aligned} \text{Now, } s_{n+1} - \frac{1}{2}s_{n+1} &= \frac{1}{2}s_{n+1} \leq 1 - \left(\frac{1}{2}\right)^{n+1} \\ \text{or, } s_{n+1} &\leq 2 \left(1 - \left(\frac{1}{2}\right)^{n+1}\right). \end{aligned}$$

Since

$$\lim_{n \rightarrow \infty} s_{n+1} \leq \lim_{n \rightarrow \infty} 2 \left(1 - \left(\frac{1}{2}\right)^{n+1}\right) = 2,$$

we have $s_{n+1} < 2$ for any n , since s_n is an increasing function of n (due to the fact that $s_n < s_{n+1}$). So finally, we have

$$0 < s_n < s_{n+1} < 2.$$

(d) $t_n = \left[1 + \frac{1}{n}\right]^n$. Applying the binomial expansion to the function t_n we get

$$\begin{aligned} \left[1 + \frac{1}{n}\right]^n &= \binom{n}{0} \left(\frac{1}{n}\right)^0 + \binom{n}{1} \left(\frac{1}{n}\right)^1 + \binom{n}{2} \left(\frac{1}{n}\right)^2 + \binom{n}{3} \left(\frac{1}{n}\right)^3 + \cdots + \binom{n}{n} \left(\frac{1}{n}\right)^n \\ &= 1 + \frac{n}{n} + \frac{n(n-1)}{2!} \cdot \frac{1}{n^2} + \frac{n(n-1)(n-2)}{3!} \cdot \frac{1}{n^3} + \cdots + \frac{n(n-1)(n-2) \cdots (n-(n-1))}{n!} \cdot \frac{1}{n^n} \\ &= 1 + 1 + \frac{1}{2!} \left[1 - \frac{1}{n}\right] + \frac{1}{3!} \left[1 - \frac{1}{n}\right] \left[1 - \frac{2}{n}\right] + \cdots + \frac{1}{n!} \left[1 - \frac{1}{n}\right] \left[1 - \frac{2}{n}\right] \cdots \left[1 - \frac{n-1}{n}\right]. \end{aligned}$$

We have for large n ,

$$t_n < 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \cdots + \frac{1}{n!} = s_n + 1.$$

So $t_n < s_n + 1$ for finite n .

(e) Let $t(x) = \left(1 + \frac{1}{x}\right)^x$. Then $\ln t = x \ln \left(1 + \frac{1}{x}\right)$. Differentiating, we get

$$\begin{aligned} \frac{1}{t} t' &= \ln \left(1 + \frac{1}{x}\right) + x \cdot \frac{1}{1 + \frac{1}{x}} \cdot \left(-\frac{1}{x^2}\right) \\ &= \ln \left(1 + \frac{1}{x}\right) - \frac{1}{1+x} > 0 \end{aligned}$$

for $x \geq 1$. To see this is the case, proceed as follows. We require

$$\begin{aligned} \ln \left(1 + \frac{1}{x}\right) &> \frac{1}{1+x} \\ 1 + \frac{1}{x} &> e^{\frac{1}{1+x}} \\ \text{or, } e^{\frac{1}{1+x}} &< 1 + \frac{1}{x}. \end{aligned}$$

The following computation proves this last inequality:

$$\begin{aligned} e^{\frac{1}{1+x}} &= 1 + \frac{1}{1+x} + \frac{1}{2!} \frac{1}{(1+x)^2} + \frac{1}{3!} \frac{1}{(1+x)^3} + \cdots + \frac{1}{n!} \frac{1}{(1+x)^n} + \cdots \\ &< 1 + \frac{1}{1+x} + \frac{1}{(1+x)^2} + \frac{1}{(1+x)^3} + \cdots + \frac{1}{(1+x)^n} + \cdots \\ &= \sum_{k=0}^{\infty} \left(\frac{1}{1+x} \right)^k. \end{aligned}$$

Now, the series $\sum_{k=0}^{\infty} r^k = \sum_{k=0}^{\infty} \left(\frac{1}{1+x} \right)^k$ is a geometric series which converges to the sum of $\frac{1}{1-r}$ since $|r| = \left| \frac{1}{1+x} \right| < 1$ for $x \geq 1$. So we have

$$\begin{aligned} e^{\frac{1}{1+x}} &< \sum_{k=0}^{\infty} \left(\frac{1}{1+x} \right)^k \\ &= \frac{1}{1 - \frac{1}{1+x}} \\ &= \frac{x+1}{1+x-1} \\ &= \frac{x+1}{x} \\ &= 1 + \frac{1}{x} \end{aligned}$$

that is,

$$e^{\frac{1}{1+x}} < 1 + \frac{1}{x}$$

for $x \geq 1$ as was to be shown. So we have shown that the function $t(x)$ is an increasing function for $x \geq 1$, which means the function $t_n = t(n)$ is increasing for integers $n \geq 1$. This means

$$0 < t_n < t_{n+1} < s_{n+1} + 1 < 2 + 1 = 3.$$

Since $e = \lim_{n \rightarrow \infty} \left[1 + \frac{1}{n} \right]^n = \lim_{n \rightarrow \infty} t_n$, we see that by the Squeeze theorem,

$$0 \leq \lim_{n \rightarrow \infty} t_n = \lim_{n \rightarrow \infty} t_{n+1} \leq 3$$

or $e = \lim_{n \rightarrow \infty} t_n \leq 3$.

63. From the results of Problem 62, since t_n is an increasing function of n and $\lim_{n \rightarrow \infty} t_n = e$, for any finite value of n , we must have $t_n < e$ for $n > 0$.

64. Let $x \geq 0$. We are given that $\sin t \leq t$. By integrating both sides repeatedly we have:

$$\begin{aligned}
 \int_0^x \sin t \, dt &\leq \int_0^x t \, dt \\
 [-\cos t]_0^x &\leq \frac{x^2}{2} \\
 -\cos x + 1 &\leq \frac{x^2}{2} \\
 \text{or,} \quad 1 - \frac{x^2}{2} &\leq \cos x. \\
 \int_0^x \left(1 - \frac{t^2}{2}\right) dt &\leq \int_0^x \cos t \, dt \\
 \left[t - \frac{t^3}{6}\right]_0^x &\leq [\sin t]_0^x \\
 x - \frac{x^3}{6} &\leq \sin x. \\
 \int_0^x \left(t - \frac{t^3}{6}\right) dt &\leq \int_0^x \sin t \, dt \\
 \left[\frac{t^2}{2} - \frac{t^4}{24}\right]_0^x &\leq [-\cos t]_0^x = -\cos x + 1 \\
 \text{or,} \quad \cos x &\leq 1 - \frac{x^2}{2} + \frac{x^4}{24} = 1 - \frac{x^2}{2!} + \frac{x^4}{4!}.
 \end{aligned}$$

So we conclude that

$$1 - \frac{x^2}{2!} \leq \cos x \leq 1 - \frac{x^2}{2!} + \frac{x^4}{4!} \text{ for all } x \geq 0.$$

65. $f(x) = (1+x)^x$. Let $y = f(x)$, $y' = f'(x)$, etc, and let $y_0 = f(0)$, $y'_0 = f'(0)$, etc. Also, since $\ln y = x \ln(1+x)$, we can differentiate both sides to get $\frac{y'}{y} = \ln(1+x) + \frac{x}{1+x}$, or $y' = y \left[\ln(1+x) + \frac{x}{1+x} \right]$. To find the Maclaurin expansion of $f(x)$ to four terms we begin by evaluating the function and its

derivatives until the third nonzero derivative is reached.

$$\begin{aligned}
 y &= (1+x)^x \\
 y' &= y \left[\ln(1+x) + \frac{x}{1+x} \right] \\
 y'' &= y' \left[\ln(1+x) + \frac{x}{1+x} \right] + y \left[\frac{1}{1+x} + \frac{(1+x) \cdot 1 - x}{(1+x)^2} \right] \\
 &= y' \left[\ln(1+x) + \frac{x}{1+x} \right] + y \left[\frac{1}{1+x} + \frac{1}{(1+x)^2} \right] \\
 y''' &= y'' \left[\ln(1+x) + \frac{x}{1+x} \right] + y' \left[\frac{1}{1+x} + \frac{1}{(1+x)^2} \right] + \\
 &\quad + y' \left[\frac{1}{1+x} + \frac{1}{(1+x)^2} \right] + y \left[-\frac{1}{(1+x)^2} - \frac{2}{(1+x)^3} \right] \\
 &= y'' \left[\ln(1+x) + \frac{x}{1+x} \right] + 2y' \left[\frac{1}{1+x} + \frac{1}{(1+x)^2} \right] + \\
 &\quad + y \left[-\frac{1}{(1+x)^2} - \frac{2}{(1+x)^3} \right] \\
 y^{(4)} &= y''' \left[\ln(1+x) + \frac{x}{1+x} \right] + y'' \left[\frac{1}{1+x} + \frac{1}{(1+x)^2} \right] + \\
 &\quad + 2y'' \left[\frac{1}{1+x} + \frac{1}{(1+x)^2} \right] + 2y' \left[-\frac{1}{(1+x)^2} - \frac{2}{(1+x)^3} \right] + \\
 &\quad + y' \left[-\frac{1}{(1+x)^2} - \frac{2}{(1+x)^3} \right] + y \left[\frac{2}{(1+x)^3} + \frac{6}{(1+x)^4} \right] \\
 &= y''' \left[\ln(1+x) + \frac{x}{1+x} \right] + 3y'' \left[\frac{1}{1+x} + \frac{1}{(1+x)^2} \right] + \\
 &\quad + 3y' \left[-\frac{1}{(1+x)^2} - \frac{2}{(1+x)^3} \right] + y \left[\frac{2}{(1+x)^3} + \frac{6}{(1+x)^4} \right]
 \end{aligned}$$

$$\begin{aligned}
 y_0 &= (1)^0 = \boxed{1.} \\
 y'_0 &= y_0 \left[\ln 1 + \frac{0}{1+0} \right] \\
 &= (1)[0+0] = \boxed{0.}
 \end{aligned}$$

$$\begin{aligned}
 y''_0 &= y'_0 \left[\ln 1 + \frac{0}{1+0} \right] + y_0 \left[\frac{1}{1+0} + \frac{1}{(1+0)^2} \right] \\
 &= (0)[0+0] + (1)[1+1] = \boxed{2.}
 \end{aligned}$$

$$\begin{aligned}
 y'''_0 &= y''_0 \left[\ln 1 + \frac{0}{1+0} \right] + 2y'_0 \left[\frac{1}{1+0} + \frac{1}{(1+0)^2} \right] + \\
 &\quad + y_0 \left[-\frac{1}{(1+0)^2} - \frac{2}{(1+0)^3} \right] \\
 &= (2)[0+0] + 2(0)[1+1] + (1)[-1-2] = \boxed{-3.}
 \end{aligned}$$

$$\begin{aligned}
 y^{(4)}_0 &= y'''_0 \left[\ln 1 + \frac{0}{1+0} \right] + 3y''_0 \left[\frac{1}{1+0} + \frac{1}{(1+0)^2} \right] + \\
 &\quad + 3y'_0 \left[-\frac{1}{(1+0)^2} - \frac{2}{(1+0)^3} \right] \\
 &\quad + y_0 \left[\frac{2}{(1+0)^3} + \frac{6}{(1+0)^4} \right] \\
 &= (-3)[0+0] + 3(2)[1+1] + \\
 &\quad + 3(0)[-1-2] + (1)[2+6] = \boxed{20.}
 \end{aligned}$$

The first four nonzero terms of the Maclaurin series are

$$\begin{aligned}
 f(x) &= (1+x)^x \\
 &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\
 &= 1 + \frac{0}{1!}x^1 + \frac{2}{2!}x^2 + \frac{-3}{3!}x^3 + \frac{20}{4!}x^4 + \dots \\
 &= 1 + 0 + \frac{2}{2}x^2 + \frac{-3}{6}x^3 + \frac{20}{24}x^4 + \dots \\
 &= \boxed{1 + x^2 - \frac{x^3}{2} + \frac{5x^4}{6} + \dots}
 \end{aligned}$$

66. Let us prove first the following result: For any positive integer n ,

$$\lim_{x \rightarrow 0} \frac{1}{x^n} e^{-1/x^2} = 0.$$

Using $y = \frac{1}{x}$ and applying L'Hôpital's rule repeatedly, we have

$$\begin{aligned}
 \lim_{x \rightarrow 0^+} \frac{1}{x^n} e^{-1/x^2} &= \lim_{y \rightarrow \infty} y^n e^{-y^2} = \lim_{y \rightarrow \infty} \frac{y^n}{e^{y^2}} \\
 &= \lim_{y \rightarrow \infty} \frac{ny^{n-1}}{2ye^{y^2}} = \lim_{y \rightarrow \infty} \frac{ny^{n-2}}{2e^{y^2}} \\
 &= \lim_{y \rightarrow \infty} \frac{n(n-2)y^{n-3}}{2 \cdot 2ye^{y^2}} = \lim_{y \rightarrow \infty} \frac{n(n-2)y^{n-4}}{2 \cdot 2e^{y^2}} \\
 &= \dots = \lim_{y \rightarrow \infty} \frac{n(n-2)(n-4) \dots 4 \cdot 2}{2 \cdot 2 \dots 2 e^{y^2}} \\
 &= 0.
 \end{aligned}$$

We also have

$$\lim_{x \rightarrow 0^-} \frac{1}{x^n} e^{-1/x^2} = \lim_{y \rightarrow -\infty} y^n e^{-y^2} = \lim_{y' \rightarrow \infty} (-y')^n e^{-y'^2} = (-1)^n \lim_{y' \rightarrow \infty} y'^n e^{-y'^2} = 0,$$

where $y' = -y$, using the result just proved above. Since we have shown the two sided limit is zero, we have shown that the limit is zero. The function $f(x) = e^{-1/x^2}$ is continuous at $x = 0$, infinitely differentiable at $x = 0$, and all its derivatives at $x = 0$ are equal to zero, due to the result proved above. For example, the first derivative evaluation at $x = 0$ is:

$$\begin{aligned}
 f'(x) &= \frac{d}{dx} \left(-\frac{1}{x^2} \right) e^{-1/x^2} = \frac{2}{x^3} e^{-1/x^2} \\
 f'(0) &= 2 \cdot \lim_{x \rightarrow 0} \frac{1}{x^3} e^{-1/x^2} = 2(0) = 0,
 \end{aligned}$$

because it is an instance of the limit result for $n = 3$. The second derivative evaluated at $x = 0$ is:

$$\begin{aligned}
 f''(x) &= -\frac{2 \cdot 3}{x^4} e^{-1/x^2} + \frac{2 \cdot 2}{x^6} e^{-1/x^2} \\
 f''(0) &= -6 \cdot \lim_{x \rightarrow 0} \frac{1}{x^4} e^{-1/x^2} + 4 \cdot \lim_{x \rightarrow 0} \frac{1}{x^6} e^{-1/x^2} = -6(0) + 4(0) = 0,
 \end{aligned}$$

because we have instances of the limit result for $n = 4$ and $n = 6$. Since all the derivatives $f^{(n)}(0) = 0$, the Maclaurin series of the function, is $\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k = 0$. However, the function itself is not the zero function. So we have shown that the Maclaurin series of $f(x)$ does not converge to the function $f(x)$.

8.10 Approximations Using Taylor/Maclaurin Expansions

Skill Building

1. (a) The Maclaurin series approximation to four nonzero terms of $y = \cos x$ is

$$\begin{aligned}\cos x &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\ &= 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + \cdots \\ &\approx 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} \\ &= \boxed{1 - \frac{x^2}{2} + \frac{x^4}{24} - \frac{x^6}{720}}.\end{aligned}$$

- (b) The figure below shows the graph of both the function and its Maclaurin approximation found in part (a).

- (c) Evaluating the approximation at $x = \frac{\pi}{90}$, we get

$$\cos\left(\frac{\pi}{90}\right) \approx 1 - \frac{1}{2!} \left(\frac{\pi}{90}\right)^2 + \frac{1}{4!} \left(\frac{\pi}{90}\right)^4 - \frac{1}{6!} \left(\frac{\pi}{90}\right)^6 \approx \boxed{0.9994}.$$

- (d) Since the series is alternating, the error in the approximation is given by the next term's absolute value in the computation of part (c), which is

$$\frac{1}{8!} \left(\frac{\pi}{90}\right)^8 \approx \boxed{5.47 \times 10^{-17}}.$$

- (e) Since the error is given by $\frac{1}{8!}x^8$, and we need this to be less than 0.0001 or 10^{-4} , we solve:

$$\begin{aligned}\frac{1}{8!}x^8 &< 10^{-4} \\ x^8 &< 8! 10^{-4}\end{aligned}$$

Taking the eighth root of both sides of this last inequality, we obtain the approximate interval for x to be $\boxed{-1.1904 < x < 1.1904}$.

2. (a) The Maclaurin series approximation to four terms of $y = e^x$ is

$$\begin{aligned} e^x &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\ &= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots \\ &\approx 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} \\ &= \boxed{1 + x + \frac{x^2}{2} + \frac{x^3}{6}}. \end{aligned}$$

(b) The figure below shows the graph of both the function and its Maclaurin approximation found in part (a).

(c) Evaluating the approximation at $x = \frac{1}{2}$, we get

$$e^{1/2} \approx 1 + \frac{1}{2} + \frac{1}{2!} \left(\frac{1}{2}\right)^2 + \frac{1}{3!} \left(\frac{1}{2}\right)^3 \approx \boxed{1.6458}.$$

(d) The actual value of $e^{1/2} \approx 1.6487$, so the error is $\boxed{0.0029}$.

(e) For the error to be less than 0.0001, we require

$$e^x - \left[1 + x + \frac{x^2}{2} + \frac{x^3}{6}\right] < 0.0001.$$

Since the series is not alternating, we don't have an estimate for the error term. We proceed by trial and error to find $\boxed{|x| < 0.0838}$.

3. (a) The Maclaurin series of $f(x) = \sqrt[3]{1+x}$ is given by the Binomial Series:

$$f(x) = \sqrt[3]{1+x} = (1+x)^{1/3} = \sum_{k=0}^{\infty} \binom{\frac{1}{3}}{k} x^k$$

$$= 1 + \frac{1}{3}x + \frac{\frac{1}{3}(-\frac{2}{3})}{2!}x^2 + \frac{\frac{1}{3}(-\frac{2}{3})(-\frac{5}{3})}{3!}x^3 + \frac{\frac{1}{3}(-\frac{2}{3})(-\frac{5}{3})(-\frac{8}{3})}{4!}x^4 + \cdots + \binom{\frac{1}{3}}{n}x^n + \cdots$$

(b) By the theorem on p.620, since $m = \frac{1}{3} > 0$, but not an integer, the binomial series converges for $[-1, 1]$.

(c) Using the first five terms of the Maclaurin series found in part (a), we get

$$f(x) \approx 1 + \frac{1}{3}x + \frac{\frac{1}{3}(-\frac{2}{3})}{2!}x^2 + \frac{\frac{1}{3}(-\frac{2}{3})(-\frac{5}{3})}{3!}x^3 + \frac{\frac{1}{3}(-\frac{2}{3})(-\frac{5}{3})(-\frac{8}{3})}{4!}x^4$$

$$= 1 + \frac{1}{3}x - \frac{1}{9}x^2 + \frac{5}{81}x^3 - \frac{10}{243}x^4.$$

(d) The figure below shows the graph of both the function and its Maclaurin approximation found in part (c).

(e) From the graphs we see that the approximation is good for values of x in the range of convergence $[-1, 1]$, and not so good outside that range.

(f) To approximate $\sqrt[3]{0.9}$, we substitute $x = -0.1$ into the approximation found in part (c):

$$\sqrt[3]{0.9} = \sqrt[3]{1-0.1} \approx 1 + \frac{1}{3}(-0.1) - \frac{1}{9}(-0.1)^2 + \frac{5}{81}(-0.1)^3 - \frac{10}{243}(-0.1)^4 \approx \boxed{0.9655}.$$

Since the series is a convergent alternating series, the error in the approximation is bounded from above by the absolute value of the next term of the approximation, which is

$$E(x) \leq \left| \frac{\binom{\frac{1}{3}}{5} x^5}{5!} \right|$$

$$= \left| \frac{22}{729} x^5 \right|.$$

So the error is less than or equal to

$$E(-0.1) = \left| \frac{22}{729}(-0.1)^5 \right| = \boxed{3.018 \times 10^{-7}}.$$

4. (a) The Maclaurin series of $y = \frac{1}{\sqrt{4+x}}$ is given by the Binomial Series:

$$\begin{aligned} y &= \frac{1}{\sqrt{4+x}} = (4+x)^{-1/2} = 4^{-1/2} \cdot \left(1 + \frac{x}{4}\right)^{-1/2} \\ &= \frac{1}{2} \cdot \left(1 + \frac{x}{4}\right)^{-1/2} = \frac{1}{2} \sum_{k=0}^{\infty} \binom{-\frac{1}{2}}{k} \left(\frac{x}{4}\right)^k \\ &= \frac{1}{2} \left[1 + \binom{-\frac{1}{2}}{1} \frac{x}{4} + \frac{\binom{-\frac{1}{2}}{2} \left(\frac{x}{4}\right)^2}{2!} + \frac{\binom{-\frac{1}{2}}{3} \left(\frac{x}{4}\right)^3}{3!} + \cdots + \binom{-\frac{1}{2}}{n} \left(\frac{x}{4}\right)^n + \cdots \right] \\ &= \boxed{\frac{1}{2} \left[1 - \frac{x}{8} + \frac{3}{128}x^2 - \frac{5}{1024}x^3 + \cdots + \binom{-\frac{1}{2}}{n} \left(\frac{x}{4}\right)^n + \cdots \right]}. \end{aligned}$$

(b) By the theorem on p.620, since $m = -\frac{1}{2}$ satisfies $-1 < m < 0$, the interval of convergence is $(-1, 1]$.

(c) Keeping the first four terms of the Maclaurin expansion found in part (a), we have the desired approximation

$$\begin{aligned} y &= \frac{1}{\sqrt{4+x}} \approx \frac{1}{2} \left[1 - \frac{x}{8} + \frac{3}{128}x^2 - \frac{5}{1024}x^3 \right] \\ &= \boxed{\frac{1}{2} - \frac{x}{16} + \frac{3}{256}x^2 - \frac{5}{2048}x^3}. \end{aligned}$$

(d) The figure below shows the graph of both the function and its Maclaurin approximation found in part (c).

(e) From the graphs we see that the approximation is good for values of x in the range of convergence $(-1, 1]$ of the series, and not so good outside that range.

(f) To approximate $\frac{1}{\sqrt{4.2}}$ we substitute $x = 0.2$ into the approximation found in part (c):

$$\frac{1}{\sqrt{4.2}} = y(0.2) \approx \frac{1}{2} - \frac{0.2}{16} + \frac{3}{256}(0.2)^2 - \frac{5}{2048}(0.2)^3 \approx \boxed{0.487949}.$$

Since the series is a converging, alternating series, the error in the approximation is bounded from above by the absolute value of the next term of the approximation, which is

$$\begin{aligned} E(x) &\leq \left| \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\left(-\frac{7}{2}\right)}{4!} \left(\frac{x}{4}\right)^4 \right| \\ &= \left| \frac{35}{32,768} x^4 \right|. \end{aligned}$$

So the error is less than or equal to

$$E(0.2) = \left| \frac{35}{32,768} (0.2)^4 \right| \approx \boxed{1.71 \times 10^{-6}}.$$

5. (a) From p.608, Example 9, the Maclaurin series of $y = \tan^{-1} x$ is given by Gregory's series:

$$y = \tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots + (-1)^n \frac{x^{2n+1}}{2n+1} + \cdots = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{2k+1}.$$

(b) From p.608, Example 9, it is seen that the series converges in the interval $[-1, 1]$.

(c) Keeping the first five nonzero terms of Gregory's series, we get the desired approximation

$$y = \tan^{-1} x \approx x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9}.$$

(d) The figure below shows the graph of both the function and its Maclaurin approximation found in part (c).

(e) We see that the approximation matches the function best in the interval of convergence $[-1, 1]$ of the Maclaurin series, and diverges rapidly from the function outside that range.

6. (a) Using the formula for the sum of geometric series, we see that the Maclaurin series is

$$y = \frac{1}{1-x} = \sum_{k=0}^{\infty} x^k = 1 + x + x^2 + x^3 + \cdots + x^n + \cdots .$$

(b) Since the geometric series $\sum_{k=0}^{\infty} r^k$ converges if $|r| < 1$, the series above converges for $|x| < 1$, or in the open interval $\boxed{(-1, 1)}$.

(c) Using the first four nonzero terms of the Maclaurin series found in (a), we get

$$y = \frac{1}{1-x} \approx 1 + x + x^2 + x^3 .$$

(d) The figure below shows the graph of both the function and its Maclaurin approximation found in part (c).

(e) We see from the graph that the approximation matches the function pretty well on the interval $(-0.5, 0.5)$. In the range $(-1, -0.5)$, which is within the range of convergence, the deviation is quite small, but in the range $(0.5, 1)$, which is also in the range of convergence, the deviation is large. Also, beyond $x = 1$, there is no agreement as to even the correct quadrant of the approximation and the function, which assumes another branch (as it is a hyperbola with asymptote $x = 1$). This is to be expected, because the series does not converge for values of $x > 1$.

7. To evaluate $\int_0^1 \sin x^2 dx$, we first find the Maclaurin series for the integrand. From p.616, we write the Maclaurin series of $\sin x$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots .$$

So the Maclaurin series of $\sin x^2$ is

$$\sin x^2 = x^2 - \frac{x^6}{3!} + \frac{x^{10}}{5!} - \frac{x^{14}}{7!} + \cdots + (-1)^n \frac{x^{4n+2}}{(2n+1)!} + \cdots.$$

Approximating to four nonzero terms, we get

$$\sin x^2 \approx x^2 - \frac{x^6}{3!} + \frac{x^{10}}{5!} - \frac{x^{14}}{7!}.$$

Integrating both sides we have

$$\begin{aligned} \int_0^1 \sin x^2 dx &\approx \int_0^1 \left[x^2 - \frac{x^6}{3!} + \frac{x^{10}}{5!} - \frac{x^{14}}{7!} \right] dx \\ &= \left[\frac{x^3}{3} - \frac{x^7}{7 \cdot 3!} + \frac{x^{11}}{11 \cdot 5!} - \frac{x^{15}}{15 \cdot 7!} \right]_0^1 \\ &= \frac{1}{3} - \frac{1}{42} + \frac{1}{1320} - \frac{1}{75600} \\ &= \frac{258,019}{831,600} \\ &\approx \boxed{0.310}. \end{aligned}$$

8. To evaluate $\int_0^1 \cos x^2 dx$, we first find the Maclaurin series for the integrand. The Maclaurin series of $\cos x$ (see p.617) is

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + \cdots.$$

So the Maclaurin series of $\cos x^2$ is

$$\cos x^2 = 1 - \frac{x^4}{2!} + \frac{x^8}{4!} - \frac{x^{12}}{6!} + \cdots + (-1)^n \frac{x^{4n}}{(2n)!} + \cdots.$$

Approximating to four nonzero terms, we get

$$\cos x^2 \approx 1 - \frac{x^4}{2!} + \frac{x^8}{4!} - \frac{x^{12}}{6!}.$$

Integrating both sides, we have

$$\begin{aligned} \int_0^1 \cos x^2 dx &\approx \int_0^1 \left[1 - \frac{x^4}{2!} + \frac{x^8}{4!} - \frac{x^{12}}{6!} \right] dx \\ &= \left[x - \frac{x^5}{5 \cdot 2!} + \frac{x^9}{9 \cdot 4!} - \frac{x^{13}}{13 \cdot 6!} \right]_0^1 \\ &= 1 - \frac{1}{10} + \frac{1}{216} - \frac{1}{9360} \\ &= \frac{25,399}{28,080} \\ &\approx \boxed{0.905}. \end{aligned}$$

9. $\int_0^1 \frac{x^2}{1+\cos x} dx$. Write the integrand as

$$\frac{x^2}{1+\cos x} = \frac{x^2}{2 \cos^2 \left(\frac{x}{2} \right)} = \frac{x^2}{2} \sec^2 \left(\frac{x}{2} \right).$$

The Maclaurin series for $\sec x$ to five nonzero terms was worked out in **Problem 47** in Section 8.9. It is

$$\begin{aligned}\sec x &= 1 + \frac{1}{2}x^2 + \frac{5}{24}x^4 + \frac{61}{720}x^6 + \frac{277}{8064}x^8 + \cdots \\ &\approx 1 + \frac{1}{2}x^2 + \frac{5}{24}x^4 + \frac{61}{720}x^6,\end{aligned}$$

where we keep the first four nonzero terms for purposes of the current problem. So the series for $\sec\left(\frac{x}{2}\right)$ to four nonzero terms is

$$\begin{aligned}\sec\left(\frac{x}{2}\right) &\approx 1 + \frac{1}{2}\left(\frac{x}{2}\right)^2 + \frac{5}{24}\left(\frac{x}{2}\right)^4 + \frac{61}{720}\left(\frac{x}{2}\right)^6 \\ &= 1 + \frac{x^2}{8} + \frac{5x^4}{384} + \frac{61x^6}{46,080}.\end{aligned}$$

To find the series approximation to four nonzero terms of $\sec^2\left(\frac{x}{2}\right)$, we multiply the series approximation of $\sec\left(\frac{x}{2}\right)$ with itself (keeping only terms up to the sixth order):

$$\begin{aligned}\sec^2\left(\frac{x}{2}\right) &= \sec\left(\frac{x}{2}\right) \cdot \sec\left(\frac{x}{2}\right) \approx \left(1 + \frac{x^2}{8} + \frac{5x^4}{384} + \frac{61x^6}{46,080}\right) \cdot \left(1 + \frac{x^2}{8} + \frac{5x^4}{384} + \frac{61x^6}{46,080}\right) \\ &= 1 \cdot \left(1 + \frac{x^2}{8} + \frac{5x^4}{384} + \frac{61x^6}{46,080}\right) + \frac{x^2}{8} \cdot \left(1 + \frac{x^2}{8} + \frac{5x^4}{384} + \frac{61x^6}{46,080}\right) + \\ &\quad + \frac{5x^4}{384} \cdot \left(1 + \frac{x^2}{8} + \frac{5x^4}{384} + \frac{61x^6}{46,080}\right) + \frac{61x^6}{46,080} \cdot \left(1 + \frac{x^2}{8} + \frac{5x^4}{384} + \frac{61x^6}{46,080}\right) \\ &= \left(1 + \frac{x^2}{8} + \frac{5x^4}{384} + \frac{61x^6}{46,080}\right) + \left(\frac{x^2}{8} + \frac{x^4}{64} + \frac{5x^6}{3072} + \cdots\right) + \left(\frac{5x^4}{384} + \frac{5x^6}{3072} + \cdots\right) + \\ &\quad + \left(\frac{61x^6}{46,080} + \cdots\right) \\ &\approx 1 + \left(\frac{1}{8} + \frac{1}{8}\right)x^2 + \left(\frac{5}{384} + \frac{1}{64} + \frac{5}{384}\right)x^4 + \left(\frac{61}{46,080} + \frac{5}{3072} + \frac{5}{3072} + \frac{61}{46,080}\right)x^6 \\ &= 1 + \frac{x^2}{4} + \frac{1}{24}x^4 + \frac{17}{2880}x^6.\end{aligned}$$

So the integrand, $\frac{x^2}{1+\cos x} = \frac{x^2}{2} \sec^2\left(\frac{x}{2}\right)$ can be approximated by multiplying the series for $\sec^2\left(\frac{x}{2}\right)$ by $\frac{x^2}{2}$; to four nonzero terms, this is

$$\begin{aligned}\frac{x^2}{1+\cos x} &= \frac{x^2}{2} \sec^2\left(\frac{x}{2}\right) \approx \frac{x^2}{2} \left(1 + \frac{x^2}{4} + \frac{1}{24}x^4 + \frac{17}{2880}x^6\right) \\ &= \frac{1}{2} \left(x^2 + \frac{x^4}{4} + \frac{1}{24}x^6 + \frac{17}{2880}x^8\right).\end{aligned}$$

Integrating both sides, we have

$$\begin{aligned}\int_0^1 \frac{x^2}{1+\cos x} dx &\approx \int_0^1 \frac{1}{2} \left[x^2 + \frac{x^4}{4} + \frac{x^6}{24} + \frac{17}{2880}x^8\right] dx \\ &= \frac{1}{2} \left[\frac{x^3}{3} + \frac{x^5}{5 \cdot 4} + \frac{x^7}{7 \cdot 24} + \frac{17x^9}{9 \cdot (2880)}\right]_0^1 \\ &= \frac{1}{2} \left(\frac{1}{3} + \frac{1}{20} + \frac{1}{168} + \frac{17}{25,920}\right) \\ &= \frac{70,751}{362,880} \\ &\approx \boxed{0.195}\end{aligned}$$

where we rounded the answer off to three decimal places.

10. $\int_0^{0.1} \frac{x}{\ln(2+x)} dx$. Let $\ln(2+x) = u$, which means $2+x = e^u$, or $x = e^u - 2$. Then $dx = e^u du$. When $x = 0$, $u = \ln 2$. When $x = 0.1$, $u = \ln(2.1)$. The integral becomes

$$\int_{\ln(2)}^{\ln(2.1)} \frac{e^u - 2}{u} \cdot e^u du = \int_{\ln(2)}^{\ln(2.1)} \frac{e^{2u} - 2e^u}{u} du.$$

The Maclaurin series for e^u is

$$\begin{aligned} e^u &= 1 + u + \frac{u^2}{2!} + \frac{u^3}{3!} + \frac{u^4}{4!} + \cdots + \frac{u^n}{n!} + \cdots \\ &= 1 + u + \frac{u^2}{2} + \frac{u^3}{6} + \frac{u^4}{24} + \cdots + \frac{u^n}{n!} + \cdots. \end{aligned}$$

The Maclaurin series for e^{2u} is

$$\begin{aligned} e^{2u} &= 1 + 2u + \frac{(2u)^2}{2!} + \frac{(2u)^3}{3!} + \frac{(2u)^4}{4!} + \cdots + \frac{(2u)^n}{n!} + \cdots \\ &= 1 + 2u + 2u^2 + \frac{4}{3}u^3 + \frac{2}{3}u^4 + \cdots + \frac{2^n}{n!}u^n + \cdots. \end{aligned}$$

So we have

$$\begin{aligned} e^{2u} - 2e^u &= \left(1 + 2u + 2u^2 + \frac{4}{3}u^3 + \frac{2}{3}u^4 + \cdots + \frac{2^n}{n!}u^n + \cdots\right) - 2\left(1 + u + \frac{u^2}{2} + \frac{u^3}{6} + \frac{u^4}{24} + \cdots + \frac{u^n}{n!} + \cdots\right) \\ &\approx \left(1 + 2u + 2u^2 + \frac{4}{3}u^3 + \frac{2}{3}u^4\right) - \left(2 + 2u + u^2 + \frac{1}{3}u^3 + \frac{1}{12}u^4\right) \\ &= (1-2) + (2-2)u + (2-1)u^2 + \left(\frac{4}{3} - \frac{1}{3}\right)u^3 + \left(\frac{2}{3} - \frac{1}{12}\right)u^4 \\ &= -1 + u^2 + u^3 + \frac{7}{12}u^4. \end{aligned}$$

So the Maclaurin series for the integrand approximated to four nonzero terms will be

$$\begin{aligned} \frac{e^{2u} - 2e^u}{u} &\approx \frac{-1 + u^2 + u^3 + \frac{7}{12}u^4}{u} \\ &= -\frac{1}{u} + u + u^2 + \frac{7}{12}u^3. \end{aligned}$$

Integrating both sides we have

$$\begin{aligned} \int_{\ln(2)}^{\ln(2.1)} \frac{e^{2u} - 2e^u}{u} du &= \int_{\ln(2)}^{\ln(2.1)} \left[-\frac{1}{u} + u + u^2 + \frac{7}{12}u^3\right] du \\ &= \left[-\ln u + \frac{u^2}{2} + \frac{u^3}{3} + \frac{7}{48}u^4\right]_{\ln(2)}^{\ln(2.1)} \\ &= \left[-\ln(\ln(2.1)) + \frac{(\ln(2.1))^2}{2} + \frac{(\ln(2.1))^3}{3} + \frac{7}{48}(\ln(2.1))^4\right] + \\ &\quad - \left[-\ln(\ln(2)) + \frac{(\ln(2))^2}{2} + \frac{(\ln(2))^3}{3} + \frac{7}{48}(\ln(2))^4\right] \\ &\approx [-(-0.29849) + (0.27524) + (0.13614) + (0.04419)] + \\ &\quad - [-(-0.36651) + (0.24023) + (0.11101) + (0.03366)] \\ &\approx [0.75406] - [0.75141] \\ &\approx 0.002650 \\ &= \boxed{2.650 \times 10^{-3}} \end{aligned}$$

correct to three decimal places.

11. The integrand in $\int_0^{0.2} \sqrt[3]{1+x^4} dx$ can be expanded as a Binomial Series:

$$\begin{aligned}\sqrt[3]{1+x^4} &= (1+x^4)^{1/3} = \sum_{k=0}^{\infty} \binom{\frac{1}{3}}{k} (x^4)^k \\ &= 1 + \frac{1}{3}x^4 + \frac{\frac{1}{3}(\frac{1}{3}-1)}{2!}x^8 + \frac{\frac{1}{3}(\frac{1}{3}-1)(\frac{1}{3}-2)}{3!}x^{12} + \dots + \binom{\frac{1}{3}}{n}x^{4n} + \dots \\ &\approx 1 + \frac{1}{3}x^4 - \frac{1}{9}x^8 + \frac{5}{81}x^{12}\end{aligned}$$

which is the integrand approximated to four nonzero terms. Integrating both sides, we have

$$\begin{aligned}\int_0^{0.2} \sqrt[3]{1+x^4} dx &\approx \int_0^{0.2} \left[1 + \frac{1}{3}x^4 - \frac{1}{9}x^8 + \frac{5}{81}x^{12} \right] dx \\ &= \left[x + \frac{x^5}{5 \cdot 3} - \frac{x^9}{9 \cdot 9} + \frac{5x^{13}}{13 \cdot 81} \right]_0^{0.2} \\ &= (0.2) + \frac{(0.2)^5}{15} - \frac{(0.2)^9}{81} + \frac{5(0.2)^{13}}{1053} \\ &\approx 0.2 + 2.133 \times 10^{-5} - 6.321 \times 10^{-9} + 3.889 \times 10^{-12} \\ &\approx 0.2000213 \\ &\approx \boxed{0.2000}\end{aligned}$$

which is correct to three decimal places.

12. The integrand in $\int_0^{1/2} \sqrt[3]{1+x} dx$ can be expanded as a Binomial Series:

$$\begin{aligned}\sqrt[3]{1+x} &= (1+x)^{1/3} = \sum_{k=0}^{\infty} \binom{\frac{1}{3}}{k} x^k \\ &= 1 + \frac{1}{3}x + \frac{\frac{1}{3}(\frac{1}{3}-1)}{2!}x^2 + \frac{\frac{1}{3}(\frac{1}{3}-1)(\frac{1}{3}-2)}{3!}x^3 + \dots + \binom{\frac{1}{3}}{n}x^n + \dots \\ &\approx 1 + \frac{1}{3}x - \frac{1}{9}x^2 + \frac{5}{81}x^3\end{aligned}$$

which is the integrand expanded to four nonzero terms. Integrating both sides, we have

$$\begin{aligned}\int_0^{1/2} \sqrt[3]{1+x} dx &\approx \int_0^{1/2} \left[1 + \frac{1}{3}x - \frac{1}{9}x^2 + \frac{5}{81}x^3 \right] dx \\ &= \left[x + \frac{x^2}{2 \cdot 3} - \frac{x^3}{3 \cdot 9} + \frac{5}{4 \cdot 81}x^4 \right]_0^{1/2} \\ &= \frac{1}{2} + \frac{1}{6} \left(\frac{1}{2} \right)^2 - \frac{1}{27} \left(\frac{1}{2} \right)^3 + \frac{5}{324} \left(\frac{1}{2} \right)^4 \\ &= \frac{2789}{5184} \\ &\approx \boxed{0.538.}\end{aligned}$$

13. The integrand in $\int_0^{1/2} \frac{1}{\sqrt[3]{1+x^2}} dx$ can be expanded as a Binomial Series:

$$\begin{aligned}\frac{1}{\sqrt[3]{1+x^2}} &= (1+x^2)^{-1/3} = \sum_{k=0}^{\infty} \binom{-\frac{1}{3}}{k} (x^2)^k \\ &= 1 - \frac{1}{3}x^2 + \frac{(-\frac{1}{3})(-\frac{1}{3}-1)}{2!}x^4 + \frac{(-\frac{1}{3})(-\frac{1}{3}-1)(-\frac{1}{3}-2)}{3!}x^6 + \cdots + \binom{-\frac{1}{3}}{n}x^{2n} + \cdots \\ &\approx 1 - \frac{1}{3}x^2 + \frac{2}{9}x^4 - \frac{14}{81}x^6\end{aligned}$$

which is the integrand expanded to four nonzero terms. Integrating both sides, we have

$$\begin{aligned}\int_0^{1/2} \frac{1}{\sqrt[3]{1+x^2}} dx &\approx \int_0^{1/2} \left[1 - \frac{1}{3}x^2 + \frac{2}{9}x^4 - \frac{14}{81}x^6 \right] dx \\ &= \left[x - \frac{x^3}{3 \cdot 3} + \frac{2}{5 \cdot 9}x^5 - \frac{14}{7 \cdot 81}x^7 \right]_0^{1/2} \\ &= \left(\frac{1}{2} \right) - \frac{1}{9} \left(\frac{1}{2} \right)^3 + \frac{2}{45} \left(\frac{1}{2} \right)^5 - \frac{14}{567} \left(\frac{1}{2} \right)^7 \\ &= \frac{12,631}{25,920} \\ &\approx \boxed{0.487}.\end{aligned}$$

14. The integrand in $\int_0^{0.2} \frac{1}{\sqrt{1+x^3}} dx$ can be expanded as a Binomial Series:

$$\begin{aligned}\frac{1}{\sqrt{1+x^3}} &= (1+x^3)^{-1/2} = \sum_{k=0}^{\infty} \binom{-\frac{1}{2}}{k} (x^3)^k \\ &= 1 - \frac{1}{2}x^3 + \frac{(-\frac{1}{2})(-\frac{1}{2}-1)}{2!}x^6 + \frac{(-\frac{1}{2})(-\frac{1}{2}-1)(-\frac{1}{2}-2)}{3!}x^9 + \cdots + \binom{-\frac{1}{2}}{n}x^{3n} + \cdots \\ &\approx 1 - \frac{1}{2}x^3 + \frac{3}{8}x^6 - \frac{5}{16}x^9\end{aligned}$$

which is the integrand expanded to four nonzero terms. Integrating both sides, we have

$$\begin{aligned}\int_0^{0.2} \frac{1}{\sqrt{1+x^3}} dx &\approx \int_0^{0.2} \left[1 - \frac{1}{2}x^3 + \frac{3}{8}x^6 - \frac{5}{16}x^9 \right] dx \\ &= \left[x - \frac{1}{2 \cdot 4}x^4 + \frac{3}{8 \cdot 7}x^7 - \frac{5}{16 \cdot 10}x^{10} \right]_0^{0.2} \\ &= 0.2 - \frac{(0.2)^4}{8} + \frac{3}{56}(0.2)^7 - \frac{5}{160}(0.2)^{10} \\ &\approx \boxed{0.1998}.\end{aligned}$$

Applications and Extensions

15. We use the recursion relation

$$\ln(N+1) = \ln N + 2 \left[\frac{1}{2N+1} + \frac{1}{3} \left(\frac{1}{2N+1} \right)^3 + \frac{1}{5} \left(\frac{1}{2N+1} \right)^5 + \cdots \right].$$

Substituting $N = 3$, and repeatedly using the recursion relation we get

$$\begin{aligned}
 \ln 4 &= \ln 3 + 2 \left[\frac{1}{2 \cdot 3 + 1} + \frac{1}{3} \left(\frac{1}{2 \cdot 3 + 1} \right)^3 + \frac{1}{5} \left(\frac{1}{2 \cdot 3 + 1} \right)^5 + \cdots \right] \\
 &= \ln 2 + 2 \left[\frac{1}{2 \cdot 2 + 1} + \frac{1}{3} \left(\frac{1}{2 \cdot 2 + 1} \right)^3 + \frac{1}{5} \left(\frac{1}{2 \cdot 2 + 1} \right)^5 + \cdots \right] + 2 \left[\frac{1}{7} + \frac{1}{3} \left(\frac{1}{7} \right)^3 + \frac{1}{5} \left(\frac{1}{7} \right)^5 + \cdots \right] \\
 &= \ln 1 + 2 \left[\frac{1}{2 \cdot 1 + 1} + \frac{1}{3} \left(\frac{1}{2 \cdot 1 + 1} \right)^3 + \frac{1}{5} \left(\frac{1}{2 \cdot 1 + 1} \right)^5 + \cdots \right] + 2 \left[\frac{1}{5} + \frac{1}{3} \left(\frac{1}{5} \right)^3 + \frac{1}{5} \left(\frac{1}{5} \right)^5 + \cdots \right] + \\
 &\quad + 2 \left[\frac{1}{7} + \frac{1}{3} \left(\frac{1}{7} \right)^3 + \frac{1}{5} \left(\frac{1}{7} \right)^5 + \cdots \right] \\
 &= 0 + 2 \left[\left\{ \frac{1}{3} + \frac{1}{5} + \frac{1}{7} \right\} + \frac{1}{3} \left\{ \left(\frac{1}{3} \right)^3 + \left(\frac{1}{5} \right)^3 + \left(\frac{1}{7} \right)^3 \right\} + \frac{1}{5} \left\{ \left(\frac{1}{3} \right)^5 + \left(\frac{1}{5} \right)^5 + \left(\frac{1}{7} \right)^5 \right\} + \cdots \right] \\
 &\approx \boxed{1.386147}
 \end{aligned}$$

16. (a) The Maclaurin series of $\sin x$ is (see p.616, Example 3)

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots$$

So the Maclaurin series of $3 \sin \left(\frac{x}{2} \right)$ is

$$\begin{aligned}
 3 \sin \left(\frac{x}{2} \right) &= 3 \left[\left(\frac{x}{2} \right) - \frac{1}{3!} \left(\frac{x}{2} \right)^3 + \frac{1}{5!} \left(\frac{x}{2} \right)^5 - \cdots + (-1)^n \frac{1}{(2n+1)!} \left(\frac{x}{2} \right)^{2n+1} + \cdots \right] \\
 &= \boxed{\frac{3x}{2} - \frac{x^3}{16} + \frac{x^5}{1280} - \cdots + (-1)^n \frac{x^{2n+1}}{2^{2n+1}(2n+1)!} + \cdots}
 \end{aligned}$$

(b) As shown in Example 3 on p.616, the interval of convergence of the Maclaurin series for $\sin x$ is $(-\infty, \infty)$. So the interval of convergence of the Maclaurin series for $3 \sin \left(\frac{x}{2} \right)$ is also $\boxed{(-\infty, \infty)}$.

(c) The error in using the first n nonzero terms of a convergent alternating series is bounded from above by the absolute value of the $n+1^{st}$ term. The error terms are all monomials which take their maximum values on the interval $(-2, 2)$ at the endpoints (as limits of $x \rightarrow -2^+$ or $x \rightarrow 2^-$) of the interval. We proceed by trial and error:

The error in keeping just the first term is $\left| -\frac{x^3}{16} \right|$, which as $x \rightarrow 2^-$ evaluates to $\left| \frac{2^3}{16} \right| = 0.5$.

The error in keeping the first two terms is $\left| \frac{x^5}{1280} \right|$, which as $x \rightarrow 2^-$ evaluates to $\left| \frac{2^5}{1280} \right| = 0.025$. The error is already less than the required 0.1, so that only $\boxed{two}$ terms are needed in order to approximate f on the interval $(-2, 2)$ to an error less than or equal to 0.1. (As a check, $3 \sin \left(\frac{2}{2} \right) = 3 \sin 1 \approx 2.524$, while $\frac{3x}{2} - \frac{x^3}{16}$ evaluated at $x = 2$ gives 2.5, and $|2.524 - 2.5| = 0.024 < 0.1$.)

17. (a) From p.616, we write the Maclaurin series of $\sin x$ as

$$F(x) = \sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots$$

Since this series is a convergent alternating series, the error in using n terms of the series as an approximation is bounded from above by the absolute value of the $n+1^{st}$ term.

For $x = 4^\circ = 4^\circ \cdot \frac{\pi}{180^\circ} = \frac{\pi}{45}$, keeping just the first term in the Maclaurin expansion will result in an error that is less than absolute value of the second term, or $\left| -\frac{x^3}{3!} \right|$. At $x = 4^\circ = \frac{\pi}{45}$, the error bound will be

$$\left| -\frac{\left(\frac{\pi}{45}\right)^3}{3!} \right| \approx 0.00005 < 0.001.$$

So we just need the first term to give an answer correct to three decimal places:

$$\sin 4^\circ \approx \frac{\pi}{45} \approx \boxed{0.0698}.$$

(b) From p.617, we write the Maclaurin series of $\cos x$ as

$$F(x) = \cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + \cdots.$$

Since the series is a convergent alternating series, the error in using n terms of the series as an approximation is bounded from above by the absolute value of the $n+1^{\text{st}}$ term.

For $x = 15^\circ = 15^\circ \cdot \frac{\pi}{180^\circ} = \frac{\pi}{12}$, keeping just the first two terms in the Maclaurin expansion will result in an error that is less than the absolute value of the third term, or $\left| \frac{x^4}{4!} \right|$. At $x = 15^\circ = \frac{\pi}{12}$, the error bound will be

$$\left| \frac{\left(\frac{\pi}{12}\right)^4}{4!} \right| \approx 0.0002 < 0.001.$$

So keeping the first two terms, we have an answer that is correct to three decimal places:

$$\cos 15^\circ \approx 1 - \frac{1}{2!} \left(\frac{\pi}{12}\right)^2 \approx \boxed{0.9659}.$$

(c) From p.608, using Gregory's series, we write the Maclaurin expansion of $\tan^{-1} x$ as

$$F(x) = \tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)} + \cdots.$$

Since the series is a convergent alternating series, the error in using n terms of the series as an approximation is bounded from above by the absolute value of the $n+1^{\text{st}}$ term.

For $x = 0.05$, the error in keeping just the first two terms in the Maclaurin expansion will result in an error that is less than the absolute value of the third term, or $\left| \frac{x^5}{5} \right|$. At $x = 0.05$, the error bound will be

$$\left| \frac{(0.05)^5}{5} \right| = 6.25 \times 10^{-8} < 0.001.$$

So keeping the first two terms, we get an answer correct to three decimal places:

$$\tan^{-1} 0.05 \approx 0.05 - \frac{(0.05)^3}{3} \approx \boxed{0.04496}.$$

18. (a) We have, using the standard result (or using the substitution $u = \tan x$, $du = \sec^2 x \, dx$)

$$\int_0^1 \frac{1}{1+x^2} \, dx = [\tan^{-1} x]_0^1 = \tan^{-1} 1 - \tan^{-1} 0 = \frac{\pi}{4} - 0 = \boxed{\frac{\pi}{4}}.$$

(b) Using the geometric series sum, provided that $|x| < 1$, we have

$$\frac{1}{1+x^2} = \frac{1}{1-(-x^2)} = \sum_{k=0}^{\infty} (-1)^k x^{2k} = 1 - x^2 + x^4 - x^6 + x^8 - \cdots + (-1)^n x^{2n} + \cdots.$$

Integrating term by term, we have, also using the result of part (a):

$$\begin{aligned}\int_0^1 \frac{1}{1+x^2} dx &= \frac{\pi}{4} = \lim_{b \rightarrow 1^-} \int_0^b [1 - x^2 + x^4 - x^6 + x^8 - \cdots + (-1)^n x^{2n} + \cdots] dx \\ &= \lim_{b \rightarrow 1^-} \left[x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9} - \cdots + (-1)^n \frac{x^{2n+1}}{2n+1} + \cdots \right]_0^b \\ \text{or, } \quad &\boxed{\frac{\pi}{4} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \cdots + \frac{(-1)^n}{2n+1} + \cdots}\end{aligned}$$

which is Leibniz's result.

(c) Keeping the first ten terms, we have

$$\frac{\pi}{4} \approx 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \frac{1}{11} + \frac{1}{13} - \frac{1}{15} + \frac{1}{17} - \frac{1}{19} \approx \boxed{0.7604}$$

giving $\pi \approx 4(0.7604) = 3.0416$. The actual value is $\pi \approx 3.1416$, rounded to four decimal places. So we see that the agreement is pretty poor, accurate to only about

$$\left| \frac{3.1416 - 3.0416}{3.1416} \right| \approx 3\%.$$

(d) To get an approximation of π accurate to the tenth decimal place, we need the error to be smaller than 10^{-10} . Since the series for $\frac{\pi}{4}$ is a convergent alternating series, the error in using n terms of the series as an approximation is bounded from above by the absolute value of the $n+1^{\text{st}}$ term. So we need, noting that to get the series for π , we need to multiply the series for $\frac{\pi}{4}$ by 4,

$$4 \cdot \left| \frac{(-1)^n}{2n+1} \right| \leq 10^{-10}$$

or $2n+1 \geq 4 \cdot 10^{10}$, or $n \geq 2 \cdot 10^{10} - \frac{1}{2}$, or $\boxed{n \approx 2 \times 10^{10}}$ terms of the series.

19. Gregory's series is (see p. 608)

$$\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots + (-1)^n \frac{x^{2n+1}}{2n+1} + \cdots$$

At $x = \frac{1}{2}$, we have, approximating with the first four terms of the series,

$$\tan^{-1} \left(\frac{1}{2} \right) \approx \frac{1}{2} - \frac{1}{3} \left(\frac{1}{2} \right)^3 + \frac{1}{5} \left(\frac{1}{2} \right)^5 - \frac{1}{7} \left(\frac{1}{2} \right)^7 = \frac{6,229}{13,440}.$$

At $x = \frac{1}{3}$, we have, approximating with the first four terms of the series,

$$\tan^{-1} \left(\frac{1}{3} \right) \approx \frac{1}{3} - \frac{1}{3} \left(\frac{1}{3} \right)^3 + \frac{1}{5} \left(\frac{1}{3} \right)^5 - \frac{1}{7} \left(\frac{1}{3} \right)^7 = \frac{24,628}{76,545}.$$

Since

$$\tan^{-1} 1 = \frac{\pi}{4} = \tan^{-1} \left(\frac{1}{2} \right) + \tan^{-1} \left(\frac{1}{3} \right),$$

we have

$$\begin{aligned}\pi &= 4 \left[\tan^{-1} \left(\frac{1}{2} \right) + \tan^{-1} \left(\frac{1}{3} \right) \right] \\ &\approx 4 \left[\frac{6,229}{13,440} + \frac{24,628}{76,545} \right] \\ &= \frac{1,538,665}{489,888} \\ &\approx \boxed{3.14085}\end{aligned}$$

an answer that is correct to three decimal places.

20. The general kinetic energy formula may be expanded using the Binomial Series as follows:

$$\begin{aligned}
 K_{\text{gen.}}(v) &= mc^2 \left(\frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} - 1 \right) \\
 &= mc^2 \left(\left(1 - \frac{v^2}{c^2} \right)^{-1/2} - 1 \right) \\
 &= mc^2 \left(\sum_{k=0}^{\infty} \binom{-\frac{1}{2}}{k} \left(-\frac{v^2}{c^2} \right)^k - 1 \right) \\
 &= mc^2 \left[1 - \frac{1}{2} \left(-\frac{v^2}{c^2} \right) + \frac{(-\frac{1}{2})(-\frac{1}{2}-1)}{2!} \left(-\frac{v^2}{c^2} \right)^2 + \frac{(-\frac{1}{2})(-\frac{1}{2}-1)(-\frac{1}{2}-2)}{3!} \left(-\frac{v^2}{c^2} \right)^3 + \cdots - 1 \right] \\
 &= mc^2 \left[\frac{1}{2} \frac{v^2}{c^2} + \frac{3}{8} \frac{v^4}{c^4} + \frac{5}{16} \frac{v^6}{c^6} + \cdots \right] \\
 &= \frac{1}{2} mv^2 + \frac{3}{8} mv^2 \left(\frac{v^2}{c^2} \right) + \frac{5}{16} mv^2 \left(\frac{v^4}{c^4} \right) + \cdots \\
 &= \frac{1}{2} mv^2 \left[1 + \frac{3}{4} \left(\frac{v}{c} \right)^2 + \frac{5}{8} \left(\frac{v}{c} \right)^4 + \cdots \right] \\
 &\approx \frac{1}{2} mv^2
 \end{aligned}$$

if $\frac{v}{c} \rightarrow 0$. So we see that the general kinetic energy formula reduces to the classical one $K = \frac{1}{2}mv^2$ at speeds $v \rightarrow 0$, that is, for low speeds compared to the speed of light.

Challenge Problems

21. (a) $a_k = (-1)^{k+1} \int_0^{\pi/k} \sin(kx) dx$. Set $kx = u$. Then $x = \frac{u}{k}$, and $dx = \frac{1}{k} du$. When $x = 0$, $u = 0$; when $x = \frac{\pi}{k}$, $u = \pi$. So the integral becomes

$$\begin{aligned}
 a_k &= (-1)^{k+1} \frac{1}{k} \int_0^{\pi} \sin u du \\
 &= \frac{(-1)^{k+1}}{k} [-\cos u] \Big|_0^{\pi} \\
 &= \frac{(-1)^{k+1}}{k} [-\cos \pi - (-\cos 0)] \\
 &= \boxed{\frac{2}{k} (-1)^{k+1}}.
 \end{aligned}$$

(b) The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{2}{k} (-1)^{k+1} = 2 \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k}$ is a constant multiple of the alternating harmonic series, which converges, so it converges as well.

(c) On p.607-608, in Example 8 of Section 8.8, it is demonstrated that

$$\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} = \ln 2 \approx 0.693.$$

So we have

$$\sum_{k=1}^{\infty} a_k = 2 \sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k} \approx 2(0.693) = 1.386.$$

So we conclude that

$$1 \leq \sum_{k=1}^{\infty} a_k \leq \frac{3}{2}.$$

22. The Maclaurin expansion of e^x is

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots.$$

So the Maclaurin expansion of e^{x^3} is

$$e^{x^3} = 1 + x^3 + \frac{x^6}{2!} + \frac{x^9}{3!} + \cdots + \frac{x^{3n}}{n!} + \cdots.$$

The Maclaurin series of xe^{x^3} is given by

$$xe^{x^3} = x + x^4 + \frac{x^7}{2!} + \frac{x^{10}}{3!} + \cdots + \frac{x^{3n+1}}{n!} + \cdots = \sum_{k=0}^{\infty} \frac{x^{3k+1}}{k!}.$$

23. (a) Some terms of the Maclaurin expansion of $\sin^{-1} x$ were obtained in Example 10 of Section 8.9, p.621. To the ninth order in x , it is

$$\sin^{-1} x = x + \frac{x^3}{6} + \frac{3}{40}x^5 + \frac{5}{112}x^7 + \frac{35}{1152}x^9 + \cdots.$$

So we have for $x = 1$,

$$\sin^{-1} 1 = \frac{\pi}{2} = 1 + \frac{1}{6} + \frac{3}{40} + \frac{5}{112} + \frac{35}{1152} + \cdots$$

and for $x = \frac{1}{2}$, we have

$$\sin^{-1} \left(\frac{1}{2} \right) = \frac{\pi}{6} = \frac{1}{2} + \frac{1}{6} \left(\frac{1}{2} \right)^3 + \frac{3}{40} \left(\frac{1}{2} \right)^5 + \frac{5}{112} \left(\frac{1}{2} \right)^7 + \frac{35}{1152} \left(\frac{1}{2} \right)^9 + \cdots$$

$$\text{or, } \frac{\pi}{6} = \frac{1}{2} + \frac{1}{48} + \frac{3}{1280} + \frac{5}{14,336} + \frac{35}{589,824} + \cdots.$$

(b) Evaluating the terms shown in the first expression, we get $\frac{\pi}{2} \approx 1.571$ correct to three decimal places.

(c) Evaluating the terms shown in the second expression, we get $\frac{\pi}{6} \approx 0.524$ correct to three decimal places.

8.11 Chapter 8 Review Exercises

1. The n^{th} term of the sequence is $s_n = \frac{(-1)^{n+1}}{n^4}$. Setting $n = 1, 2, 3, 4, 5$, we get the first five terms of the sequence to be

$$\begin{aligned}\{s_n\} &= \left\{ \frac{(-1)^{1+1}}{1^4}, \frac{(-1)^{2+1}}{2^4}, \frac{(-1)^{3+1}}{3^4}, \frac{(-1)^{4+1}}{4^4}, \frac{(-1)^{5+1}}{5^4}, \dots \right\} \\ &= \left\{ 1, -\frac{1}{2^4}, \frac{1}{3^4}, -\frac{1}{4^4}, \frac{1}{5^4}, \dots \right\}.\end{aligned}$$

So the first five terms of the sequence are

$$\boxed{1, -\frac{1}{16}, \frac{1}{81}, -\frac{1}{256}, \frac{1}{625}}.$$

2. The n^{th} term of the sequence is $s_n = \frac{2^n}{3^n}$. Setting $n = 1, 2, 3, 4, 5$, we get the first five terms of the sequence to be

$$\begin{aligned}\{s_n\} &= \left\{ \frac{2^1}{3^1}, \frac{2^2}{3^2}, \frac{2^3}{3^3}, \frac{2^4}{3^4}, \frac{2^5}{3^5}, \dots \right\} \\ &= \left\{ \frac{2}{3}, \frac{4}{9}, \frac{8}{27}, \frac{16}{81}, \frac{32}{243}, \dots \right\}.\end{aligned}$$

So the first five terms of the sequence are

$$\boxed{\frac{2}{3}, \frac{4}{9}, \frac{8}{27}, \frac{16}{81}, \frac{32}{243}}.$$

3. The terms of the sequence

$$2, -\frac{3}{2}, \frac{9}{8}, -\frac{27}{32}, \frac{81}{128}, \dots$$

can be written as

$$(-1)^{1+1} \frac{3^0}{2^{0-1}}, (-1)^{2+1} \frac{3^1}{2^{2-1}}, (-1)^{3+1} \frac{3^2}{2^{4-1}}, (-1)^{4+1} \frac{3^3}{2^{6-1}}, (-1)^{5+1} \frac{3^4}{2^{8-1}}, \dots$$

So the n^{th} term of the sequence is

$$\begin{aligned}s_n &= (-1)^{n+1} \frac{3^{n-1}}{2^{2n-3}} \\ &= (-1)^{n-1} \cdot (-1)^2 \cdot 2 \cdot \frac{3^{n-1}}{2^{2n-2}} \\ &= (-1)^{n-1} 2 \cdot \frac{3^{n-1}}{4^{n-1}} \\ &= \boxed{2 \left(-\frac{3}{4} \right)^{n-1}}.\end{aligned}$$

4. The sequence is $\{s_n\} = \left\{ 1 + \frac{n}{n^2+1} \right\}$. Using the sum and difference property of sequences, we have

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(1 + \frac{n}{n^2+1} \right) = \lim_{n \rightarrow \infty} 1 + \lim_{n \rightarrow \infty} \frac{n}{n^2+1} = 1 + 0 = \boxed{1}.$$

5. The sequence is $\{s_n\} = \{\ln \frac{n+2}{n}\} = \{\ln b_n\}$, where $b_n = \frac{n+2}{n}$. The sequence $\{b_n\}$ converges to

$$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{n+2}{n} = \lim_{n \rightarrow \infty} \left(1 + \frac{2}{n}\right) = 1 + 0 = 1.$$

So by the theorem on p.543, setting $f(x) = \ln x$, which is continuous at $x = 1$ (the value of the limit of b_n), we conclude that the limit of the original sequence is

$$\ln(1) = \boxed{0.}$$

6. The sequence is $\{s_n\} = \{\tan^{-1} n\}$. Let $f(x) = \tan^{-1} x$ be a related function of the sequence. Since $f'(x) = \frac{1}{1+x^2} > 0$ for all $x \geq 1$, the function is monotonically increasing, which means the sequence is also monotonically increasing for $n \geq 1$. Also,

$$\tan^{-1} n \leq \frac{\pi}{2}$$

for all positive nonzero integers n , so the sequence $\{s_n\}$ is bounded from above. Since the sequence $\{s_n\}$ is an increasing sequence that is bounded from above, it converges, and the limit of the sequence is

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \tan^{-1} n = \boxed{\frac{\pi}{2}.}$$

7. The sequence is $\{s_n\} = \left\{\frac{(-1)^n}{(n+1)^2}\right\}$. Since

$$-\frac{1}{(n+1)^2} \leq \frac{(-1)^n}{(n+1)^2} \leq \frac{1}{(n+1)^2},$$

and the sequences $\left\{-\frac{1}{(n+1)^2}\right\}$ and $\left\{\frac{1}{(n+1)^2}\right\}$ are both convergent, and converge to the limit of 0, since $\lim_{n \rightarrow \infty} \frac{1}{(n+1)^2} = 0$, we have by the Squeeze Theorem of sequences that

$$\lim_{n \rightarrow \infty} s_n = \boxed{0.}$$

8. The sequence is $\{s_n\} = \left\{\frac{e^n}{(n+2)^2}\right\}$. To determine if the sequence is increasing or decreasing, apply the Algebraic Ratio Test:

$$\frac{s_{n+1}}{s_n} = \frac{\frac{e^{n+1}}{(n+3)^2}}{\frac{e^n}{(n+2)^2}} = e \left(\frac{n+2}{n+3}\right)^2.$$

We show that

$$2 \left(\frac{n+2}{n+3}\right)^2 > 1.$$

Then this will mean that $e \left(\frac{n+2}{n+3}\right)^2 > 1$ as well, since $e > 2$. Expanding the desired inequality, we get

$$\begin{aligned} 2 \left(\frac{n+2}{n+3}\right)^2 &> 1 \\ 2(n+2)^2 &> (n+3)^2 \\ 2(n^2 + 4n + 4) &> n^2 + 6n + 9 \\ 2n^2 + 8n + 8 &> n^2 + 6n + 9 \\ n^2 + 2n - 1 &> 0 \\ n^2 + 2n + 1 - 2 &> 0 \\ (n+1)^2 - 2 &> 0 \\ (n+1)^2 &> 2, \end{aligned}$$

which is true for all $n \geq 1$. So this shows that the sequence is increasing since we have shown that $\frac{s_{n+1}}{s_n} > 1$. Also the sequence is bounded from below by its first term

$$s_1 = \frac{e}{(1+2)^2} = \frac{e}{9}.$$

It is not bounded from above since

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{e^n}{(n+2)^2} = \lim_{x \rightarrow \infty} \frac{e^x}{(x+2)^2} = \lim_{x \rightarrow \infty} \frac{e^x}{2(x+2)} = \lim_{x \rightarrow \infty} \frac{e^x}{2} = \infty,$$

where we used a related function of the n^{th} term of the sequence and applied L'Hôpital's rule to it. Since the sequence is increasing, and it is not bounded from above, it diverges.

9. The sequence $\{s_n\} = \{n!\}$ diverges since $\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} n! = \infty$.

10. The sequence $\{s_n\} = \left\{\left(\frac{5}{8}\right)^n\right\}$ is of the form $\{s_n\} = \{r^n\}$ where $-1 < r = \frac{5}{8} < 1$. Since $\lim_{n \rightarrow \infty} r^n = 0$ for $-1 < r < 1$, we have $\lim_{n \rightarrow \infty} s_n = 0$, that is, the sequence converges to the limit of 0.

11. The sequence $\{s_n\} = \left\{\left(-\frac{1}{2}\right)^n\right\}$ is of the form $\{s_n\} = \{r^n\}$ where $-1 < r = -\frac{1}{2} < 1$. Since $\lim_{n \rightarrow \infty} r^n = 0$ for $-1 < r < 1$, we have $\lim_{n \rightarrow \infty} s_n = 0$, that is, the sequence converges to the limit of 0.

12. The sequence is $\{s_n\} = \{(-1)^n + e^{-n}\}$. As $n \rightarrow \infty$, $\lim_{n \rightarrow \infty} e^{-n} = 0$ but $\lim_{n \rightarrow \infty} (-1)^n$ does not exist. Since $\lim_{n \rightarrow \infty} s_n$ does not exist, the sequence diverges.

13. The sequence $\{s_n\} = \left\{1 + \frac{2}{n}\right\}$ is decreasing since using the Algebraic Difference Test, we have

$$s_{n+1} - s_n = 1 + \frac{2}{n+1} - 1 - \frac{2}{n} = 2 \left(\frac{1}{n+1} - \frac{1}{n} \right) = -\frac{2}{n(n+1)} < 0$$

for $n \geq 1$. It's also bounded from below by 1, since $s_n = 1 + \frac{2}{n} > 1$ for all $n \geq 1$. Since the sequence is decreasing and bounded from below, it converges.

14. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{4^{k-1}}$. The fifth partial sum of the series is

$$\begin{aligned} S_5 &= \sum_{k=1}^5 \frac{(-1)^k}{4^{k-1}} \\ &= \frac{(-1)^1}{4^{1-1}} + \frac{(-1)^2}{4^{2-1}} + \frac{(-1)^3}{4^{3-1}} + \frac{(-1)^4}{4^{4-1}} + \frac{(-1)^5}{4^{5-1}} \\ &= -\frac{1}{4^0} + \frac{1}{4} - \frac{1}{4^2} + \frac{1}{4^3} - \frac{1}{4^4} \\ &= -1 + \frac{1}{4} - \frac{1}{16} + \frac{1}{64} - \frac{1}{256} \\ &= \boxed{-\frac{205}{256}}. \end{aligned}$$

15. The telescoping series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{4}{k+4} - \frac{4}{k+5} \right)$. The n^{th} partial sum of the series is

$$\begin{aligned} S_n &= \sum_{k=1}^n \left(\frac{4}{k+4} - \frac{4}{k+5} \right) \\ &= \left(\frac{4}{1+4} - \frac{4}{1+5} \right) + \left(\frac{4}{2+4} - \frac{4}{2+5} \right) + \cdots + \left(\frac{4}{n-1+4} - \frac{4}{n-1+5} \right) + \left(\frac{4}{n+4} - \frac{4}{n+5} \right) \\ &= \left(\frac{4}{5} - \frac{4}{6} \right) + \left(\frac{4}{6} - \frac{4}{7} \right) + \cdots + \left(\frac{4}{n+3} - \frac{4}{n+4} \right) + \left(\frac{4}{n+4} - \frac{4}{n+5} \right) \\ &= \frac{4}{5} - \frac{4}{n+5}. \end{aligned}$$

The limit of the sequence of partial sums is

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(\frac{4}{5} - \frac{4}{n+5} \right) = \lim_{n \rightarrow \infty} \frac{4}{5} - \lim_{n \rightarrow \infty} \frac{4}{n+5} = \frac{4}{5} - 0 = \boxed{\frac{4}{5}}$$

is the sum of the telescoping series.

16. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\cos^2(k\pi)}{k}$. Since $\cos^2(n\pi) = 1$ for any value of n , we may write the series as

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k}. \text{ But this is the harmonic series which } \boxed{\text{diverges.}}$$

17. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} -(\ln 2)^k = \sum_{k=1}^{\infty} (-\ln 2)(\ln 2)^{k-1}$ is a geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$ where $a = (-\ln 2)$ and $r = \ln 2 \approx 0.693 < 1$. Since $|r| < 1$, the geometric series converges to a sum of

$$\frac{a}{1-r} = \frac{-\ln 2}{1-\ln 2} = \boxed{\frac{\ln 2}{\ln 2 - 1}}.$$

18. The series can be written $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{e}{3^k} = e + \sum_{k=1}^{\infty} \left(\frac{e}{3} \right) \left(\frac{1}{3} \right)^{k-1}$. The second term is a geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$ where $a = \frac{e}{3}$ and $r = \frac{1}{3}$. Since $|r| < 1$, the geometric series converges to a sum of

$$\frac{a}{1-r} = \frac{\frac{e}{3}}{1-\frac{1}{3}} = \frac{e/3}{2/3} = \frac{e}{2}.$$

The original series then converges to a sum of $e + \frac{e}{2} = \boxed{\frac{3e}{2}}.$

19. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} (4^{1/3})^k = \sum_{k=1}^{\infty} 4^{1/3} \cdot (4^{1/3})^{k-1}$ is of the form of a geometric series $\sum_{k=1}^{\infty} ar^{k-1}$ where $a = 4^{1/3}$ and $r = 4^{1/3} > 1$. Since $|r| > 1$, the series $\boxed{\text{diverges.}}$

20. The number $r = 0.123123123\cdots$ can be written and then summed into a rational number form, using the properties of convergent geometric series as shown below:

$$\begin{aligned}
 r &= 0.123123123123\cdots \\
 &= 0.123 + 0.123 \times 10^{-3} + 0.123 \times 10^{-6} + 0.123 \times 10^{-9} + \cdots \\
 &= 0.123 \left[1 + 10^{-3} + (10^{-3})^2 + (10^{-3})^3 + \cdots \right] \\
 &= 0.123 \cdot \sum_{k=1}^{\infty} (10^{-3})^{k-1} \\
 &= 0.123 \cdot \frac{1}{1 - 10^{-3}} \\
 &= 0.123 \cdot \frac{10^3}{10^3 - 1} = 0.123 \left(\frac{1000}{999} \right) = \frac{123}{999} = \boxed{\frac{41}{333}}.
 \end{aligned}$$

21. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{3k-2}{k}$. Since

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{3n-2}{n} = \lim_{n \rightarrow \infty} \left(3 - \frac{2}{n} \right) = \lim_{n \rightarrow \infty} 3 - \lim_{n \rightarrow \infty} \frac{2}{n} = 3 - 0 = 3 \neq 0,$$

the series *diverges* by the Divergence Test.

22. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\ln k}{k^2}$. A related function of the n^{th} term of the series is $f(x) = \frac{\ln x}{x^2}$, which is continuous and decreasing on $[1, \infty)$, and for which $f(k) = a_k$ for all positive nonzero integers k . To see it is decreasing, compute $f'(x)$:

$$f'(x) = \frac{x^2 \cdot \frac{1}{x} - \ln x \cdot 2x}{x^4} = \frac{x - 2x \ln x}{x^4} = \frac{1 - 2 \ln x}{x^3} < 0$$

for $x > \sqrt{e}$. So the series decreases for $n > 1$. By the Integral Test,

$$I = \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{\ln x}{x^2} dx.$$

Let $u = \ln x$, $dv = \frac{dx}{x^2}$. Then $du = \frac{dx}{x}$, $v = -\frac{1}{x}$. So

$$\begin{aligned}
 I &= \lim_{b \rightarrow \infty} \int_1^b \frac{\ln x}{x^2} dx = \lim_{b \rightarrow \infty} \left[\left[\ln x \cdot -\frac{1}{x} \right]_1^b + \int_1^b \frac{dx}{x^2} \right] \\
 &= \lim_{b \rightarrow \infty} \left[\left(-\frac{\ln b}{b} + \frac{\ln 1}{1} \right) + \left[-\frac{1}{x} \right]_1^b \right] \\
 &= -\lim_{b \rightarrow \infty} \frac{\ln b}{b} + 0 + \lim_{b \rightarrow \infty} \left(-\frac{1}{b} + 1 \right) \\
 &= -\lim_{b \rightarrow \infty} \frac{\frac{1}{b}}{1} + (-0 + 1) = -0 + (-0 + 1) = 1,
 \end{aligned}$$

where L'Hôpital's rule was used on the first term in the final line. Since the limit is a positive real number, by the Integral Test, the series *converges*.

23. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{4k^2+9}$. A related function of the n^{th} term of the series is $f(x) = \frac{1}{4x^2+9}$, which is continuous and decreasing on $[1, \infty)$, and for which $f(k) = a_k$ for all positive nonzero integers k . To

apply the integral test, we have to evaluate

$$I = \int_1^{\infty} f(x) dx = \int_1^{\infty} \frac{dx}{4x^2 + 9}.$$

Let $x = \frac{3}{2} \tan \theta$. Then $dx = \frac{3}{2} \sec^2 \theta d\theta$. When $x = 1$, $\tan \theta = \frac{2}{3}$, or $\theta = \tan^{-1} \frac{2}{3}$. As $n \rightarrow \infty$, $\theta \rightarrow \frac{\pi}{2}$. So we have

$$\begin{aligned} I &= \int_{\tan^{-1} \frac{2}{3}}^{\frac{\pi}{2}} \frac{\frac{3}{2} \sec^2 \theta d\theta}{4 \left(\frac{9}{4} \tan^2 \theta \right) + 9} = \frac{3}{2 \cdot 9} \int_{\tan^{-1} \frac{2}{3}}^{\frac{\pi}{2}} \frac{\sec^2 \theta d\theta}{1 + \tan^2 \theta} \\ &= \frac{1}{6} \int_{\tan^{-1} \frac{2}{3}}^{\frac{\pi}{2}} \frac{\sec^2 \theta d\theta}{\sec^2 \theta} = \frac{1}{6} [\theta]_{\tan^{-1} \frac{2}{3}}^{\frac{\pi}{2}} \\ &= \frac{1}{6} \left[\frac{\pi}{2} - \tan^{-1} \frac{2}{3} \right]. \end{aligned}$$

Since $\tan^{-1} x < \frac{\pi}{2}$ for any x , the integral is a positive real number, so by the Integral Test, the series *converges*.

24. The p -series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{k^{5/2}}$ *converges* since $p = \frac{5}{2} > 1$. The bounds for the sum for a general convergent p -series are

$$\frac{1}{p-1} < \sum_{k=1}^{\infty} \frac{1}{k^p} < 1 + \frac{1}{p-1},$$

so for this particular p -series they will be

$$\left(\frac{1}{\frac{5}{2}-1}, 1 + \frac{1}{\frac{5}{2}-1} \right) = \left(\frac{2}{3}, \frac{5}{3} \right).$$

So the series has a *lower bound* $\frac{2}{3}$ and *upper bound* $\frac{5}{3}$.

25. The series is $\sum_{k=5}^{\infty} a_k = \sum_{k=5}^{\infty} \left[\frac{1}{k^5} \cdot \frac{1}{2^k} \right]$. We have

$$a_n = \frac{1}{n^5} \cdot \frac{1}{2^n} < \frac{1}{n^5} = b_n$$

for all $n \geq 5$. Since the series $\sum_{k=5}^{\infty} b_k = \sum_{k=5}^{\infty} \frac{1}{k^5}$ is a convergent p -series (since $p = 5 > 1$) from the fifth term forward, and since the omission of a finite number of terms does not affect convergence or divergence properties of a p -series, the original series $\sum_{k=5}^{\infty} a_k$ also *converges* by the Comparison Test.

26. The series $\sum_{k=1}^{\infty} \left[\frac{3}{5^k} - \left(\frac{2}{3} \right)^{k-1} \right] = \sum_{k=1}^{\infty} \left[\frac{3}{5} \cdot \left(\frac{1}{5} \right)^{k-1} - \left(\frac{2}{3} \right)^{k-1} \right]$ can be written as a difference of two geometric series, $\sum_{k=1}^{\infty} \frac{3}{5} \cdot \left(\frac{1}{5} \right)^{k-1} - \sum_{k=1}^{\infty} \left(\frac{2}{3} \right)^{k-1}$ each of which converges absolutely (since $|r| = \frac{1}{5} < 1$ and $|r| = \frac{2}{3} < 1$), so the original series also *converges*.

27. The series $\sum_{k=1}^{\infty} \frac{3}{k^5}$ is a constant multiple of a convergent p -series (since $p = 5 > 1$), so it also *converges*.

28. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{k+1}}$. The n^{th} term of the series satisfies

$$a_n = \frac{1}{\sqrt{n+1}} > \frac{1}{n+1} = b_n$$

for $n \geq 1$ since $n+1 > \sqrt{n+1}$ for $n \geq 1$. But the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k+1} = \frac{1}{2} + \frac{1}{3} + \frac{1}{3} + \cdots + \frac{1}{n} + \cdots$ is a harmonic series from the second term forward, and since the convergence or divergence properties of a series is not affected by the omission of a finite number of terms, the series $\sum_{k=1}^{\infty} b_k$ diverges, and so we see that the original series *diverges* as well by the Comparison Test.

29. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k+1}{k^{k+1}}$. The n^{th} term of the series behaves like

$$a_n = \frac{n+1}{n^{n+1}} = \frac{n+1}{n} \cdot \frac{1}{n^n} = \left(1 + \frac{1}{n}\right) \cdot \frac{1}{n^n} \approx \frac{1}{n^n} = b_n$$

for large values of n . We evaluate

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n+1}{n^{n+1}}}{\frac{1}{n^n}} = \lim_{n \rightarrow \infty} (n+1) \cdot \left(\frac{n^n}{n^{n+1}}\right) = \lim_{n \rightarrow \infty} \frac{n+1}{n} = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right) = 1.$$

Since the limit is a positive real number and the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^k}$ is the convergent “k-to-the-k” series, the original series $\sum_{k=1}^{\infty} a_k$ is also *convergent* by the Limit Comparison Test.

30. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{4}{k \cdot 3^k}$. The n^{th} term of the series satisfies

$$a_n = \frac{4}{n \cdot 3^n} \leq \frac{4}{3^n} = b_n$$

for $n \geq 1$. Since the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{4}{3^k} = \sum_{k=1}^{\infty} \frac{4}{3} \left(\frac{1}{3}\right)^{k-1}$ is a convergent geometric series (since $|r| = \frac{1}{3} < 1$), the original series *converges* by the Comparison Test.

31. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+2}{k(k+1)}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n+2}{n(n+1)} = \lim_{n \rightarrow \infty} \frac{1 + \frac{2}{n}}{n \left(1 + \frac{1}{n}\right)} = 0.$$

By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{n+3}{(n+1)(n+2)}}{\frac{n+2}{n(n+1)}} = \frac{n(n+3)}{(n+2)^2} = \frac{n^2 + 3n}{n^2 + 4n + 4} < 1.$$

So by the Alternating Series Test, the series *converges*.

To find the sum of the series to an accuracy of 0.001, we first estimate how many terms we must keep in the summation of the series. The error in keeping the first $n-1$ terms of a convergent alternating series is bounded from above by the absolute value of the n^{th} term; so we require $\frac{n+2}{n(n+1)} = 0.001$. This is equivalent to

$$\begin{aligned} \frac{n+2}{n(n+1)} &= \frac{1}{1000} \\ 1000n + 2000 &= n^2 + n \\ n^2 - 999n - 2000 &= 0. \end{aligned}$$

Solving the quadratic equation, we find that the smallest number greater than the positive solution is $n = 1001$. Carrying out the sum of the first 1000 terms of the series (since $n - 1 = 1001 - 1 = 1000$), we get

$$\sum_{k=1}^{1000} (-1)^{k+1} \frac{k+2}{k(k+1)} \approx \boxed{1.079}$$

which is correct to three decimal places.

32. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k^2}{e^k}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^2}{e^n} = \lim_{x \rightarrow \infty} \frac{x^2}{e^x} = \lim_{x \rightarrow \infty} \frac{2x}{e^x} = \lim_{x \rightarrow \infty} \frac{2}{e^x} = 0,$$

using L'Hôpital's rule repeatedly on a related function of the n^{th} term. By the Algebraic Ratio Test,

$$\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \frac{\frac{(n+1)^2}{e^{n+1}}}{\frac{n^2}{e^n}} = \left(\frac{n+1}{n} \right)^2 \cdot \frac{1}{e} < 1,$$

if $n+1 < \sqrt{e}n$ or $(\sqrt{e}-1)n > 1$, or $n > \frac{1}{\sqrt{e}-1} \approx 1.54$. So for $n \geq 2$, the series decreases. Since the convergence property does not depend on the behavior of a finite number of terms, we conclude that by the Algebraic Ratio Test, the series converges, even if its sum begins at $n = 1$.

To find the sum of the series to an accuracy of 0.001, we first estimate how many terms we must keep in the summation of the series. The error in keeping the first $n-1$ terms of a convergent alternating series is bounded from above by the absolute value of the n^{th} term; so we require $\frac{n^2}{e^n} = 0.001$, or $e^n = 1000n^2$. By a process of trial and error, we find that $n \approx 12$. Carrying out the sum of the first 11 terms of the series (since $n-1 = 12-1 = 11$) we get

$$\sum_{k=1}^{11} (-1)^{k+1} \frac{k^2}{e^k} \approx \boxed{0.091}$$

which is correct to three decimal places.

33. The series is $\sum_{k=1}^{\infty} (-1)^k a_k = \sum_{k=1}^{\infty} (-1)^k \frac{3}{\sqrt[3]{k}}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \sin \frac{3}{\sqrt[3]{n}} = 0.$$

By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{3}{\sqrt[3]{n+1}}}{\frac{3}{\sqrt[3]{n}}} = \sqrt[3]{\frac{n}{n+1}} < 1,$$

for $n \geq 1$. So, by the Alternating Series Test, the series converges. This series cannot be summed by exact methods, so we have to approximate the sum by using the error estimate. The error in keeping the first $n-1$ terms of a convergent alternating series is bounded from above by the absolute value of the n^{th} term; so we require

$$a_n = \frac{3}{\sqrt[3]{n}} = 10^{-3} \text{ or } \sqrt[3]{n} = 3 \times 10^3 \text{ or } n = 27 \times 10^9.$$

Using a CAS, we do the computation to these many terms, and obtain the sum of approximately $\boxed{-1.715}$, an answer that is correct to three decimal places. (The exact answer is $3(2^{2/3} - 1)\zeta(\frac{1}{3})$, where $\zeta(s)$ is the Riemann zeta function introduced in Problem 75, Section 8.3, p.575.)

34. The series is $\sum_{k=1}^{\infty} \sin\left(\frac{\pi}{2}k\right)$. The sequence of partial sums has the form $\{S_n\} = \{1, 0, -1, 0, 1, \dots\}$. It does not converge, so the series $\boxed{\text{diverges}}$.

35. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{\sqrt{k}}$. We have

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n}} = 0.$$

By the Algebraic Ratio Test,

$$\frac{a_{n+1}}{a_n} = \frac{\frac{1}{\sqrt{n+1}}}{\frac{1}{\sqrt{n}}} = \frac{\sqrt{n}}{\sqrt{n+1}} < 1$$

for all $n \geq 1$. So, by the Alternating Series Test, the series converges. The series of absolute values $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\sqrt{k}}$ is a p -series with $0 < p = \frac{1}{2} < 1$, so it is divergent. Since the original series converges, but the series of absolute values diverges, the original series *converges conditionally.*

36. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{\cos k}{k^3}$. The series of absolute values is $\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{|\cos k|}{k^3}$. The n^{th} term satisfies

$$|a_n| = \frac{|\cos n|}{n^3} \leq \frac{1}{n^3} = b_n$$

for all $n \geq 1$. Since the series $\sum_{k=1}^{\infty} b_k = \sum_{k=1}^{\infty} \frac{1}{k^3}$ is a convergent p -series (since $p = 3 > 1$), the series of absolute values converges by the Comparison Test, and so the original series is *absolutely convergent.*

37. The n^{th} term of the series

$$\frac{1}{2} - \frac{4}{2^3 + 1} + \frac{9}{3^3 + 1} - \frac{16}{4^3 + 1} + \cdots$$

is

$$a_n = (-1)^{n+1} \frac{n^2}{n^3 + 1}.$$

It satisfies

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{n^2}{n^3 + 1} = 0.$$

By the Algebraic Ratio Test,

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \frac{\frac{(n+1)^2}{(n+1)^3 + 1}}{\frac{n^2}{n^3 + 1}} = \frac{(n+1)^2}{n^2} \cdot \frac{(n^3 + 1)}{[(n+1)^3 + 1]} \\ &= \frac{(n^2 + 2n + 1)(n^3 + 1)}{n^2[(n^3 + 3n^2 + 3n + 1) + 1]} = \frac{n^5 + 2n^4 + n^3 + n^2 + 2n + 1}{n^5 + 3n^4 + 3n^3 + 2n^2} < 1, \end{aligned}$$

provided we have

$$\begin{aligned} n^5 + 2n^4 + n^3 + n^2 + 2n + 1 &< n^5 + 3n^4 + 3n^3 + 2n^2 \\ \text{or,} \quad 2n + 1 &< n^4 + 2n^3 + n^2 \\ \text{or,} \quad 2n + 1 &< n^2(n^2 + 2n + 1) \end{aligned}$$

which is true for all $n \geq 1$. So the series of absolute values decreases as well. By the Alternating Series Test, the original series converges. The n^{th} term of the series of absolute values $\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{k^2}{k^3 + 1}$ behaves for large values of n like

$$|a_n| = \frac{n^2}{n^3 + 1} = \frac{n^2}{n^3 \left(1 + \frac{1}{n^3}\right)} \approx \frac{1}{n} = |b_n|.$$

Comparing with the divergent harmonic series $\sum_{k=1}^{\infty} |b_k| = \sum_{k=1}^{\infty} \frac{1}{k}$, we get

$$\lim_{n \rightarrow \infty} \left| \frac{a_n}{b_n} \right| = \lim_{n \rightarrow \infty} \frac{\frac{n^2}{n^3+1}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n^3}{n^3+1} = 1.$$

Since the limit is a positive real number and the series $\sum_{k=1}^{\infty} |b_k|$ is divergent, it means that the series of absolute values $\sum_{k=1}^{\infty} |a_k|$ is also divergent by the Limit Comparison Test. Since the original series converges, but the series of absolute values diverges, the original series is *conditionally convergent*.

38. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{2^k}{k!}$ is a series of nonzero terms. By the Ratio Test,

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{2^{n+1}}{(n+1)!}}{\frac{2^n}{n!}} \right| = \lim_{n \rightarrow \infty} \left| \frac{2^{n+1}}{2^n} \cdot \frac{n!}{(n+1)n!} \right| = 2 \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0 < 1.$$

Since the limit is less than 1, the series *converges* by the Ratio Test.

39. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k!}{e^{k^2}}$ is a series of nonzero terms. By the Ratio Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)!}{e^{(n+1)^2}}}{\frac{n!}{e^{n^2}}} \right| = \lim_{n \rightarrow \infty} \left| \frac{e^{n^2}}{e^{(n^2+2n+1)}} \cdot \frac{(n+1)n!}{n!} \right| \\ &= \lim_{n \rightarrow \infty} \frac{n+1}{e^{2n+1}} = \lim_{x \rightarrow \infty} \frac{x+1}{e^{2x+1}} = \lim_{x \rightarrow \infty} \frac{1}{2e^{2x+1}} \\ &= 0, \end{aligned}$$

applying L'Hôpital's rule to a related function of the ratio. Since the limit is less than 1, by the Ratio Test, we conclude that the series *converges*.

40. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{2^k}{(k+3)^{k+1}}$ is a series of nonzero terms. By the Root Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} &= \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{2^n}{(n+3)^{n+1}} \right|} = 2 \lim_{n \rightarrow \infty} \frac{1}{(n+3)^{(n+1)/n}} = 2 \lim_{n \rightarrow \infty} \frac{1}{(n+3)(n+3)^{1/n}} \\ &= 2 \lim_{n \rightarrow \infty} \frac{1}{n+3} \cdot \lim_{n \rightarrow \infty} \frac{1}{n^{1/n}} \cdot \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{3}{n}\right)^{1/n}} \\ &= 2 \cdot 0 \cdot 1 \cdot \frac{1}{(1+0)^0} \\ &= 0, \end{aligned}$$

where we have used the limit result $\lim_{n \rightarrow \infty} n^{1/n} = 1$ (see solutions to Exercise 31 of Section 8.6 for a proof). Since the limit is less than 1, by the Root Test, the series *converges*.

41. $\sum_{k=1}^{\infty} (-1)^k a_k = \sum_{k=1}^{\infty} (-1)^k (e^{-k} - 1)^k$ is a series of nonzero terms. Applying the Root Test,

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{|(e^{-n} - 1)^n|} = \lim_{n \rightarrow \infty} |e^{-n} - 1| = \lim_{n \rightarrow \infty} (1 - e^{-n}) = 1.$$

Since the limit is equal to 1, the Root Test is inconclusive. However, we note

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} |(e^{-n} - 1)^n| = 1 \neq 0,$$

where we have used the fact that $\lim_{n \rightarrow \infty} r^n = 0$ if $0 < |r| < 1$; here $r = \frac{1}{e}$. Since the limit of the n^{th} term is nonzero, by the Divergence Test, the series *diverges*.

42. The series $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{2^{k+1}}{3^k} = \sum_{k=1}^{\infty} \frac{(-2)^{k+1}}{3^k} = \sum_{k=1}^{\infty} \frac{(-2)^2}{3} \cdot \left(-\frac{2}{3}\right)^{k-1} = \sum_{k=1}^{\infty} \frac{4}{3} \left(-\frac{2}{3}\right)^{k-1}$ is a geometric series of the form $\sum_{k=1}^{\infty} ar^{k-1}$ with $a = \frac{4}{3}$ and $r = -\frac{2}{3}$. Since $0 < |r| < 1$, the series *converges*.

43. The series can be written $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \ln\left(1 + \frac{1}{k}\right) = \sum_{k=1}^{\infty} \ln\left(\frac{k+1}{k}\right) = \sum_{k=1}^{\infty} (\ln(k+1) - \ln k)$. The n^{th} partial sum is

$$\begin{aligned} S_n &= \sum_{k=1}^n (\ln(k+1) - \ln k) \\ &= (\ln 2 - \ln 1) + (\ln 3 - \ln 2) + \cdots + (\ln n - \ln(n-1)) + (\ln(n+1) - \ln n) \\ &= \ln(n+1) - \ln 1 = \ln(n+1) - 0 \\ &= \ln(n+1). \end{aligned}$$

Since

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \ln(n+1) = \infty,$$

the sequence of partial sums $\{S_n\}$ diverges, which means that the series *diverges* as well.

44. The series is $\sum_{k=5}^{\infty} a_k = \sum_{k=5}^{\infty} \frac{3}{k\sqrt{k-4}}$. The n^{th} term satisfies

$$a_n = \frac{3}{n\sqrt{n-4}} < \frac{3}{(n-4)\sqrt{n-4}} = \frac{3}{(n-4)^{3/2}} = b_n,$$

for all $n \geq 5$. Consider the series $\sum_{k=5}^{\infty} b_k = \sum_{k=5}^{\infty} \frac{3}{(k-4)^{3/2}}$. Setting $k-4 = k'$, we get $\sum_{k'=1}^{\infty} \frac{3}{k'^{3/2}}$. This is a constant multiple of a convergent p -series (since $p = \frac{3}{2} > 1$), so the series $\sum_{k=5}^{\infty} b_k$ converges. By the Comparison Test, this means that the original series $\sum_{k=5}^{\infty} a_k$ *converges* as well.

45. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{1}{\left(1 + \frac{k^2+1}{k^2}\right)^k}$ is a series of nonzero terms. Using the Root Test,

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{1}{\left(1 + \frac{n^2+1}{n^2}\right)^n} \right|} = \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{n^2+1}{n^2}\right)} = \lim_{n \rightarrow \infty} \frac{1}{1 + \left(1 + \frac{1}{n^2}\right)} = \frac{1}{1 + (1+0)} = \frac{1}{2} < 1.$$

Since the limit is less than 1, the series *converges* by the Root Test.

46. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{2 \cdot 4 \cdot 6 \cdots (2k)}{1 \cdot 3 \cdot 5 \cdots (2k-1)}$. We can write the n^{th} term as

$$a_n = \frac{2 \cdot 4 \cdot 6 \cdots (2n)}{1 \cdot 3 \cdot 5 \cdots (2n-1)} = \frac{(2 \cdot 4 \cdot 6 \cdots (2n))^2}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdots (2n-1)(2n)} = \frac{[2^n \cdot n!]^2}{(2n)!} = \frac{2^{2n} (n!)^2}{(2n)!}.$$

The Ratio Test can be used since $a_n \neq 0$ for all $n \geq 1$. We have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{2^{2(n+1)}((n+1)!)^2}{(2(n+1))!}}{\frac{2^{2n}(n!)^2}{(2n)!}} \right| \\ &= \lim_{n \rightarrow \infty} \left| \frac{2^{2n+2}}{2^{2n}} \cdot \left(\frac{(n+1)n!}{n!} \right)^2 \cdot \frac{(2n)!}{(2n+2)(2n+1)(2n)!} \right| \\ &= 2^2 \lim_{n \rightarrow \infty} \left| \frac{(n+1)^2}{(2n+2)(2n+1)} \right| \\ &= 4 \lim_{n \rightarrow \infty} \left| \frac{\left(1 + \frac{1}{n}\right)^2}{\left(2 + \frac{2}{n}\right)\left(2 + \frac{1}{n}\right)} \right| \\ &= 4 \cdot \left| \frac{1+0}{(2+0)(2+0)} \right| = 4 \cdot \frac{1}{4} = 1. \end{aligned}$$

Since the limit is equal to 1, the Ratio Test is inconclusive. However, observe that using

$$\left| \frac{a_{n+1}}{a_n} \right| = 4 \left| \frac{(n+1)^2}{(2n+2)(2n+1)} \right|$$

we can show that $\left| \frac{a_{n+1}}{a_n} \right| > 1$. This happens when

$$\begin{aligned} 4 \left| \frac{(n+1)^2}{(2n+2)(2n+1)} \right| &> 1 \\ 4(n+1)^2 &> (2n+2)(2n+1) \\ 4(n^2 + 2n + 1) &> 4n^2 + 4n + 2n + 2 \\ 4n^2 + 8n + 4 &> 4n^2 + 6n + 2 \\ 2n + 4 &> 2 \\ \text{or,} \quad 2n &> -2, \end{aligned}$$

which is true for all $n \geq 1$. So the terms of the series are increasing. Since the first term, $a_1 = \frac{2^2(1!)}{2!} = 2$, and the terms of the series are increasing, it would mean that

$$\lim_{n \rightarrow \infty} a_n > a_1 = 2 \neq 0.$$

So the series *diverges* by the Divergence Test.

47. The series is $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^2}{(1+k^3) \ln(\sqrt[3]{1+k^3})}$. Consider a related function of the n^{th} term of the series,

$$f(x) = \frac{x^2}{(1+x^3) \ln(\sqrt[3]{1+x^3})}.$$

This is continuous and defined on $[1, \infty)$, decreasing, and such that $f(k) = a_k$ for all $k \geq 1$. (To see that it is decreasing for $[\sqrt[3]{2}, \infty)$ we can use the following argument:

$$f'(x) = -\frac{[3x^4 + (x^3 - 2)x \ln(1+x^3)]}{(1+x^3)^2 (\ln(1+x^3))^2}.$$

Since denominator is always positive being the product of two squared terms, the sign of $f'(x)$ is negative if the numerator is positive. (Note the minus sign outside.) The numerator is positive at least for $x^3 - 2 \geq 0$ or $x \geq \sqrt[3]{2} \approx 1.26$.) the Using the Integral Test, we compute

$$I = \int_1^{\infty} f(x) dx = \lim_{b \rightarrow \infty} \int_1^b \frac{x^2 dx}{(1+x^3) \ln(\sqrt[3]{1+x^3})}.$$

Let $u = 1 + x^3$. Then $du = 3x^2 dx$. When $x = 1$, $u = 2$. When $x = b$, $u = 1 + b^3$. The integral becomes

$$I = \lim_{b \rightarrow \infty} \int_2^{1+b^3} \frac{\frac{1}{3} du}{\frac{1}{3} u \ln u} = \lim_{b \rightarrow \infty} \int_2^{1+b^3} \frac{du}{u \ln u}.$$

Let $v = \ln u$. Then $dv = \frac{du}{u}$. When $u = 2$, $v = \ln 2$. When $u = 1 + b^3$, $v = \ln(1 + b^3)$. So we have

$$I = \lim_{b \rightarrow \infty} \int_{\ln 2}^{\ln(1+b^3)} \frac{dv}{v} = \lim_{b \rightarrow \infty} [\ln |v|] \Big|_{\ln 2}^{\ln(1+b^3)} = \lim_{b \rightarrow \infty} [\ln(\ln(1 + b^3)) - \ln(\ln 2)] = \infty.$$

Since the limit of the improper integral is not finite, by the Integral Test, the series *diverges.*

48. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^{10}}{2^k}$ is a series of nonzero terms. By the Ratio Test,

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{n^{10+1}}{2^{n+1}}}{\frac{n^{10}}{2^n}} \right| = \lim_{n \rightarrow \infty} \left| \frac{2^n}{2 \cdot 2^n} \cdot \frac{n^{10} \cdot n}{n^{10}} \right| = \frac{1}{2} \lim_{n \rightarrow \infty} n = \infty.$$

Since the limit is ∞ , by the Ratio Test, the series *diverges.*

49. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(1 + \frac{1}{k^2})^{k^2}}{2^k}$ is a series of nonzero terms. Using the Root Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} &= \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{(1 + \frac{1}{n^2})^{n^2}}{2^n} \right|} = \frac{1}{2} \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n^2} \right)^{n^2/n} \\ &= \frac{1}{2} \left[\lim_{n^2 \rightarrow \infty} \left(1 + \frac{1}{n^2} \right)^{n^2} \right]^{\lim_{n \rightarrow \infty} 1/n} \\ &= \frac{1}{2} \left[\lim_{m \rightarrow \infty} \left(1 + \frac{1}{m} \right)^m \right]^0 \\ &= \frac{1}{2} [e]^0 = \frac{1}{2} < 1, \end{aligned}$$

where we used the substitution $m = n^2$ and the standard result that $\lim_{m \rightarrow \infty} (1 + \frac{1}{m})^m = e$. Since the limit is less than 1, by the Ratio Test, the series *converges.*

50. $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \left(\frac{k^2+1}{k} \right)^k$ is a series of nonzero terms. Using the Root Test,

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \left(\frac{n^2+1}{n} \right)^n \right|} = \lim_{n \rightarrow \infty} \left| \frac{n^2+1}{n} \right| = \infty.$$

Since the limit is ∞ , by the Root Test, the series *diverges.*

51. The series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k!}{3^k k^k}$ is a series of nonzero terms. Using the Ratio Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)!}{3^{n+1} (n+1)^{n+1}}}{\frac{n!}{3^n n^n}} \right| \\ &= \lim_{n \rightarrow \infty} \left| \frac{(n+1)n!}{n!} \cdot \frac{n^n}{(n+1)(n+1)^n} \right| = \lim_{n \rightarrow \infty} \left(\frac{n}{1+n} \right)^n \\ &= \lim_{n \rightarrow \infty} \left(\frac{1}{1+\frac{1}{n}} \right)^n = \frac{1}{\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n} \\ &= \frac{1}{e} < 1, \end{aligned}$$

since $e > 1$, where we have used the standard result that $\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n = e$. Since the limit is less than 1, by the Ratio Test, the series *converges*.

52. The series is $\sum_{k=1}^{\infty} (-1)^{k+1} a_k = \sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+2}{3^{k-2}}$. The absolute value of the n^{th} term satisfies

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n+2}{3n-2} = \lim_{n \rightarrow \infty} \frac{1+\frac{2}{n}}{3-\frac{2}{n}} = \frac{1}{3} \neq 0.$$

Since the limit is nonzero, the series *diverges* by the Divergence Test.

53. (a) The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x-3)^{3k-1}}{k^2}$ is a series of nonzero terms if $x \neq 3$. (If $x = 3$, the series sums to 0.) Applying the Ratio Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(x-3)^{3(n+1)-1}}{(n+1)^2}}{\frac{(x-3)^{3n-1}}{n^2}} \right| \\ &= \lim_{n \rightarrow \infty} \left| \frac{(x-3)^{3n-1+3}}{(x-3)^{3n-1}} \cdot \frac{n^2}{(n+1)^2} \right| = |x-3|^3 \left(\lim_{n \rightarrow \infty} \frac{n}{n+1} \right)^2 \\ &= |x-3|^3 \left(\lim_{n \rightarrow \infty} \frac{1}{1+\frac{1}{n}} \right)^2 = |x-3|^3 \cdot \left(\frac{1}{1+0} \right)^2 \\ &= |x-3|^3 < 1 \end{aligned}$$

for convergence of the series by the Ratio Test. So the power series converges in the interval $-1 < x-3 < 1$, or $2 < x < 4$. The radius of convergence is $R = 1$.

(b) At $x = 2$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(2-3)^{3k-1}}{k^2} = \sum_{k=1}^{\infty} \frac{(-1)^{3k-1}}{k^2} = \sum_{k=1}^{\infty} \frac{(-1)^{3k+3}(-1)^{-4}}{k^2} = \sum_{k=1}^{\infty} \frac{[(-1)^3]^{k+1}}{k^2} = \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^2}.$$

The series of absolute values $\sum_{k=1}^{\infty} |a_k| = \sum_{k=1}^{\infty} \frac{1}{k^2}$ is a convergent p -series (since $p = 2 > 1$), so the original series is absolutely convergent, hence converges. So the power series converges at $x = 2$.

At $x = 4$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(4-3)^{3k-1}}{k^2} = \sum_{k=1}^{\infty} \frac{(1)^{3k-1}}{k^2} = \sum_{k=1}^{\infty} \frac{1}{k^2}$$

which is a convergent p -series (since $p = 2 > 1$). So the power series converges at $x = 4$. Concluding, the interval of convergence of the power series is $\boxed{2 \leq x \leq 4}$.

54. (a) The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{x^k}{\sqrt[3]{k}}$ is a series of nonzero terms if $x \neq 0$. (If $x = 0$, the series sums to 0.) By the Ratio Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{\sqrt[3]{n+1}}}{\frac{x^n}{\sqrt[3]{n}}} \right| \\ &= |x| \lim_{n \rightarrow \infty} \sqrt[3]{\frac{n}{n+1}} = |x| \sqrt[3]{\lim_{n \rightarrow \infty} \left(\frac{1}{1 + \frac{1}{n}} \right)} \\ &= |x| \sqrt[3]{\frac{1}{1+0}} = |x| < 1 \end{aligned}$$

for convergence of the series by the Ratio Test. So the power series converges in the interval $-1 < x < 1$, and the radius of convergence is $\boxed{R = 1}$.

(b) At $x = -1$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(-1)^k}{\sqrt[3]{k}}.$$

The absolute value of the n^{th} term satisfies

$$\lim_{n \rightarrow \infty} |a_n| = \lim_{n \rightarrow \infty} \frac{1}{\sqrt[3]{n}} = 0.$$

By the Algebraic Ratio Test, we have

$$\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{\frac{1}{\sqrt[3]{n+1}}}{\frac{1}{\sqrt[3]{n}}} \right| = \sqrt[3]{\frac{n}{n+1}} < 1$$

for all $n \geq 1$. So the absolute value of the terms of the series are decreasing. By the Alterbating Series Test, the series converges. So the power series converges at $x = -1$.

At $x = 1$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(1)^k}{\sqrt[3]{k}} = \sum_{k=1}^{\infty} \frac{1}{k^{1/3}}.$$

This is a p -series with $0 < p = \frac{1}{3} < 1$, so it diverges. So the power series diverges at $x = 1$.

Concluding, the interval of convergence of the power series is $\boxed{-1 \leq x < 1}$.

55. (a) The power series $\sum_{k=0}^{\infty} (-1)^k a_k = \sum_{k=0}^{\infty} (-1)^k \frac{1}{k!(k+1)} \left(\frac{x}{2}\right)^{2k+1}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) Using the Ratio Test,

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{1}{(n+1)!(n+2)} \left(\frac{x}{2}\right)^{2(n+1)+1}}{\frac{1}{n!(n+1)} \left(\frac{x}{2}\right)^{2n+1}} \right| \\ &= \left| \frac{x}{2} \right|^2 \lim_{n \rightarrow \infty} \left| \frac{n+1}{n+2} \cdot \frac{n!}{(n+1)n!} \right| = \left| \frac{x}{2} \right|^2 \cdot \lim_{n \rightarrow \infty} \frac{1}{n+2} \\ &= 0 \end{aligned}$$

for any value of x . So the radius of convergence of the power series is $\boxed{R = \infty}$.

(b) Since the series converges for any value of x , the interval of convergence of the series is $[-\infty < x < \infty]$.

56. (a) The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{k^k}{(k!)^2} x^k$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 0.) Using the Ratio Test, we have

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(n+1)^{n+1} x^{n+1}}{((n+1)!)^2}}{\frac{n^n x^n}{(n!)^2}} \right| \\ &= |x| \lim_{n \rightarrow \infty} \left| \frac{(n+1)(n+1)^n}{n^n} \cdot \left(\frac{n!}{(n+1)n!} \right)^2 \right| \\ &= |x| \lim_{n \rightarrow \infty} \left| \left(\frac{n+1}{n} \right)^n \cdot \frac{1}{n+1} \right| \\ &= |x| \cdot \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n \cdot \lim_{n \rightarrow \infty} \frac{1}{n+1} \\ &= |x| \cdot e \cdot 0 = 0, \end{aligned}$$

where the standard limit result $\lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^n = e$ has been used. Since the limit is less than 1 for any value of x , the radius of convergence of the power series is $[R = \infty]$.

(b) Since the series converges for any value of x , the interval of convergence of the series is $[-\infty < x < \infty]$.

57. (a) The power series $\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(x-1)^k}{k}$ is a series of nonzero terms for $x \neq 1$. (At $x = 1$, the series converges to 0.) Using the Ratio Test, we get

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{(x-1)^{n+1}}{n+1}}{\frac{(x-1)^n}{n}} \right| = |x-1| \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right) = |x-1| \lim_{n \rightarrow \infty} \left(\frac{1}{1 + \frac{1}{n}} \right) = |x-1| \cdot \frac{1}{1+0} = |x-1| < 1$$

for convergence of the series by the Ratio Test. So the power series converges in the interval $-1 < x-1 < 1$, or $0 < x < 2$, and the radius of convergence is $[R = 1]$.

(b) At $x = 0$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(0-1)^k}{k} = \sum_{k=1}^{\infty} \frac{(-1)^k}{k} = -1 + \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \cdots$$

which, being a constant multiple of the alternating harmonic series (namely the alternating harmonic series multiplied by -1), converges. So the power series converges for $x = 0$.

At $x = 2$, the series becomes

$$\sum_{k=1}^{\infty} a_k = \sum_{k=1}^{\infty} \frac{(2-1)^k}{k} = \sum_{k=1}^{\infty} \frac{(1)^k}{k} = \sum_{k=1}^{\infty} \frac{1}{k}$$

which is the divergent harmonic series. So the power series diverges for $x = 2$.

Concluding, the interval of convergence of the power series is $[0 \leq x < 2]$.

58. (a) The power series $\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{3^k x^k}{5^k}$ is a series of nonzero terms for $x \neq 0$. (At $x = 0$, the series converges to 1.) By the Ratio Test, we get

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{3^{n+1} x^{n+1}}{5^{n+1}}}{\frac{3^n x^n}{5^n}} \right| = \frac{3}{5} |x| < 1$$

for convergence of the series by the Ratio Test. So $|x| < \frac{5}{3}$, which means the power series converges in the interval $-\frac{5}{3} < x < \frac{5}{3}$, and its radius of convergence is $R = \frac{5}{3}$.

(b) At $x = -\frac{5}{3}$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{3^k}{5^k} \cdot \left(-\frac{5}{3}\right)^k = \sum_{k=0}^{\infty} (-1)^k.$$

The sequence of partial sums of this series is $\{S_n\} = \{1, 0, 1, 0, \dots\}$ which does not converge, and this means the series does not converge either. So the power series diverges for $x = -\frac{5}{3}$.

At $x = \frac{5}{3}$, the series becomes

$$\sum_{k=0}^{\infty} a_k = \sum_{k=0}^{\infty} \frac{3^k}{5^k} \cdot \left(\frac{5}{3}\right)^k = \sum_{k=0}^{\infty} 1$$

which diverges. So the power series diverges for $x = \frac{5}{3}$.

Concluding, the interval of convergence of the power series is $-\frac{5}{3} < x < \frac{5}{3}$.

59. To express the function $f(x) = \frac{2}{x+3}$ as a power series centered at 0, we use the following function respresented as a geometric series: $g(x) = \frac{1}{1-x} = \sum_{k=0}^{\infty} x^k$ for $-1 < x < 1$. So,

$$\begin{aligned} f(x) &= \frac{2}{3+x} = \frac{2}{3} \left(\frac{1}{1+\frac{x}{3}} \right) = \frac{2}{3} \left[\frac{1}{1 - \left(-\frac{x}{3}\right)} \right] \\ &= \frac{2}{3} \sum_{k=0}^{\infty} \left(-\frac{x}{3}\right)^k = \frac{2}{3} \sum_{k=0}^{\infty} (-1)^k \left(\frac{x}{3}\right)^k, \end{aligned}$$

which converges for $\left|\frac{x}{3}\right| < 1$ or $-1 < \frac{x}{3} < 1$, or $-3 < x < 3$.

60. To express the function $f(x) = \frac{1}{1-3x}$ as a power series centered at 0, we use the following function represented as a geometric series: $g(x) = \frac{1}{1-x} = \sum_{k=0}^{\infty} x^k$ for $-1 < x < 1$. So we have

$$f(x) = \frac{1}{1-3x} = g(3x) = \sum_{k=0}^{\infty} (3x)^k = \sum_{k=0}^{\infty} 3^k x^k,$$

which converges for $|3x| < 1$ or $-1 < 3x < 1$ or $-\frac{1}{3} < x < \frac{1}{3}$.

61. (a) From Problem 60 above, the series centered about 0 for

$$\frac{1}{1-3x^2} = f(x^2) = \sum_{k=0}^{\infty} 3^k (x^2)^k = 1 + 3x^2 + 9x^4 + 27x^6 + \dots + 3^n x^{2n} + \dots$$

Integrating both sides we get

$$\begin{aligned} \int_0^x \frac{1}{1-3t^2} dt &= \int_0^x [1 + 3t^2 + 9t^4 + 27t^6 + \dots + 3^n t^{2n} + \dots] dt \\ &= \boxed{x + x^3 + \frac{9}{5}x^5 + \frac{27}{7}x^7 + \dots + \frac{3^n}{2n+1}x^{2n+1} + \dots} \end{aligned}$$

(b) To ascertain the correct number of terms to keep, we calculate the n for which the contribution to the sum becomes less than 0.001, for $x = \frac{1}{2}$. So, setting $x = \frac{1}{2}$ in the n^{th} term, we get

$$\frac{3^n}{2n+1} \left(\frac{1}{2}\right)^{2n+1} \leq 0.001.$$

Proceeding by trial and error, we find that $n = 11$. So we have

$$\int_0^{1/2} \frac{1}{1-3x^2} dx \approx \sum_{k=0}^{11} \frac{3^k}{2k+1} \left(\frac{1}{2}\right)^{2k+1} \approx \boxed{0.758}$$

an answer that is correct to three decimal places.

62. To find the Taylor expansion of $f(x) = \frac{1}{1-2x}$ about $c = 1$, we begin by evaluating the function and its derivatives at $x = 1$.

$$\begin{array}{ll} f(x) = \frac{1}{1-2x} & f(1) = \frac{1}{1-2 \cdot 1} = -1 \\ f'(x) = \frac{2 \cdot 1}{(1-2x)^2} & f'(1) = \frac{2 \cdot 1}{(1-2 \cdot 1)^2} = 2 \cdot 1! \\ f''(x) = \frac{2^2 \cdot 2 \cdot 1}{(1-2x)^3} & f''(1) = \frac{2^2 \cdot 2!}{(1-2 \cdot 1)^3} = -2^2 \cdot 2! \\ f'''(x) = \frac{2^3 \cdot 3 \cdot 2 \cdot 1}{(1-2x)^4} & f'''(1) = \frac{2^3 \cdot 3!}{(1-2 \cdot 1)^4} = 2^3 \cdot 3! \\ \vdots & \vdots \end{array}$$

The Taylor expansion of the function about $c = 1$ is

$$\begin{aligned} f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\ &= \frac{-1}{0!} (x-1)^0 + \frac{2 \cdot 1!}{1!} (x-1)^1 - \frac{2^2 \cdot 2!}{2!} (x-1)^2 + \frac{2^3 \cdot 3!}{3!} (x-1)^3 - \cdots + (-1)^{n+1} \frac{2^n \cdot n!}{n!} (x-1)^n + \cdots \\ &= -1 + 2(x-1) - 2^2(x-1)^2 + 2^3(x-1)^3 - \cdots + (-1)^{n+1} 2^n (x-1)^n + \cdots \\ &= \boxed{\sum_{k=0}^{\infty} (-1)^{k+1} 2^k (x-1)^k}. \end{aligned}$$

63. To find the Taylor expansion of $f(x) = e^{x/2}$ about $c = 1$, we begin by evaluating the function and its derivatives at $x = 1$.

$$\begin{array}{ll} f(x) = e^{x/2} & f(1) = e^{1/2} \\ f'(x) = \frac{1}{2} e^{x/2} & f'(1) = \frac{1}{2} e^{1/2} \\ f''(x) = \frac{1}{2^2} e^{x/2} & f''(1) = \frac{1}{2^2} e^{1/2} \\ f'''(x) = \frac{1}{2^3} e^{x/2} & f'''(1) = \frac{1}{2^3} e^{1/2} \\ \vdots & \vdots \end{array}$$

The Taylor expansion of the function about $c = 1$ is

$$\begin{aligned} f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\ &= \frac{1}{0!} e^{1/2} (x-1)^0 + \frac{1}{1!} 2 e^{1/2} (x-1)^1 + \frac{1}{2!} 2^2 e^{1/2} (x-1)^2 + \frac{1}{3!} 2^3 e^{1/2} (x-1)^3 + \cdots + \frac{1}{n!} 2^n e^{1/2} (x-1)^n + \cdots \\ &= \boxed{\sum_{k=0}^{\infty} \frac{1}{k!} 2^k e^{1/2} (x-1)^k}. \end{aligned}$$

64. To find the Maclaurin expansion of $f(x) = 2x^3 - 3x^2 + x + 5$, we begin by evaluating the function and its derivatives at $x = 0$.

$$\begin{array}{ll} f(x) = 2x^3 - 3x^2 + x + 5 & f(0) = 2(0)^3 - 3(0)^2 + 0 + 5 = 5 \\ f'(x) = 6x^2 - 6x + 1 & f'(0) = 6(0)^2 - 6(0) + 1 = 1 \\ f''(x) = 12x - 6 & f''(0) = -6 \\ f'''(x) = 12 & f'''(0) = 12 \\ f^{(4)}(x) = 0 & f^{(4)}(0) = 0. \end{array}$$

The higher derivatives and their evaluations at $x = 0$ are all 0 as well. So the Maclaurin series is

$$\begin{aligned} f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \\ &= \frac{5}{0!} x^0 + \frac{1}{1!} x^1 + \frac{-6}{2!} x^2 + \frac{12}{3!} x^3 \\ &= 5 + x - 3x^2 + 2x^3 \\ &= \boxed{2x^3 - 3x^2 + x + 5}. \end{aligned}$$

We see that the Maclaurin expansion of the function is equivalent to the function itself.

65. To find the Taylor series for $f(x) = \tan x$ about $c = \frac{\pi}{4}$, we begin by evaluating the function and its derivatives at $x = \frac{\pi}{4}$. Let $y = f(x)$, $y_1 = f\left(\frac{\pi}{4}\right)$, $y' = f'(x)$, $y'_1 = f'\left(\frac{\pi}{4}\right)$, etc.

$$\begin{array}{ll} y = \tan x & y_1 = \tan\left(\frac{\pi}{4}\right) = 1 \\ y' = \sec^2 x = 1 + \tan^2 x = 1 + y^2 & y'_1 = 1 + y_1^2 = 1 + (1)^2 = 2 \\ y'' = 2yy' & y''_1 = 2y_1 y'_1 = 2(1)(2) = 4 \\ y''' = 2y'^2 + 2yy'' & y'''_1 = 2y'^2_1 + 2y_1 y''_1 \\ & \quad = 2(2)^2 + 2(1)(4) = 16 \\ y^{(4)} = 4y' y'' + 2y' y''' & y^{(4)}_1 = 4y'_1 y''_1 + 2y'_1 y'''_1 \\ & \quad = 6y'_1 y''_1 + 2y_1 y'''_1 \\ & \quad = 6(2)(4) + 2(1)(16) = 80 \\ y^{(5)} = 6y''^2 + 6y' y''' + 2y' y^{(4)} & y^{(5)}_1 = 6y''^2_1 + 6y'_1 y'''_1 + 2y'_1 y^{(4)}_1 \\ & \quad = 6(4)^2 + 6(2)(16) + 2(1)(80) = 512 \\ \vdots & \vdots \end{array}$$

The Taylor expansion of the function about $c = \frac{\pi}{4}$ is

$$\begin{aligned}
 f(x) &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k \\
 &= 1 + \frac{2}{1!} \left(x - \frac{\pi}{4}\right)^1 + \frac{4}{2!} \left(x - \frac{\pi}{4}\right)^2 + \frac{16}{3!} \left(x - \frac{\pi}{4}\right)^3 + \frac{80}{4!} \left(x - \frac{\pi}{4}\right)^4 + \frac{512}{5!} \left(x - \frac{\pi}{4}\right)^5 + \cdots \\
 &= \boxed{1 + 2 \left(x - \frac{\pi}{4}\right) + 2 \left(x - \frac{\pi}{4}\right)^2 + \frac{8}{3} \left(x - \frac{\pi}{4}\right)^3 + \frac{10}{3} \left(x - \frac{\pi}{4}\right)^4 + \frac{64}{15} \left(x - \frac{\pi}{4}\right)^5 + \cdots}
 \end{aligned}$$

66. The Maclaurin expansion of $f(x) = e^{-x} \sin x$ is obtained by multiplying the Maclaurin expansions of e^{-x} and $\sin x$ together. From Example 2, p.615 of Section 8.9, we get the Maclaurin expansion

$$g(x) = e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots + \frac{x^n}{n!} + \cdots.$$

So we have

$$g(-x) = e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \cdots + (-1)^n \frac{x^n}{n!} + \cdots.$$

From p.616 of Section 8.9 the book, we have

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots.$$

So the first five terms of the Maclaurin series of $f(x)$ are

$$\begin{aligned}
 f(x) &= e^{-x} \sin x \\
 &= \left(1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \frac{x^5}{5!} + \cdots + (-1)^n \frac{x^n}{n!} + \cdots\right) \cdot \left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots\right) \\
 &= \left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + \cdots\right) \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) \\
 &= 1 \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) - x \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \frac{x^2}{2} \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \\
 &\quad - \frac{x^3}{6} \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \frac{x^4}{24} \cdot \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) - \frac{x^5}{120} \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \cdots \\
 &= \left(x - \frac{x^3}{6} + \frac{x^5}{120} - \cdots\right) + \left(-x^2 + \frac{x^4}{6} - \frac{x^6}{120} + \cdots\right) + \left(\frac{x^3}{2} - \frac{x^5}{12} + \frac{x^7}{240} - \cdots\right) + \\
 &\quad + \left(-\frac{x^4}{6} + \frac{x^6}{36} - \frac{x^8}{720} + \cdots\right) + \left(\frac{x^5}{24} - \frac{x^7}{144} + \frac{x^9}{2880} - \cdots\right) + \left(-\frac{x^6}{120} + \cdots\right) + \cdots \\
 &= x - x^2 + x^3 \left(\frac{1}{2} - \frac{1}{6}\right) + x^4 \left(\frac{1}{6} - \frac{1}{6}\right) + x^5 \left(\frac{1}{120} + \frac{1}{24} - \frac{1}{12}\right) + x^6 \left(-\frac{1}{120} + \frac{1}{36} - \frac{1}{120}\right) - \cdots \\
 &= \boxed{x - x^2 + \frac{1}{3}x^3 - \frac{1}{30}x^5 + \frac{1}{90}x^6 - \cdots}.
 \end{aligned}$$

67. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial series of $f(x) = \frac{1}{(x+1)^4} = (1+x)^{-4}$ is given by

$$\begin{aligned} f(x) &= \sum_{k=0}^{\infty} \binom{-4}{k} x^k \\ &= \binom{-4}{0} x^0 + \binom{-4}{1} x^1 + \binom{-4}{2} x^2 + \binom{-4}{3} x^3 + \cdots + \binom{-4}{n} x^n + \cdots \\ &= 1 - 4x + \frac{(-4)(-4-1)}{2!} x^2 + \frac{(-4)(-4-1)(-4-2)}{3!} x^3 + \cdots \\ &= \boxed{1 - 4x + 10x^2 - 20x^3 + \cdots} \end{aligned}$$

Since $m = -4$ satisfies $m \leq -1$, by the conditions of the theorem on p.620, the binomial series of $\frac{1}{(x+1)^4}$ converges on the open interval $\boxed{(-1, 1)}$.

68. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial series of $f(x) = \sqrt[3]{x^2 - 1} = (-1)^{1/3} (1 - x^2)^{1/3} = -1(1 - x^2)^{1/3}$ is given by

$$\begin{aligned} f(x) &= - \sum_{k=0}^{\infty} \binom{\frac{1}{3}}{k} (-x^2)^k \\ &= - \left[\binom{\frac{1}{3}}{0} (-x^2)^0 + \binom{\frac{1}{3}}{1} (-x^2)^1 + \binom{\frac{1}{3}}{2} (-x^2)^2 + \binom{\frac{1}{3}}{3} (-x^2)^3 + \cdots + \binom{\frac{1}{3}}{n} (-x^2)^n + \cdots \right] \\ &= - \left[1 - \frac{1}{3} x^2 + \frac{\frac{1}{3}(\frac{1}{3}-1)}{2!} x^4 - \frac{\frac{1}{3}(\frac{1}{3}-1)(\frac{1}{3}-2)}{3!} x^6 + \cdots \right] \\ &= \boxed{-1 + \frac{1}{3} x^2 + \frac{1}{9} x^4 + \frac{5}{81} x^6 + \cdots} \end{aligned}$$

Since $m = \frac{1}{3}$ satisfies $m > 0$ but m is not an integer, by the conditions of the theorem on p.620, the series converges on the closed interval $\boxed{[-1, 1]}$.

69. Since $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$, the binomial expansion of $f(x) = \frac{1}{\sqrt{1-x}} = (1-x)^{-1/2}$ is given by

$$\begin{aligned} f(x) &= \sum_{k=0}^{\infty} \binom{-\frac{1}{2}}{k} (-1)^k x^k \\ &= \binom{-\frac{1}{2}}{0} (-1)^0 x^0 + \binom{-\frac{1}{2}}{1} (-1)^1 x^1 + \binom{-\frac{1}{2}}{2} (-1)^2 x^2 + \binom{-\frac{1}{2}}{3} (-1)^3 x^3 + \cdots \\ &= 1 - \left(-\frac{1}{2} \right) x + \frac{(-\frac{1}{2})(-\frac{3}{2})}{2!} x^2 - \frac{(-\frac{1}{2})(-\frac{3}{2})(-\frac{5}{2})}{3!} x^3 + \cdots \\ &= \boxed{1 + \frac{1}{2} x + \frac{3}{8} x^2 + \frac{5}{16} x^3 + \cdots} \end{aligned}$$

Since $m = -\frac{1}{2}$ satisfies $-1 < m < 0$, by the conditions of the theorem on p.620, the series converges on the half open interval $\boxed{(-1, 1]}$.

70. (a) To find the Taylor expansion to four nonzero terms of $y = \cos x$ about $x = \frac{\pi}{2}$, we compute the

function and its derivatives at $x = \frac{\pi}{2}$ until four nonzero values result.

$y = \cos x$	$y\left(\frac{\pi}{2}\right) = \cos\left(\frac{\pi}{2}\right) = 0$
$y'(x) = -\sin x$	$y'\left(\frac{\pi}{2}\right) = -\sin\left(\frac{\pi}{2}\right) = \boxed{-1}$
$y''(x) = -\cos x$	$y''\left(\frac{\pi}{2}\right) = -\cos\left(\frac{\pi}{2}\right) = 0$
$y'''(x) = \sin x$	$y'''\left(\frac{\pi}{2}\right) = \sin\left(\frac{\pi}{2}\right) = \boxed{1}$
$y^{(4)}(x) = \cos x$	$y^{(4)}\left(\frac{\pi}{2}\right) = \cos\left(\frac{\pi}{2}\right) = 0$
$y^{(5)}(x) = -\sin x$	$y^{(5)}\left(\frac{\pi}{2}\right) = -\sin\left(\frac{\pi}{2}\right) = \boxed{-1}$
$y^{(6)}(x) = -\cos x$	$y^{(6)}\left(\frac{\pi}{2}\right) = -\cos\left(\frac{\pi}{2}\right) = 0$
$y^{(7)}(x) = \sin x$	$y^{(7)}\left(\frac{\pi}{2}\right) = \sin\left(\frac{\pi}{2}\right) = \boxed{1}$
$\vdots$	$\vdots$

So the Taylor expansion to four nonzero terms of $y = \cos x$ about $c = \frac{\pi}{2}$ is given by

$$\begin{aligned}
 y = f(x) = \cos x &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x - c)^k \\
 &= \frac{1}{1!} \left(x - \frac{\pi}{2}\right)^1 + \frac{1}{3!} \left(x - \frac{\pi}{2}\right)^3 - \frac{1}{5!} \left(x - \frac{\pi}{2}\right)^5 + \frac{1}{7!} \left(x - \frac{\pi}{2}\right)^7 - \dots \\
 &= \boxed{-\left(x - \frac{\pi}{2}\right) + \frac{1}{6} \left(x - \frac{\pi}{2}\right)^3 - \frac{1}{120} \left(x - \frac{\pi}{2}\right)^5 + \frac{1}{5040} \left(x - \frac{\pi}{2}\right)^7 - \dots}
 \end{aligned}$$

(b) The figure below shows the graph of both the function and its Maclaurin approximation found above in part (a).

(c) Set $x = 88^\circ = \frac{22}{45}\pi$. Then $(x - \frac{\pi}{2}) = (\frac{22}{45}\pi - \frac{\pi}{2}) = -\frac{\pi}{90}$. So

$$\begin{aligned}\cos(88^\circ) &\approx -\left(-\frac{\pi}{90}\right) + \frac{1}{6}\left(-\frac{\pi}{90}\right)^3 - \frac{1}{120}\left(-\frac{\pi}{90}\right)^5 + \frac{1}{5040}\left(-\frac{\pi}{90}\right)^7 \\ &\approx \boxed{0.0349}.\end{aligned}$$

(d) Since the series is a converging alternating one, the error in using this approximation is bounded from above by the absolute value of the next nonzero term, which is

$$\left|\frac{1}{9!}\left(x - \frac{\pi}{2}\right)^9\right|.$$

Evaluating this error bound for $x = 88^\circ$, we have

$$\text{error} \leq \left|\frac{1}{9!}\left(-\frac{\pi}{90}\right)^9\right| \approx \boxed{2.12 \times 10^{-19}}.$$

(e) We need to determine the x values for which the error term would be less than or equal to 0.0001, that is, we need

$$\begin{aligned}\left|\frac{1}{9!}\left(x - \frac{\pi}{2}\right)^9\right| &\leq 0.0001 \\ -36.288 &\leq \left(x - \frac{\pi}{2}\right)^9 \leq 36.288 \\ -1.490414 &\lesssim x - \frac{\pi}{2} \lesssim 1.490414 \\ -1.490414 + \frac{\pi}{2} &\lesssim x \lesssim 1.490414 + \frac{\pi}{2} \\ 0.08038 &\lesssim x \lesssim 3.061210 \\ 4.6^\circ &\lesssim x \lesssim 175.4^\circ.\end{aligned}$$

So the x values for which the error in the approximation would be less than or equal to 0.0001 are approximately $\boxed{4.6^\circ \leq x \leq 175.4^\circ}$.

71. The Maclaurin series for $f(x) = e^x$ is given by (see p.615) by

$$f(x) = e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots$$

To ensure the accuracy of the approximation of $e^{0.3}$ to three decimal places, let us find the number of terms we need to keep:

$$\frac{x^n}{n!} = 0.001$$

gives, by trial and error, $n = 4$. Keeping the first five nonzero terms of the expansion, we have

$$\begin{aligned}e^{0.3} &\approx 1 + 0.3 + \frac{(0.3)^2}{2!} + \frac{(0.3)^3}{3!} + \frac{(0.3)^4}{4!} \\ &\approx 1 + 0.3 + 0.045 + 0.0045 + 0.00033 \\ &\approx \boxed{1.34983}\end{aligned}$$

The exact value is $e^{0.3} \approx 1.34986$ so the value found using the first five terms is accurate to at least three decimal places.

72. The integrand in $\int_0^{1/2} \frac{1}{\sqrt{1-x^3}} dx$ can be expressed as a binomial series:

$$\begin{aligned} \frac{1}{\sqrt{1-x^3}} &= (1-x^3)^{-1/2} = \sum_{k=0}^{\infty} \binom{-\frac{1}{2}}{k} (-x^3)^k \\ &= 1 - \frac{1}{2}(-x^3) + \frac{\left(-\frac{1}{2}\right)\left(-\frac{1}{2}-1\right)}{2!}(-x^3)^2 + \frac{\left(-\frac{1}{2}\right)\left(-\frac{1}{2}-1\right)\left(-\frac{1}{2}-2\right)}{3!}(-x^3)^3 + \cdots + \binom{-\frac{1}{2}}{n}(-x^3)^n + \cdots \\ &\approx 1 + \frac{1}{2}x^3 + \frac{3}{8}x^6 + \frac{5}{16}x^9 \end{aligned}$$

which is the integrand expanded to four nonzero terms. Integrating both sides between the limits, we have

$$\begin{aligned} \int_0^{1/2} \frac{1}{\sqrt{1-x^3}} dx &\approx \int_0^{1/2} \left[1 + \frac{1}{2}x^3 + \frac{3}{8}x^6 + \frac{5}{16}x^9 \right] dx \\ &= \left[x + \frac{1}{2 \cdot 4}x^4 + \frac{3}{8 \cdot 7}x^7 + \frac{5}{16 \cdot 10}x^{10} \right]_0^{1/2} \\ &= (0.5) + \frac{1}{8}(0.5)^4 + \frac{3}{56}(0.5)^7 + \frac{1}{32}(0.5)^{10} \\ &\approx \boxed{0.5083.} \end{aligned}$$

73. The Maclaurin expansion of e^x is (see p.615)

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots .$$

So the Maclaurin expansion of e^{x^2} is

$$e^{x^2} = 1 + x^2 + \frac{x^4}{2!} + \frac{x^6}{3!} + \cdots + \frac{x^{2n}}{n!} + \cdots .$$

The integrand is expanded to four nonzero terms for the approximation:

$$\begin{aligned} \int_0^{1/2} e^{x^2} dx &\approx \int_0^{1/2} \left[1 + x^2 + \frac{x^4}{2!} + \frac{x^6}{3!} \right] dx \\ &= \left[x + \frac{x^3}{3} + \frac{x^5}{2! \cdot 5} + \frac{x^7}{3! \cdot 7} \right]_0^{1/2} \\ &= 0.5 + \frac{(0.5)^3}{3} + \frac{(0.5)^5}{10} + \frac{(0.5)^7}{42} \\ &\approx \boxed{0.545.} \end{aligned}$$

Chapter 9

Parametric Equations; Polar Equations

9.1 Parametric Equations

Concepts and Vocabulary

1. Let $x = x(t)$ and $y = y(t)$ be two functions whose common domain is some interval I . The collection of points defined by $(x, y) = (x(t), y(t))$ is called a plane **curve**. The variable t is called a **parameter**.
2. The parametric equations $x(t) = 2 \sin t$, $y(t) = 3 \cos t$ define an **(c) ellipse**.
3. The parametric equations $x(t) = a \sin t$, $y(t) = a \cos t$ define a **(d) circle**.
4. If a circle rolls along a horizontal line without slipping, a point P on the circle traces out a curve called a **cycloid**.
5. **False**. A curve can be defined parametrically in an infinite number of ways.
6. **True**. As the parameter increases, we plot the corresponding points in a certain order which defines the orientation of the curve.

Skill Building

7. (a) Solving for t in the $x(t)$ equation, we have $t = \frac{1}{2}(x - 1)$. Plug this into $y(t)$: $y = \frac{1}{2}(x - 1) + 2$ or

$y = \frac{1}{2}x + \frac{3}{2}$. Since t varies from $-\infty$ to $+\infty$, the rectangular equation is defined for all x from $-\infty$ to ∞ .

(b)

8. (a) Solving for t in the $x(t)$ equation, we have $t = x + 2$. Plug this into $y(t)$: $y = 3(x + 2) + 1$ or $y = 3x + 7$. Since t varies from $-\infty$ to $+\infty$, the rectangular equation is defined for all x from $-\infty$ to ∞ .

(b)

9. (a) Solving for t in the $y(t)$ equation, we have $t = y - 2$. Plug this into $x(t)$: $x = 2(y - 2) + 1$ or $x = 2y - 3$. Since t varies from 0 to 2, we have $1 \leq x \leq 5$ and y varies from $y(0) = 2$ to $y(2) = 4$.

(b)

10. (a) Solving for t in the $x(t)$ equation, we have $t = x + 2$. Plug this into $y(t)$: $y = 3(x + 2) + 1$ or $y = 3x + 7$. Since t varies from 0 to 2, x varies from $x(0) = -2$ to $x(2) = 0$.

(b)

11. (a) Plug $y = t$ into $x(t)$: $x = e^y$. This can be rewritten as $y = \ln x$. Since $-\infty < t < \infty$, we see that $0 < x(t) < \infty$.

(b)

12. (a) Plug $x = t$ into $y(t)$: $y = \frac{1}{x}$. Since $x = t$, the rectangular equation is defined for all $x \neq 0$.

(b)

13. (a) Notice that $[x(t)]^2 + [y(t)]^2 = \sin^2 t + \cos^2 t = 1$, which means our parametrization is that of a circle of radius 1 centered at $(0, 0)$, namely $x^2 + y^2 = 1$. To find its starting point, ending point, and orientation, plot the points $t = 0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}, 2\pi$. We find, respectively, the points $(0, 1), (1, 0), (0, -1), (-1, 0)$, and $(0, 1)$. Plotted in this order, we trace a circle starting at the point $(0, 1)$ and moving clockwise until we arrive back at $(0, 1)$.

(b)

14. (a) Notice that $[x(t)]^2 + [y(t)]^2 = \cos^2 t + \sin^2 t = 1$, which means our parametrization is that of a circle of radius 1 centered at $(0, 0)$, namely $x^2 + y^2 = 1$. To find its starting point, ending point, and orientation, plot the points $t = 0, \frac{\pi}{2}, \pi$. We find, respectively, the points $(1, 0), (0, 1)$, and $(-1, 0)$. Plotted in this order, we trace a semicircle, starting at the point $(1, 0)$ and moving counterclockwise until we end at the point $(-1, 0)$.

(b)

15. (a) We eliminate the parameter t using the Pythagorean Theorem $\sin^2 t + \cos^2 t = 1$. Since $\sin t = \frac{x}{2}$ and $\cos t = \frac{y}{3}$,

$$\left(\frac{x}{2}\right)^2 + \left(\frac{y}{3}\right)^2 = \sin^2 t + \cos^2 t = 1$$

$$\boxed{\frac{x^2}{4} + \frac{y^2}{9} = 1}$$

which is an ellipse centered at the origin. To find its starting point, ending point, and orientation, plot the points $t = 0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}, 2\pi$. We find, respectively, the points $(0, 3), (2, 0), (0, -3), (-2, 0)$, and $(0, 3)$. Plotted in this order, we trace an ellipse oriented clockwise.

(b)

16. (a) We eliminate the parameter t using the Pythagorean Theorem $\cos^2 t + \sin^2 t = 1$. Since $\cos t = \frac{x}{4}$ and $\sin t = \frac{y}{3}$,

$$\left(\frac{x}{4}\right)^2 + \left(\frac{y}{3}\right)^2 = \cos^2 t + \sin^2 t = 1$$

$$\boxed{\frac{x^2}{16} + \frac{y^2}{9} = 1}$$

which is an ellipse centered at the origin. To find its starting point, ending point, and orientation, plot the points $t = 0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}, 2\pi$. We find, respectively, the points $(4, 0), (0, 3), (-4, 0), (0, -3)$, and $(4, 0)$. Plotted in this order, we trace an ellipse oriented counterclockwise.

(b)

17. (a) Notice that $2 \sin t = x + 3$ and $2 \cos t = y - 1$. If we square and add both equations, then we have

$$(x + 3)^2 + (y - 1)^2 = 4 \sin^2 t + 4 \cos^2 t = 4$$

$$\boxed{\frac{(x + 3)^2}{4} + \frac{(y - 1)^2}{4} = 1},$$

which is a circle centered at $(-3, 1)$ with radius 2. To find its starting point, ending point, and orientation, plot the points $t = 0, \frac{\pi}{2}$, and π . We find, respectively, the points $(-3, 3), (-1, 1)$, and $(-3, -1)$. Plotted in this order, we trace the right half of the circle centered at $(-3, 1)$ with radius 2 oriented clockwise.

(b)

18. (a) Notice that $4 \cos t = x - 1$ and $4 \sin t = y + 3$. If we square and add both equations, then we have

$$\boxed{(x - 1)^2 + (y + 3)^2 = 16 \cos^2 t + 16 \sin^2 t = 16},$$

which is a circle centered at $(1, -3)$ with radius 4. To find its starting point, ending point, and orientation, plot the points $t = 0, \frac{\pi}{2}$, and π . We find, respectively, the points $(5, -3), (1, 1)$, and $(-3, -3)$. Plotted in this order, we trace the top half of the circle centered at $(1, -3)$ with radius 4 oriented counterclockwise.

(b)

19. (a) Since $x(t) = 3$, every point on our plane curve has x -coordinate equal to 3. These points describe the line $x = 3$. Since t goes from $-\infty$ to ∞ , so does y so the orientation of the curve is upward.

(b)

20. (a) Solving for t in the $y(t)$ equation, we have $t = \frac{y}{2}$. Plug this into $x(t)$: $x = 4\left(\frac{y}{2}\right) + 1$ or

$y = \frac{1}{2}(x - 1)$. Since t varies from $-\infty$ to ∞ , so does x .

(b)

21. (a) Since $x(t) = 2$, the rectangular equation is $x = 2$.

(b)

(c) Since $t > 0$, we know that $y > 4$.

(d)

22. (a) Solving for t in the $x(t)$ equation, we have $t = x - 3$. Plug this into the $y(t)$ equation: $y = (x - 3)^3$.

(b)

(c) Since $-4 \leq t \leq 4$, we see that $-1 \leq x \leq 7$ and $-64 \leq y \leq 64$.

(d)

23. (a) Solving for t in the $y(t)$ equation, we have $t = y^2$. Plug this into the $x(t)$ equation: $x = y^2 + 5$.

(b)

(c) Since $t \geq 0$, we see that the parametric curve is defined only for $x \geq 5$ and $y \geq 0$.

(d)

24. (a) Solve for t in the $y(t)$ equation: $t = (y/2)^{1/3}$. Plug this into the $x(t)$ equation: $x = 2[(y/2)^{1/3}]^2$. Simplifying, $x = 2^{1/3}y^{2/3}$.

(b)

(c) Since $0 \leq t \leq 3$, we see that $0 \leq x \leq 18$ and $0 \leq y \leq 54$.

(d)

25. (a) Solving for t in the $y(t)$ equation: $t = y^{2/3}$. Plug this into the $x(t)$ equation: $x = (y^{2/3})^{1/2} + 1$ which is the same as $x = y^{1/3} + 1$, or, equivalently, $y = (x - 1)^3$.

(b)

(c) Since $t \geq 1$, we see that $x \geq 2$ and $y \geq 1$.

(d)

26. (a) Solving for e^t in the $x(t)$ equation: $e^t = \frac{x}{2}$. Plug this into the $y(t)$ equation: $y = 1 - \frac{x}{2}$.

(b)

(c) For $t \geq 0$, it must be that $x \geq 2 \cdot e^0 = 2$ and $y \leq 1 - e^0 = 0$.

(d)

27. (a) Solving for t we have y equation, we have $t = \tan^{-1} y$, so that $x = \sec(\tan^{-1} y)$.

(b)

(c) Since $\sec t \geq 1$ for all $t \geq 1$, we have $x \geq 1$, so we only have the right-hand portion of the graph in part (b).

(d)

28. (a) Using the hyperbolic identity $\cosh^2 t - \sinh^2 t = 1$, we see that $\left(\frac{y}{2}\right)^2 - \left(\frac{x}{3}\right)^2 = 1$.

(b)

(c) Since $\cosh t > 1$ for all $-\infty < t < \infty$, the parametric graph only represents the top half of the figure in part (b), so $y \geq 2$.

(d)

29. Since $x = t^4$ and $y^2 = (t^2)^2 = t^4$, we see that $x = y^2$.

(b)

(c) There are no restrictions on t , so we assume $-\infty < t < \infty$. Since $y(t)$ is an even power of t , we have that $y \geq 0$ and also $x \geq 0$.

(d)

30. Since $x^2 = (t^2)^2 = t^4$ and $y = t^2$, we see that $y = x^2$.

(b)

(c) There are no restrictions on t , so we assume $-\infty < t < \infty$. Since $x(t)$ and $y(t)$ are both even powers of t , we see that $x \geq 0$ and $y \geq 0$ for all values of t .

(d)

31. Solving for t in the $y(t)$ equation: $t = \frac{y+1}{2}$. Plug this into the $x(t)$ equation: $x = \left(\frac{y+1}{2}\right)^2$.

(b)

(c) Since $x \geq 0$, there are no restrictions on the plane curve.

(d)

32. Notice that this parametrization is the same as in Problem 31 replacing t with e^t . This means the plane

curve equation is the same: $x = \left(\frac{y+1}{2}\right)^2$.

(b)

(c) Since $x(t) = e^{2t}$, we see that $x(t) > 0$ for all t . Also, $y(t) > 0 - 1 = -1$ since $e^t > 0$ for all t .

(d)

33. Notice that this parametrization is the same as in Problem 31 replacing t with $\frac{1}{t}$. This means the plane

curve is the same: $x = \left(\frac{y+1}{2}\right)^2$.

(b)

(c) Since $t \neq 0$, $x > 0$ and $y \neq -1$.

(d)

34. Notice that this parametrization is the same as in Problem 31 replacing t with t^2 . This means the plane curve is the same: $x = \left(\frac{y+1}{2}\right)^2$.

(b)

(c) There are no restrictions on t . Since $t^2 \geq 0$, we see that $y \geq -1$.

(d)

35. (a) Solving for $\sin^2 t$ in $x(t)$ we have $\sin^2 t = \frac{x+2}{3}$. Since $\cos^2 t = \left(\frac{y}{2}\right)^2$ we see that

$$\frac{x+2}{3} + \frac{y^2}{4} = 1.$$

(b)

(c) For $0 \leq t \leq \pi$, we have $0 \leq \sin t \leq 1$ and $-1 \leq \cos t \leq 1$ so we see that $-2 \leq x \leq 1$ and $-2 \leq y \leq 2$.

(d)

36. (a) Solving for $\sin^2 t$ in $x(t)$ we have $\sin^2 t = \frac{x-1}{2}$ and solving for $\cos t$ in $y(t)$ we have $\cos t = 2-y$. This means $\cos^2 t = (2-y)^2$ and we see that

$$\frac{x-1}{2} + (2-y)^2 = 1.$$

(b)

(c) For $0 \leq t \leq 2\pi$ we have $0 \leq \sin^2 t \leq 1$ and $-1 \leq \cos t \leq 1$ so we see that $x \geq 1$ and $1 \leq y \leq 3$.

(d)

37. Solving for t^2 , we have $t^2 = 1/x$. Now plug this into y :

$$y = \frac{2}{1/x + 1} = \frac{2x}{1 + x}.$$

As t increases, x approaches 0 and so does y . Also $x \geq 0$ and $0 < y \leq 2$.

38. If we square both $x(t)$ and $y(t)$ and add them together, we have

$$x^2 + y^2 = \frac{9t^2}{t^2 + 1} + \frac{9}{t^2 + 1} = \frac{9(t^2 + 1)}{t^2 + 1} = 9$$

$$x^2 + y^2 = 9$$

which is a circle centered at the origin of radius 3. At $t = 0$, we are at the point $(0, 3)$. As t increases, the x values approach 3 and the y values approach 0. Since $y \geq 0$ for all t , the object is traveling along the quarter circle from $(0, 3)$ to $(3, 0)$ as t goes from 0 to ∞ . Also $-3 < x < 3$ and $0 < y < 3$.

39. Solving for t^2 in the $x(t)$ equation, we have

$$\begin{aligned} x^2 &= \frac{16}{4 - t^2} \\ 4 - t^2 &= \frac{16}{x^2} \\ t^2 &= 4 - \frac{16}{x^2}. \end{aligned}$$

Taking the square root to solve for t and plugging both t and t^2 into the $y(t)$ equation, we have

$$\begin{aligned} y &= \frac{4 \left(\sqrt{4 - \frac{16}{x^2}} \right)}{\sqrt{4 - \left(4 - \frac{16}{x^2} \right)}} \\ y &= \frac{4 \sqrt{4 - \frac{16}{x^2}}}{\sqrt{\frac{16}{x^2}}} \\ y &= \frac{4 \sqrt{4 - \frac{16}{x^2}}}{\frac{4}{x}} \\ y &= x \sqrt{4 - \frac{16}{x^2}} \\ y &= 2\sqrt{x^2 - 4}. \end{aligned}$$

As t approaches 2, the denominators of $x(t)$ and $y(t)$ are getting close to 0, so $x(t)$ and $y(t)$ are approaching ∞ . The points are going upward from the point $(2, 0)$ along the curve $y = 2\sqrt{x^2 - 4}$. Also $x \geq 2$ and $y \geq 0$.

40. Squaring $x(t)$ and solving for t , we have $t = x^2 + 3$. Plug this into $y(t)$:

$$y = \sqrt{x^2 + 4}.$$

As t increases, so do x and y along the curve $y = \sqrt{x^2 + 4}$ starting at the point $(0, 2)$. Also $x \geq 0$ and $y \geq 2$.

41. Solving for $\sin t$ and $\cos t$ in $x(t)$ and $y(t)$, respectively, and then squaring, we have

$$\begin{aligned}\sin t &= x + 2 \\ \cos t &= \frac{y - 4}{-2} \\ \boxed{(x + 2)^2 + \frac{(y - 4)^2}{4} = 1},\end{aligned}$$

which is an ellipse centered at $(-2, 4)$. At $t = 0$, the object is at the point $(-2, 2)$; at $t = \frac{\pi}{2}$, the object is at the point $(-1, 4)$. This means the object is tracing this ellipse in a counterclockwise manner. Also $\boxed{-3 \leq x \leq -1}$ and $\boxed{2 \leq y \leq 6}$.

42. Solving for $\tan t$ and $\sec t$ in $x(t)$ and $y(t)$, respectively, and then squaring, we have

$$\begin{aligned}\tan t &= x - 2 \\ \sec t &= \frac{y - 3}{-2} \\ 1 + (x - 2)^2 &= \frac{(y - 3)^2}{9} \\ \boxed{\frac{(y - 3)^2}{9} - (x - 2)^2 = 1},\end{aligned}$$

where we used the Pythagorean Identity $1 + \tan^2 t = \sec^2 t$. Since $\sec t \geq 1$ for all t , we have $y = 3 - 2 \sec t \leq 3 - 2 = 1$, so $y \leq 1$. An object moving along the parametrized curve follows the bottom half of the hyperbola $\frac{(y - 3)^2}{9} - (x - 2)^2 = 1$ moving from left to right. Also $\boxed{-\infty < x < \infty}$ and $\boxed{y \leq 1}$.

43. Answers will vary. Here are two parameterizations.

$$\boxed{x(t) = t, \ y(t) = 4t - 2, \ -\infty < t < \infty}$$

$$\boxed{x(t) = t^3, \ y(t) = 4t^3 - 2, \ -\infty < t < \infty}$$

44. Answers will vary. Here are two parameterizations.

$$\boxed{x(t) = t, \ y(t) = -8t + 3, \ -\infty < t < \infty}$$

$$\boxed{x(t) = t^3, \ y(t) = -8t^3 + 3, \ -\infty < t < \infty}$$

45. Answers will vary. Here are two parameterizations.

$$\boxed{x(t) = t, \ y(t) = -2t^2 + 1, \ -\infty < t < \infty}$$

$$\boxed{x(t) = t + 1, \ y(t) = -2(t + 1)^2 + 1, \ -\infty < t < \infty}$$

46. Answers will vary. Here are two parameterizations.

$$\boxed{x(t) = t, \ y(t) = t^2 + 1, \ -\infty < t < \infty}$$

$$\boxed{x(t) = -t, \ y(t) = t^2 + 1, \ -\infty < t < \infty}$$

47. Answers will vary. Here are two parameterizations.

$$\boxed{x(t) = t, \ y(t) = 4t^3, \ -\infty < t < \infty}$$

$$x(t) = t^3, y(t) = 4t, -\infty < t < \infty$$

48. Answers will vary. Here are two parameterizations.

$$x(t) = t, y(t) = 2t^2, -\infty < t < \infty$$

$$x(t) = -t, y(t) = 2t^2, -\infty < t < \infty$$

49. Answers will vary. Here are two parameterizations.

$$y(t) = t, x(t) = \frac{1}{3}\sqrt{t} - 3, t \geq 0$$

$$y(t) = t^3, x(t) = \frac{1}{3}t^{1/6} - 3, t \geq 0$$

50. Answers will vary. Here are two parameterizations.

$$y(t) = t, x(t) = t^{3/2}, t \geq 0$$

$$x(t) = t, y(t) = t^{2/3}, t \geq 0$$

51. Answers will vary. One such answer would be the following: The line through the given segment is $y = x - 2$ so one pair of parametric equations would be $x(t) = t, y(t) = t - 2; 2 \leq t \leq 7$.

52. Answers will vary. One such answer would be the following: The line through the given segment is $y = -x + 1$ so one pair of parametric equations would be $x(t) = t, y(t) = -t + 1; -1 \leq t \leq 3$.

53. Answers will vary. One such answer would be the following: The ellipse can be parametrized by $x(t) = 3 \cos t, y(t) = 2 \sin t$. To start at the left end of the ellipse, we can begin with $t = \pi$. At $t = \frac{3\pi}{2}$, we are at the bottom of the ellipse (which agrees with the counterclockwise orientation), so an appropriate range on t would be $\pi \leq t \leq \frac{5\pi}{2}$.

54. Answers will vary. One such answer would be the following: The ellipse can be parametrized by $x(t) = \cos t, y(t) = 4 \sin t$. To start at the bottom of the ellipse, we can begin with $t = -\frac{\pi}{2}$. At $t = 0$, we are at the right end of the ellipse (which agrees with the counterclockwise orientation), so an appropriate range on t would be $-\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$.

For problems 55-58, the ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 1$ can be parametrized by either $x(t) = 3 \cos(\omega t), y(t) = 2 \sin(\omega t)$ (counterclockwise orientation) or $x(t) = 3 \sin(\omega t), y(t) = 2 \cos(\omega t)$ (clockwise orientation) for some real number $\omega > 0$ and for $0 \leq t \leq \frac{2\pi}{\omega}$.

55. For counterclockwise orientation, we choose $x(t) = 3 \cos(\omega t), y(t) = 2 \sin(\omega t)$. If 1 revolution takes 3 seconds, the period is $\frac{2\pi}{\omega} = 3$, so $\omega = \frac{2\pi}{3}$. The parametrization is

$$x(t) = 3 \cos\left(\frac{2\pi}{3}t\right), y(t) = 2 \sin\left(\frac{2\pi}{3}t\right).$$

To begin at $(3, 0)$ the interval on t would be $0 \leq t \leq 3$.

56. For clockwise orientation, we choose $x(t) = 3 \sin(\omega t), y(t) = 2 \cos(\omega t)$. If 1 revolution takes 3 seconds, the period is $\frac{2\pi}{\omega} = 3$, so $\omega = \frac{2\pi}{3}$. The parametrization is

$$x(t) = 3 \sin\left(\frac{2\pi}{3}t\right), y(t) = 2 \cos\left(\frac{2\pi}{3}t\right).$$

To begin at $(3, 0)$, we need to find t such that $3 \sin\left(\frac{2\pi}{3}t\right) = 3$, or $\frac{2\pi}{3}t = \frac{\pi}{2}$. The value $t = \frac{3}{4}$ solves this equation. To complete one revolution, we need the interval on t to be $\frac{3}{4} \leq t \leq 3 + \frac{3}{4}$. To start our parametrization at $t = 0$ we introduce the time-shift $t \mapsto t + \frac{3}{4}$. The parametrization is then

$$x(t) = 3 \sin\left(\frac{2\pi}{3}\left(t + \frac{3}{4}\right)\right), \quad y(t) = 2 \cos\left(\frac{2\pi}{3}\left(t + \frac{3}{4}\right)\right), \quad 0 \leq t \leq 3.$$

57. For clockwise orientation, we choose $x(t) = 3 \sin(\omega t)$, $y(t) = 2 \cos(\omega t)$. If 1 revolution takes 2 seconds, the period is $\frac{2\pi}{\omega} = 2$, so $\omega = \pi$. The parametrization is

$$x(t) = 3 \sin(\pi t), \quad y(t) = 2 \cos(\pi t).$$

To begin at $(0, 2)$ the interval on t would be $0 \leq t \leq 2$.

58. For counterclockwise orientation, we choose $x(t) = 3 \cos(\omega t)$, $y(t) = 2 \sin(\omega t)$. If 1 revolution takes 1 second, the period is $\frac{2\pi}{\omega} = 1$, so $\omega = 2\pi$. The parametrization is

$$x(t) = 3 \cos(2\pi t), \quad y(t) = 2 \sin(2\pi t).$$

To begin at $(0, 2)$, we need to find t such that $2 \sin(2\pi t) = 2$, or $2\pi t = \frac{\pi}{2}$. The value $t = \frac{1}{4}$ solves this equation. To complete one revolution, we need the interval on t to be $\frac{1}{4} \leq t \leq 1 + \frac{1}{4}$. To start the parametrization at $t = 0$, we introduce the time-shift $t \mapsto t + \frac{1}{4}$. The parametrization is then

$$x(t) = 3 \cos\left(2\pi\left(t + \frac{1}{4}\right)\right), \quad y(t) = 2 \sin\left(2\pi\left(t + \frac{1}{4}\right)\right), \quad 0 \leq t \leq 1.$$

59. Notice that the parametrization in (a) is the plane curve $y = x^2$ for $-4 \leq x \leq 4$. Each of the parameterizations in (b), (c), and (d) are some variation of the parametrization in (a). Part (b) is the same plane curve as (a) if we replace t with $\sqrt{t}$, but now we can only consider non-negative x -values since in (b) $x(t) = \sqrt{t} \geq 0$; there are no restrictions on x in (a). Part (c) is the same plane curve as (a) if we replace t with e^t , but again there are included restrictions since in (b) $x > 0$. Part (d) is the same plane curve as (a) if we replace t with $\cos t$ (with no included restrictions) except that the orientation is opposite of that in (a) and $-1 \leq x \leq 1$ whereas in (a) $-4 \leq x \leq 4$.

(b) $(x(2.1), y(2.1)) \approx (8.66, 10.53)$

66. (a)

(b) $(x(1.5), y(1.5)) \approx (-2.98, 4.23)$

67. Answers will vary.

68. Answers will vary.

69. (a) Using the given formulas $x(t) = (125 \cos 40^\circ)t \approx 95.8t$ and $y(t) = -\frac{1}{2} \cdot 32t^2 + (125 \sin 40^\circ)t + 3 \approx -16t^2 + 80.3t + 3$

(b) The height of the ball after 2 seconds is $y(2) = -\frac{1}{2} \cdot 32(2)^2 + (125 \sin 40^\circ) \cdot 2 + 3 \approx 99.6$ feet.

(c) The horizontal distance the ball has traveled after 2 seconds is

$$x(2) - x(0) = (125 \cos 40^\circ) \cdot 2 - 0 \approx 191.6 \text{ feet}.$$

(d) To find how long it takes, solve $x(t) = 300$ for t .

$$(125 \cos 40^\circ)t = 300$$

$$t = \frac{300}{125 \cos 40^\circ}$$

$$t \approx 3.13 \text{ seconds}.$$

(e) The height at $t \approx 3.13$ seconds is $y(3.1) \approx 97.6$ feet.

(f) To find the time when the ball hits the ground, we need to solve $y(t) = 0$ (i.e. the height of the is 0).

$$-\frac{1}{2} \cdot 32t^2 + (125 \sin 40^\circ)t + 3 = 0.$$

Using the quadratic formula, we find the two solutions $t \approx -0.04$ seconds and $t \approx 5.1$ seconds. Since $t \geq 0$, it must be ≈ 5.1 seconds that the ball is in the air.

(g) The ball has traveled $x(5.1) \approx 488.6$ feet horizontally before it hits the ground.

70. (a) Using the given formulas $x(t) = (145 \cos 20^\circ)t$ and $y(t) = -\frac{1}{2} \cdot 32t^2 + (145 \sin 20^\circ)t + 5$.

(b) The height of the ball after $\frac{1}{2}$ second is $y\left(\frac{1}{2}\right) = -\frac{1}{2} \cdot 32 \cdot \left(\frac{1}{2}\right)^2 + (145 \sin 20^\circ) \cdot \frac{1}{2} + 5 \approx 25.8$ feet.

(c) The horizontal distance the ball has traveled after $\frac{1}{2}$ second is

$$x\left(\frac{1}{2}\right) - x(0) = (145 \cos 20^\circ) \cdot \frac{1}{2} - 0 \approx 68.1 \text{ feet}.$$

(d) To find how long it takes, solve $x(t) = 60$ for t .

$$(145 \cos 20^\circ)t = 60$$

$$t = \frac{60}{145 \cos 20^\circ}$$

$$t \approx 0.4 \text{ seconds}.$$

(e) The height of the ball at $t \approx 0.4$ seconds is $y(0.4) \approx 23.7$ feet.

71. (a) Using the given formulas $x(t) = (80 \cos 35^\circ)t \approx 65.5t$ and $y(t) = -\frac{1}{2} \cdot 32t^2 + (80 \sin 35^\circ)t + 6 \approx -16t^2 + 45.9t + 6$.

(b) The height of the football after 1 second is $y(1) = -\frac{1}{2} \cdot 32 + (80 \sin 35^\circ) + 6 \approx 35.9$ feet.

(c) The horizontal distance the ball has traveled after 1 second is $x(1) - x(0) = (80 \cos 35^\circ) - 0 \approx 65.5$ feet.

(d) To find how long it takes, solve $x(t) = 120$ for t .

$$(80 \cos 35^\circ)t = 120$$

$$t = \frac{120}{80 \cos 35^\circ}$$

$$t \approx 1.8 \text{ seconds}.$$

(e) The height of the ball at $t \approx 1.8$ seconds is $y(1.8) \approx 36.8$ feet.

72. Both parameterizations yield the plane curve $y = x^2$ with orientation left to right as t increases, but they do not trace out the curve at the same rate. For example, when time $t = 0$, both parameterizations are at the origin $(0, 0)$. However, if we consider time $t = 10$, the parametrization (t, t^2) has only traced the curve $y = x^2$ from the origin to the point $(10, 100)$ while the parametrization (t^2, t^4) has traced the curve $y = x^2$ from the origin to the point $(100, 10000)$ in the same amount of time.

73. The parametrization $(2 \cos \theta, 2 \sin \theta)$, $0 \leq \theta \leq 2\pi$, traces a circle of radius 2 centered at the origin starting at $(2, 0)$ in the counterclockwise direction while the parametrization $(2 \sin \theta, 2 \cos \theta)$, $0 \leq \theta \leq 2\pi$, traces a circle of radius 2 centered at the origin starting at $(0, 2)$ in the clockwise direction.

74. Let $t = 0$ denote the time (in seconds) when the train leaves the station, $s_T(t)$ the position function (in miles) of the train, and $s_M(t)$ the position function (in miles) of Mary. Since t is in seconds, we convert the train's acceleration to mi/sec² and Mary's running speed to mi/sec. Doing such we find that the train accelerates at $3 \cdot \left(\frac{1}{3600}\right)^2 = \frac{1}{4320000}$ mi/sec² and Mary runs at $6 \cdot \left(\frac{1}{3600}\right) = \frac{1}{600}$ mi/sec. Using the hint, we know that

$$s_T(t) = \frac{1}{2} \cdot \frac{1}{4320000} \cdot t^2 = \frac{1}{8640000} t^2 \text{ miles}.$$

Since Mary does not arrive at the station until $t = 2$, we can assume that $s_M(t) = 0$ for $t < 2$. For $t \geq 2$, Mary runs at a constant 6 mi/h, so $s_M(2) = 0$, $s_M(3) = \frac{1}{600}$ miles, $s_M(4) = \frac{2}{600}$ miles, $s_M(5) = \frac{3}{600}$ miles, etc. Since Mary's speed is constant, her position increases linearly which means that $s_M(t) = \frac{1}{600}(t - 2)$ miles for $t \geq 2$.

Challenge Problems 75. The line through $(-R, 0)$ with slope m has equation $y = m(x + R)$. We want to find the point $P = (x, y)$ on the line $y = m(x + R)$ that intersects the circle $x^2 + y^2 = R^2$. By plugging $y = m(x + R) = mx + mR$ into the circle equation to solve for x , we have

$$\begin{aligned} x^2 + (mx + mR)^2 &= R^2 \\ x^2 + m^2x^2 + 2m^2Rx + m^2R^2 &= R^2 \\ (m^2 + 1)x^2 + (2m^2R)x + (m^2 - 1)R^2 &= 0. \end{aligned}$$

Using the quadratic equation to solve for x , the solutions are

$$\begin{aligned}
 x &= \frac{-(2m^2R) \pm \sqrt{(2m^2R)^2 - 4(m^2+1)(m^2-1)R^2}}{2(m^2+1)} \\
 &= \frac{-2m^2R \pm \sqrt{4m^4R^2 - 4(m^4-1)R^2}}{2(m^2+1)} \\
 &= \frac{-2m^2R \pm \sqrt{4R^2}}{2(m^2+1)} \\
 &= \frac{-2m^2R \pm 2R}{2(m^2+1)} \\
 &= \frac{-m^2 \pm 1}{m^2+1} \cdot R.
 \end{aligned}$$

Writing the two solutions separately, they are

$$x = \frac{-m^2+1}{m^2+1} \cdot R, \quad x = \frac{-m^2-1}{m^2+1} \cdot R = -R.$$

The second solution $x = -R$ is the original point we wrote the equation of the line through, so the new point $P = (x, y)$ has as its x -coordinate

$$x = \frac{-m^2+1}{m^2+1} \cdot R.$$

To find the y -coordinate, we know that P lies on the line $y = m(x + R)$. Plugging in x -coordinate, we have

$$y = m \left(\frac{-m^2+1}{m^2+1} \cdot R + R \right) = \frac{2mR}{m^2+1}.$$

This means we can parametrize a circle using the slope m through the point $(-R, 0)$ using the equations

$$\boxed{x(m) = \frac{R(1-m^2)}{1+m^2} \quad y(m) = \frac{2Rm}{1+m^2}}$$

for $-\infty < m < \infty$.

76. The line through $(1, 1)$ with slope m has equation $y - 1 = m(x - 1)$ or $y = mx - m + 1$. We want to find the point $P = (x, y)$ on the line $y = mx - m + 1$ that intersects the parabola $y = x^2$. By plugging $y = mx - m + 1$ into the equation $y = x^2$ to solve for x , we have

$$\begin{aligned}
 mx - m + 1 &= x^2 \\
 x^2 - mx + (m - 1) &= 0.
 \end{aligned}$$

Factoring to solve for x (or using the quadratic formula), we have

$$(x - 1)(x - m + 1) = 0,$$

which means $x = 1$ or $x = m - 1$. The solution $x = 1$ corresponds to the initial point $(1, 1)$ that we wrote the equation of the line through. The other point of intersection is at $P = (x, y)$, where $x = m - 1$. This then gives $y = x^2 = (m - 1)^2$ so the parametrization of $y = x^2$ using the slope m through the point $(1, 1)$ is

$$\boxed{x(m) = m - 1, \quad y(m) = (m - 1)^2, \quad -\infty < m < \infty}.$$

77. By referring to the picture, the center of the smaller circle traces out a circle centered at the origin of radius $a - b$ in a counterclockwise manner.

The center of the smaller circle $(x_c(t), y_c(t))$ is parametrized by

$$\begin{aligned}x_c(t) &= (a - b) \cos t \\y_c(t) &= (a - b) \sin t,\end{aligned}$$

for $0 \leq t \leq 2\pi$. Now refer to the following picture.

Note that arc AT is equal to arc TP since the inner circle is rolling along the outer circle. Recall that in a circle of radius R , the measure of an arc with central angle θ is $(2\pi R) \cdot \frac{\theta}{2\pi} = R \cdot \theta$. With this in hand, we know that arc AT is $a \cdot t$. This means that arc TP is also $a \cdot t$ so the central angle PCT has measure satisfying the equation

$$b \cdot m\angle PCT = a \cdot t.$$

This means

$$m\angle PCT = \frac{a}{b}t.$$

Now picture the inner circle rotated so that CT is parallel to the x -axis. [Keep in mind that this amounts to a clockwise rotation of t radians.] Then since the center of the inner circle is located at (x_c, y_c) with radius b and rotates clockwise, this circle could be parametrized by $(x_c + b \cos t, y_c - b \sin t)$. The point P would be located on the circle after we moved through an angle with measure $m\angle PCT = \frac{a}{b}t$, so it would be located at

$$\left(x_c + b \cos\left(\frac{a}{b}t\right), y_c - b \sin\left(\frac{a}{b}t\right)\right).$$

But to find where P is *actually* located (remember we rotated the inner circle t radians clockwise), we need to rotate the inner circle back t radians (i.e. subtract t radians inside the sine and cosine). The parametrization of the point P , as it travels around the hypocycloid, is given by

$$\begin{aligned}x(t) &= x_c + b \cos\left(\frac{a}{b}t - t\right) = (a - b) \cos t + b \cos\left(\frac{a - b}{b}t\right) \\y(t) &= y_c - b \sin\left(\frac{a}{b}t - t\right) = (a - b) \sin t - b \sin\left(\frac{a - b}{b}t\right),\end{aligned}$$

for $0 \leq t \leq 2\pi$.

78. Using the parametric equations developed in Problem 77 with $a = 4b$, we find that

$$\begin{aligned}x(t) &= 3b \cos t + b \cos(3t) \\y(t) &= 3b \sin t - b \sin(3t).\end{aligned}$$

We will need the following *triple* angle formulas for cosine and sine (which can be proved using angle sum formulas for cosine and sine):

$$\begin{aligned}\cos(3t) &= 4 \cos^3 t - 3 \cos t \\ \sin(3t) &= -4 \sin^3 t + 3 \sin t.\end{aligned}$$

Plugging these formulas into $x(t)$ and $y(t)$, we have the parametric equations

$$\begin{aligned}x(t) &= 3b \cos t + b(4 \cos^3 t - 3 \cos t) = 4b \cos^3 t \\y(t) &= 3b \sin t - b(-4 \sin^3 t + 3 \sin t) = 4b \sin^3 t.\end{aligned}$$

If we raise both $x(t)$ and $y(t)$ to the $\frac{2}{3}$ power, we have

$$\begin{aligned}x(t)^{2/3} &= (4b \cos^3 t)^{2/3} = (4b)^{2/3} \cos^2 t \\y(t)^{2/3} &= (4b \sin^3 t)^{2/3} = (4b)^{2/3} \sin^2 t.\end{aligned}$$

If we add these together, then we can factor out the $(4b)^{2/3}$ and we have

$$\begin{aligned}x(t)^{2/3} + y(t)^{2/3} &= (4b)^{2/3}(\cos^2 t + \sin^2 t) \\&= (4b)^{2/3} \\&= a^{2/3},\end{aligned}$$

since $a = 4b$.

79. It will be helpful to look through the solution to Problem 77 before reading this solution. The smaller circle's center traces out a circle centered at $(0,0)$ with radius $a + b$ in a counterclockwise manner. The center of the smaller circle $(x_c(t), y_c(t))$, oriented counterclockwise, is parametrized by

$$\begin{aligned}x_c(t) &= (a + b) \cos t \\y_c(t) &= (a + b) \sin t,\end{aligned}$$

for $0 \leq t \leq 2\pi$. In the following picture,

we have that arc AT is equal to arc TP . Reasoning as in Problem 77, we find that $m\angle PCT = \frac{a}{b}t$. If we rotate the smaller circle about its center so that TC is parallel to the x -axis with T to the right of C (which is a clockwise rotation of $\pi + t$ radians), then the smaller circle (also oriented counterclockwise) can be parametrized by $(x_c + b \cos t, y_c + b \sin t)$. The point P would be located on this circle after we moved through an angle with measure $m\angle PCT = \frac{a}{b}t$, so it would be located at

$$\left(x_c + b \cos\left(\frac{a}{b}t\right), y_c + b \sin\left(\frac{a}{b}t\right)\right).$$

If we undo the original clockwise rotation of $\pi + t$ radians (this would amount to adding $\pi + t$ radians inside the sine and cosine), we find that the parametrization of the point P on the epicycloid is given by

$$\begin{aligned}x(t) &= x_c + b \cos\left(\frac{a}{b}t + (\pi + t)\right) = (a + b) \cos t - b \cos\left(\frac{a + b}{b}t\right) \\y(t) &= y_c + b \sin\left(\frac{a}{b}t + (\pi + t)\right) = (a + b) \sin t - b \sin\left(\frac{a + b}{b}t\right),\end{aligned}$$

for $0 \leq t \leq 2\pi$ where we used that $\cos(\theta + \pi) = -\cos \theta$ and $\sin(\theta + \pi) = -\sin \theta$ for any angle θ .

9.2 Tangent Lines; Arc Length

Concepts and Vocabulary

1. Let C denote a curve represented by the parametric equations $x = x(t), y = y(t), a \leq t \leq b$, where each function $x(t)$ and $y(t)$ is continuous on the closed interval $[a, b]$ and differentiable on the open interval (a, b) .

If both $\frac{dx}{dt}$ and $\frac{dy}{dt}$ are continuous and never simultaneously 0 on (a, b) , then C is called a (a) smooth curve.

2. True.

3. If in the formula for the slope of a tangent line, $\frac{dy}{dt} = 0$ (but $\frac{dx}{dt} \neq 0$), then the curve has a horizontal

tangent line at the point $(x(t), y(t))$. If $\frac{dx}{dt} = 0$ (but $\frac{dy}{dt} \neq 0$), then the curve has a vertical tangent line at the point $(x(t), y(t))$.

4. False. The formula should be

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt,$$

which means under the square root we should square the first derivatives of x and y , not take the second derivative of x and y .

Skill Building

For problems 5-12, we will use the formula $\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$.

5. $\frac{dx}{dt} = e^t \cos t - e^t \sin t$ and $\frac{dy}{dt} = e^t \sin t + e^t \cos t$, so

$$\frac{dy}{dx} = \frac{e^t \sin t + e^t \cos t}{e^t \cos t - e^t \sin t} = \frac{\sin t + \cos t}{\cos t - \sin t}.$$

6. $\frac{dx}{dt} = -e^{-t}$ and $\frac{dy}{dt} = 3e^{3t}$, so

$$\frac{dy}{dx} = \frac{3e^{3t}}{-e^{-t}} = -3e^{4t}.$$

7. $\frac{dx}{dt} = 1 - \frac{1}{t^2}$ and $\frac{dy}{dt} = 1$, so

$$\frac{dy}{dx} = \frac{1}{1 - \frac{1}{t^2}}.$$

8. $\frac{dx}{dt} = 1 - \frac{1}{t^2}$ and $\frac{dy}{dt} = 1 + \frac{1}{t^2}$, so

$$\frac{dy}{dx} = \frac{1 + \frac{1}{t^2}}{1 - \frac{1}{t^2}} = \frac{t^2 + 1}{t^2 - 1}.$$

9. $\frac{dx}{dt} = -\sin t + \sin t + t \cos t = t \cos t$ and $\frac{dy}{dt} = \cos t - \cos t + t \sin t = t \sin t$, so

$$\frac{dy}{dx} = \frac{t \sin t}{t \cos t} = \tan t.$$

10. $\frac{dx}{dt} = -3 \cos^2 t \sin t$ and $\frac{dy}{dt} = 3 \sin^2 t \cos t$, so

$$\frac{dy}{dx} = \frac{3 \sin^2 t \cos t}{-3 \cos^2 t \sin t} = -\frac{\sin t}{\cos t} = -\tan t.$$

11. $\frac{dx}{dt} = -2 \cot t \csc^2 t$ and $\frac{dy}{dt} = -\csc^2 t$, so

$$\frac{dy}{dx} = \frac{-\csc^2 t}{-2 \cot t \csc^2 t} = \boxed{\frac{1}{2 \cot t}}.$$

12. $\frac{dx}{dt} = \cos t$ and $\frac{dy}{dt} = 2 \sec t \cdot \sec t \tan t$, so

$$\frac{dy}{dx} = \frac{2 \sec^2 t \tan t}{\cos t} = \boxed{\frac{2 \tan t}{\cos^3 t}}.$$

In Problems 13-26, we use the fact that the slope of the tangent at a value t is found by evaluating the derivative $\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$ at t .

13. (a) The slope of the tangent line is $\left[\frac{1}{4t}\right]_{t=2} = \frac{1}{8}$. The equation of the tangent line at $(x(2), y(2)) = (8, 2)$ is

$$y - 2 = \frac{1}{8}(x - 8)$$

$$\boxed{y = \frac{1}{8}x + 1}.$$

(b)

14. (a) The slope of the tangent line is $\left[\frac{6t}{1}\right]_{t=-2} = -12$. The equation of the tangent line at $(x(-2), y(-2)) = (-2, 12)$ is

$$y - 12 = -12(x + 2)$$

$$\boxed{y = -12x - 12}.$$

(b)

15. (a) The slope of the tangent line is $\left[\frac{4t}{3}\right]_{t=1} = \frac{4}{3}$. The equation of the tangent line at $(x(1), y(1)) = (3, 1)$ is

$$y - 1 = \frac{4}{3}(x - 3)$$

$$\boxed{y = \frac{4}{3}x - 3}.$$

(b)

16. (a) The slope of the tangent line is $\left[\frac{2t}{2}\right]_{t=2} = 2$. The equation of the tangent line at $(x(2), y(2)) = (4, 2)$ is

$$y - 2 = 2(x - 4)$$

$$\boxed{y = 2x - 6}.$$

(b)

17. (a) The slope of the tangent line is $\left[\frac{-t^{-2}}{\frac{1}{2}t^{-1/2}}\right]_{t=4} = \left[\frac{-2}{t^{3/2}}\right]_{t=4} = -\frac{1}{4}$. The equation of the tangent line at $(x(4), y(4)) = (2, 1/4)$ is

$$y - \frac{1}{4} = -\frac{1}{4}(x - 2)$$

$$\boxed{y = -\frac{1}{4}x + \frac{3}{4}}.$$

(b)

18. (a) The slope of the tangent line is $\left[\frac{-t^{-2}}{-4t^{-3}} \right]_{t=1} = \frac{-1}{-4} = \frac{1}{4}$. The equation of the tangent line at $(x(1), y(1)) = (2, 1)$ is

$$y - 1 = \frac{1}{4}(x - 2)$$

$$\boxed{y = \frac{1}{4}x + \frac{1}{2}}.$$

(b)

19. (a) The slope of the tangent line is $\left[\frac{-4(t+2)^{-2}}{2(t+2)^{-2}} \right]_{t=0} = -2$. The equation of the tangent line at $(x(0), y(0)) = (0, 2)$ is

$$y - 2 = -2(x - 0)$$

$$\boxed{y = -2x + 2}.$$

If we add $x(t)$ and $y(t)$ together, then

$$\begin{aligned} x(t) + y(t) &= \frac{t}{t+2} + \frac{4}{t+2} = \frac{t+4}{t+2} = \frac{t+2+2}{t+2} \\ &= \frac{t+2}{t+2} + \frac{2}{t+2} = 1 + \frac{1}{2}y(t). \end{aligned}$$

So $x + y = 1 + \frac{1}{2}y$, or $y = -2x + 2$, is the equation of the plane curve. This means that the tangent line is the plane curve itself.

(b)

20. (a) The slope of the tangent line is $\left[\frac{-(1+t)^{-2}}{\frac{2t+t^2}{(1+t)^2}} \right]_{t=0} = \left[-\frac{1}{2t+t^2} \right]_{t=0}$ which is undefined. This means the tangent line is vertical. The equation of the tangent line at $(x(0), y(0)) = (0, 1)$ is $\boxed{x = 0}$.

(b)

21. (a) The slope of the tangent line is $\left[\frac{-e^{-t}}{e^t} \right]_{t=0} = -1$. The equation of the tangent line at $(x(0), y(0)) = (1, 1)$ is

$$y - 1 = -(x - 1)$$

$$\boxed{y = -x + 2}.$$

(b)

22. (a) The slope of the tangent line is $\left[\frac{e^t}{2e^{2t}} \right]_{t=0} = \frac{1}{2}$. The equation of the tangent line at $(x(0), y(0)) = (1, 1)$ is

$$y - 1 = \frac{1}{2}(x - 1)$$

$$\boxed{y = \frac{1}{2}x + \frac{1}{2}}.$$

(b)

23. (a) The slope of the tangent line is $\left[\frac{-\sin t}{\cos t} \right]_{t=\pi/4} = \frac{-\sqrt{2}/2}{\sqrt{2}/2} = -1$. The equation of the tangent line at $(x(\pi/4), y(\pi/4)) = (\sqrt{2}/2, \sqrt{2}/2)$ is

$$y - \frac{\sqrt{2}}{2} = - \left(x - \frac{\sqrt{2}}{2} \right)$$

$$\boxed{y = -x + \sqrt{2}}.$$

(b)

24. (a) The slope of the tangent line is $\left[\frac{-\sin t}{2 \sin t \cos t} \right]_{t=\pi/4} = \frac{-\frac{\sqrt{2}}{2}}{1} = -\frac{\sqrt{2}}{2}$. The equation of the tangent line at $(x(\pi/4), y(\pi/4)) = (1/2, \sqrt{2}/2)$ is

$$y - \frac{1}{2} = -\frac{\sqrt{2}}{2} \left(x - \frac{1}{2} \right)$$

$$\boxed{y = -\frac{\sqrt{2}}{2}x + \frac{\sqrt{2}}{4} + \frac{1}{2}}.$$

(b)

25. (a) The slope of the tangent line is $\left[\frac{-3 \sin t}{4 \cos t} \right]_{t=\pi/3} = \frac{-3\sqrt{3}/2}{4 \cdot 1/2} = -\frac{3\sqrt{3}}{4}$. The equation of the tangent line at $(x(\pi/3), y(\pi/3)) = (2\sqrt{3}, 3/2)$ is

$$y - \frac{3}{2} = -\frac{3\sqrt{3}}{4} (x - 2\sqrt{3})$$

$$y = -\frac{3\sqrt{3}}{4}x + 6.$$

(b)

26. (a) The slope of the tangent line is $\left[\frac{-\sin t}{2 \cos t} \right]_{t=\pi/6} = \frac{-1/2}{\sqrt{3}} = -\frac{\sqrt{3}}{6}$. The equation of the tangent line at $(x(\pi/6), y(\pi/6)) = (0, \sqrt{3}/2 + 2)$ is

$$y - \left(\frac{\sqrt{3}}{2} + 2 \right) = -\frac{\sqrt{3}}{6} (x - 0)$$

$$y = -\frac{\sqrt{3}}{6}x + \frac{\sqrt{3}}{2} + 2.$$

(b)

In Problems 27-30, we use the facts

$\frac{dy}{dt} = 0$ and $\frac{dx}{dt} \neq 0$ implies a horizontal tangent line at t

$\frac{dx}{dt} = 0$ and $\frac{dy}{dt} \neq 0$ implies a vertical tangent line at t .

27.

$$\begin{aligned}\frac{dx}{dt} &= 2t \\ \frac{dy}{dt} &= 3t^2 - 4\end{aligned}$$

$\frac{dy}{dt} = 0$ when $t = \pm \frac{2}{\sqrt{3}} = \pm \frac{2\sqrt{3}}{3}$. At both values, $\frac{dx}{dt} \neq 0$, so we have horizontal tangent lines at $t = \pm \frac{2\sqrt{3}}{3}$

which correspond to the points $\left(\frac{4}{3}, -\frac{16\sqrt{3}}{9}\right)$ and $\left(\frac{4}{3}, \frac{16\sqrt{3}}{9}\right)$. Next, $\frac{dx}{dt} = 0$ when $t = 0$. At $t = 0$,

$\frac{dy}{dt} \neq 0$, so we have a vertical tangent line at $t = 0$ which corresponds to the point $(0, 0)$.

28.

$$\begin{aligned}\frac{dx}{dt} &= 3t^2 - 9 \\ \frac{dy}{dt} &= 2t\end{aligned}$$

$\frac{dy}{dt} = 0$ when $t = 0$. At $t = 0$, $\frac{dx}{dt} \neq 0$, so we have a horizontal tangent line at $t = 0$ which corresponds to the point $(0, 0)$. Next, $\frac{dx}{dt} = 0$ when $t = \pm\sqrt{3}$. At $t = \pm\sqrt{3}$, $\frac{dy}{dt} \neq 0$, so we have vertical tangent lines at both values which correspond to the points $(-6\sqrt{3}, 3)$ and $(6\sqrt{3}, 3)$.

29.

$$\begin{aligned}\frac{dx}{dt} &= \sin t \\ \frac{dy}{dt} &= -\cos t\end{aligned}$$

On the interval $0 \leq t \leq 2\pi$, $\frac{dy}{dt} = 0$ when $t = \frac{\pi}{2}, \frac{3\pi}{2}$. At both values, $\frac{dx}{dt} \neq 0$, so we have horizontal tangent lines at $t = \frac{\pi}{2}, \frac{3\pi}{2}$ which correspond to the points $(1, 0)$ and $(1, 2)$. Next, on the interval $0 \leq t \leq 2\pi$, $\frac{dx}{dt} = 0$ when $t = 0, \pi, 2\pi$. At all three values, $\frac{dy}{dt} \neq 0$, so we have vertical tangent lines at $t = 0, \pi, 2\pi$ which correspond to the points $(0, 1)$ and $(2, 1)$.

30.

$$\begin{aligned}\frac{dx}{dt} &= 3 \sin t - 3 \sin(3t) \\ \frac{dy}{dt} &= \cos t\end{aligned}$$

On the interval $0 \leq t \leq 2\pi$, $\frac{dy}{dt} = 0$ when $t = \frac{\pi}{2}, \frac{3\pi}{2}$. At both values, $\frac{dx}{dt} \neq 0$, so we have horizontal tangent lines at $t = \frac{\pi}{2}, \frac{3\pi}{2}$ which correspond to the points $(0, 1)$ and $(0, -1)$. Next, $\frac{dx}{dt} = 0$ when $\sin t = \sin(3t)$. If we use the triple angle formula for $\sin(3t)$, which says

$$\sin(3t) = -4 \sin^3 t + 3 \sin t,$$

then we need to solve the equation $\sin t = -4 \sin^3 t + 3 \sin t$. This equation can be solved as follows

$$\begin{aligned}\sin t &= -4 \sin^3 t + 3 \sin t \\ 4 \sin^3 t - 2 \sin t &= 0 \\ 2 \sin t(2 \sin^2 t - 1) &= 0 \\ 2 \sin t = 0 \quad \text{or} \quad 2 \sin^2 t - 1 = 0.\end{aligned}$$

On the interval $0 \leq t \leq 2\pi$, the left equation has solutions $t = 0, \pi, 2\pi$. The right equation can be simplified further to $\sin^2 t = \frac{1}{2}$ or $\sin t = \pm \frac{\sqrt{2}}{2}$. The values for t on the interval $0 \leq t \leq 2\pi$ that satisfy this set of equations is $\frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$. At each of the values $t = 0, \pi, 2\pi, \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$, $\frac{dy}{dt} \neq 0$, so each yields a point where we have a vertical tangent line. Those points are $(-2, 0), (2, 0), (-2\sqrt{2}, \sqrt{2}/2), (2\sqrt{2}, \sqrt{2}/2), (2\sqrt{2}, -\sqrt{2}/2)$, and $(-2\sqrt{2}, -\sqrt{2}/2)$. A picture of the plane curve is as follows.

For Problem 31-38, we will use the formula $s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$ to find the length of the parametrized curve $(x(t), y(t))$ over the interval $a \leq t \leq b$.

31. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 3t^2 \quad \text{and} \quad \frac{dy}{dt} = 2t$$

The curve is smooth for $0 \leq t \leq 2$. Using the arc length formula, we have

$$\begin{aligned}s &= \int_0^2 \sqrt{(3t^2)^2 + (2t)^2} dt \\ &= \int_0^2 \sqrt{9t^4 + 4t^2} dt \\ &= \int_0^2 t\sqrt{9t^2 + 4} dt.\end{aligned}$$

We use the substitution $u = 9t^2 + 4$. Then $du = 18t \, dt$, or equivalently, $t \, dt = \frac{du}{18}$. Changing the limits of integration, we find that when $t = 0$, then $u = 4$, and when $t = 2$, then $u = 40$. The arc length s is

$$\begin{aligned} s &= \int_0^2 t \sqrt{9t^2 + 4} \, dt = \int_4^{40} \sqrt{u} \frac{du}{18} = \frac{1}{18} \int_4^{40} u^{1/2} \, du = \frac{1}{18} \left[\frac{u^{3/2}}{3/2} \right]_4^{40} \\ &= \frac{1}{27} \left[40^{3/2} - 4^{3/2} \right] = \boxed{\frac{1}{27} [80\sqrt{10} - 8]}. \end{aligned}$$

32. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 6t \quad \text{and} \quad \frac{dy}{dt} = 3t^2$$

The curve is smooth for $0 \leq t \leq 2$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^2 \sqrt{(6t)^2 + (3t^2)^2} \, dt \\ &= \int_0^2 \sqrt{36t^2 + 9t^4} \, dt \\ &= \int_0^2 3t \sqrt{4 + t^2} \, dt. \end{aligned}$$

We use the substitution $u = 4 + t^2$. Then $du = 2t \, dt$, or equivalently, $3t \, dt = \frac{3du}{2}$. Changing the limits of integration, we find that when $t = 0$, then $u = 4$, and when $t = 2$, then $u = 8$. The arc length s is

$$\begin{aligned} s &= \int_0^2 3t \sqrt{4 + t^2} \, dt = \int_4^8 \sqrt{u} \frac{3du}{2} = \frac{3}{2} \int_4^8 u^{1/2} \, du = \frac{3}{2} \left[\frac{u^{3/2}}{3/2} \right]_4^8 \\ &= 8^{3/2} - 4^{3/2} = \boxed{16\sqrt{2} - 8}. \end{aligned}$$

33. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 1 \quad \text{and} \quad \frac{dy}{dt} = t$$

The curve is smooth for $0 \leq t \leq 2$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^2 \sqrt{(1)^2 + (t)^2} \, dt \\ &= \int_0^2 \sqrt{1 + t^2} \, dt. \end{aligned}$$

To compute this integral, we use the Table of Integrals 49 with $a = 1$. Then

$$\begin{aligned} s &= \left[\frac{t}{2} \sqrt{1 + t^2} + \frac{1}{2} \ln |t + \sqrt{1 + t^2}| \right]_0^2 \\ &= \sqrt{5} + \frac{1}{2} \ln |2 + \sqrt{5}| - 0 \\ &= \boxed{\sqrt{5} + \frac{1}{2} \ln(2 + \sqrt{5})}. \end{aligned}$$

34. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 2t \quad \text{and} \quad \frac{dy}{dt} = 2$$

The curve is smooth for $1 \leq t \leq 3$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_1^3 \sqrt{(2t)^2 + (2)^2} dt \\ &= 2 \int_1^3 \sqrt{t^2 + 1} dt. \end{aligned}$$

This is the same integrand we found in Problem 33. As in Problem 33, we use the Table of Integrals 49 with $a = 1$. Then

$$\begin{aligned} s &= 2 \left[\frac{t}{2} \sqrt{1+t^2} + \frac{1}{2} \ln |t + \sqrt{1+t^2}| \right]_1^3 \\ &= 2 \left[\frac{3}{2} \sqrt{10} + \frac{1}{2} \ln |3 + \sqrt{10}| \right] - 2 \left[\frac{1}{2} \sqrt{2} + \frac{1}{2} \ln |1 + \sqrt{2}| \right] \\ &= \boxed{3\sqrt{10} - \sqrt{2} + \ln \left(\frac{\sqrt{10} + 3}{\sqrt{2} + 1} \right)}. \end{aligned}$$

35. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 4 \cos t \quad \text{and} \quad \frac{dy}{dt} = -4 \sin t$$

The curve is smooth for $-\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_{-\pi/2}^{\pi/2} \sqrt{(4 \cos t)^2 + (-4 \sin t)^2} dt \\ &= \int_{-\pi/2}^{\pi/2} 4 dt \\ &= [4t]_{-\pi/2}^{\pi/2} \\ &= 4 \left(\frac{\pi}{2} \right) - 4 \left(-\frac{\pi}{2} \right) \\ &= \boxed{4\pi}. \end{aligned}$$

36. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 6 \cos t \quad \text{and} \quad \frac{dy}{dt} = -6 \sin t$$

The curve is smooth for $-\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_{-\pi/2}^{\pi/2} \sqrt{(6 \cos t)^2 + (-6 \sin t)^2} dt \\ &= \int_{-\pi/2}^{\pi/2} 6 dt \\ &= [6t]_{-\pi/2}^{\pi/2} \\ &= 6 \left(\frac{\pi}{2} \right) - 6 \left(-\frac{\pi}{2} \right) \\ &= \boxed{6\pi}. \end{aligned}$$

37. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 2 \cos t \quad \text{and} \quad \frac{dy}{dt} = -2 \sin t$$

The curve is smooth for $0 \leq t \leq 2\pi$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^{2\pi} \sqrt{(2 \cos t)^2 + (-2 \sin t)^2} dt \\ &= \int_0^{2\pi} 2 dt \\ &= [2t]_0^{2\pi} \\ &= 2(2\pi) - 2(0) \\ &= \boxed{4\pi}. \end{aligned}$$

38. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = e^t \sin t + e^t \cos t \quad \text{and} \quad \frac{dy}{dt} = e^t \cos t - e^t \sin t$$

The curve is smooth for $0 \leq t \leq \pi$. Using the arc length formula, we have

$$s = \int_0^{\pi} \sqrt{(e^t \sin t + e^t \cos t)^2 + (e^t \sin t - e^t \cos t)^2} dt.$$

We will simplify the expression under the square root first.

$$\begin{aligned} (e^t \sin t + e^t \cos t)^2 + (e^t \sin t - e^t \cos t)^2 &= [e^t(\sin t + \cos t)]^2 + [e^t(\sin t - \cos t)]^2 \\ &= e^{2t}[\sin^2 t + 2 \sin t \cos t + \cos^2 t] + e^{2t}[\sin^2 t - 2 \sin t \cos t + \cos^2 t] \\ &= e^{2t}[1 + 2 \sin t \cos t] + e^{2t}[1 - 2 \sin t \cos t] \\ &= 2e^{2t}. \end{aligned}$$

Then the arc length is

$$\begin{aligned} s &= \int_0^{\pi} \sqrt{2e^{2t}} dt = \sqrt{2} \int_0^{\pi} e^t dt \\ &= \left[\sqrt{2}e^t \right]_0^{\pi} = \boxed{\sqrt{2}e^{\pi} - \sqrt{2}}. \end{aligned}$$

39. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = -4 \sin(2t) \quad \text{and} \quad \frac{dy}{dt} = 2t$$

The curve is smooth for $0 \leq t \leq 2\pi$. Using the arc length formula, we have

$$s = \int_0^{2\pi} \sqrt{(-4 \sin(2t))^2 + (2t)^2} dt.$$

(b) Using a Computer Algebra system to compute this integral, we find that $\boxed{s \approx 44.527}$.

(c)

40. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 2t \quad \text{and} \quad \frac{dy}{dt} = \cos t$$

The curve is smooth for $0 \leq t \leq 2\pi$. Using the arc length formula, we have

$$s = \int_0^{2\pi} \sqrt{(2t)^2 + (\cos t)^2} dt.$$

(b) Using a Computer Algebra system to compute this integral, we find that $s \approx 40.051$.

(c)

41. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 2t \quad \text{and} \quad \frac{dy}{dt} = \frac{1}{2}(t+2)^{-1/2}$$

The curve is smooth for $-2 \leq t \leq 2$. Using the arc length formula, we have

$$s = \int_{-2}^2 \sqrt{(2t)^2 + \left(\frac{1}{2\sqrt{t+2}}\right)^2} dt.$$

Note that this is an improper integral because of the discontinuity at $t = -2$.

(b) Using a Computer Algebra system to compute this integral, we find that $s \approx 8.429$.

(c)

42. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 1 + \sin t \quad \text{and} \quad \frac{dy}{dt} = -\cos t$$

The curve is smooth for $0 \leq t \leq \pi$. Using the arc length formula, we have

$$s = \int_0^\pi \sqrt{(1 + \sin t)^2 + (-\cos t)^2} dt.$$

(b) Using a Computer Algebra system to compute this integral, we find that $s = 4\sqrt{2}$.

(c)

43. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = -3\sin t - 3\sin(3t) \quad \text{and} \quad \frac{dy}{dt} = 3\cos t - 3\cos(3t)$$

By using a Computer Algebra system, we find that $\frac{dx}{dt}$ and $\frac{dy}{dt}$ are simultaneously 0 on $0 < t < 2\pi$ when $t = \frac{\pi}{2}, \pi, \frac{3\pi}{2}$ so the curve is not smooth on $[0, 2\pi]$. To find the arc length, we will exploit symmetry and find the arc length on the interval $\left[0, \frac{\pi}{2}\right]$ (where the curve is smooth) and then quadruple it. Using the arc length formula, the full arc length is

$$s = 4 \cdot \int_0^{\pi/2} \sqrt{(-3\sin t - 3\sin(3t))^2 + (3\cos t - 3\cos(3t))^2} dt.$$

(b) Using a Computer Algebra system to compute this integral, we find that $s = 24$.

(c)

44. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = -5 \sin t + 5 \sin(5t) \quad \text{and} \quad \frac{dy}{dt} = 5 \cos t - 5 \cos(5t)$$

By using a Computer Algebra system, we find that $\frac{dx}{dt}$ and $\frac{dy}{dt}$ are simultaneously 0 on $0 < t < 2\pi$ when $t = \frac{\pi}{2}, \pi, \frac{3\pi}{2}$ so the curve is not smooth on $[0, 2\pi]$. To find the arc length, we will exploit symmetry and find the arc length on the interval $\left[0, \frac{\pi}{2}\right]$ (where the curve is smooth) and then quadruple it. Using the arc length formula, we have

$$s = 4 \cdot \int_0^{\pi/2} \sqrt{(-5 \sin t + 5 \sin(5t))^2 + (5 \cos t - 5 \cos(5t))^2} dt.$$

(b) Using a Computer Algebra system to compute this integral, we find that $s = 40$.

(c)

Applications and Extensions

45. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 2t \quad \text{and} \quad \frac{dy}{dt} = 3t^2 - 4$$

The vertical tangent lines occur when $\frac{dx}{dt} = 0$ and $\frac{dy}{dt} \neq 0$. Notice that this is when $t = 0$, which corresponds to the point $(2, 0)$. The horizontal tangent lines occur when $\frac{dy}{dt} = 0$ and $\frac{dx}{dt} \neq 0$. This is when

$$\begin{aligned} 3t^2 - 4 &= 0 \\ t^2 &= \frac{4}{3} \\ t &= \pm \frac{2}{\sqrt{3}}. \end{aligned}$$

For both of these values, $\frac{dx}{dt} \neq 0$, so the horizontal tangent lines occur at the points

$$(x(2/\sqrt{3}), y(2/\sqrt{3})) = \left(\frac{10}{3}, -\frac{16\sqrt{3}}{9}\right) \text{ and } (x(-2/\sqrt{3}), y(-2/\sqrt{3})) = \left(\frac{10}{3}, \frac{16\sqrt{3}}{9}\right).$$

(b) The point $(6, 0)$ corresponds to the values $t = \pm 2$. Each of these values produces a slope of a tangent line at $(6, 0)$, namely

$$\frac{dy}{dx} = \left[\frac{\frac{dy}{dt}}{\frac{dx}{dt}} \right]_{t=2} = \frac{3(2)^2 - 4}{2(2)} = 2 \text{ and } \frac{dy}{dx} = \left[\frac{\frac{dy}{dt}}{\frac{dx}{dt}} \right]_{t=-2} = \frac{3(-2)^2 - 4}{2(-2)} = -2.$$

(c) The equations of the two tangent lines at $(6, 0)$ are

$$\begin{aligned} y &= 2x - 12 \\ y &= -2x + 12. \end{aligned}$$

(d)

46. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 4t \quad \text{and} \quad \frac{dy}{dt} = 8 - 3t^2$$

The vertical tangent lines occur when $\frac{dx}{dt} = 0$ and $\frac{dy}{dt} \neq 0$. Notice that this is when $t = 0$, which corresponds to the point $(0, 0)$. The horizontal tangent lines occur when $\frac{dy}{dt} = 0$ and $\frac{dx}{dt} \neq 0$. This is when

$$\begin{aligned} 8 - 3t^2 &= 0 \\ t^2 &= \frac{8}{3} \\ t &= \pm \frac{2\sqrt{2}}{\sqrt{3}} = \pm \frac{2\sqrt{6}}{3}. \end{aligned}$$

For both of these values, $\frac{dx}{dt} \neq 0$, so the horizontal tangent lines occur at the points

$$(x(2\sqrt{6}/3), y(2\sqrt{6}/3)) = \left(\frac{16}{3}, \frac{32\sqrt{6}}{9}\right) \text{ and } (x(-2\sqrt{6}/3), y(-2\sqrt{6}/3)) = \left(\frac{16}{3}, -\frac{32\sqrt{6}}{9}\right).$$

(b) The point $(16, 0)$ corresponds to the values satisfying $2t^2 = 16$, or $t = \pm 2\sqrt{2}$. Each of these values produces a slope of a tangent line at $(16, 0)$, namely

$$\frac{dy}{dx} = \left[\frac{\frac{dy}{dt}}{\frac{dx}{dt}} \right]_{t=2\sqrt{2}} = \frac{8 - 3(2\sqrt{2})^2}{4(2\sqrt{2})} = -\sqrt{2} \text{ and } \frac{dy}{dx} = \left[\frac{\frac{dy}{dt}}{\frac{dx}{dt}} \right]_{t=-2\sqrt{2}} = \frac{8 - 3(-2\sqrt{2})^2}{4(-2\sqrt{2})} = \sqrt{2}.$$

(c) The equations of the two tangent lines at $(16, 0)$ are

$$y = -\sqrt{2}(x - 16)$$

$$y = \sqrt{2}(x - 16).$$

(d)

47. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 3b \sin^2 t \cos t \quad \text{and} \quad \frac{dy}{dt} = -3b \cos^2 t \sin t$$

The curve is smooth for $0 \leq t \leq \frac{\pi}{2}$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^{\pi/2} \sqrt{(3b \sin^2 t \cos t)^2 + (-3b \cos^2 t \sin t)^2} dt \\ &= \int_0^{\pi/2} \sqrt{9b^2 \sin^4 t \cos^2 t + 9b^2 \cos^4 t \sin^2 t} dt \\ &= \int_0^{\pi/2} \sqrt{9b^2 \sin^2 t \cos^2 t (\sin^2 t + \cos^2 t)} dt \\ &= \int_0^{\pi/2} 3b \sin t \cos t dt. \end{aligned}$$

Using the substitution $u = \sin t$, we have $du = \cos t dt$ and the new limits of integration are $u = 0$ to $u = 1$. So the arc length is

$$\begin{aligned} s &= 3b \int_0^1 u du \\ &= \left[\frac{3b}{2} u^2 \right]_0^1 = \boxed{\frac{3b}{2}}. \end{aligned}$$

(b) The following graph shows the case $b = 1$.

48. (a) We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = \cos t - t \sin t \quad \text{and} \quad \frac{dy}{dt} = \sin t + t \cos t$$

Using a Computer Algebra system, we find that $\frac{dx}{dt} = 0$ on $0 < t < \pi$ when $t \approx 0.86$ and $\frac{dy}{dt} = 0$ on $0 < t < \pi$ when $t \approx 2.03$. From these solutions, we see that the curve is smooth for $0 \leq t \leq \pi$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^\pi \sqrt{(\cos t - t \sin t)^2 + (\sin t + t \cos t)^2} dt \\ &= \int_0^\pi \sqrt{\cos^2 t - 2t \sin t \cos t + t^2 \sin^2 t + \sin^2 t + 2t \cos t \sin t + t^2 \cos^2 t} dt \\ &= \int_0^\pi \sqrt{1 + t^2} dt. \end{aligned}$$

Using the Table of Integrals 49 with $a = 1$, we find that

$$\begin{aligned} s &= \left[\frac{t}{2} \sqrt{1 + t^2} + \frac{1}{2} \ln \left| t + \sqrt{1 + t^2} \right| \right]_0^\pi \\ &= \left[\frac{\pi}{2} \sqrt{1 + \pi^2} + \frac{1}{2} \ln \left| \sqrt{1 + \pi^2} + \pi \right| \right] - 0 \\ &= \boxed{\frac{\pi}{2} \sqrt{1 + \pi^2} + \frac{1}{2} \ln \left(\sqrt{1 + \pi^2} + \pi \right)}. \end{aligned}$$

(b)

49. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 3 \quad \text{and} \quad \frac{dy}{dt} = 2t$$

The curve is smooth for $0 \leq t \leq 2$ so the distance traveled by the particle over the time interval is equal to the arc length over that interval. Using the arc length formula, we have

$$s = \int_0^2 \sqrt{(3)^2 + (2t)^2} dt = \int_0^2 \sqrt{4\left(\frac{9}{4} + t^2\right)} dt = 2 \int_0^2 \sqrt{\frac{9}{4} + t^2} dt.$$

Using the Table of Integrals 49 with $a = \frac{3}{2}$, we find that

$$\begin{aligned} s &= 2 \left[\frac{t}{2} \sqrt{\frac{9}{4} + t^2} + \frac{9}{8} \ln \left| t + \sqrt{\frac{9}{4} + t^2} \right| \right]_0^2 \\ &= 2 \left[\frac{5}{2} + \frac{9}{8} \ln \left| \frac{9}{2} \right| \right] - 2 \left[\frac{9}{8} \ln \left| \frac{3}{2} \right| \right] \\ &= \boxed{5 + \frac{9}{4} \ln(3)}. \end{aligned}$$

50. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 2t \quad \text{and} \quad \frac{dy}{dt} = 3$$

The curve is smooth for $0 \leq t \leq 2$ so the distance traveled by the particle over the time interval is equal to the arc length over that interval. Using the arc length formula, we have

$$s = \int_0^2 \sqrt{(2t)^2 + (3)^2} dt.$$

Notice that this is the same integral as Problem 49. This means the distance traveled is $\boxed{5 + \frac{9}{4} \ln(3)}$.

51. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = t \quad \text{and} \quad \frac{dy}{dt} = \sqrt{2t+3}$$

The curve is smooth for $0 \leq t \leq 2$ so the distance traveled by the particle over the time interval is equal to the arc length over that interval. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^2 \sqrt{(t)^2 + (\sqrt{2t+3})^2} dt \\ &= \int_0^2 \sqrt{t^2 + 2t + 3} dt \\ &= \int_0^2 \sqrt{(t+1)^2 + 2} dt, \end{aligned}$$

where in the last step we completed the square. If we make a substitution $u = t + 1$, then $du = dt$ and changing the limits of integration

$$s = \int_1^3 \sqrt{u^2 + 2} du.$$

Using the Table of Integrals 49 with $a = \sqrt{2}$, we find that

$$\begin{aligned} s &= \left[\frac{u}{2} \sqrt{u^2 + 2} + \ln \left| u + \sqrt{u^2 + 2} \right| \right]_1^3 \\ &= \left[\frac{3}{2} \sqrt{11} + \ln \left| 3 + \sqrt{11} \right| \right] - \left[\frac{1}{2} \sqrt{3} + \ln \left| 1 + \sqrt{3} \right| \right] \\ &= \boxed{\frac{3\sqrt{11} - \sqrt{3}}{2} + \ln \left(\frac{3 + \sqrt{11}}{1 + \sqrt{3}} \right)}. \end{aligned}$$

52. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = -a \sin t \quad \text{and} \quad \frac{dy}{dt} = a \cos t$$

The curve is smooth for $0 \leq t \leq \pi$ so the distance traveled by the particle over the time interval is equal to the arc length over that interval. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^\pi \sqrt{(-a \sin t)^2 + (a \cos t)^2} dt \\ &= \int_0^\pi \sqrt{a^2 \sin^2 t + a^2 \cos^2 t} dt \\ &= \int_0^\pi a dt \\ &= [at]_0^\pi \\ &= \boxed{a\pi}. \end{aligned}$$

53. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = -2 \sin(2t) \quad \text{and} \quad \frac{dy}{dt} = 2 \sin t \cos t$$

The curve is smooth for $0 \leq t \leq \frac{\pi}{2}$ so the distance traveled by the particle over the time interval is equal to the arc length over that interval. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^{\pi/2} \sqrt{(-2 \sin(2t))^2 + (2 \sin t \cos t)^2} dt \\ &= \int_0^{\pi/2} \sqrt{4 \sin^2(2t) + (2 \sin t \cos t)^2} dt. \end{aligned}$$

Using the double angle formula $\sin(2t) = 2 \sin t \cos t$, we have

$$\begin{aligned} s &= \int_0^{\pi/2} \sqrt{4 \sin^2(2t) + \sin^2(2t)} dt \\ &= \int_0^{\pi/2} \sqrt{5} \sin(2t) dt = \left[-\frac{\sqrt{5}}{2} \cos(2t) \right]_0^{\pi/2} \\ &= -\frac{\sqrt{5}}{2}(-1) + \frac{\sqrt{5}}{2}(1) \\ &= \boxed{\sqrt{5}}. \end{aligned}$$

54. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = -t^{-2} \quad \text{and} \quad \frac{dy}{dt} = t^{-1}$$

The curve is smooth for $1 \leq t \leq 2$ so the distance traveled by the particle over the time interval is equal to the arc length over that interval. Using the arc length formula, we have

$$s = \int_1^2 \sqrt{(-t^{-2})^2 + (t^{-1})^2} dt = \int_1^2 \sqrt{t^{-4} + t^{-2}} dt = \int_1^2 \sqrt{\frac{1+t^2}{t^4}} dt.$$

Using the Table of Integrals 54 with $a = 1$, we find that

$$\begin{aligned} s &= \left[-\frac{\sqrt{1+t^2}}{t} + \ln |t + \sqrt{1+t^2}| \right]_1^2 \\ &= \left[-\frac{\sqrt{5}}{2} + \ln |2 + \sqrt{5}| \right] - \left[-\sqrt{2} + \ln |1 + \sqrt{2}| \right] \\ &= \boxed{-\frac{\sqrt{5}}{2} + \sqrt{2} + \ln \left(\frac{2 + \sqrt{5}}{1 + \sqrt{2}} \right)}. \end{aligned}$$

For Problems 55-57, we recall that the speed of an object is the absolute value of the rate of change of s with respect to t , or $\left| \frac{ds}{dt} \right|$. Using the formula for s and the Fundamental Theorem of Calculus, we have

$$\left| \frac{ds}{dt} \right| = \sqrt{\left(\frac{dx}{dt} \right)^2 + \left(\frac{dy}{dt} \right)^2}.$$

55. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 20 \quad \text{and} \quad \frac{dy}{dt} = -32t$$

So

$$\left| \frac{ds}{dt} \right| = \sqrt{(20)^2 + (-32t)^2} = \boxed{\sqrt{400 + 1024t^2}}.$$

56. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 1 - \sin t \quad \text{and} \quad \frac{dy}{dt} = 2 - \cos t$$

So

$$\left| \frac{ds}{dt} \right| = \sqrt{(1 - \sin t)^2 + (2 - \cos t)^2} = \boxed{\sqrt{6 - 2 \sin t - 4 \cos t}}.$$

57. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 40 \cos(2t) \quad \text{and} \quad \frac{dy}{dt} = -6 \sin t$$

So

$$\left| \frac{ds}{dt} \right| = \sqrt{(40 \cos(2t))^2 + (-6 \sin t)^2} = \boxed{\sqrt{1600 \cos^2(2t) + 36 \sin^2 t}}.$$

58. A circle of radius r can be parametrized by $x(t) = r \cos t$ and $y(t) = r \sin t$ for $0 \leq t \leq 2\pi$. Then the arc length s of an arc subtended by a central angle of θ radians is the arc length of the above parametrization over the interval $0 \leq t \leq \theta$. Notice that $\sqrt{[x'(t)]^2 + [y'(t)]^2} = r$ which gives the length of the arc

$$\begin{aligned} s &= \int_0^\theta \sqrt{[x'(t)]^2 + [y'(t)]^2} dt = \int_0^\theta r dt = [rt]_0^\theta \\ &= \boxed{r\theta}. \end{aligned}$$

59. For a function $y = f(x)$ on $a \leq x \leq b$ representing a smooth curve C , we can parametrize C by choosing $x(t) = t$ and $y(t) = f(t)$ on the interval $a \leq t \leq b$. It is given that C is smooth on $a \leq t \leq b$, so we compute the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = 1 \quad \text{and} \quad \frac{dy}{dt} = f'(t)$$

The arc length s of C on $a \leq t \leq b$ using the arc length formula is

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \int_a^b \sqrt{1 + [f'(t)]^2} dt = \int_a^b \sqrt{1 + [f'(x)]^2} dx.$$

For Problems 60-63, we note that since ds approximates s for nearby points, we will compute ds by the formula $ds = \sqrt{(dx)^2 + (dy)^2}$ where dx and dy represent that changes in x and y , respectively, between the nearby points.

60. We start by computing dx and dy .

$$\begin{aligned} dx &= x(1.1) - x(1) = 1.1^{1/3} - 1^3 = 1.1^{1/3} - 1 \\ dy &= y(1.1) - y(1) = 1.1^2 - 1^2 = 0.21. \end{aligned}$$

The arc length s is approximately

$$s \approx ds = \sqrt{(1.1^{1/3} - 1)^2 + (0.21)^2} \approx 0.212466.$$

To see how this estimate compares to the actual value of

$$s = \int_1^{1.1} \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt,$$

using a CAS, we find that $s \approx 0.212472$.

61. We start by computing dx and dy .

$$\begin{aligned} dx &= x(1.2) - x(1) = \sqrt{1.2} - \sqrt{1} = \sqrt{1.2} - 1 \\ dy &= y(1.2) - y(1) = 1.2^3 - 1^3 = 0.728. \end{aligned}$$

The arc length s is approximately

$$s \approx ds = \sqrt{(\sqrt{1.2} - 1)^2 + (0.728)^2} \approx 0.7342.$$

To see how this estimate compares to the actual value of

$$s = \int_1^{1.2} \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt,$$

using a CAS, we find that $s \approx 0.7343$.

62. We start by computing dx and dy .

$$\begin{aligned} dx &= x(0.1) - x(0) = a \sin(0.1) - a \sin(0) = a \sin(0.1) \\ dy &= y(0.1) - y(0) = b \cos(0.1) - b \cos(0) = b \cos(0.1) - b. \end{aligned}$$

So the arc length is

$$s \approx ds = \sqrt{(a \sin(0.1))^2 + (b \cos(0.1) - b)^2},$$

for given values of a and b .

63. We start by computing dx and dy .

$$\begin{aligned} dx &= x(0.2) - x(0) = e^{0.2a} - e^{0a} = e^{0.2a} - 1 \\ dy &= y(0.2) - y(0) = e^{0.2b} - e^{0b} = e^{0.2b} - 1. \end{aligned}$$

The arc length s is approximately

$$s \approx ds = \sqrt{(e^{0.2a} - 1)^2 + (e^{0.2b} - 1)^2} = \sqrt{e^{0.4a} - 2e^{0.2a} + e^{0.4b} - 2e^{0.2b} + 2},$$

for given values of a and b .

Challenge Problems

64. If $\frac{dx}{dt}$ is never equal to 0, then $x(t)$ is always increasing or always decreasing, which means that $x(t)$ passes the horizontal line test. Since $x(t)$ passes the horizontal line test, we know an inverse of $x = f(t)$ exists, namely $t = f^{-1}(x)$. If we substitute $t = f^{-1}(x)$ into $y = g(t)$, then

$$y = g(f^{-1}(x)).$$

By defining the function $F = g \circ f^{-1}$, we see that $y = F(x)$. Furthermore, we know that $\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$ and

since the curve C is smooth (and $\frac{dx}{dt} \neq 0$), $\frac{dy}{dx}$ exists, making F differentiable.

65. An equivalent question would be to find the value d such that the arc length s along $(x(t), y(t))$ on $0 \leq t \leq d$ equals $\frac{80\sqrt{2} - 40}{3}$. Then

$$s = \int_0^d \sqrt{(4t^2 + 6t)^2 + (3t^2 - 8t)^2} dt = \int_0^d \sqrt{25t^4 + 100t^2} dt = \int_0^d 5t\sqrt{t^2 + 4} dt.$$

Using the u -substitution $u = t^2 + 4$ and changing the limits of integration, we find that

$$s = \frac{5}{2} \int_4^{d^2+4} u^{1/2} du = \left[\frac{5}{3} u^{3/2} \right]_4^{d^2+4} = \frac{5}{3} (d^2 + 4)^{3/2} - \frac{40}{3}.$$

If we want the value of d so that $s = \frac{80\sqrt{2} - 40}{3}$, then

$$\begin{aligned} \frac{5}{3} (d^2 + 4)^{3/2} - \frac{40}{3} &= \frac{80\sqrt{2} - 40}{3} \\ \frac{5}{3} (d^2 + 4)^{3/2} &= \frac{80\sqrt{2}}{3} \\ (d^2 + 4)^{3/2} &= 16\sqrt{2} \\ d^2 + 4 &= (16\sqrt{2})^{2/3} = 8 \\ d &= \pm 2. \end{aligned}$$

Since we started at $t = 0$, the points on the curve that have arc length $\frac{80\sqrt{2} - 40}{3}$ from $(0, 0)$ are

$$(x(2), y(2)) = \left(\frac{68}{3}, -8 \right) \quad \text{and} \quad (x(-2), y(-2)) = \left(\frac{4}{3}, -24 \right).$$

66. In this section, we developed the formula $\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$, assuming $\frac{dx}{dt} \neq 0$, using the Chain Rule. We knew that $y = F(x)$, and that x is a function of t to write $y(t) = F(x(t))$. Then we found the derivative using the

Chain Rule:

$$\frac{dy}{dt} = F'(x(t)) \cdot \frac{dx}{dt} = \frac{dy}{dx} \cdot \frac{dx}{dt}$$

where we noted that $F'(x(t)) = F'(x) = \frac{dy}{dx}$. Take the equation $\frac{dy}{dt} = F'(x(t)) \cdot \frac{dx}{dt}$ and differentiate again with respect to t (remember to use the product rule!).

$$\begin{aligned} \frac{d}{dt} \left(\frac{dy}{dt} \right) &= \frac{d}{dt} \left(F'(x(t)) \cdot \frac{dx}{dt} \right) \\ \frac{d^2 y}{dt^2} &= \left[F''(x(t)) \cdot \frac{dx}{dt} \right] \cdot \frac{dx}{dt} + F'(x(t)) \cdot \frac{d^2 x}{dt^2}. \end{aligned}$$

Noting that $F'(x(t)) = \frac{dy}{dx}$ and $F''(x(t)) = \frac{d^2 y}{dx^2}$, we have

$$\begin{aligned} \frac{d^2 y}{dt^2} &= \frac{d^2 y}{dx^2} \left(\frac{dx}{dt} \right)^2 + \frac{dy}{dx} \cdot \frac{d^2 x}{dt^2} \\ \frac{d^2 y}{dx^2} &= \frac{\frac{d^2 y}{dt^2} - \frac{dy}{dx} \cdot \frac{d^2 x}{dt^2}}{\left(\frac{dx}{dt} \right)^2}. \end{aligned}$$

Using the formula above for $\frac{dy}{dx}$, we have

$$\begin{aligned} \frac{d^2 y}{dx^2} &= \frac{\frac{d^2 y}{dt^2} - \frac{dy}{dx} \cdot \frac{d^2 x}{dt^2}}{\left(\frac{dx}{dt} \right)^2} \\ &= \boxed{\frac{\frac{d^2 y}{dt^2} \cdot \frac{dx}{dt} - \frac{dy}{dt} \cdot \frac{d^2 x}{dt^2}}{\left(\frac{dx}{dt} \right)^3}}. \end{aligned}$$

67. Using the formula developed in Problem 66, we start by finding the first and second derivatives of x and y with respect to θ .

$$\begin{aligned} \frac{dx}{d\theta} &= -3a \cos^2 \theta \sin \theta \\ \frac{dy}{d\theta} &= 3a \sin^2 \theta \cos \theta \\ \frac{d^2 x}{d\theta^2} &= 6a \sin^2 \theta \cos \theta - 3a \cos^3 \theta \\ \frac{d^2 y}{d\theta^2} &= 6a \cos^2 \theta \sin \theta - 3a \sin^3 \theta. \end{aligned}$$

So

$$\begin{aligned}
 \frac{dy}{dx} &= \frac{(6a \cos^2 \theta \sin \theta - 3a \sin^3 \theta)(-3a \cos^2 \theta \sin \theta) - (3a \sin^2 \theta \cos \theta)(6a \sin^2 \theta \cos \theta - 3a \cos^3 \theta)}{(-3a \cos^2 \theta \sin \theta)^3} \\
 &= \frac{-18a^2 \cos^4 \theta \sin^2 \theta + 9a^2 \sin^4 \theta \cos^2 \theta - 18a^2 \sin^4 \theta \cos^2 \theta + 9a^2 \sin^2 \theta \cos^4 \theta}{-27a^3 \cos^6 \theta \sin^3 \theta} \\
 &= \frac{-18a^2 \cos^2 \theta \sin^2 \theta (\cos^2 \theta + \sin^2 \theta) + 9a^2 \sin^2 \theta \cos^2 \theta (\sin^2 \theta + \cos^2 \theta)}{-27a^3 \cos^6 \theta \sin^3 \theta} \\
 &= \frac{-9a^2 \sin^2 \theta \cos^2 \theta}{-27a^3 \cos^6 \theta \sin^3 \theta} \\
 &= \boxed{\frac{1}{3a \cos^4 \theta \sin \theta}}.
 \end{aligned}$$

68. Consider the following graph of the cycloid where $a = 1$.

The value $t = 0$ corresponds to $(0,0)$. As we approach the origin from the left, the slopes of the tangent lines are approaching $-\infty$ and as we approach the origin from the right, the slopes of the tangent lines are approaching $+\infty$. This can be verified by determining $\frac{dy}{dx}$, which is

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{a \sin t}{a(1 - \cos t)} = \frac{\sin t}{1 - \cos t},$$

and computing the left and right hand limits at $t = 0$. From the left,

$$\lim_{t \rightarrow 0^-} \frac{dy}{dx} = \frac{0}{0},$$

so using L'Hopital's rule

$$\begin{aligned}
 \lim_{t \rightarrow 0^-} \frac{dy}{dx} &= \lim_{t \rightarrow 0^-} \frac{\cos t}{\sin t} \\
 &= \lim_{t \rightarrow 0^-} \cot t = -\infty.
 \end{aligned}$$

From the right,

$$\lim_{t \rightarrow 0^+} \frac{dy}{dx} = \frac{0}{0},$$

so using L'Hopital's rule

$$\begin{aligned}
 \lim_{t \rightarrow 0^+} \frac{dy}{dx} &= \lim_{t \rightarrow 0^+} \frac{\cos t}{\sin t} \\
 &= \lim_{t \rightarrow 0^+} \cot t = +\infty.
 \end{aligned}$$

9.3 Surface Area of a Solid of Revolution

Concepts and Vocabulary

1. **False**. The formula should be

$$S = 2\pi \int_a^b y(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt.$$

2. The surface area S of a solid of revolution generated by revolving the smooth curve C represented by

$$x = x(t), y = y(t), a \leq t \leq b, \text{ where } x(t) \geq 0, \text{ about the } y\text{-axis is } S = \boxed{2\pi \int_a^b x(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt}.$$

Skill Building

3. We use formula (2) with $\frac{dx}{dt} = 6t$ and $\frac{dy}{dt} = 6$. Then

$$S = 2\pi \int_0^1 6t \sqrt{(6t)^2 + (6)^2} dt = 2\pi \int_0^1 36t \sqrt{t^2 + 1} dt.$$

Using the substitution $u = t^2 + 1$, then $du = 2t dt$ and the new limits are $u = (0)^2 + 1 = 1$ to $u = (1)^2 + 1 = 2$, so we have

$$\begin{aligned} S &= 36\pi \int_1^2 \sqrt{u} du = 36\pi \left[\frac{2}{3} u^{3/2} \right]_1^2 \\ &= 36\pi \left(\frac{2}{3} (2)^{3/2} - \frac{2}{3} \right) = 36\pi \left(\frac{4\sqrt{2} - 2}{3} \right) \\ &= \boxed{24\pi(2\sqrt{2} - 1)}. \end{aligned}$$

4. We use formula (2) with $\frac{dx}{dt} = 2t$ and $\frac{dy}{dt} = 2$. Then

$$S = 2\pi \int_0^3 2t \sqrt{(2t)^2 + (2)^2} dt = 2\pi \int_0^3 4t \sqrt{t^2 + 1} dt.$$

Using the substitution $u = t^2 + 1$, then $du = 2t dt$ and the new limits are $u = (0)^2 + 1 = 1$ to $u = (3)^2 + 1 = 10$, so we have

$$\begin{aligned} S &= 4\pi \int_1^{10} \sqrt{u} du = 4\pi \left[\frac{2}{3} u^{3/2} \right]_1^{10} \\ &= 4\pi \left(\frac{2}{3} (10)^{3/2} - \frac{2}{3} \right) = \boxed{4\pi \left(\frac{20\sqrt{10} - 2}{3} \right)}. \end{aligned}$$

5. We use formula (2) with $\frac{dx}{d\theta} = -3 \cos^2 \theta \sin \theta$ and $\frac{dy}{d\theta} = 3 \sin^2 \theta \cos \theta$. Then

$$\begin{aligned} S &= 2\pi \int_0^{\pi/2} \sin^3 \theta \sqrt{(-3 \cos^2 \theta \sin \theta)^2 + (3 \sin^2 \theta \cos \theta)^2} d\theta \\ &= 2\pi \int_0^{\pi/2} \sin^3 \theta \sqrt{9 \cos^2 \theta \sin^2 \theta (\cos^2 \theta + \sin^2 \theta)} d\theta \\ &= 2\pi \int_0^{\pi/2} \sin^3 \theta \cdot 3 \cos \theta \sin \theta d\theta = 6\pi \int_0^{\pi/2} \sin^4 \theta \cos \theta d\theta. \end{aligned}$$

Using the substitution $u = \sin \theta$, then $du = \cos \theta d\theta$ and the new limits are $u = \sin(0) = 0$ to $u = \sin(\pi/2) = 1$, so we have

$$\begin{aligned} S &= 6\pi \int_0^1 u^4 du = 6\pi \left[\frac{1}{5} u^5 \right]_0^1 \\ &= 6\pi \left(\frac{1}{5} (1)^5 - 0 \right) \\ &= \boxed{\frac{6\pi}{5}}. \end{aligned}$$

6. We use formula (2) with $\frac{dx}{dt} = 1 - \cos t$ and $\frac{dy}{dt} = \sin t$. Then

$$\begin{aligned} S &= 2\pi \int_0^\pi (1 - \cos t) \sqrt{(1 - \cos t)^2 + (\sin t)^2} dt \\ &= 2\pi \int_0^\pi (1 - \cos t) \sqrt{1 - 2\cos t + \cos^2 t + \sin^2 t} dt \\ &= 2\pi \int_0^\pi (1 - \cos t) \sqrt{2 - 2\cos t} dt \\ &= 2\pi \int_0^\pi \sqrt{2}(1 - \cos t)^{3/2} dt. \end{aligned}$$

Make the substitution $u = 1 - \cos t$ so $du = \sin t dt$, or $\frac{du}{\sin t} = dt$, and the new limits are $u = 1 - \cos(0) = 0$ to $u = 1 - \cos(\pi) = 2$. We need to rewrite $\sin t$ in terms of u . If we solve $u = 1 - \cos t$ for $\cos t$, then $\cos t = 1 - u$ which means $\cos^2 t = (1 - u)^2$. Using the Pythagorean Identity, we have

$$1 - \sin^2 t = \cos^2 t = (1 - u)^2 = 1 - 2u + u^2$$

so

$$\sin t = \sqrt{2u - u^2}.$$

This means the equation above with differentials becomes

$$\frac{du}{\sqrt{2u - u^2}} = dt.$$

With this substitution,

$$S = 2\sqrt{2}\pi \int_0^2 u^{3/2} \frac{du}{\sqrt{2u - u^2}} = 2\sqrt{2}\pi \int_0^2 \frac{u^{3/2}}{\sqrt{u}\sqrt{2 - u}} du = 2\sqrt{2}\pi \int_0^2 \frac{u}{\sqrt{2 - u}} du.$$

Now use the substitution $w = 2 - u$ where $dw = -du$ and the new limits of integration are $w = 2 - (0) = 2$ to $w = 2 - (2) = 0$. Then

$$\begin{aligned} S &= 2\sqrt{2}\pi \int_2^0 -\frac{2-w}{w^{1/2}} dw = 2\sqrt{2}\pi \int_0^2 \left(2w^{-1/2} - w^{1/2} \right) dw \\ &= 2\sqrt{2}\pi \left[4w^{1/2} - \frac{2}{3}w^{3/2} \right]_0^2 = 2\sqrt{2}\pi \left[4\sqrt{2} - \frac{4}{3}\sqrt{2} \right] \\ &= \boxed{\frac{32}{3}\pi}. \end{aligned}$$

7. We use formula (3) with $f(x) = x^3$ and $f'(x) = 3x^2$. Then

$$S = 2\pi \int_0^1 x^3 \sqrt{1 + [3x^2]^2} dx = 2\pi \int_0^1 x^3 \sqrt{1 + 9x^4} dx.$$

Using the substitution $u = 1 + 9x^4$, then $du = 36x^3 dx$ and the new limits are $u = 1 + 9(0)^2 = 1$ to $u = 1 + 9(1)^2 = 10$, so we have

$$\begin{aligned} S &= \frac{\pi}{18} \int_1^{10} \sqrt{u} du = \frac{\pi}{18} \left[\frac{2}{3} u^{3/2} \right]_1^{10} \\ &= \frac{\pi}{18} \left(\frac{2}{3} (10)^{3/2} - \frac{2}{3} \right) = \frac{\pi}{18} \left(\frac{20\sqrt{10} - 2}{3} \right) \\ &= \boxed{\frac{\pi(10\sqrt{10} - 1)}{27}}. \end{aligned}$$

8. We use formula (3) with $f(x) = 4x^3$ and $f'(x) = 12x^2$. Then

$$S = 2\pi \int_0^2 4x^3 \sqrt{1 + [12x^2]^2} dt = 2\pi \int_0^2 4x^3 \sqrt{1 + 144x^4} dx.$$

Using the substitution $u = 1 + 144x^4$, then $du = 576x^3 dx$ and the new limits are $u = 1 + 144(0)^4 = 1$ to $u = 1 + 144(2)^4 = 2305$, so we have

$$\begin{aligned} S &= \frac{\pi}{72} \int_1^{2305} \sqrt{u} du = \frac{\pi}{72} \left[\frac{2}{3} u^{3/2} \right]_1^{2305} \\ &= \frac{\pi}{72} \left(\frac{2}{3} (2305)^{3/2} - \frac{2}{3} \right) = \frac{\pi}{72} \left(\frac{4610\sqrt{2305} - 2}{3} \right) \\ &= \boxed{\frac{\pi(2305\sqrt{2305} - 1)}{108}}. \end{aligned}$$

9. We use formula (3) with $f(x) = \frac{x^4}{8} + \frac{1}{4x^2} = \frac{1}{8}x^4 + \frac{1}{4}x^{-2}$ and $f'(x) = \frac{1}{2}x^3 - \frac{1}{2}x^{-3}$. Then

$$\begin{aligned} S &= 2\pi \int_1^2 \left(\frac{1}{8}x^4 + \frac{1}{4}x^{-2} \right) \sqrt{1 + \left[\frac{1}{2}x^3 - \frac{1}{2}x^{-3} \right]^2} dx \\ &= 2\pi \int_1^2 \left(\frac{1}{8}x^4 + \frac{1}{4}x^{-2} \right) \sqrt{1 + \left[\frac{1}{4}x^6 - \frac{1}{2} + \frac{1}{4}x^{-6} \right]} dx \\ &= 2\pi \int_1^2 \left(\frac{1}{8}x^4 + \frac{1}{4}x^{-2} \right) \sqrt{\frac{1}{4}x^6 + \frac{1}{2} + \frac{1}{4}x^{-6}} dx \\ &= 2\pi \int_1^2 \left(\frac{1}{8}x^4 + \frac{1}{4}x^{-2} \right) \sqrt{\left[\frac{1}{2}x^3 + \frac{1}{2}x^{-3} \right]^2} dx \\ &= 2\pi \int_1^2 \left(\frac{1}{8}x^4 + \frac{1}{4}x^{-2} \right) \left[\frac{1}{2}x^3 + \frac{1}{2}x^{-3} \right] dx \\ &= 2\pi \int_1^2 \left(\frac{1}{16}x^7 + \frac{3}{16}x + \frac{1}{8}x^{-5} \right) dx \\ &= 2\pi \left[\frac{1}{128}x^8 + \frac{3}{32}x^2 - \frac{1}{32}x^{-4} \right]_1^2 \\ &= 2\pi \left[\frac{1}{128}(2)^8 + \frac{3}{32}(2)^2 - \frac{1}{32}(2)^{-4} \right] - 2\pi \left[\frac{1}{128} + \frac{3}{32} - \frac{1}{32} \right] \\ &= \boxed{\frac{1179\pi}{256}}. \end{aligned}$$

10. We use formula (3) with $f(x) = \sqrt{x} = x^{1/2}$ and $f'(x) = \frac{1}{2}x^{-1/2}$. Then

$$\begin{aligned} S &= 2\pi \int_1^9 x^{1/2} \sqrt{1 + \left[\frac{1}{2}x^{-1/2}\right]^2} dx = 2\pi \int_1^9 \sqrt{x} \sqrt{1 + \frac{1}{4}x^{-1}} dx \\ &= 2\pi \int_1^9 \sqrt{x + \frac{1}{4}} dx. \end{aligned}$$

Using the substitution $u = x + \frac{1}{4}$, then $du = dx$ and the new limits are $u = (1) + \frac{1}{4} = \frac{5}{4}$ to $u = (9) + \frac{1}{4} = \frac{37}{4}$, so we have

$$\begin{aligned} S &= 2\pi \int_{5/4}^{37/4} \sqrt{u} du = 2\pi \left[\frac{2}{3} u^{3/2} \right]_{5/4}^{37/4} \\ &= \boxed{2\pi \left(\frac{37^{3/2}}{12} - \frac{5^{3/2}}{12} \right)}. \end{aligned}$$

11. We use formula (3) with $f(x) = e^x$ and $f'(x) = e^x$. Then

$$S = 2\pi \int_0^1 e^x \sqrt{1 + [e^x]^2} dx = 2\pi \int_0^1 e^x \sqrt{1 + e^{2x}} dx.$$

Using the substitution $u = e^x$, then $du = e^x dx$ and the new limits are $u = e^0 = 1$ to $u = e^1 = e$, so we have

$$S = 2\pi \int_1^e \sqrt{1 + u^2} du.$$

Using the Table of Integrals 49 with $a = 1$, we have

$$\begin{aligned} S &= 2\pi \left[\frac{u}{2} \sqrt{1 + u^2} + \frac{1}{2} \ln |u + \sqrt{1 + u^2}| \right]_1^e \\ &= 2\pi \left[\frac{e}{2} \sqrt{1 + e^2} + \frac{1}{2} \ln |e + \sqrt{1 + e^2}| \right] - 2\pi \left[\frac{1}{2} \sqrt{2} + \frac{1}{2} \ln |1 + \sqrt{2}| \right] \\ &= \boxed{\pi \left[e \sqrt{1 + e^2} - \sqrt{2} + \ln \left(\frac{e + \sqrt{1 + e^2}}{1 + \sqrt{2}} \right) \right]}. \end{aligned}$$

12. We use formula (3) with $f(x) = e^{-x}$ and $f'(x) = -e^{-x}$. Then

$$S = 2\pi \int_0^1 e^{-x} \sqrt{1 + [-e^{-x}]^2} dx = 2\pi \int_0^1 e^{-x} \sqrt{1 + e^{-2x}} dx.$$

Using the substitution $u = e^{-x}$, then $du = -e^{-x} dx$ and the new limits are $u = e^{-0} = 1$ to $u = e^{-1}$, so we have

$$S = 2\pi \int_1^{e^{-1}} -\sqrt{1 + u^2} du = -2\pi \int_1^{e^{-1}} \sqrt{1 + u^2} du.$$

Using the Table of Integrals 49 with $a = 1$, we have

$$\begin{aligned} S &= -2\pi \left[\frac{u}{2} \sqrt{1 + u^2} + \frac{1}{2} \ln |u + \sqrt{1 + u^2}| \right]_1^{e^{-1}} \\ &= -2\pi \left[\frac{e^{-1}}{2} \sqrt{1 + e^{-2}} + \frac{1}{2} \ln |e^{-1} + \sqrt{1 + e^{-2}}| \right] + 2\pi \left[\frac{1}{2} \sqrt{2} + \frac{1}{2} \ln |1 + \sqrt{2}| \right] \\ &= \boxed{-\pi \left[e^{-1} \sqrt{1 + e^{-2}} - \sqrt{2} + \ln \left(\frac{e^{-1} + \sqrt{1 + e^{-2}}}{1 + \sqrt{2}} \right) \right]}. \end{aligned}$$

13. We start by computing the derivative of $f(x) = \sqrt{a^2 - x^2} = (a^2 - x^2)^{1/2}$, namely $f'(x) = \frac{1}{2}(a^2 - x^2)^{-1/2} \cdot (-2x) = -x(a^2 - x^2)^{-1/2}$. Then

$$\begin{aligned} 1 + [f'(x)]^2 &= 1 + \left[-x(a^2 - x^2)^{-1/2} \right]^2 = 1 + x^2(a^2 - x^2)^{-1} \\ &= 1 + \frac{x^2}{a^2 - x^2} \\ &= \frac{a^2}{a^2 - x^2}. \end{aligned}$$

This means

$$f(x)\sqrt{1 + [f'(x)]^2} = (a^2 - x^2)^{1/2} \cdot \frac{a}{(a^2 - x^2)^{1/2}} = a.$$

Using formula (3)

$$\begin{aligned} S &= 2\pi \int_{-a}^a f(x)\sqrt{1 + [f'(x)]^2} dx \\ &= 2\pi \int_{-a}^a a dx = 2\pi [ax]_{-a}^a \\ &= \boxed{4\pi a^2}. \end{aligned}$$

[Note that $y = \sqrt{a^2 - x^2}$ from $-a \leq x \leq a$ rotated about the x -axis gives a sphere of radius a , so our answer gives the surface area of a sphere of radius a .]

14. The derivative of $f(x) = \frac{a}{2} (e^{x/a} + e^{-x/a})$ is $f'(x) = \frac{a}{2} \left(e^{x/a} \cdot \frac{1}{a} - e^{-x/a} \cdot \frac{1}{a} \right) = \frac{1}{2} (e^{x/a} - e^{-x/a})$.

Then

$$\begin{aligned} 1 + [f'(x)]^2 &= 1 + \left[\frac{1}{2} (e^{x/a} - e^{-x/a}) \right]^2 \\ &= 1 + \frac{1}{4} (e^{2x/a} - 2 + e^{-2x/a}) \\ &= \frac{1}{4} (e^{2x/a} + 2 + e^{-2x/a}) \\ &= \frac{1}{4} (e^{x/a} + e^{-x/a})^2. \end{aligned}$$

Using formula (3)

$$\begin{aligned} S &= 2\pi \int_0^a \frac{a}{2} (e^{x/a} + e^{-x/a}) \sqrt{\frac{1}{4} (e^{x/a} + e^{-x/a})^2} dx \\ &= \pi \int_0^a \frac{a}{2} (e^{x/a} + e^{-x/a})^2 dx \\ &= \frac{\pi a}{2} \int_0^a (e^{2x/a} + 2 + e^{-2x/a}) dx \\ &= \frac{\pi a}{2} \left[\frac{a}{2} e^{2x/a} + 2x - \frac{a}{2} e^{-2x/a} \right]_0^a \\ &= \frac{\pi a}{2} \left[\frac{a}{2} e^2 + 2a - \frac{a}{2} e^{-2} \right] - \frac{\pi a}{2} \left[\frac{a}{2} - \frac{a}{2} \right] \\ &= \boxed{\frac{\pi a^2}{4} (e^2 + 4 - e^{-2})}. \end{aligned}$$

15. We use the formula following Example 1 with $\frac{dx}{dt} = 6t$ and $\frac{dy}{dt} = 6t^2$. Then

$$\begin{aligned} S &= 2\pi \int_0^1 3t^2 \sqrt{[6t]^2 + [6t^2]^2} dt = 2\pi \int_0^1 3t^2 \sqrt{36t^2 + 36t^4} dt \\ &= 2\pi \int_0^1 18t^3 \sqrt{1+t^2} dt = 36\pi \int_0^1 t^3 \sqrt{1+t^2} dt. \end{aligned}$$

Using the substitution $u = 1 + t^2$, we have $du = 2t dt$ and the new limits are $u = 1 + (0)^2 = 1$ to $u = 1 + (1)^2 = 2$. Solving for t^2 in the first equation, we have $t^2 = u - 1$ and so

$$(u - 1) du = (t^2) \cdot 2t dt = 2t^3 dt \text{ or } \frac{u-1}{2} du = t^3 dt.$$

With this substitution, our surface area integral becomes

$$\begin{aligned} S &= 18\pi \int_1^2 (u-1)\sqrt{u} du = 18\pi \int_1^2 (u^{3/2} - u^{1/2}) du \\ &= 18\pi \left[\frac{2}{5}u^{5/2} - \frac{2}{3}u^{3/2} \right]_1^2 = 18\pi \left[\frac{2}{5}(2)^{5/2} - \frac{2}{3}(2)^{3/2} \right] - 18\pi \left[\frac{2}{5} - \frac{2}{3} \right] \\ &= 18\pi \left[\frac{8}{5}\sqrt{2} - \frac{4}{3}\sqrt{2} \right] + \frac{24}{5}\pi = \boxed{\frac{24}{5}\pi(\sqrt{2}+1)} \end{aligned}$$

16. We use the formula following Example 1 with $\frac{dx}{dt} = 2$ and $\frac{dy}{dt} = 2t$. Then

$$\begin{aligned} S &= 2\pi \int_0^3 (2t+1)\sqrt{[2]^2 + [2t]^2} dt = 2\pi \int_0^3 (2t+1)\sqrt{4(1+t^2)} dt = 4\pi \int_0^3 (2t+1)\sqrt{1+t^2} dt \\ &= 4\pi \int_0^3 2t\sqrt{1+t^2} dt + 4\pi \int_0^3 \sqrt{1+t^2} dt. \end{aligned}$$

To compute the first integral, use the substitution $u = 1 + t^2$. Then $du = 2t dt$ and the new limits are $u = 1 + (0)^2 = 1$ to $u = 1 + (3)^2 = 10$, so we have

$$\begin{aligned} 4\pi \int_0^3 2t\sqrt{1+t^2} dt &= 4\pi \int_1^{10} \sqrt{u} du = 4\pi \left[\frac{2}{3}u^{3/2} \right]_1^{10} \\ &= \frac{8}{3}\pi(10)^{3/2} - \frac{8\pi}{3}(1)^{3/2} = \frac{8}{3}\pi(10\sqrt{10} - 1). \end{aligned}$$

To compute the second integral, we use the Table of Integrals 49 with $a = 1$. Then

$$\begin{aligned} 4\pi \int_0^3 \sqrt{1+t^2} dt &= 4\pi \left[\frac{t}{2}\sqrt{1+t^2} + \frac{1}{2}\ln|t + \sqrt{1+t^2}| \right]_0^3 \\ &= 4\pi \left(\frac{3}{2}\sqrt{10} + \frac{1}{2}\ln(3 + \sqrt{10}) \right) - 0. \end{aligned}$$

Putting these two integrals together,

$$\begin{aligned} S &= \frac{8}{3}\pi(10\sqrt{10} - 1) + 4\pi \left(\frac{3}{2}\sqrt{10} + \frac{1}{2}\ln(3 + \sqrt{10}) \right) \\ &= \boxed{\frac{8}{3}\pi(10\sqrt{10} - 1) + 2\pi(3\sqrt{10} + \ln(3 + \sqrt{10}))}. \end{aligned}$$

17. We use the formula following Example 1 with $\frac{dx}{dt} = 2 \cos t$ and $\frac{dy}{dt} = -2 \sin t$. Then

$$\begin{aligned} S &= 2\pi \int_0^{\pi/2} 2 \sin t \sqrt{[2 \cos t]^2 + [-2 \sin t]^2} dt = 8\pi \int_0^{\pi/2} \sin t dt \\ &= 8\pi [-\cos t]_0^{\pi/2} = 8\pi [0 - (-1)] \\ &= \boxed{8\pi}. \end{aligned}$$

18. We use the formula following Example 1 with $\frac{dx}{dt} = -3 \sin t$ and $\frac{dy}{dt} = 2 \cos t$. Then

$$\begin{aligned} S &= 2\pi \int_0^{\pi/2} 3 \cos t \sqrt{[-3 \sin t]^2 + [2 \cos t]^2} dt = 6\pi \int_0^{\pi/2} \cos t \sqrt{9 \sin^2 t + 4 \cos^2 t} dt \\ &= 6\pi \int_0^{\pi/2} \cos t \sqrt{9 \sin^2 t + 4(1 - \sin^2 t)} dt = 6\pi \int_0^{\pi/2} \cos t \sqrt{5 \sin^2 t + 4} dt. \end{aligned}$$

Introduce the substitution $u = \sin t$, where $du = \cos t$ and the new limits are $u = \sin(0) = 0$ to $u = \sin(\pi/2) = 1$. Then

$$S = 6\pi \int_0^1 \sqrt{5u^2 + 4} du = 6\sqrt{5}\pi \int_0^1 \sqrt{u^2 + \frac{4}{5}} du.$$

Now we use the Table of Integrals 49 with $a = \frac{2}{\sqrt{5}}$. Then

$$\begin{aligned} S &= 6\sqrt{5}\pi \left[\frac{u}{2} \sqrt{u^2 + \frac{4}{5}} + \frac{4/5}{2} \ln \left| u + \sqrt{u^2 + \frac{4}{5}} \right| \right]_0^1 \\ &= 6\sqrt{5}\pi \left[\frac{1}{2} \frac{3}{\sqrt{5}} + \frac{2}{5} \ln \left| 1 + \frac{3}{\sqrt{5}} \right| \right] - 6\sqrt{5}\pi \left[0 + \frac{2}{5} \ln \left| \frac{2}{\sqrt{5}} \right| \right] \\ &= \boxed{9\pi + \frac{12\sqrt{5}\pi}{5} \ln \left(\frac{\sqrt{5} + 3}{2} \right)}. \end{aligned}$$

19. We can parametrize the given curve with

$$\begin{aligned} y(t) &= t \\ x(t) &= \frac{1}{4}t^2, \end{aligned}$$

for $0 \leq t \leq 2$. Using the formula following Example 1 with $\frac{dx}{dt} = \frac{1}{2}t$ and $\frac{dy}{dt} = 1$, the surface area is

$$S = 2\pi \int_0^2 \frac{1}{4}t^2 \sqrt{\left[\frac{1}{2}t\right]^2 + [1]^2} dt = 2\pi \int_0^2 \frac{1}{4}t^2 \sqrt{\frac{1}{4}t^2 + 1} dt.$$

Using the u -substitution $u = \frac{1}{4}t^2$, we have $du = \frac{1}{2}t dt$ which, using the u equation, can be rewritten as $dt = \frac{1}{\sqrt{u}} du$, and the new limits of integration are $u = \frac{1}{4}(0)^2 = 0$ to $u = \frac{1}{4}(2)^2 = 1$. Then the surface area integral becomes

$$\begin{aligned} S &= 2\pi \int_0^1 u \sqrt{1+u} \frac{1}{\sqrt{u}} du \\ &= 2\pi \int_0^1 \sqrt{u^2 + u} du \\ &= 2\pi \int_0^1 \sqrt{\left(u + \frac{1}{2}\right)^2 - \frac{1}{4}} du, \end{aligned}$$

where we completed the square in the last step. Now we make the substitution $w = u + \frac{1}{2}$, with $dw = du$ and new limits $w = (0) + \frac{1}{2} = \frac{1}{2}$ to $w = (1) + \frac{1}{2} = \frac{3}{2}$, and then

$$\begin{aligned}
 S &= 2\pi \int_{1/2}^{3/2} \sqrt{w^2 - \frac{1}{4}} dw \\
 &= 2\pi \left[\frac{w}{2} \sqrt{w^2 - \frac{1}{4}} - \frac{1/4}{2} \ln \left| w + \sqrt{w^2 - \frac{1}{4}} \right| \right]_{1/2}^{3/2} \\
 &= 2\pi \left(\frac{3}{4} \sqrt{2} - \frac{1}{8} \ln \left| \frac{3}{2} + \sqrt{2} \right| \right) - 2\pi \left(0 - \frac{1}{8} \ln \left| \frac{1}{2} \right| \right) \\
 &= \boxed{2\pi \left(\frac{3}{4} \sqrt{2} + \frac{1}{8} \ln \left(\frac{1}{3 + 2\sqrt{2}} \right) \right)},
 \end{aligned}$$

where we used the Table of Integrals 49 with $a = \frac{1}{2}$ to compute the integral.

20. Using Problem 78 from Section 9.1, we recognize that the given equation is a hypocycloid where $a = 4b$. Using the formula developed in Section 9.1 Problem 77 parametric equations for the given plane curve are

$$\begin{aligned}
 x(t) &= (4b - b) \cos t + b \cos \left(\frac{4b - b}{b} t \right) = 3b \cos t + b \cos(3t) \\
 y(t) &= (4b - b) \sin t - b \sin \left(\frac{4b - b}{b} t \right) = 3b \sin t - b \sin(3t),
 \end{aligned}$$

for $0 \leq t \leq 2\pi$. The inequalities $x \geq 0$ and $0 \leq y \leq a$ restrict our attention to the hypocycloid in the first quadrant, so $0 \leq t \leq \frac{\pi}{2}$. The following picture shows the hypocycloid in the first quadrant.

Using the formula following Example 1 with

$$\begin{aligned}
 \frac{dx}{dt} &= -3b \sin t - 3b \sin(3t) \\
 \frac{dy}{dt} &= 3b \cos t - 3b \cos(3t),
 \end{aligned}$$

the surface area S is

$$S = 2\pi \int_0^{\pi/2} (3b \cos t + b \cos(3t)) \sqrt{(-3b \sin t - 3b \sin(3t))^2 + (3b \cos t - 3b \cos(3t))^2} dt.$$

Using the triple angle formulas

$$\begin{aligned}
 \sin(3t) &= -4 \sin^3 t + 3 \sin t \\
 \cos(3t) &= 4 \cos^3 t - 3 \cos t,
 \end{aligned}$$

we have

$$\begin{aligned}
 S &= 2\pi \int_0^{\pi/2} (3b \cos t + 4b \cos^3 t - 3b \cos t) \sqrt{(-3b \sin t - 3b(-4 \sin^3 t + 3 \sin t))^2 + (3b \cos t - 3b(4 \cos^3 t - 3 \cos t))^2} dt \\
 &= 2\pi \int_0^{\pi/2} 4b \cos^3 t \sqrt{(-12b \sin t + 12b \sin^3 t)^2 + (12b \cos t - 12b \cos^3 t)^2} dt \\
 &= 2\pi \int_0^{\pi/2} 4b \cos^3 t \sqrt{(-12b \sin t)^2(1 - \sin^2 t)^2 + (12b \cos t)^2(1 - \cos^2 t)^2} dt \\
 &= 8\pi b \int_0^{\pi/2} \cos^3 t \sqrt{144b^2 \sin^2 t \cos^4 t + 144b^2 \cos^2 t \sin^4 t} dt \\
 &= 8\pi b \int_0^{\pi/2} \cos^3 t \sqrt{144b^2 \sin^2 t \cos^2 t} dt \\
 &= 8\pi b \int_0^{\pi/2} (12b \cos^4 t \sin t) dt \\
 &= 96b^2 \pi \int_0^{\pi/2} \cos^4 t \sin t dt.
 \end{aligned}$$

If we let $u = \cos t$, then $du = -\sin t dt$ and the new limits are $u = \cos(0) = 1$ to $u = \cos(\pi/2) = 0$, so the surface area integral becomes

$$\begin{aligned}
 S &= 96b^2 \pi \int_1^0 -u^4 du \\
 &= 96b^2 \pi \int_0^1 u^4 du \\
 &= \frac{96b^2 \pi}{5}.
 \end{aligned}$$

Finally, since $b = \frac{a}{4}$ we have

$$S = \boxed{\frac{6a^2 \pi}{5}}.$$

21. The graph of the given cycloid over one period $0 \leq t \leq 2\pi$ is

Using formula (2) with $\frac{dx}{dt} = 6(1 - \cos t)$ and $\frac{dy}{dt} = 6 \sin t$, the surface area S of the cycloid over the interval $0 \leq t \leq 2\pi$ is

$$\begin{aligned}
 S &= 2\pi \int_0^{2\pi} 6(1 - \cos t) \sqrt{[6(1 - \cos t)]^2 + [6 \sin t]^2} dt = 72\pi \int_0^{2\pi} (1 - \cos t) \sqrt{(1 - \cos t)^2 + \sin^2 t} dt \\
 &= 72\pi \int_0^{2\pi} (1 - \cos t) \sqrt{1 - 2 \cos t + \cos^2 t + \sin^2 t} dt = 72\pi \int_0^{2\pi} (1 - \cos t) \sqrt{2 - 2 \cos t} dt \\
 &= 72\sqrt{2}\pi \int_0^{2\pi} (1 - \cos t)^{3/2} dt.
 \end{aligned}$$

To compute this integral, we make the substitution $u = 1 - \cos t$, so $du = \sin t dt$, or $\frac{du}{\sin t} = dt$. Solving for $\cos t$ in the first equation and squaring both sides, we have $\cos^2 t = (u - 1)^2$ or, using the Pythagorean

Identity,

$$\begin{aligned} 1 - \sin^2 t &= (u - 1)^2 \\ \sin^2 t &= 2u - u^2 \\ \sin t &= \pm \sqrt{2u - u^2}. \end{aligned}$$

On the interval $[0, \pi]$ we have $\sin t \geq 0$ and on $[\pi, 2\pi]$, we have $\sin t \leq 0$, so to calculate our original integral, we will split it into two: one over $[0, \pi]$ and the other over $[\pi, 2\pi]$. Then

$$\int_0^{2\pi} (1 - \cos t)^{3/2} dt = \underbrace{\int_0^{\pi} (1 - \cos t)^{3/2} dt}_A + \underbrace{\int_{\pi}^{2\pi} (1 - \cos t)^{3/2} dt}_B.$$

Label the integral over $[0, \pi]$ A and the integral over $[\pi, 2\pi]$ B .

To calculate A , we use the substitution $u = 1 - \cos t$, so $\frac{du}{\sin t} = dt$, or $\frac{du}{\sqrt{2u - u^2}} = dt$ with new limits of integration $u = 1 - \cos(0) = 0$ to $u = 1 - \cos(\pi) = 2$. To calculate B , we use the substitution $u = 1 - \cos t$, so $\frac{du}{\sin t} = dt$, or $\frac{du}{-\sqrt{2u - u^2}} = dt$ with new limits of integration $u = 1 - \cos(\pi) = 2$ to $u = 1 - \cos(2\pi) = 0$. Then

$$\begin{aligned} A &= \int_0^2 u^{3/2} \cdot \frac{1}{\sqrt{2u - u^2}} du \\ B &= \int_2^0 u^{3/2} \frac{1}{-\sqrt{2u - u^2}} du, \end{aligned}$$

and we notice that $A = B$. To compute A , we have

$$A = \int_0^2 u^{3/2} \frac{du}{\sqrt{2u - u^2}} = \int_0^2 \frac{u^{3/2}}{\sqrt{u}\sqrt{2-u}} du = \int_0^2 \frac{u}{\sqrt{2-u}} du.$$

Now use the substitution $w = 2 - u$ where $dw = -du$ and the new limits of integration are $w = 2 - (0) = 2$ to $w = 2 - (2) = 0$. Then

$$\begin{aligned} A &= \int_2^0 -\frac{2-w}{w^{1/2}} dw = \int_0^2 (2w^{-1/2} - w^{1/2}) dw \\ &= \left[4w^{1/2} - \frac{2}{3}w^{3/2} \right]_0^2 = \left[4\sqrt{2} - \frac{4}{3}\sqrt{2} \right] \\ &= \frac{8\sqrt{2}}{3}. \end{aligned}$$

This means $A = B = \frac{8\sqrt{2}}{3}$ and if we put this altogether, we have

$$\begin{aligned} S &= 72\sqrt{2}\pi(A + B) = 72\sqrt{2}\pi \cdot \frac{16\sqrt{2}}{3} \\ &= \boxed{768\pi}. \end{aligned}$$

22. Using formula (3) with $f(x) = \ln x$ and $f'(x) = \frac{1}{x}$, the surface area S of the generated solid is

$$S = 2\pi \int_1^{10} \ln x \sqrt{1 + \left(\frac{1}{x}\right)^2} dx.$$

Using a CAS, we find that $\boxed{S \approx 90.157}$.

Applications and Extensions

23. (a) Using formula (3) with $f(x) = \frac{1}{x} = x^{-1}$ and $f'(x) = -x^{-2}$, the surface area of Gabriel's Horn is

$$S = 2\pi \int_1^\infty \frac{1}{x} \sqrt{1 + [-x^{-2}]^2} dx = 2\pi \int_1^\infty \frac{1}{x} \sqrt{1 + \frac{1}{x^4}} dx.$$

Note that if $x \geq 1$, then $\sqrt{1 + \frac{1}{x^4}} \geq 1$ so

$$\frac{1}{x} \sqrt{1 + \frac{1}{x^4}} \geq \frac{1}{x}.$$

This implies that

$$S \geq 2\pi \int_1^\infty \frac{1}{x} dx.$$

However we know this integral is divergent, so S must be infinite by the Comparison Test for Improper Integrals.

(b) To find the volume of Gabriel's horn, we will use the disk method. The radius of a slice for $x \geq 1$ is $\frac{1}{x}$. Since $x \rightarrow \infty$, the integral representing volume will be an improper integral. The volume V is

$$\begin{aligned} V &= \int_1^\infty \pi \left(\frac{1}{x}\right)^2 dx \\ &= \lim_{b \rightarrow \infty} \int_1^b \pi x^{-2} dx = \lim_{b \rightarrow \infty} [\pi (-x^{-1})]_1^b \\ &= \lim_{b \rightarrow \infty} \left[-\pi \cdot \frac{1}{b} + \pi\right] = \boxed{\pi}. \end{aligned}$$

24. Using formula (3) with $f(x) = e^{-x}$ and $f'(x) = -e^{-x}$ for $x \geq 0$ and noting that the integral representing surface area S is an improper integral, we find that

$$S = 2\pi \int_0^\infty e^{-x} \sqrt{1 + [-e^{-x}]^2} dx = \lim_{b \rightarrow \infty} 2\pi \int_0^b e^{-x} \sqrt{1 + e^{-2x}} dx.$$

Using the substitution $u = e^{-x}$ so $du = -e^{-x} dx$ and our new lower limit is $e^{-0} = 1$ and our new upper limit is e^{-b} , and we have

$$S = \lim_{b \rightarrow \infty} 2\pi \int_1^{e^{-b}} -\sqrt{1 + u^2} du = \lim_{b \rightarrow \infty} -2\pi \int_1^{e^{-b}} \sqrt{1 + u^2} du.$$

Using the Table of Integrals 49 with $a = 1$, we have

$$\begin{aligned} S &= \lim_{b \rightarrow \infty} -2\pi \left[\frac{u}{2} \sqrt{1 + u^2} + \frac{1}{2} \ln |u + \sqrt{1 + u^2}| \right]_1^{e^{-b}} \\ &= \lim_{b \rightarrow \infty} \left(-2\pi \left[\frac{e^{-b}}{2} \sqrt{1 + e^{-2b}} + \frac{1}{2} \ln |e^{-b} + \sqrt{1 + e^{-2b}}| \right] + 2\pi \left[\frac{1}{2} \sqrt{2} + \frac{1}{2} \ln |1 + \sqrt{2}| \right] \right). \end{aligned}$$

Noting that $\lim_{b \rightarrow \infty} e^{-b} = 0$, then

$$S = 2\pi \left[\frac{1}{2} \sqrt{2} + \frac{1}{2} \ln |1 + \sqrt{2}| \right] = \boxed{\pi \left(\sqrt{2} + \ln(1 + \sqrt{2}) \right)}.$$

25. To find the surface area S of the catenoid, we use formula (3) with $f(x) = \cosh x$ and $f'(x) = \sinh x$ on the interval $a \leq x \leq b$. Then

$$S = 2\pi \int_a^b \cosh x \sqrt{1 + [\sinh x]^2} dx.$$

Using the hyperbolic identity $\cosh^2 x - \sinh^2 x = 1$, we can rewrite our integral for S .

$$\begin{aligned} S &= 2\pi \int_a^b \cosh x \sqrt{\cosh^2 x} \, dx = 2\pi \int_a^b \cosh^2 x \, dx \\ &= 2\pi \left[\frac{\sinh(2x)}{4} + \frac{x}{2} \right]_a^b = 2\pi \left[\frac{\sinh(2b)}{4} + \frac{b}{2} \right] - 2\pi \left[\frac{\sinh(2a)}{4} + \frac{a}{2} \right] \\ &= \boxed{\frac{\pi}{2} [\sinh(2b) - \sinh(2a)] + \pi(b-a)}, \end{aligned}$$

where we used the Table of Integrals 138 for $\int \cosh^2 x \, dx$.

26. The surface area of a sphere is found by taking the top half of a circle of radius R , parametrized by the equations $x(t) = R \cos t$ and $y(t) = R \sin t$ for $0 \leq t \leq \pi$, and rotating it about the x -axis. Using formula (2), we find that the surface area S of the sphere is

$$\begin{aligned} S &= 2\pi \int_0^\pi R \sin t \sqrt{(-R \sin t)^2 + (R \cos t)^2} \, dt = 2\pi \int_0^\pi R^2 \sin t \, dt \\ &= 2\pi R^2 [-\cos t]_0^\pi = \boxed{4\pi R^2}. \end{aligned}$$

27. A right circular cone can be created by taking a line with negative slope in the first quadrant and rotating it about the x -axis. Consider the following picture of the line through the points $(0, b)$ and $(h, 0)$ where $b, h > 0$.

The line through these points is $y = -\frac{b}{h}x + b$. If we rotate this line from $0 \leq x \leq h$ about the x -axis, we will have a right circular cone with altitude h and base of radius b . Using formula (3) with $f(x) = -\frac{b}{h}x + b$ and $f'(x) = -\frac{b}{h}$, the surface area S of a right circular cone is

$$\begin{aligned} S &= 2\pi \int_0^h \left(-\frac{b}{h}x + b \right) \sqrt{1 + \left(-\frac{b}{h} \right)^2} \, dx \\ &= 2\pi \sqrt{1 + \frac{b^2}{h^2}} \int_0^h \left(-\frac{b}{h}x + b \right) \, dx \\ &= 2\pi \sqrt{1 + \frac{b^2}{h^2}} \left[-\frac{b}{2h}x^2 + bx \right]_0^h \\ &= 2\pi \sqrt{1 + \frac{b^2}{h^2}} \left(\left[-\frac{b}{2h} \cdot (h)^2 + bh \right] - [0] \right) \\ &= 2\pi \sqrt{1 + \frac{b^2}{h^2}} \left(\frac{1}{2}bh \right) = \pi b \sqrt{h^2 + b^2} \\ &= \boxed{\pi b \sqrt{h^2 + b^2}}. \end{aligned}$$

Challenge Problems

28. To create the reflector, we rotate the top part of a parabola $x = cy^2$ about the x -axis for $0 \leq x \leq \frac{1}{4}$ where c is some positive constant. We are given that the reflector is 1 meter tall when it is $\frac{1}{4}$ meters deep.

These specifications mean that the points $\left(\frac{1}{4}, \frac{1}{2}\right)$ and $\left(\frac{1}{4}, -\frac{1}{2}\right)$ lie on the parabola $x = cy^2$. To find c , we substitute the first point in.

$$\begin{aligned} x &= cy^2 \\ \frac{1}{4} &= c\left(\frac{1}{2}\right)^2 \\ c &= 1. \end{aligned}$$

Solving the equation $x = y^2$ for y , we have $y = \sqrt{x}$. Using formula (3) to find the surface area S of rotating $y = \sqrt{x}$ about the x -axis from $0 \leq x \leq \frac{1}{4}$, we find that

$$\begin{aligned} S &= 2\pi \int_0^{1/4} \sqrt{x} \sqrt{1 + \left(\frac{1}{2\sqrt{x}}\right)^2} dx = 2\pi \int_0^{1/4} \sqrt{x \left(1 + \frac{1}{4x}\right)} dx \\ &= 2\pi \int_0^{1/4} \frac{1}{2} \sqrt{4x + 1} dx. \end{aligned}$$

Using the substitution $u = 4x + 1$, with $du = 4 dx$ and the new limits $u = 4(0) + 1 = 1$ to $u = 4\left(\frac{1}{4}\right) + 1 = 2$, we have

$$\begin{aligned} S &= \frac{\pi}{4} \int_1^2 \sqrt{u} du = \frac{\pi}{4} \left[\frac{2}{3} u^{3/2} \right]_1^2 \\ &= \frac{\pi}{6} (2\sqrt{2} - 1). \end{aligned}$$

Then the reflector has surface area $\boxed{\frac{\pi}{6} (2\sqrt{2} - 1) \approx 0.957}$ square meters.

29. Utilizing symmetry, we will find the surface area of the bead on the top hemisphere of the bead, and then double it to find the full surface area. Consider the following picture.

To find the surface area of the top half of the bead, we can take the top half of a circle of radius R centered at the origin and rotate it about the y -axis for $a \leq x \leq R$. Instead of working with the equation of a circle in the form $y = f(x)$ to rotate, we will parametrize it using $x(t) = R \cos t$ and $y(t) = R \sin t$. Before calculating the surface area, we must find the bounds on t . Consider now the following picture.

The piece of the circle we will rotate about the y -axis ranges from $t = 0$ to the value of t satisfying $\cos t = \frac{a}{R}$, or equivalently $\sin t = \frac{\sqrt{R^2 - a^2}}{R}$ which means $t = \sin^{-1} \left(\frac{\sqrt{R^2 - a^2}}{R} \right)$. Using the formula after Example 1, we find that the surface area S of the top half of the bead is

$$\begin{aligned} S &= 2\pi \int_0^{\sin^{-1} \left(\frac{\sqrt{R^2 - a^2}}{R} \right)} R \cos t \sqrt{(-R \sin t)^2 + (R \cos t)^2} dt = 2\pi \int_0^{\sin^{-1} \left(\frac{\sqrt{R^2 - a^2}}{R} \right)} R^2 \cos t dt \\ &= 2\pi R^2 [\sin t]_0^{\sin^{-1} \left(\frac{\sqrt{R^2 - a^2}}{R} \right)} = 2\pi R^2 \sin \left(\sin^{-1} \left(\frac{\sqrt{R^2 - a^2}}{R} \right) \right) - 2\pi R^2 \sin(0) \\ &= 2\pi R^2 \left(\frac{\sqrt{R^2 - a^2}}{R} \right). \end{aligned}$$

Finally, we find that the surface area of the bead is

$$4\pi R^2 \left(\frac{\sqrt{R^2 - a^2}}{R} \right) = \boxed{4\pi R \sqrt{R^2 - a^2}}.$$

30. Notice that the surface area of the plug is the surface area of the full sphere minus the surface area we found in Problem 29. In Problem 26, we found that the surface area of a sphere of radius R is $4\pi R^2$. This means that the surface area of the plug is

$$4\pi R^2 - 4\pi R^2 \left(\frac{\sqrt{R^2 - a^2}}{R} \right) = \boxed{4\pi R^2 \left(1 - \frac{\sqrt{R^2 - a^2}}{R} \right)}.$$

9.4 Polar Coordinates

Concepts and Vocabulary

1. In a polar coordinate system, the origin is called the **pole**, and the **polar axis** coincides with the positive x -axis of the rectangular coordinate system.
2. **False**. The point $\left(2, \frac{\pi}{3}\right)$ is in the first quadrant whereas the point $\left(2, \frac{4\pi}{3}\right)$ is in the third quadrant.
3. **False**. A point in polar coordinates has infinitely many representations in polar coordinates by adding multiples of 2π to the angle to obtain a new, equivalent point.
4. **True**. Every point in rectangular coordinates has a unique representation.
5. **True**. If $r < 0$, then we move r units from the origin in the opposite direction of θ to plot the point.
6. **True**.
7. To convert the point (r, θ) in polar coordinates to a point (x, y) in rectangular coordinates, use the formulas $x = r \cos \theta$ and $y = r \sin \theta$.
8. An equation whose variables are polar coordinates is called a **polar equation**.

$$(c) \left(-2, -\frac{2\pi}{3}\right) = \left(2, -\frac{2\pi}{3} + \pi\right) = \left(2, \frac{\pi}{3}\right) = \left(2, \frac{\pi}{3} + 2\pi\right) = \boxed{\left(2, \frac{7\pi}{3}\right)}$$

33.

$$\begin{aligned}x &= r \cos \theta = 6 \cos \left(\frac{\pi}{6} \right) = 3\sqrt{3} \\y &= r \sin \theta = 6 \sin \left(\frac{\pi}{6} \right) = 3\end{aligned}$$

The rectangular coordinates of the point are $\boxed{(3\sqrt{3}, 3)}$.

34.

$$\begin{aligned}x &= r \cos \theta = -6 \cos \left(\frac{\pi}{6} \right) = -3\sqrt{3} \\y &= r \sin \theta = -6 \sin \left(\frac{\pi}{6} \right) = -3\end{aligned}$$

The rectangular coordinates of the point are $\boxed{(-3\sqrt{3}, -3)}$.

35.

$$\begin{aligned}x &= r \cos \theta = -6 \cos \left(-\frac{\pi}{6} \right) = -3\sqrt{3} \\y &= r \sin \theta = -6 \sin \left(-\frac{\pi}{6} \right) = 3\end{aligned}$$

The rectangular coordinates of the point are $\boxed{(-3\sqrt{3}, 3)}$.

36.

$$\begin{aligned}x &= r \cos \theta = 6 \cos \left(-\frac{\pi}{6} \right) = 3\sqrt{3} \\y &= r \sin \theta = 6 \sin \left(-\frac{\pi}{6} \right) = -3\end{aligned}$$

The rectangular coordinates of the point are $\boxed{(3\sqrt{3}, -3)}$.

37.

$$\begin{aligned}x &= r \cos \theta = 5 \cos \left(\frac{\pi}{2} \right) = 0 \\y &= r \sin \theta = 5 \sin \left(\frac{\pi}{2} \right) = 5\end{aligned}$$

The rectangular coordinates of the point are $\boxed{(0, 5)}$.

38.

$$\begin{aligned}x &= r \cos \theta = 8 \cos \left(\frac{\pi}{4} \right) = 4\sqrt{2} \\y &= r \sin \theta = 8 \sin \left(\frac{\pi}{4} \right) = 4\sqrt{2}\end{aligned}$$

The rectangular coordinates of the point are $\boxed{(4\sqrt{2}, 4\sqrt{2})}$.

39.

$$\begin{aligned}x &= r \cos \theta = 2\sqrt{2} \cos \left(-\frac{\pi}{4} \right) = 2 \\y &= r \sin \theta = 2\sqrt{2} \sin \left(-\frac{\pi}{4} \right) = -2\end{aligned}$$

The rectangular coordinates of the point are $\boxed{(2, -2)}$.

40.

$$\begin{aligned}x &= r \cos \theta = -5 \cos \left(-\frac{\pi}{3}\right) = -\frac{5}{2} \\y &= r \sin \theta = -5 \sin \left(-\frac{\pi}{3}\right) = \frac{5\sqrt{3}}{2}\end{aligned}$$

The rectangular coordinates of the point are $\boxed{\left(-\frac{5}{2}, \frac{5\sqrt{3}}{2}\right)}$.

For Problems 41-45, the graph of these points follows Problem 45.

41. The point $(5, 0)$ is located on the polar axis $\theta = 0$, 5 units from the origin, so the polar coordinates of the point are $\boxed{(5, 0)}$.

42. The point $(2, -2)$ is in the fourth quadrant a distance of $r = \sqrt{x^2 + y^2} = \sqrt{(2)^2 + (-2)^2} = 2\sqrt{2}$ from the origin. The angle θ satisfies $\frac{3\pi}{2} \leq \theta < 2\pi$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) + 2\pi = \tan^{-1}\left(\frac{-2}{2}\right) + 2\pi = \tan^{-1}(-1) + 2\pi = -\frac{\pi}{4} + 2\pi = \frac{7\pi}{4}.$$

The polar coordinates of the point are $\boxed{\left(2\sqrt{2}, \frac{7\pi}{4}\right)}$.

43. The point $(-2, 2)$ is in the second quadrant a distance of $r = \sqrt{x^2 + y^2} = \sqrt{(-2)^2 + (2)^2} = 2\sqrt{2}$ from the origin. The angle θ satisfies $\frac{\pi}{2} \leq \theta \leq \pi$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) + \pi = \tan^{-1}\left(\frac{2}{-2}\right) + \pi = \tan^{-1}(-1) + \pi = -\frac{\pi}{4} + \pi = \frac{3\pi}{4}.$$

The polar coordinates of the point are $\boxed{\left(2\sqrt{2}, \frac{3\pi}{4}\right)}$.

44. The point $(-2, -2\sqrt{3})$ is in the third quadrant a distance of $r = \sqrt{x^2 + y^2} = \sqrt{(-2)^2 + (-2\sqrt{3})^2} = 4$ from the origin. The angle θ satisfies $\pi \leq \theta \leq \frac{3\pi}{2}$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) + \pi = \tan^{-1}\left(\frac{-2\sqrt{3}}{-2}\right) + \pi = \tan^{-1}(\sqrt{3}) + \pi = \frac{\pi}{3} + \pi = \frac{4\pi}{3}.$$

The polar coordinates of the point are $\boxed{\left(4, \frac{4\pi}{3}\right)}$.

45. The point $(\sqrt{3}, 1)$ is in the first quadrant a distance of $r = \sqrt{x^2 + y^2} = \sqrt{(\sqrt{3})^2 + (1)^2} = 2$ from the origin. The angle θ satisfies $0 \leq \theta \leq \frac{\pi}{2}$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) = \tan^{-1}\left(\frac{1}{\sqrt{3}}\right) = \frac{\pi}{6}.$$

The polar coordinates of the point are $\boxed{\left(2, \frac{\pi}{6}\right)}$.

For Problems 46-50, the graph of these points follows Problem 50.

46. The point $(0, -3)$ is on the negative y -axis three units down. So $r = 3$ and $\theta = \frac{3\pi}{2}$. The polar coordinates of the point are $\left(3, \frac{3\pi}{2}\right)$.

47. The point $(-\sqrt{3}, 1)$ is in the second quadrant a distance of $r = \sqrt{x^2 + y^2} = \sqrt{(-\sqrt{3})^2 + (1)^2} = 2$ from the origin. The angle θ satisfies $\frac{\pi}{2} \leq \theta \leq \pi$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) + \pi = \tan^{-1}\left(\frac{1}{-\sqrt{3}}\right) + \pi = -\frac{\pi}{6} + \pi = \frac{5\pi}{6}.$$

The polar coordinates of the point are $\left(2, \frac{5\pi}{6}\right)$.

48. The point $(3\sqrt{2}, -3\sqrt{2})$ is in the fourth quadrant a distance of $r = \sqrt{x^2 + y^2} = \sqrt{(3\sqrt{2})^2 + (-3\sqrt{2})^2} = 6$ from the origin. The angle θ satisfies $\frac{3\pi}{2} \leq \theta < 2\pi$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) + 2\pi = \tan^{-1}\left(\frac{-3\sqrt{2}}{3\sqrt{2}}\right) + 2\pi = -\frac{\pi}{4} + 2\pi = \frac{7\pi}{4}.$$

The polar coordinates of the point are $\left(6, \frac{7\pi}{4}\right)$.

49. The point $(3, 2)$ is in the first quadrant a distance of $r = \sqrt{x^2 + y^2} = \sqrt{(3)^2 + (2)^2} = \sqrt{13}$ from the origin. The angle θ satisfies $0 \leq \theta \leq \frac{\pi}{2}$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) = \tan^{-1}\left(\frac{2}{3}\right).$$

Using a calculator $\tan^{-1}\left(\frac{2}{3}\right) \approx 0.588$ radians. The polar coordinates of the point are

$$\left(\sqrt{13}, \tan^{-1}\left(\frac{2}{3}\right)\right) \approx (\sqrt{13}, 0.588).$$

50. The point $(-6.5, 1.2)$ is in the second quadrant a distance of $r = \sqrt{x^2 + y^2} = \sqrt{(-6.5)^2 + (1.2)^2} = \sqrt{43.69}$ from the origin. The angle θ satisfies $\frac{\pi}{2} \leq \theta \leq \pi$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) + \pi = \tan^{-1}\left(\frac{1.2}{-6.5}\right) + \pi.$$

Using a calculator $\tan^{-1}\left(\frac{1.2}{-6.5}\right) + \pi \approx 2.959$ radians. The polar coordinates of the point are

$$\left(\sqrt{43.69}, \tan^{-1} \left(\frac{1.2}{-6.5} \right) + \pi \right) \approx \left(\sqrt{43.69}, 2.959 \right).$$

51. If r is fixed at 2, then the set of points are all a distance of 2 units from the origin, forming a circle of radius 2 centered at the origin, which matches graph $\boxed{(E)}$.

52. If θ is fixed at $\frac{\pi}{4}$ and r is allowed to vary, the result is a line containing the pole, making an angle of $\frac{\pi}{4}$ with the polar axis. Such a line has slope $\tan \frac{\pi}{4} = 1$, which has rectangular equation $y = x$ and matches graph $\boxed{(A)}$.

53. If we multiply both sides by r , the equation becomes $r^2 = 2r \cos \theta$. Now use the formulas $r^2 = x^2 + y^2$ and $x = r \cos \theta$ to convert the equation to rectangular coordinates.

$$\begin{aligned} r^2 &= 2r \cos \theta \\ x^2 + y^2 &= 2x \\ x^2 - 2x + y^2 &= 0 \\ (x - 1)^2 + y^2 &= 1 \end{aligned}$$

This is a circle of radius 1 centered at $(1, 0)$, which matches graph $\boxed{(F)}$.

54. Using the formula $x = r \cos \theta$, the polar equation becomes $x = 2$, which matches graph $\boxed{(B)}$.

55. If we multiply both sides by r , the equation becomes $r^2 = -2r \cos \theta$. Now use the formulas $r^2 = x^2 + y^2$ and $x = r \cos \theta$ to convert the equation to rectangular coordinates.

$$\begin{aligned} r^2 &= -2r \cos \theta \\ x^2 + y^2 &= -2x \\ x^2 + 2x + y^2 &= 0 \\ (x + 1)^2 + y^2 &= 1 \end{aligned}$$

This is a circle of radius 1 centered at $(-1, 0)$, which matches graph $\boxed{(H)}$.

56. If we multiply both sides by r , the equation becomes $r^2 = 2r \sin \theta$. Now use the formulas $r^2 = x^2 + y^2$ and $y = r \sin \theta$ to convert the equation to rectangular coordinates.

$$\begin{aligned} r^2 &= 2r \sin \theta \\ x^2 + y^2 &= 2y \\ x^2 + y^2 - 2y &= 0 \\ x^2 + (y - 1)^2 &= 1 \end{aligned}$$

This is a circle of radius 1 centered at $(0, 1)$, which matches graph $\boxed{(G)}$.

57. If θ is fixed at $\frac{3\pi}{4}$ and r is allowed to vary, the result is a line containing the pole, making an angle of $\frac{3\pi}{4}$ with the polar axis. Such a line has slope $\tan \frac{3\pi}{4} = -1$, which has rectangular equation $y = -x$ and matches graph $\boxed{(D)}$.

58. Using the formula $y = r \sin \theta$, the polar equation becomes $y = 2$, which matches graph $\boxed{(C)}$.

59. $r = 4$ is a circle centered at $(0, 0)$ of radius 4.

60. $r = 2$ is a circle centered at $(0, 0)$ of radius 2.

61. $\theta = \frac{\pi}{3}$ is a line through the origin making an angle of $\frac{\pi}{3}$ with the positive x -axis.

62. $\theta = -\frac{\pi}{4}$ is a line through the origin making an angle of $-\frac{\pi}{4}$ with the positive x -axis. The angle $-\frac{\pi}{4}$ creates the same angle as $\frac{7\pi}{4}$ with the positive x -axis.

63. $r \sin \theta = 4$ is the equivalent of $y = 4$.

64. $r \cos \theta = 4$ is the equivalent of $x = 4$.

65. $r \cos \theta = -2$ is the equivalent of $x = -2$.

66. $r \sin \theta = -2$ is the equivalent of $y = -2$.

67. If we multiply both sides of the equation by r , then we have $r^2 = 2r \cos \theta$. Since $r^2 = x^2 + y^2$ and $x = r \cos \theta$, the equation becomes $x^2 + y^2 = 2x$. By moving the $2x$ term to the left side and completing the square, we have

$$(x - 1)^2 + y^2 = 1,$$

which is a circle centered at $(1, 0)$ with radius 1.

68. If we multiply both sides of the equation by r , then we have $r^2 = 2r \sin \theta$. Since $r^2 = x^2 + y^2$ and $y = r \sin \theta$, the equation becomes $x^2 + y^2 = 2y$. By moving the $2y$ term to the left side and completing the square, we have

$$x^2 + (y - 1)^2 = 1,$$

which is a circle centered at $(0, 1)$ with radius 1.

69. If we multiply both sides of the equation by r , then we have $r^2 = -4r \sin \theta$. Since $r^2 = x^2 + y^2$ and $y = r \sin \theta$, the equation becomes $x^2 + y^2 = -4y$. By moving the $-4y$ term to the left side and completing the square, we have

$$x^2 + (y + 2)^2 = 4,$$

which is a circle centered at $(0, -2)$ with radius 2.

70. If we multiply both sides of the equation by r , then we have $r^2 = -4r \cos \theta$. Since $r^2 = x^2 + y^2$ and $x = r \cos \theta$, the equation becomes $x^2 + y^2 = -4x$. By moving the $-4x$ term to the left side and completing the square, we have

$$(x + 2)^2 + y^2 = 4,$$

which is a circle centered at $(-2, 0)$ with radius 2.

- 71.** The polar equation $r \sec \theta = 4$ can be rewritten as $r = 4 \cos \theta$ when $\cos \theta \neq 0$. The θ values where $\cos \theta = 0$ are $\theta = \frac{\pi}{2} + k\pi$ for some integer k . This is a circle centered at $(2, 0)$ with radius 2, excluding the points where $\theta = \frac{\pi}{2} + k\pi$ which is the pole.

- 72.** The polar equation $r \csc \theta = 8$ can be rewritten as $r = 8 \sin \theta$ when $\sin \theta \neq 0$. The θ values where $\sin \theta = 0$ are $\theta = k\pi$ for some integer k . This is a circle centered at $(0, 4)$ with radius 4, excluding the points where $\theta = k\pi$ which is the pole.

- 73.** The polar equation $r \csc \theta = -2$ can be rewritten as $r = -2 \sin \theta$ when $\sin \theta \neq 0$. The θ values where $\sin \theta = 0$ are $\theta = k\pi$ for some integer k . This is a circle centered at $(0, -1)$ with radius 1, excluding the points where $\theta = k\pi$ which is the pole.

- 74.** The polar equation $r \sec \theta = -4$ can be rewritten as $r = -4 \cos \theta$ when $\cos \theta \neq 0$. The θ values where $\cos \theta = 0$ are $\theta = \frac{\pi}{2} + k\pi$ for some integer k . This is a circle centered at $(-2, 0)$ with radius 2, excluding the points where $\theta = \frac{\pi}{2} + k\pi$ which is the pole.

75. Substituting $x = r \cos \theta$ and $y = r \sin \theta$, the equation becomes

$$\begin{aligned} \frac{(r \cos \theta)^2}{4} + \frac{(r \sin \theta)^2}{9} &= 1 \\ 9r^2 \cos^2 \theta + 4r^2 \sin^2 \theta &= 36 \\ r^2 &= \frac{36}{9 \cos^2 \theta + 4 \sin^2 \theta} \\ r &= 6 \frac{\sqrt{9 \cos^2 \theta + 4 \sin^2 \theta}}{9 \cos^2 \theta + 4 \sin^2 \theta}. \end{aligned}$$

76. Substituting $x = r \cos \theta$ and $y = r \sin \theta$, the equation becomes

$$\begin{aligned} r \cos \theta - 4r \sin \theta &= -4 \\ r &= -\frac{4}{\cos \theta - 4 \sin \theta}. \end{aligned}$$

77. Substituting $r^2 = x^2 + y^2$ and $x = r \cos \theta$, the equation becomes

$$\begin{aligned} r^2 - 4r \cos \theta &= 0 \\ r &= 4 \cos \theta. \end{aligned}$$

78. Substituting $y = r \sin \theta$, the equation becomes

$$r \sin \theta = -6.$$

79. Substituting $x = r \cos \theta$ and $y = r \sin \theta$, the equation becomes

$$\begin{aligned} (r \cos \theta)^2 &= 1 - 4r \sin \theta \\ r^2 \cos^2 \theta + 4 \cos \theta - 1 &= 0. \end{aligned}$$

80. Substituting $x = r \cos \theta$ and $y = r \sin \theta$, the equation becomes

$$(r \sin \theta)^2 = 1 - 4r \cos \theta.$$

81. Substituting $x = r \cos \theta$ and $y = r \sin \theta$, the equation becomes

$$\begin{aligned} (r \cos \theta)(r \sin \theta) &= 1 \\ r^2 &= \frac{1}{\cos \theta \sin \theta} \\ r &= \frac{\sqrt{\cos \theta \sin \theta}}{\cos \theta \sin \theta}. \end{aligned}$$

82. Substituting $r^2 = x^2 + y^2$, $x = r \cos \theta$, and $y = r \sin \theta$, the equation becomes

$$\begin{aligned} r^2 &= 2r \cos \theta - 4r \sin \theta \\ r &= 2 \cos \theta - 4 \sin \theta. \end{aligned}$$

83. Multiplying both sides by r , we have $r^2 = r \cos \theta$. Using $r^2 = x^2 + y^2$ and $x = r \cos \theta$, the equation becomes

$$\begin{aligned} x^2 + y^2 &= x \\ \left(x - \frac{1}{2}\right)^2 + y^2 &= \frac{1}{4}, \end{aligned}$$

where we completed the square in the final step.

84. First we rewrite the equation

$$\begin{aligned} r - \cos \theta &= 2 \\ r^2 - r \cos \theta &= 2r. \end{aligned}$$

Now we use the equations $r^2 = x^2 + y^2$ and $x = r \cos \theta$.

$$x^2 + y^2 - x = 2\sqrt{x^2 + y^2}.$$

85. Multiply both sides by r and use the equations $r = \sqrt{x^2 + y^2}$ and $y = r \sin \theta$.

$$\begin{aligned} r^3 &= r \sin \theta \\ \left(\sqrt{x^2 + y^2}\right)^3 &= y \\ (x^2 + y^2)^{3/2} &= y. \end{aligned}$$

86. Multiply both sides by r and use the equations $r = \sqrt{x^2 + y^2}$ and $y = r \sin \theta$.

$$\begin{aligned} r^3 &= r - r \sin \theta \\ \left(\sqrt{x^2 + y^2}\right)^3 &= \sqrt{x^2 + y^2} - y. \end{aligned}$$

87. Multiply both sides by $1 - \cos \theta$ and use the equations $r = \sqrt{x^2 + y^2}$ and $x = r \cos \theta$.

$$\begin{aligned} r - r \cos \theta &= 4 \\ \sqrt{x^2 + y^2} - x &= 4. \end{aligned}$$

88. Multiply both sides by $3 - \cos \theta$ and use the equations $r = \sqrt{x^2 + y^2}$ and $x = r \cos \theta$.

$$\begin{aligned} 3r - r \cos \theta &= 3 \\ 3\sqrt{x^2 + y^2} - x &= 3. \end{aligned}$$

89. Substituting $r^2 = x^2 + y^2$ and $\theta = \tan^{-1}\left(\frac{y}{x}\right)$ the equation becomes

$$\begin{aligned} x^2 + y^2 &= \tan^{-1}\left(\frac{y}{x}\right) \\ \tan(x^2 + y^2) &= \frac{y}{x} \\ y &= x \tan(x^2 + y^2). \end{aligned}$$

90. Substituting $\theta = \tan^{-1}\left(\frac{y}{x}\right)$ the equation becomes

$$\begin{aligned}\tan^{-1}\left(\frac{y}{x}\right) &= -\frac{\pi}{4} \\ \frac{y}{x} &= \tan\left(-\frac{\pi}{4}\right) \\ y &= -1 \cdot x \\ \boxed{y} &= \boxed{-x}.\end{aligned}$$

91. Substituting $r = \sqrt{x^2 + y^2}$ the equation becomes

$$\begin{aligned}\sqrt{x^2 + y^2} &= 2 \\ \boxed{y\sqrt{4 - x^2}} &.\end{aligned}$$

92. Substituting $r = \sqrt{x^2 + y^2}$ the equation becomes

$$\begin{aligned}\sqrt{x^2 + y^2} &= -5 \\ \boxed{x^2 + y^2} &= \boxed{25}.\end{aligned}$$

93. Substituting $\theta = \tan^{-1}\left(\frac{y}{x}\right)$ the equation becomes

$$\begin{aligned}\tan\left(\tan^{-1}\left(\frac{y}{x}\right)\right) &= 4 \\ \frac{y}{x} &= 4 \\ \boxed{y} &= \boxed{4x}.\end{aligned}$$

94. Rewriting the equation as $\frac{1}{\tan \theta} = 3$ and substituting $\theta = \tan^{-1}\left(\frac{y}{x}\right)$ the equation becomes

$$\begin{aligned}\frac{1}{\tan\left(\tan^{-1}\left(\frac{y}{x}\right)\right)} &= 3 \\ \frac{1}{y/x} &= 3 \\ y &= \frac{1}{3}x.\end{aligned}$$

Applications and Extensions

95. (a) Wrigley Field resides at the point $\boxed{(-10, 36)}$ in rectangular coordinates.

(b) The point $(-10, 36)$ lies in the second quadrant so the angle θ satisfies $\frac{\pi}{2} \leq \theta \leq \pi$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) + \pi = \tan^{-1}\left(\frac{36}{-10}\right) + \pi \approx 1.842 \text{ radians.}$$

Wrigley Field is $r = \sqrt{(-10)^2 + (36)^2} = \sqrt{1396} = 2\sqrt{349} \approx 37.363$ blocks from the intersection of Madison and State Streets, so in polar coordinates, Wrigley Field is located approximately at $\boxed{(37.363, 1.842)}$.

(c) U.S. Cellular Field resides at the point $\boxed{(-3, -35)}$ in rectangular coordinates.

(d) The point $(-3, -35)$ lies in the third quadrant so the angle θ satisfies $\pi \leq \theta \leq \frac{3\pi}{2}$ where

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) + \pi = \tan^{-1}\left(\frac{-35}{-3}\right) + \pi \approx 4.627 \text{ radians.}$$

U.S. Cellular Field is $r = \sqrt{(-3)^2 + (-35)^2} = \sqrt{1234} \approx 35.128$ blocks from the intersection of Madison and State Streets, so in polar coordinates, U.S. Cellular Field is located approximately at $\boxed{(35.128, 4.627)}$.

96. If we convert P_1 and P_2 to rectangular coordinates, then

$$\begin{aligned} P_1 &= (r_1 \cos \theta_1, r_1 \sin \theta_1) \\ P_2 &= (r_2 \cos \theta_2, r_2 \sin \theta_2). \end{aligned}$$

Using the rectangular distance formula, the distance d between P_1 and P_2 is

$$\begin{aligned} d &= \sqrt{(r_1 \cos \theta_1 - r_2 \cos \theta_2)^2 + (r_1 \sin \theta_1 - r_2 \sin \theta_2)^2} \\ &= \sqrt{r_1^2 \cos^2 \theta_1 - 2r_1 r_2 \cos \theta_1 \cos \theta_2 + r_2^2 \cos^2 \theta_2 + r_1^2 \sin^2 \theta_1 - 2r_1 r_2 \sin \theta_1 \sin \theta_2 + r_2^2 \sin^2 \theta_2} \\ &= \sqrt{r_1^2 + r_2^2 - 2r_1 r_2 (\cos \theta_1 \cos \theta_2 + \sin \theta_1 \sin \theta_2)} \\ &= \sqrt{r_1^2 + r_2^2 - 2r_1 r_2 \cos(\theta_1 - \theta_2)}, \end{aligned}$$

where in the final step we used the angle difference formula for cosine.

97. Since $y = r \sin \theta$, the polar equation $r \sin \theta = a$ converts to $y = a$ in rectangular coordinates, which is a horizontal line a units above the origin (i.e. above the pole) if $a > 0$ and $|a|$ units below the origin (i.e. below the pole) if $a < 0$.

98. Since $x = r \cos \theta$, the polar equation $r \cos \theta = a$ converts to $x = a$ in rectangular coordinates, which is a vertical line a units to the right of the origin (i.e. right of the pole) if $a > 0$ and $|a|$ units to the left of the origin (i.e. left of the pole) if $a < 0$.

99. If we multiply the equation on both sides by r , then we have $r^2 = 2ar \sin \theta$. If we use the equations $r^2 = x^2 + y^2$ and $y = r \sin \theta$, then the polar equation becomes

$$\begin{aligned} x^2 + y^2 &= 2ay \\ x^2 + (y - a)^2 &= a^2 \end{aligned}$$

in rectangular coordinates. Since $a > 0$, then this is the equation of a circle centered at $(0, a)$ with radius a .

100. If we multiply the equation on both sides by r , then we have $r^2 = -2ar \sin \theta$. If we use the equations $r^2 = x^2 + y^2$ and $y = r \sin \theta$, then the polar equation becomes

$$\begin{aligned} x^2 + y^2 &= -2ay \\ x^2 + (y + a)^2 &= a^2 \end{aligned}$$

in rectangular coordinates. Since $a > 0$, then this is the equation of a circle centered at $(0, -a)$ with radius a .

101. If we multiply the equation on both sides by r , then we have $r^2 = 2ar \cos \theta$. If we use the equations $r^2 = x^2 + y^2$ and $x = r \cos \theta$, then the polar equation becomes

$$\begin{aligned} x^2 + y^2 &= 2ax \\ (x - a)^2 + y^2 &= a^2 \end{aligned}$$

in rectangular coordinates. Since $a > 0$, then this is the equation of a circle centered at $(a, 0)$ with radius a .

102. If we multiply the equation on both sides by r , then we have $r^2 = -2ar \cos \theta$. If we use the equations $r^2 = x^2 + y^2$ and $x = r \cos \theta$, then the polar equation becomes

$$\begin{aligned} x^2 + y^2 &= -2ax \\ (x + a)^2 + y^2 &= a^2 \end{aligned}$$

in rectangular coordinates. Since $a > 0$, then this is the equation of a circle centered at $(-a, 0)$ with radius a .

103. (a) The smallest circle is r_1 , the middle circle is r_2 , and the largest circle is r_3 .

(b) Answers will vary.

(c) The smallest circle is r_1 , the middle circle is r_2 , and the largest circle is r_3 .

(d) Answers will vary.

104. (a) The smallest circle is r_1 , the middle circle is r_2 , and the largest circle is r_3 .

(b) Answers will vary.

(c) The smallest circle is r_1 , the middle circle is r_2 , and the largest circle is r_3 .

(d) Answers will vary.

Challenge Problems

105. If we multiply both sides of the equation by r , then the equation becomes $r^2 = ar \sin \theta + br \cos \theta$. Now if we use the equations $r^2 = x^2 + y^2$, $x = r \cos \theta$, and $y = r \sin \theta$, then the polar equation becomes

$$\begin{aligned} x^2 + y^2 &= ay + bx \\ x^2 - bx + y^2 - ay &= 0 \\ x^2 - bx + \frac{b^2}{4} - \frac{b^2}{4} + y^2 - ay + \frac{a^2}{4} - \frac{a^2}{4} &= 0 \\ \left(x - \frac{b}{2}\right)^2 + \left(y - \frac{a}{2}\right)^2 &= \frac{a^2 + b^2}{4}. \end{aligned}$$

This is the equation of a circle centered at $\left(\frac{b}{2}, \frac{a}{2}\right)$ of radius $\frac{\sqrt{a^2 + b^2}}{2}$.

106. If we use the double-angle formula for cosine, then the equation becomes $r^2 = 2 \cos^2 \theta - 1$. If we use the equations $r^2 = x^2 + y^2$ and $x = r \cos \theta$ (rewritten as $\frac{x}{r} = \cos \theta$), then the equation becomes

$$\begin{aligned} x^2 + y^2 &= 2 \left(\frac{x}{r}\right)^2 - 1 \\ x^2 + y^2 &= \frac{2x^2}{r^2} - 1 \\ x^2 + y^2 &= \frac{2x^2}{x^2 + y^2} - 1 = \frac{2x^2 - x^2 - y^2}{x^2 + y^2} \\ (x^2 + y^2)^2 &= x^2 - y^2. \end{aligned}$$

107. Consider the following picture.

From the point (r_2, θ_2) , drop a perpendicular to the segment connecting the pole and the point (r_1, θ_1) . If we denote the length of the perpendicular by h , then the area of the triangle is $\frac{1}{2}r_1h$. The angle $\theta = \theta_2 - \theta_1$ and then we have the equation $\sin \theta = \frac{h}{r_2}$ or $h = r_2 \sin \theta$. Using these equations, the area of the triangle is

$$\frac{1}{2}r_1r_2 \sin(\theta_2 - \theta_1).$$

9.5 Polar Equations; Parametric Equations of Polar Equations; Arc Length of Polar Equations

Concepts and Vocabulary

- True**.
- The equations for cardioids and limaçons are very similar. They all have the form

$$r = a \pm b \cos \theta \quad r = a \pm b \sin \theta, \quad a > 0, b > 0$$

The equations represent a limaçon with an inner loop if **(a)** $a < b$; a cardioid if **(c)** $a = b$; and a limaçon without an inner loop if **(b)** $a > b$.

- True**. The rose has eight petals.
- The rose $r = \cos(3\theta)$ has **three** petals.

Skill Building

- (a)** The polar equation $r = 2 + 2 \cos \theta$ contains $\cos \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (2 + 2 \cos \theta, \theta)$, and trace out the graph, beginning at the point $(4, 0)$ and ending at $(4, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(4, 0)$	$(2 + \sqrt{3}, \frac{\pi}{6})$	$(2 + \sqrt{2}, \frac{\pi}{4})$	$(3, \frac{\pi}{3})$	$(2, \frac{\pi}{2})$	$(1, \frac{2\pi}{3})$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(2 - \sqrt{2}, \frac{3\pi}{4})$	$(2 - \sqrt{3}, \frac{5\pi}{6})$	$(0, \pi)$	$(2 - \sqrt{3}, \frac{7\pi}{6})$	$(2 - \sqrt{2}, \frac{5\pi}{4})$	$(1, \frac{4\pi}{3})$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$(2, \frac{3\pi}{2})$	$(3, \frac{5\pi}{3})$	$(2 + \sqrt{2}, \frac{7\pi}{4})$	$(2 + \sqrt{3}, \frac{11\pi}{6})$	$(4, 2\pi)$

- Parametric equations for $r = 2 + 2 \cos \theta$:

$$x = r \cos \theta = 2(1 + \cos \theta) \cos \theta \quad y = r \sin \theta = 2(1 + \cos \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

- (a)** The polar equation $r = 3 - 3 \sin \theta$ contains $\sin \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (3 - 3 \sin \theta, \theta)$, and trace out the graph,

beginning at the point $(3, 0)$ and ending at $(3, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(3, 0)$	$\left(\frac{3}{2}, \frac{\pi}{6}\right)$	$\left(3 - \frac{3}{2}\sqrt{2}, \frac{\pi}{4}\right)$	$\left(3 - \frac{3}{2}\sqrt{3}, \frac{\pi}{3}\right)$	$\left(0, \frac{\pi}{2}\right)$	$\left(3 - \frac{3}{2}\sqrt{3}, \frac{2\pi}{3}\right)$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(3 - \frac{3}{2}\sqrt{2}, \frac{3\pi}{4}\right)$	$\left(\frac{3}{2}, \frac{5\pi}{6}\right)$	$(3, \pi)$	$\left(\frac{9}{2}, \frac{7\pi}{6}\right)$	$\left(3 + \frac{3}{2}\sqrt{2}, \frac{5\pi}{4}\right)$	$\left(3 + \frac{3}{2}\sqrt{3}, \frac{4\pi}{3}\right)$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$\left(6, \frac{3\pi}{2}\right)$	$\left(3 + \frac{3}{2}\sqrt{3}, \frac{5\pi}{3}\right)$	$\left(3 + \frac{3}{2}\sqrt{2}, \frac{7\pi}{4}\right)$	$\left(\frac{9}{2}, \frac{11\pi}{6}\right)$	$(3, 2\pi)$

(b) Parametric equations for $r = 3 - 3 \sin \theta$:

$$x = r \cos \theta = (3 - 3 \sin \theta) \cos \theta \quad y = r \sin \theta = (3 - 3 \sin \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

7. (a) The polar equation $r = 4 - 2 \cos \theta$ contains $\cos \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (4 - 2 \cos \theta, \theta)$, and trace out the graph, beginning at the point $(2, 0)$ and ending at $(2, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(2, 0)$	$\left(4 - \sqrt{3}, \frac{\pi}{6}\right)$	$\left(4 - \sqrt{2}, \frac{\pi}{4}\right)$	$\left(3, \frac{\pi}{3}\right)$	$\left(4, \frac{\pi}{2}\right)$	$\left(5, \frac{2\pi}{3}\right)$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(4 + \sqrt{2}, \frac{3\pi}{4}\right)$	$\left(4 + \sqrt{3}, \frac{5\pi}{6}\right)$	$(6, \pi)$	$\left(4 + \sqrt{3}, \frac{7\pi}{6}\right)$	$\left(4 + \sqrt{2}, \frac{5\pi}{4}\right)$	$\left(5, \frac{4\pi}{3}\right)$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$\left(4, \frac{3\pi}{2}\right)$	$\left(3, \frac{5\pi}{3}\right)$	$\left(4 - \sqrt{2}, \frac{7\pi}{4}\right)$	$\left(4 - \sqrt{3}, \frac{11\pi}{6}\right)$	$(2, 2\pi)$

(b) Parametric equations for $r = 4 - 2 \cos \theta$:

$$x = r \cos \theta = (4 - 2 \cos \theta) \cos \theta \quad y = r \sin \theta = (4 - 2 \cos \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

8. (a) The polar equation $r = 2 + \sin \theta$ contains $\sin \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (2 + \sin \theta, \theta)$, and trace out the graph, beginning at the point $(2, 0)$ and ending at $(2, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(2, 0)$	$(\frac{5}{2}, \frac{\pi}{6})$	$(2 + \frac{\sqrt{2}}{2}, \frac{\pi}{4})$	$(2 + \frac{\sqrt{3}}{2}, \frac{\pi}{3})$	$(3, \frac{\pi}{2})$	$(2 + \frac{\sqrt{3}}{2}, \frac{2\pi}{3})$
θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(2 + \frac{\sqrt{2}}{2}, \frac{3\pi}{4})$	$(\frac{5}{2}, \frac{5\pi}{6})$	$(2, \pi)$	$(\frac{3}{2}, \frac{7\pi}{6})$	$(2 - \frac{\sqrt{2}}{2}, \frac{5\pi}{4})$	$(2 - \frac{\sqrt{3}}{2}, \frac{4\pi}{3})$
θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π	
(r, θ)	$(1, \frac{3\pi}{2})$	$(2 - \frac{\sqrt{3}}{2}, \frac{5\pi}{3})$	$(2 - \frac{\sqrt{2}}{2}, \frac{7\pi}{4})$	$(\frac{3}{2}, \frac{11\pi}{6})$	$(2, 2\pi)$	

(b) Parametric equations for $r = 2 + \sin \theta$:

$$x = r \cos \theta = (2 + \sin \theta) \cos \theta \quad y = r \sin \theta = (2 + \sin \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

9. (a) The polar equation $r = 1 + 2 \sin \theta$ contains $\sin \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (1 + 2 \sin \theta, \theta)$, and trace out the graph, beginning at the point $(1, 0)$ and ending at $(1, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(1, 0)$	$(2, \frac{\pi}{6})$	$(1 + \sqrt{2}, \frac{\pi}{4})$	$(1 + \sqrt{3}, \frac{\pi}{3})$	$(3, \frac{\pi}{2})$	$(1 + \sqrt{3}, \frac{2\pi}{3})$
θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(1 + \sqrt{2}, \frac{3\pi}{4})$	$(2, \frac{5\pi}{6})$	$(1, \pi)$	$(0, \frac{7\pi}{6})$	$(1 - \sqrt{2}, \frac{5\pi}{4})$	$(1 - \sqrt{3}, \frac{4\pi}{3})$
θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π	
(r, θ)	$(-1, \frac{3\pi}{2})$	$(1 - \sqrt{3}, \frac{5\pi}{3})$	$(1 - \sqrt{2}, \frac{7\pi}{4})$	$(0, \frac{11\pi}{6})$	$(1, 2\pi)$	

(b) Parametric equations for $r = 1 + 2 \sin \theta$:

$$x = r \cos \theta = (1 + 2 \sin \theta) \cos \theta \quad y = r \sin \theta = (1 + 2 \sin \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

10. (a) The polar equation $r = 2 - 3 \cos \theta$ contains $\cos \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (2 - 3 \cos \theta, \theta)$, and trace out the graph, beginning at the point $(-1, 0)$ and ending at $(-1, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(-1, 0)$	$(2 - \frac{3\sqrt{3}}{2}, \frac{\pi}{6})$	$(2 - \frac{3\sqrt{2}}{2}, \frac{\pi}{4})$	$(\frac{1}{2}, \frac{\pi}{3})$	$(2, \frac{\pi}{2})$	$(\frac{7}{2}, \frac{2\pi}{3})$
θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(2 + \frac{3\sqrt{2}}{2}, \frac{3\pi}{4})$	$(2 + \frac{3\sqrt{3}}{2}, \frac{5\pi}{6})$	$(5, \pi)$	$(2 + \frac{3\sqrt{3}}{2}, \frac{7\pi}{6})$	$(2 + \frac{3\sqrt{2}}{2}, \frac{5\pi}{4})$	$(\frac{7}{2}, \frac{4\pi}{3})$
θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π	
(r, θ)	$(2, \frac{3\pi}{2})$	$(\frac{1}{2}, \frac{5\pi}{3})$	$(2 - \frac{3\sqrt{2}}{2}, \frac{7\pi}{4})$	$(2 - \frac{3\sqrt{3}}{2}, \frac{11\pi}{6})$	$(-1, 2\pi)$	

(b) Parametric equations for $r = 2 - 3 \cos \theta$:

$$x = r \cos \theta = (2 - 3 \cos \theta) \cos \theta \quad y = r \sin \theta = (2 - 3 \cos \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

11. The polar equation $r = \sin(3\theta)$ contains $\sin(3\theta)$, which has period $\frac{2\pi}{3}$. So we construct a table of common values for θ that range from $0 \leq \theta \leq 2\pi$, noting that the values $\frac{2\pi}{3} \leq \theta \leq \frac{4\pi}{3}$ and $\frac{4\pi}{3} \leq \theta \leq 2\pi$ repeat the values for $0 \leq \theta \leq \frac{2\pi}{3}$. Then we plot the points and trace out the graph.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(0, 0)$	$(1, \frac{\pi}{6})$	$(\frac{\sqrt{2}}{2}, \frac{\pi}{4})$	$(0, \frac{\pi}{3})$	$(-1, \frac{\pi}{2})$	$(0, \frac{2\pi}{3})$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(\frac{\sqrt{2}}{2}, \frac{3\pi}{4})$	$(1, \frac{5\pi}{6})$	$(0, \pi)$	$(-1, \frac{7\pi}{6})$	$(-\frac{\sqrt{2}}{2}, \frac{5\pi}{4})$	$(0, \frac{4\pi}{3})$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$(1, \frac{3\pi}{2})$	$(0, \frac{5\pi}{3})$	$(\frac{\sqrt{2}}{2}, \frac{7\pi}{4})$	$(1, \frac{11\pi}{6})$	$(0, 2\pi)$

(b) Parametric equations for $r = \sin(3\theta)$:

$$x = r \cos \theta = \sin(3\theta) \cos \theta \quad y = r \sin \theta = \sin(3\theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

12. The polar equation $r = 4\cos(4\theta)$ contains $\cos(4\theta)$, which has period $\frac{\pi}{2}$. So we construct a table of common values for θ that range from $0 \leq \theta \leq 2\pi$, noting that the values $\frac{\pi}{2} \leq \theta \leq \pi$, $\pi \leq \theta \leq \frac{3\pi}{2}$, and $\frac{3\pi}{2} \leq \theta \leq 2\pi$ repeat the values for $0 \leq \theta \leq \frac{\pi}{2}$. Then we plot the points and trace out the graph.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(4, 0)$	$(-2, \frac{\pi}{6})$	$(-4, \frac{\pi}{4})$	$(-2, \frac{\pi}{3})$	$(4, \frac{\pi}{2})$	$(-2, \frac{2\pi}{3})$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(-4, \frac{3\pi}{4})$	$(-2, \frac{5\pi}{6})$	$(4, \pi)$	$(-2, \frac{7\pi}{6})$	$(-4, \frac{5\pi}{4})$	$(-2, \frac{4\pi}{3})$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$(4, \frac{3\pi}{2})$	$(-2, \frac{5\pi}{3})$	$(-4, \frac{7\pi}{4})$	$(-2, \frac{11\pi}{6})$	$(4, 2\pi)$

(b) Parametric equations for $r = 4\cos(4\theta)$:

$$x = r \cos \theta = 4 \cos(4\theta) \cos \theta \quad y = r \sin \theta = 4 \cos(4\theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the direction drawn on the graph starting at $(4, 0)$ and ending at $(4, 2\pi)$. [The numbers inside each rose indicate the order in which the roses are drawn.]

13. To find the points of intersection, where $0 \leq \theta \leq 2\pi$, set both polar equations equal.

$$\begin{aligned} 8 \cos \theta &= 2 \sec \theta \\ 4 \cos^2 \theta &= 1 \\ \cos \theta &= \pm \frac{1}{2} \\ \theta &= \frac{\pi}{3}, \frac{2\pi}{3}, \frac{5\pi}{3}, \frac{7\pi}{3}. \end{aligned}$$

The points of intersection are

$$\begin{aligned} \left(8 \cos \left(\frac{\pi}{3} \right), \frac{\pi}{3} \right) &= \left(4, \frac{\pi}{3} \right) \\ \left(8 \cos \left(\frac{2\pi}{3} \right), \frac{2\pi}{3} \right) &= \left(-4, \frac{2\pi}{3} \right) \\ \left(8 \cos \left(\frac{4\pi}{3} \right), \frac{4\pi}{3} \right) &= \left(-4, \frac{4\pi}{3} \right) \\ \left(8 \cos \left(\frac{5\pi}{3} \right), \frac{5\pi}{3} \right) &= \left(4, \frac{5\pi}{3} \right). \end{aligned}$$

9.5. POLAR EQUATIONS; PARAMETRIC EQUATIONS OF POLAR EQUATIONS; ARC LENGTH OF POLAR EQUATIONS

Notice that the first and third points are the same, and the second and fourth points are the same, so the two unique points of intersection are

$$P = \left(4, \frac{\pi}{3}\right) \text{ and } Q = \left(4, \frac{5\pi}{3}\right).$$

14. To find the points of intersection, where $0 \leq \theta \leq 2\pi$, set both polar equations equal.

$$\begin{aligned} 8 \sin \theta &= 4 \csc \theta \\ 2 \sin^2 \theta &= 1 \\ \sin \theta &= \pm \frac{\sqrt{2}}{2} \\ \theta &= \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}. \end{aligned}$$

The points of intersection are

$$\begin{aligned} \left(8 \sin \left(\frac{\pi}{4}\right), \frac{\pi}{4}\right) &= \left(4\sqrt{2}, \frac{\pi}{4}\right) \\ \left(8 \sin \left(\frac{3\pi}{4}\right), \frac{3\pi}{4}\right) &= \left(4\sqrt{2}, \frac{3\pi}{4}\right) \\ \left(8 \sin \left(\frac{5\pi}{4}\right), \frac{5\pi}{4}\right) &= \left(-4\sqrt{2}, \frac{5\pi}{4}\right) \\ \left(8 \sin \left(\frac{7\pi}{4}\right), \frac{7\pi}{4}\right) &= \left(-4\sqrt{2}, \frac{7\pi}{4}\right). \end{aligned}$$

Notice that the first and third points are the same, and the second and fourth points are the same, so the two unique points of intersection are

$$P = \left(4\sqrt{2}, \frac{\pi}{4}\right) \text{ and } Q = \left(4\sqrt{2}, \frac{3\pi}{4}\right).$$

15. To find the points of intersection, where $0 \leq \theta \leq 2\pi$, set both polar equations equal.

$$\begin{aligned}
 \sin \theta &= 1 + \cos \theta \\
 \sin \theta - \cos \theta &= 1 \\
 (\sin \theta - \cos \theta)^2 &= 1^2 \\
 \sin^2 \theta - 2 \sin \theta \cos \theta + \cos^2 \theta &= 1 \\
 \sin \theta \cos \theta &= 0 \\
 \sin \theta = 0 &\text{ or } \cos \theta = 0 \\
 \theta &= 0, \pi, 2\pi, \frac{\pi}{2}, \frac{3\pi}{2}.
 \end{aligned}$$

By squaring both sides in the third step, we may have introduced extraneous solutions, so we need to check all of them. The values $\theta = 0, 2\pi, \frac{3\pi}{2}$ do not make $\sin \theta = 1 + \cos \theta$, so our only values of intersection are when $\theta = \pi, \frac{\pi}{2}$. The points of intersection are

$$\begin{aligned}
 P = (\sin(\pi), \pi) &= \boxed{(0, \pi)} \\
 Q = \left(\sin\left(\frac{\pi}{2}\right), \frac{\pi}{2}\right) &= \boxed{\left(1, \frac{\pi}{2}\right)}.
 \end{aligned}$$

16. To find the points of intersection, where $0 \leq \theta \leq 2\pi$, set both polar equations equal.

$$\begin{aligned}
 3 &= 2 + 2 \cos \theta \\
 \cos \theta &= \frac{1}{2} \\
 \theta &= \frac{\pi}{3}, \frac{5\pi}{3}.
 \end{aligned}$$

The points of intersection are

$$\begin{aligned}
 P &= \boxed{\left(3, \frac{\pi}{3}\right)} \\
 Q &= \boxed{\left(3, \frac{5\pi}{3}\right)}.
 \end{aligned}$$

17. To find the points of intersection, where $0 \leq \theta \leq 2\pi$, set both polar equations equal.

$$\begin{aligned} 1 + \sin \theta &= 1 + \cos \theta \\ \sin \theta &= \cos \theta \\ \tan \theta &= 1 \\ \theta &= \frac{\pi}{4}, \frac{5\pi}{4}. \end{aligned}$$

We also note that both polar curves go through the pole, so the pole is another point of intersection. The points of intersection are the pole, R , and

$$\begin{aligned} P &= \left(1 + \sin\left(\frac{\pi}{4}\right), \frac{\pi}{4}\right) = \boxed{\left(1 + \frac{\sqrt{2}}{2}, \frac{\pi}{4}\right)} \\ Q &= \left(1 + \sin\left(\frac{5\pi}{4}\right), \frac{5\pi}{4}\right) = \boxed{\left(1 - \frac{\sqrt{2}}{2}, \frac{5\pi}{4}\right)}. \end{aligned}$$

18. To find the points of intersection, where $0 \leq \theta \leq 2\pi$, set both polar equations equal.

$$\begin{aligned} 1 + \cos \theta &= 3 \cos \theta \\ \cos \theta &= \frac{1}{2} \\ \theta &= \frac{\pi}{3}, \frac{5\pi}{3}. \end{aligned}$$

We also note that both polar curves go through the pole, so the pole is another point of intersection. The points of intersection are the pole, R , and

$$\begin{aligned} P &= \left(1 + \cos\left(\frac{\pi}{3}\right), \frac{\pi}{3}\right) = \boxed{\left(\frac{3}{2}, \frac{\pi}{3}\right)} \\ Q &= \left(1 + \cos\left(\frac{5\pi}{3}\right), \frac{5\pi}{3}\right) = \boxed{\left(\frac{3}{2}, \frac{5\pi}{3}\right)}. \end{aligned}$$

19. We use the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ with $r = e^{\theta/2}$. Then $\frac{dr}{d\theta} = \frac{1}{2}e^{\theta/2}$ and

$$\begin{aligned} s &= \int_0^2 \sqrt{(e^{\theta/2})^2 + \left(\frac{1}{2}e^{\theta/2}\right)^2} d\theta = \int_0^2 \sqrt{\frac{5}{4}e^{\theta}} d\theta = \frac{\sqrt{5}}{2} \int_0^2 e^{\theta/2} d\theta \\ &= \frac{\sqrt{5}}{2} \left[2e^{\theta/2} \right]_0^2 = \boxed{\sqrt{5}(e-1)}. \end{aligned}$$

20. We use the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ with $r = e^{2\theta}$. Then $\frac{dr}{d\theta} = 2e^{2\theta}$ and

$$\begin{aligned} s &= \int_0^2 \sqrt{(e^{2\theta})^2 + (2e^{2\theta})^2} d\theta = \int_0^2 \sqrt{5e^{4\theta}} d\theta = \sqrt{5} \int_0^2 e^{2\theta} d\theta \\ &= \sqrt{5} \left[\frac{1}{2}e^{2\theta} \right]_0^2 = \boxed{\frac{\sqrt{5}}{2}(e^4-1)}. \end{aligned}$$

21. We use the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ with $r = \cos^2 \frac{\theta}{2}$. Then $\frac{dr}{d\theta} = -\cos \frac{\theta}{2} \sin \frac{\theta}{2}$ and

$$\begin{aligned} s &= \int_0^{\pi} \sqrt{\left(\cos^2 \frac{\theta}{2}\right)^2 + \left(-\cos \frac{\theta}{2} \sin \frac{\theta}{2}\right)^2} d\theta = \int_0^{\pi} \sqrt{\cos^4 \frac{\theta}{2} + \cos^2 \frac{\theta}{2} \sin^2 \frac{\theta}{2}} d\theta \\ &= \int_0^{\pi} \sqrt{\cos^2 \frac{\theta}{2} \left(\cos^2 \frac{\theta}{2} + \sin^2 \frac{\theta}{2}\right)} d\theta = \int_0^{\pi} \cos \frac{\theta}{2} d\theta \\ &= \left[2 \sin \frac{\theta}{2} \right]_0^{\pi} = \boxed{2}, \end{aligned}$$

where in the second line we are using that $\cos \frac{\theta}{2} \geq 0$ on $[0, \pi]$ when taking the square root.

22. We use the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ with $r = \sin^2 \frac{\theta}{2}$. Then $\frac{dr}{d\theta} = \cos \frac{\theta}{2} \sin \frac{\theta}{2}$ and

$$\begin{aligned} s &= \int_0^{\pi} \sqrt{\left(\sin^2 \frac{\theta}{2}\right)^2 + \left(\cos \frac{\theta}{2} \sin \frac{\theta}{2}\right)^2} d\theta = \int_0^{\pi} \sqrt{\sin^4 \frac{\theta}{2} + \cos^2 \frac{\theta}{2} \sin^2 \frac{\theta}{2}} d\theta \\ &= \int_0^{\pi} \sqrt{\sin^2 \frac{\theta}{2} \left(\sin^2 \frac{\theta}{2} + \cos^2 \frac{\theta}{2}\right)} d\theta = \int_0^{\pi} \sin \frac{\theta}{2} d\theta \\ &= \left[-2 \cos \frac{\theta}{2} \right]_0^{\pi} = \boxed{2}. \end{aligned}$$

Applications and Extensions

23. $\boxed{r = 3 + 3 \cos \theta}$

24. $\boxed{r = 3 - 3 \cos \theta}$

25. $\boxed{r = 4 + \sin \theta}$

26. $\boxed{r = 1 + 4 \sin \theta}$

In Problems 27-32, use the parameterizations $x(\theta) = r \cos \theta = f(\theta) \cos \theta$ and $y(\theta) = r \sin \theta = f(\theta) \sin \theta$ to

find $\frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}}$. Do not forget to use the product rule!

27. Since $r = f(\theta) = 2 \cos(3\theta)$, we have the parametrization $x(\theta) = 2 \cos(3\theta) \cos \theta$ and $y(\theta) = 2 \cos(3\theta) \sin \theta$. Now we find $\frac{dx}{d\theta}$ and $\frac{dy}{d\theta}$ using the product rule.

$$\begin{aligned}\frac{dx}{d\theta} &= -6 \sin(3\theta) \cos \theta - 2 \cos(3\theta) \sin \theta \\ \frac{dy}{d\theta} &= -6 \sin(3\theta) \sin \theta + 2 \cos(3\theta) \cos \theta.\end{aligned}$$

The slope of the tangent line is then

$$\left[\frac{dy}{dx} \right]_{\theta=\pi/6} = \left[\frac{-6 \sin(3\theta) \sin \theta + 2 \cos(3\theta) \cos \theta}{-6 \sin(3\theta) \cos \theta - 2 \cos(3\theta) \sin \theta} \right]_{\theta=\pi/6} = \frac{\sqrt{3}}{3}.$$

The rectangular coordinates of the point (x, y) to write the equation of the tangent line at are

$$\begin{aligned}x\left(\frac{\pi}{6}\right) &= 0 \\ y\left(\frac{\pi}{6}\right) &= 0.\end{aligned}$$

The equation of the tangent line is

$$y - 0 = \frac{\sqrt{3}}{3}(x - 0)$$

$$y = \frac{\sqrt{3}}{3}x.$$

28. Since $r = f(\theta) = 3 \sin(3\theta)$, we have the parametrization $x(\theta) = 3 \sin(3\theta) \cos \theta$ and $y(\theta) = 3 \sin(3\theta) \sin \theta$. Now we find $\frac{dx}{d\theta}$ and $\frac{dy}{d\theta}$ using the product rule.

$$\begin{aligned}\frac{dx}{d\theta} &= 9 \cos(3\theta) \cos \theta - 3 \sin(3\theta) \sin \theta \\ \frac{dy}{d\theta} &= 9 \cos(3\theta) \sin \theta + 3 \sin(3\theta) \cos \theta.\end{aligned}$$

The slope of the tangent line is then

$$\left[\frac{dy}{dx} \right]_{\theta=\pi/3} = \left[\frac{9 \cos(3\theta) \sin \theta + 3 \sin(3\theta) \cos \theta}{9 \cos(3\theta) \cos \theta - 3 \sin(3\theta) \sin \theta} \right]_{\theta=\pi/3} = \sqrt{3}.$$

The rectangular coordinates of the point (x, y) to write the equation of the tangent line at are

$$\begin{aligned}x\left(\frac{\pi}{3}\right) &= 0 \\ y\left(\frac{\pi}{3}\right) &= 0.\end{aligned}$$

The equation of the tangent line is

$$\begin{aligned}y - 0 &= \sqrt{3}(x - 0) \\ y &= \sqrt{3}x.\end{aligned}$$

29. Since $r = f(\theta) = 2 + \cos \theta$, we have the parametrization $x(\theta) = (2 + \cos \theta) \cos \theta$ and $y(\theta) = (2 + \cos \theta) \sin \theta$. Now we find $\frac{dx}{d\theta}$ and $\frac{dy}{d\theta}$ using the product rule.

$$\begin{aligned}\frac{dx}{d\theta} &= -\sin \theta \cos \theta - (2 + \cos \theta) \sin \theta \\ \frac{dy}{d\theta} &= -\sin \theta \sin \theta + (2 + \cos \theta) \cos \theta.\end{aligned}$$

The slope of the tangent line is then

$$\left[\frac{dy}{dx} \right]_{\theta=\pi/4} = \left[\frac{-\sin \theta \sin \theta + (2 + \cos \theta) \cos \theta}{-\sin \theta \cos \theta - (2 + \cos \theta) \sin \theta} \right]_{\theta=\pi/4} = \sqrt{2} - 2.$$

The rectangular coordinates of the point (x, y) to write the equation of the tangent line at are

$$\begin{aligned}x\left(\frac{\pi}{4}\right) &= \sqrt{2} + \frac{1}{2} \\ y\left(\frac{\pi}{4}\right) &= \sqrt{2} + \frac{1}{2}.\end{aligned}$$

The equation of the tangent line is

$$y - \left(\sqrt{2} + \frac{1}{2}\right) = (\sqrt{2} - 2) \left(x - \left(\sqrt{2} + \frac{1}{2}\right)\right)$$

$$\boxed{y = (\sqrt{2} - 2)x + \frac{5\sqrt{2}}{2} - \frac{1}{2}}.$$

30. Since $r = f(\theta) = 3 - \sin \theta$, we have the parametrization $x(\theta) = (3 - \sin \theta) \cos \theta$ and $y(\theta) = (3 - \sin \theta) \sin \theta$. Now we find $\frac{dx}{d\theta}$ and $\frac{dy}{d\theta}$ using the product rule.

$$\begin{aligned}\frac{dx}{d\theta} &= -\cos \theta \cos \theta - (3 - \sin \theta) \sin \theta \\ \frac{dy}{d\theta} &= -\cos \theta \sin \theta + (3 - \sin \theta) \cos \theta.\end{aligned}$$

The slope of the tangent line is then

$$\left[\frac{dy}{dx} \right]_{\theta=\pi/4} = \left[\frac{-\cos \theta \sin \theta + (3 - \sin \theta) \cos \theta}{-\cos \theta \cos \theta - (3 - \sin \theta) \sin \theta} \right]_{\theta=\pi/4} = -\frac{\sqrt{3}}{2}.$$

The rectangular coordinates of the point (x, y) to write the equation of the tangent line at are

$$\begin{aligned}x\left(\frac{\pi}{4}\right) &= \frac{5\sqrt{3}}{4} \\ y\left(\frac{\pi}{4}\right) &= \frac{5}{4}.\end{aligned}$$

The equation of the tangent line is

$$y - \frac{5}{4} = -\frac{\sqrt{3}}{2} \left(x - \frac{5\sqrt{3}}{4} \right)$$

$$y = -\frac{\sqrt{3}}{2}x + \frac{25}{8}.$$

31. Since $r = f(\theta) = 4 + 5 \sin \theta$, we have the parametrization $x(\theta) = (4 + 5 \sin \theta) \cos \theta$ and $y(\theta) = (4 + 5 \sin \theta) \sin \theta$. Now we find $\frac{dx}{d\theta}$ and $\frac{dy}{d\theta}$ using the product rule.

$$\begin{aligned}\frac{dx}{d\theta} &= 5 \cos \theta \cos \theta - (4 + 5 \sin \theta) \sin \theta \\ \frac{dy}{d\theta} &= 5 \cos \theta \sin \theta + (4 + 5 \sin \theta) \cos \theta.\end{aligned}$$

The slope of the tangent line is then

$$\left[\frac{dy}{dx} \right]_{\theta=\pi/4} = \left[\frac{5 \cos \theta \sin \theta + (4 + 5 \sin \theta) \cos \theta}{5 \cos \theta \cos \theta - (4 + 5 \sin \theta) \sin \theta} \right]_{\theta=\pi/4} = -\frac{5\sqrt{2}}{4} - 1.$$

The rectangular coordinates of the point (x, y) to write the equation of the tangent line at are

$$\begin{aligned}x\left(\frac{\pi}{4}\right) &= 2\sqrt{2} + \frac{5}{2} \\ y\left(\frac{\pi}{4}\right) &= 2\sqrt{2} + \frac{5}{2}.\end{aligned}$$

The equation of the tangent line is

$$y - \left(2\sqrt{2} + \frac{5}{2}\right) = \left(-\frac{5\sqrt{2}}{4} - 1\right) \left(x - \left(2\sqrt{2} + \frac{5}{2}\right)\right)$$

$$\boxed{y = -\left(1 + \frac{5\sqrt{2}}{4}\right)x + \frac{57\sqrt{2}}{8} + 10}.$$

32. Since $r = f(\theta) = 1 - 2 \cos \theta$, we have the parametrization $x(\theta) = (1 - 2 \cos \theta) \cos \theta$ and $y(\theta) = (1 - 2 \cos \theta) \sin \theta$. Now we find $\frac{dx}{d\theta}$ and $\frac{dy}{d\theta}$ using the product rule.

$$\begin{aligned} \frac{dx}{d\theta} &= 2 \sin \theta \cos \theta - (1 - 2 \cos \theta) \sin \theta \\ \frac{dy}{d\theta} &= 2 \sin \theta \sin \theta + (1 - 2 \cos \theta) \cos \theta. \end{aligned}$$

The slope of the tangent line is then

$$\left[\frac{dy}{dx}\right]_{\theta=\pi/4} = \left[\frac{2 \sin \theta \sin \theta + (1 - 2 \cos \theta) \cos \theta}{2 \sin \theta \cos \theta - (1 - 2 \cos \theta) \sin \theta}\right]_{\theta=\pi/4} = \frac{1 + 2\sqrt{2}}{7}.$$

The rectangular coordinates of the point (x, y) to write the equation of the tangent line at are

$$\begin{aligned} x\left(\frac{\pi}{4}\right) &= \frac{\sqrt{2}}{2} - 1 \\ y\left(\frac{\pi}{4}\right) &= \frac{\sqrt{2}}{2} - 1. \end{aligned}$$

The equation of the tangent line is

$$y - \left(\frac{\sqrt{2}}{2} - 1\right) = \frac{1 + 2\sqrt{2}}{7} \left(x - \left(\frac{\sqrt{2}}{2} - 1\right)\right)$$

$$\boxed{y = \frac{1 + 2\sqrt{2}}{7}x + \frac{1}{7}(5\sqrt{2} - 8)}.$$

33. (a)

(b) The equation $r^2 = 4 \sin(2\theta)$ can be rewritten as $r = \pm 2\sqrt{\sin(2\theta)}$. Besides orientation, the $\pm$ does not affect the graph of the lemniscate, so one set of parametric equations would be:

$$x = r \cos \theta = 2\sqrt{\sin(2\theta)} \cos \theta \quad y = r \sin \theta = 2\sqrt{\sin(2\theta)} \sin \theta$$

where θ is the parameter.

34. (a)

(b) The equation $r^2 = 9 \cos(2\theta)$ can be rewritten as $r = \pm 3\sqrt{\cos(2\theta)}$. Besides orientation, the $\pm$ does not affect the graph of the lemniscate, so one set of parametric equations would be:

$$x = r \cos \theta = 3\sqrt{\cos(2\theta)} \cos \theta \quad y = r \sin \theta = 3\sqrt{\cos(2\theta)} \sin \theta$$

where θ is the parameter.

35. (a)

(b) The equation $r^2 = \cos(2\theta)$ can be rewritten as $r = \pm\sqrt{\cos(2\theta)}$. Besides orientation, the $\pm$ does not affect the graph of the lemniscate, so one set of parametric equations would be:

$$x = r \cos \theta = \sqrt{\cos(2\theta)} \cos \theta \quad y = r \sin \theta = \sqrt{\cos(2\theta)} \sin \theta$$

where θ is the parameter.

36. (a)

(b) The equation $r^2 = 16 \sin(2\theta)$ can be rewritten as $r = \pm 4\sqrt{\sin(2\theta)}$. Besides orientation, the $\pm$ does not affect the graph of the lemniscate, so one set of parametric equations would be:

$$x = r \cos \theta = 4\sqrt{\sin(2\theta)} \cos \theta \quad y = r \sin \theta = 4\sqrt{\sin(2\theta)} \sin \theta$$

where θ is the parameter.

For Problem 37-48, to find parametric equations, we will use the formulas $x = r \cos \theta$ and $y = r \sin \theta$.

37. (a) The polar equation $r = \frac{2}{1 - \cos \theta}$ contains $\cos \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π (excluding these values since r is not defined there) and plot the points (r, θ) .

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	undefined	$\left(\frac{4}{2 - \sqrt{3}}, \frac{\pi}{6}\right)$	$\left(\frac{4}{2 - \sqrt{2}}, \frac{\pi}{4}\right)$	$\left(4, \frac{\pi}{3}\right)$	$\left(2, \frac{\pi}{2}\right)$	$\left(\frac{4}{3}, \frac{2\pi}{3}\right)$
θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$

(r, θ)	$\left(\frac{2}{\pi}, \frac{3\pi}{2}\right)$	$\left(\frac{9}{5\pi}, \frac{5\pi}{3}\right)$	$\left(\frac{12}{7\pi}, \frac{7\pi}{4}\right)$	$\left(\frac{18}{11\pi}, \frac{11\pi}{6}\right)$	$\left(\frac{3}{2\pi}, 2\pi\right)$

(b) Parametric equations for the polar equation $r = \frac{3}{\theta}$ are

$$x = \frac{3 \cos \theta}{\theta}$$

$$y = \frac{3 \sin \theta}{\theta}.$$

43. Constructing a table of common values for θ between 0 and 2π (excluding 0, π , and 2π which make r undefined), we find some points on the polar graph $r = \csc \theta - 2$.

θ	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$
(r, θ)	$\left(0, \frac{\pi}{6}\right)$	$\left(-2 + \sqrt{2}, \frac{\pi}{4}\right)$	$\left(\frac{2\sqrt{3}}{3} - 2, \frac{\pi}{3}\right)$	$\left(-1, \frac{\pi}{2}\right)$	$\left(\frac{2\sqrt{3}}{3} - 2, \frac{2\pi}{3}\right)$	$\left(-2 + \sqrt{2}, \frac{3\pi}{4}\right)$	$\left(0, \frac{5\pi}{6}\right)$

θ	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$
(r, θ)	$\left(-4, \frac{7\pi}{6}\right)$	$\left(-2 - \sqrt{2}, \frac{5\pi}{4}\right)$	$\left(-\frac{2\sqrt{3}}{3} - 2, \frac{4\pi}{3}\right)$	$\left(-3, \frac{3\pi}{2}\right)$	$\left(-\frac{2\sqrt{3}}{3} - 2, \frac{5\pi}{3}\right)$	$\left(-2 - \sqrt{2}, \frac{7\pi}{4}\right)$	$\left(-4, \frac{11\pi}{6}\right)$

(b) Parametric equations for the polar equation $r = \csc \theta - 2$ are

$$x = (\csc \theta - 2) \cos \theta$$

$$y = (\csc \theta - 2) \sin \theta.$$

44. Constructing a table of common values for θ between 0 and 2π (excluding the values 0, π , and 2π since r is not defined there), we find some points on the polar graph $r = 3 - \frac{1}{2} \csc \theta$.

θ	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$
(r, θ)	$(2, \frac{\pi}{6})$	$(3 - \frac{\sqrt{2}}{2}, \frac{\pi}{4})$	$(3 - \frac{\sqrt{3}}{3}, \frac{\pi}{3})$	$(\frac{5}{2}, \frac{\pi}{2})$	$(3 - \frac{\sqrt{3}}{3}, \frac{2\pi}{3})$	$(3 - \frac{\sqrt{2}}{2}, \frac{3\pi}{4})$	$(2, \frac{5\pi}{6})$

θ	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$
(r, θ)	$(4, \frac{7\pi}{6})$	$(3 + \frac{\sqrt{2}}{2}, \frac{5\pi}{4})$	$(3 + \frac{\sqrt{3}}{3}, \frac{4\pi}{3})$	$(\frac{7}{2}, \frac{3\pi}{2})$	$(3 + \frac{\sqrt{3}}{3}, \frac{5\pi}{3})$	$(3 + \frac{\sqrt{2}}{2}, \frac{7\pi}{4})$	$(4, \frac{11\pi}{6})$

(b) Parametric equations for the polar equation $r = 3 - \frac{1}{2} \csc \theta$ are

$$x = \left(3 - \frac{1}{2} \csc \theta\right) \cos \theta$$

$$y = \left(3 - \frac{1}{2} \csc \theta\right) \sin \theta.$$

45. (a) The polar equation $r = \sin \theta \tan \theta$ contains $\sin \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π (excluding the values $\frac{\pi}{2}$ and $\frac{3\pi}{2}$ since r is not defined there)

and plot the points (r, θ) .

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	(0, 0)	$\left(\frac{\sqrt{3}}{6}, \frac{\pi}{6}\right)$	$\left(\frac{\sqrt{2}}{2}, \frac{\pi}{4}\right)$	$\left(\frac{3}{2}, \frac{\pi}{3}\right)$	undefined	$\left(-\frac{3}{2}, \frac{2\pi}{3}\right)$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(-\frac{\sqrt{2}}{2}, \frac{3\pi}{4}\right)$	$\left(-\frac{\sqrt{3}}{6}, \frac{5\pi}{6}\right)$	(0, π)	$\left(-\frac{\sqrt{3}}{6}, \frac{7\pi}{6}\right)$	$\left(-\frac{\sqrt{2}}{2}, \frac{5\pi}{4}\right)$	$\left(-\frac{3}{2}, \frac{4\pi}{3}\right)$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	undefined	$\left(\frac{3}{2}, \frac{5\pi}{3}\right)$	$\left(\frac{\sqrt{2}}{2}, \frac{7\pi}{4}\right)$	$\left(\frac{\sqrt{3}}{6}, \frac{11\pi}{6}\right)$	(0, 2π)

(b) Parametric equations for the polar equation $r = \sin \theta \tan \theta$ are

$$x = \sin \theta \tan \theta \cos \theta = \sin^2 \theta$$

$$y = \sin \theta \tan \theta \sin \theta = \sin^2 \theta \tan \theta.$$

46. (a) The polar equation $r = \cos \frac{\theta}{2}$ contains $\cos \frac{\theta}{2}$, which has the period 4π . We construct a table of common values of θ that range from 0 to 4π and plot the points (r, θ) . The points with decimal coordinates are approximate values of r .

θ	0	$\frac{\pi}{4}$	$\frac{\pi}{2}$	$\frac{3\pi}{4}$	π	$\frac{5\pi}{4}$
(r, θ)	(1, 0)	$\left(0.924, \frac{\pi}{4}\right)$	$\left(\frac{\sqrt{2}}{2}, \frac{\pi}{2}\right)$	$\left(0.383, \frac{3\pi}{4}\right)$	(0, π)	$\left(-0.383, \frac{5\pi}{4}\right)$

θ	$\frac{3\pi}{2}$	$\frac{7\pi}{4}$	2π	$\frac{9\pi}{4}$	$\frac{5\pi}{2}$	$\frac{11\pi}{4}$
(r, θ)	$\left(-\frac{\sqrt{2}}{2}, \frac{3\pi}{2}\right)$	$\left(-0.924, \frac{7\pi}{4}\right)$	(-1, 2π)	$\left(-0.924, \frac{9\pi}{4}\right)$	$\left(-\frac{\sqrt{2}}{2}, \frac{5\pi}{2}\right)$	$\left(-0.383, \frac{11\pi}{4}\right)$

(r, θ)	undefined	$\left(-\sqrt{3}, \frac{5\pi}{3}\right)$	$\left(-1, \frac{7\pi}{4}\right)$	$\left(-\frac{\sqrt{3}}{3}, \frac{11\pi}{6}\right)$	(0, 2π)

(b) Parametric equations for the polar equation $r = \tan \theta$ are

$$x = \tan \theta \cos \theta = \sin \theta$$

$$y = \sin \theta \tan \theta.$$

48. (a) The polar equation $r = \cot \theta$ contains $\cot \theta$, which has the period π . We construct a table of common values of θ that range from 0 to 2π (excluding $\theta = 0, \pi$ and 2π since r is not defined there), noting that $\pi \leq \theta \leq 2\pi$ duplicates the values taken on $0 \leq \theta \leq \pi$, and plot the points (r, θ) .

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	undefined	$(\sqrt{3}, \frac{\pi}{6})$	$(1, \frac{\pi}{4})$	$(\frac{\sqrt{3}}{3}, \frac{\pi}{3})$	$(0, \frac{\pi}{2})$	$(-\frac{\sqrt{3}}{3}, \frac{2\pi}{3})$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(-1, \frac{3\pi}{4})$	$(-\sqrt{3}, \frac{5\pi}{6})$	undefined	$(\sqrt{3}, \frac{7\pi}{6})$	$(1, \frac{5\pi}{4})$	$(\frac{\sqrt{3}}{3}, \frac{4\pi}{3})$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$(0, \frac{3\pi}{2})$	$(-\frac{\sqrt{3}}{3}, \frac{5\pi}{3})$	$(-1, \frac{7\pi}{4})$	$(-\sqrt{3}, \frac{11\pi}{6})$	undefined

(b) Parametric equations for the polar equation $r = \cot \theta$ are

$$\begin{aligned} x &= \cot \theta \cos \theta \\ y &= \cot \theta \sin \theta. \end{aligned}$$

49. First we recall that for a polar point (r, θ) , by adding π to the angle θ and changing the sign of r , we arrive at the same point. In other words, $(r, \theta) = (-r, \theta + \pi)$. To show that $r_1 = 4(\cos \theta + 1)$ has the same graph as $r_2 = 4(\cos \theta - 1)$, we will show that every point on r_1 is also on r_2 , and vice versa.

Recalling the angle addition formula for cosine, we have

$$\cos(\theta + \pi) = \cos \theta \cos \pi - \sin \theta \sin \pi = -\cos \theta.$$

If (r, θ) is a point on the graph of r_1 , then $r_1(\theta) = r$ and

$$r_2(\theta + \pi) = 4(\cos(\theta + \pi) - 1) = 4(-\cos \theta - 1) = -4(\cos \theta + 1) = -r_1(\theta) = -r$$

and so $(-r, \theta + \pi) = (r, \theta)$ is also a point on the graph of r_2 .

If (r, θ) is a point on the graph of r_2 , then $r_2(\theta) = r$ and

$$r_1(\theta + \pi) = 4(\cos(\theta + \pi) + 1) = 4(-\cos \theta + 1) = -4(\cos \theta - 1) = -r_2(\theta) = -r$$

and so $(-r, \theta + \pi) = (r, \theta)$ is also a point on the graph of r_1 .

50. First we recall that for a polar point (r, θ) , by adding π to the angle θ and changing the sign of r , we arrive at the same point. In other words, $(r, \theta) = (-r, \theta + \pi)$. To show that $r_1 = 5(\sin \theta + 1)$ has the same graph as $r_2 = 5(\sin \theta - 1)$, we will show that every point on r_1 is also on r_2 , and vice versa.

Recalling the angle addition formula for sine, we have

$$\sin(\theta + \pi) = \sin \theta \cos \pi + \sin \pi \cos \theta = -\sin \theta.$$

If (r, θ) is a point on the graph of r_1 , then $r_1(\theta) = r$ and

$$r_2(\theta + \pi) = 5(\sin(\theta + \pi) - 1) = 5(-\sin \theta - 1) = -5(\sin \theta + 1) = -r_1(\theta) = -r$$

and so $(-r, \theta + \pi) = (r, \theta)$ is also a point on the graph of r_2 .

If (r, θ) is a point on the graph of r_2 , then $r_2(\theta) = r$ and

$$r_1(\theta + \pi) = 5(\sin(\theta + \pi) + 1) = 5(-\sin \theta + 1) = -5(\sin \theta - 1) = -r_2(\theta) = -r$$

and so $(-r, \theta + \pi) = (r, \theta)$ is also a point on the graph of r_1 .

51. We use the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ with $r = \theta$. Then $\frac{dr}{d\theta} = 1$ and

$$s = \int_0^{2\pi} \sqrt{(\theta)^2 + (1)^2} d\theta = \left[\frac{\theta}{2} \sqrt{\theta^2 + 1} + \frac{1}{2} \ln \left| \theta + \sqrt{\theta^2 + 1} \right| \right]_0^{2\pi},$$

where we have used the Table of Integrals 49 with $a = 1$. Then

$$s = \boxed{\pi \sqrt{4\pi^2 + 1} + \frac{1}{2} \ln \left(2\pi + \sqrt{4\pi^2 + 1} \right)}.$$

52. We use the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ with $r = 3\theta$. Then $\frac{dr}{d\theta} = 3$ and

$$s = \int_0^{2\pi} \sqrt{(3\theta)^2 + (3)^2} d\theta = 3 \int_0^{2\pi} \sqrt{\theta^2 + 1} d\theta = 3 \left[\frac{\theta}{2} \sqrt{\theta^2 + 1} + \frac{1}{2} \ln \left| \theta + \sqrt{\theta^2 + 1} \right| \right]_0^{2\pi},$$

where we have used the Table of Integrals 49 with $a = 1$. Then

$$s = \boxed{3\pi \sqrt{4\pi^2 + 1} + \frac{3}{2} \ln \left(2\pi + \sqrt{4\pi^2 + 1} \right)}.$$

53. The perimeter of the cardioid is found by calculating the arc length of the cardioid over the interval $[-\pi, \pi]$. We will exploit symmetry and find the length s of the top half of the cardioid using the arc length

formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ with $r = 1 - \cos \theta$ and then double it. With the function $r = 1 - \cos \theta$, we have $\frac{dr}{d\theta} = \sin \theta$ and

$$s = \int_0^{\pi} \sqrt{(1 - \cos \theta)^2 + (\sin \theta)^2} d\theta = \int_0^{\pi} \sqrt{2 - 2 \cos \theta} d\theta.$$

Let $u = 2 - 2 \cos \theta$ and then $du = 2 \sin \theta d\theta$. Solving for $\cos \theta$ in the first equation, we have

$$\cos \theta = \frac{2 - u}{2}.$$

Using the Pythagorean Identity $\cos^2 \theta + \sin^2 \theta = 1$, on the interval $0 \leq \theta \leq \pi$ we find that

$$\sin \theta = \frac{\sqrt{4u - u^2}}{2} = \frac{\sqrt{u}\sqrt{4 - u}}{2},$$

and so

$$\begin{aligned} du &= 2 \sin \theta \, d\theta \\ \frac{1}{\sqrt{u}\sqrt{4-u}} du &= d\theta. \end{aligned}$$

Changing the limits of integration to $u = 2 - 2 \cos(0) = 0$ to $u = 2 - 2 \cos \pi = 4$, the integral for s becomes

$$s = \int_0^4 \sqrt{u} \cdot \frac{1}{\sqrt{u}\sqrt{4-u}} du = \int_0^4 \frac{1}{\sqrt{4-u}} du.$$

Another substitution, $w = 4 - u$ with $dw = -du$, the limits of integration change to $w = 4 - (0) = 4$ to $w = 4 - (4) = 0$, and we have

$$s = \int_4^0 -\frac{1}{\sqrt{w}} dw = \int_0^4 \frac{1}{\sqrt{w}} dw.$$

Notice that this is an improper integral. So

$$\begin{aligned} s &= \lim_{b \rightarrow 0^+} \int_b^4 \frac{1}{\sqrt{w}} dw \\ &= \lim_{b \rightarrow 0^+} [2\sqrt{w}]_b^4 = \lim_{b \rightarrow 0^+} [4 - \sqrt{b}] \\ &= 4. \end{aligned}$$

Since the top half of the cardioid has length 4, the full cardioid has perimeter equal to $\boxed{8}$.

54. (a) The left graph is r_1 and the right graph is r_2 .

r_1 has 8 petals; r_2 has 12.

(b) Answers will vary. The graphs below, from left to right, are r_1, r_2, r_3 .

55. The graphs below, from left to right and top to bottom, are r_1, r_2, r_3, r_4 .

For Problems 56-61, using the parameterizations $x(\theta) = r \cos \theta = f(\theta) \cos \theta$ and $y(\theta) = r \sin \theta = f(\theta) \sin \theta$ we can find $\frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}}$. Then we have a horizontal tangent line if $\frac{dy}{d\theta} = 0$ and $\frac{dx}{d\theta} \neq 0$, and we have a vertical tangent line if $\frac{dx}{d\theta} = 0$ and $\frac{dy}{d\theta} \neq 0$.

56. Parametric equations for $r = 1 - \sin \theta$ are

$$x = (1 - \sin \theta) \cos \theta \quad y = (1 - \sin \theta) \sin \theta$$

and

$$\frac{dy}{d\theta} = (-\cos \theta) \sin \theta + (1 - \sin \theta) \cos \theta = \cos \theta (1 - 2 \sin \theta)$$

$$\frac{dx}{d\theta} = (-\cos \theta) \cos \theta - (1 - \sin \theta) \sin \theta = -\cos^2 \theta - \sin \theta + \sin^2 \theta = 2 \sin^2 \theta - \sin \theta - 1 = (2 \sin \theta + 1)(\sin \theta - 1).$$

Horizontal Tangent Lines on $0 \leq \theta \leq 2\pi$:

$$\begin{aligned} \frac{dy}{d\theta} &= 0 \\ \cos \theta (1 - 2 \sin \theta) &= 0 \\ \cos \theta &= 0 \quad \text{or} \quad 1 - 2 \sin \theta = 0 \\ \theta &= \frac{\pi}{2}, \frac{3\pi}{2}, \frac{\pi}{6}, \frac{5\pi}{6}. \end{aligned}$$

Notice that $\theta = \frac{\pi}{2}$ makes $\frac{dx}{d\theta} = 0$ so we must exclude it but the others do not make $\frac{dx}{d\theta}$ zero. The y -coordinates of the points corresponding to $\theta = \frac{3\pi}{2}, \frac{\pi}{6}, \frac{5\pi}{6}$ are $-2, \frac{1}{4}, \frac{1}{4}$, respectively. The horizontal tangent

lines are then $y = -2$ and $y = \frac{1}{4}$.

Vertical Tangent Lines on $0 \leq \theta \leq 2\pi$:

$$\begin{aligned}\frac{dx}{d\theta} &= 0 \\ (2 \sin \theta + 1)(\sin \theta - 1) &= 0 \\ 2 \sin \theta + 1 = 0 &\text{ or } \sin \theta - 1 = 0 \\ \theta &= \frac{7\pi}{6}, \frac{11\pi}{6}, \frac{\pi}{2}.\end{aligned}$$

Notice that $\theta = \frac{\pi}{2}$ makes $\frac{dy}{d\theta} = 0$ so we must exclude it where the others do not make $\frac{dy}{d\theta}$ zero. The x -coordinates of the points corresponding to $\theta = \frac{7\pi}{6}$ and $\frac{11\pi}{6}$ are $-\frac{3\sqrt{3}}{4}$ and $\frac{3\sqrt{3}}{4}$, respectively. The vertical

tangent lines are then $x = -\frac{3\sqrt{3}}{4}$ and $x = \frac{3\sqrt{3}}{4}$.

57. Parametric equations for $r = 3 + 3 \cos \theta$ are

$$x = (3 + 3 \cos \theta) \cos \theta \quad y = (3 + 3 \cos \theta) \sin \theta$$

and

$$\begin{aligned}\frac{dy}{d\theta} &= (-3 \sin \theta) \sin \theta + (3 + 3 \cos \theta) \cos \theta = -3 \sin^2 \theta + 3 \cos \theta + 3 \cos^2 \theta = 6 \cos^2 \theta + 3 \cos \theta - 3 \\ &= 3(\cos \theta + 1)(2 \cos \theta - 1) \\ \frac{dx}{d\theta} &= (-3 \sin \theta) \cos \theta - (3 + 3 \cos \theta) \sin \theta = -3 \sin \theta \cos \theta - 3 \sin \theta - 3 \cos \theta \sin \theta \\ &= -\sin \theta(6 \cos \theta + 3).\end{aligned}$$

Horizontal Tangent Lines on $0 \leq \theta \leq 2\pi$:

$$\begin{aligned}\frac{dy}{d\theta} &= 0 \\ 3(\cos \theta + 1)(2 \cos \theta - 1) &= 0 \\ \cos \theta + 1 = 0 &\text{ or } 2 \cos \theta - 1 = 0 \\ \theta &= \pi, \frac{\pi}{3}, \frac{5\pi}{3}.\end{aligned}$$

Notice that $\theta = \pi$ makes $\frac{dx}{d\theta} = 0$ so we must exclude it but the others do not make $\frac{dx}{d\theta}$ zero. The y -coordinates of the points corresponding to $\theta = \frac{\pi}{3}$ and $\frac{5\pi}{3}$ are $\frac{9\sqrt{3}}{4}$ and $-\frac{9\sqrt{3}}{4}$, respectively. The horizontal

tangent lines are then $y = \frac{9\sqrt{3}}{4}$ and $y = -\frac{9\sqrt{3}}{4}$.

Vertical Tangent Lines on $0 \leq \theta \leq 2\pi$:

$$\begin{aligned}\frac{dx}{d\theta} &= 0 \\ -\sin \theta(6 \cos \theta + 3) &= 0 \\ -\sin \theta = 0 &\text{ or } 6 \cos \theta + 3 = 0 \\ \theta &= 0, \pi, 2\pi, \frac{2\pi}{3}, \frac{4\pi}{3}.\end{aligned}$$

Notice that $\theta = \pi$ makes $\frac{dy}{d\theta} = 0$ so we must exclude it but the others do not make $\frac{dy}{d\theta}$ zero. The x -coordinates of the points corresponding to $\theta = 0, 2\pi, \frac{2\pi}{3}$, and $\frac{4\pi}{3}$ are 6, 6, $-\frac{3}{4}$, and $-\frac{3}{4}$, respectively. The

vertical tangent lines are then $x = 6$ and $x = -\frac{3}{4}$.

58. Parametric equations for $r = 1 + 2 \cos \theta$ are

$$x = (1 + 2 \cos \theta) \cos \theta \quad y = (1 + 2 \cos \theta) \sin \theta$$

and

$$\begin{aligned} \frac{dy}{d\theta} &= (-2 \sin \theta) \sin \theta + (1 + 2 \cos \theta) \cos \theta \\ \frac{dx}{d\theta} &= (-2 \sin \theta) \cos \theta - (1 + 2 \cos \theta) \sin \theta. \end{aligned}$$

Horizontal Tangent Lines: Using a CAS to find where $\frac{dy}{d\theta} = 0$, we find that $\theta \approx 0.936, 2.574, 3.709, 5.347$.

None of these values make $\frac{dx}{d\theta} = 0$. The y -coordinates of the points corresponding to $\theta \approx 0.936, 2.574, 3.709, 5.347$ are approximately 1.76, -0.369, 0.369, and -1.76, respectively. The horizontal tangent lines are then $y \approx \pm 1.76$ and $y \approx \pm 0.369$.

Vertical Tangent Lines: Using a CAS to find where $\frac{dx}{d\theta} = 0$, we find that $\theta = 0, \pi, 2\pi$ and $\theta \approx 1.823, 4.46$.

None of these values make $\frac{dy}{d\theta} = 0$. The x -coordinates of the points corresponding to $\theta = 0, \pi, 2\pi$ and $\theta \approx 1.823, 4.46$ are 3, 1, 3, and approximately -0.125, -0.125, respectively. The vertical tangent lines are then $x = 1$, $x = 3$ and $x \approx -0.125$.

59. Parametric equations for $r = 2 \cos(2\theta)$ are

$$x = (2 \cos(2\theta)) \cos \theta \quad y = (2 \cos(2\theta)) \sin \theta$$

and

$$\begin{aligned} \frac{dy}{d\theta} &= (-4 \sin(2\theta)) \sin \theta + (2 \cos(2\theta)) \cos \theta \\ \frac{dx}{d\theta} &= (-4 \sin(2\theta)) \cos \theta - (2 \cos(2\theta)) \sin \theta. \end{aligned}$$

Horizontal Tangent Lines: Using a CAS to find where $\frac{dy}{d\theta} = 0$, we find that

$$\theta = \frac{\pi}{2}, \frac{3\pi}{2}, \tan^{-1} \left(\frac{\sqrt{6}}{\sqrt{30}} \right), -\tan^{-1} \left(\frac{\sqrt{6}}{\sqrt{30}} \right), -\tan^{-1} \left(\frac{\sqrt{6}}{\sqrt{30}} \right) + \pi, \tan^{-1} \left(\frac{\sqrt{6}}{\sqrt{30}} \right) - \pi. \text{ None of these values}$$

make $\frac{dx}{d\theta} = 0$. The y -coordinates of the points corresponding to

$$\theta = \frac{\pi}{2}, \frac{3\pi}{2}, \tan^{-1} \left(\frac{\sqrt{6}}{\sqrt{30}} \right), -\tan^{-1} \left(\frac{\sqrt{6}}{\sqrt{30}} \right), -\tan^{-1} \left(\frac{\sqrt{6}}{\sqrt{30}} \right) + \pi, \tan^{-1} \left(\frac{\sqrt{6}}{\sqrt{30}} \right) - \pi \text{ are } -2, 2, \frac{4}{3\sqrt{6}}, -\frac{4}{3\sqrt{6}}, \frac{4}{3\sqrt{6}}, -\frac{4}{3\sqrt{6}},$$

respectively. The horizontal tangent lines are then $y = \pm 2$ and $y \pm \frac{4}{3\sqrt{6}}$.

Vertical Tangent Lines: Using a CAS to find where $\frac{dx}{d\theta} = 0$, we find that $\theta = 0, \pi, 2\pi, \tan^{-1}(\sqrt{5}), -\tan^{-1}(\sqrt{5}) +$

$\pi, -\tan^{-1}(\sqrt{5}), \tan^{-1}(\sqrt{5}) - \pi$. None of these values make $\frac{dy}{d\theta} = 0$. The x -coordinates of the points corresponding to $\theta = 0, \pi, 2\pi, \tan^{-1}(\sqrt{5}), -\tan^{-1}(\sqrt{5}) + \pi, -\tan^{-1}(\sqrt{5}), \tan^{-1}(\sqrt{5}) - \pi$ are

$$2, -2, 2, \frac{4}{3\sqrt{6}}, \frac{4}{3\sqrt{6}}, -\frac{4}{3\sqrt{6}}, -\frac{4}{3\sqrt{6}}, \text{ respectively. The vertical tangent lines are then } x = \pm 2 \text{ and } x = \pm \frac{4}{3\sqrt{6}}.$$

60. Parametric equations for $r = e^{\theta/5}$ are

$$x = (e^{\theta/5}) \cos \theta \quad y = (e^{\theta/5}) \sin \theta$$

and

$$\begin{aligned}\frac{dy}{d\theta} &= \left(\frac{1}{5}e^{\theta/5}\right)\sin\theta + \left(e^{\theta/5}\right)\cos\theta \\ \frac{dx}{d\theta} &= \left(\frac{1}{5}e^{\theta/5}\right)\cos\theta - \left(e^{\theta/5}\right)\sin\theta.\end{aligned}$$

Horizontal Tangent Lines: Using a CAS to find where $\frac{dy}{d\theta} = 0$ on $0 \leq \theta \leq 2\pi$, we find that $\theta = \tan^{-1}\left(\frac{1}{5}\right), \tan^{-1}\left(\frac{1}{5}\right) + \pi$. Neither of these values make $\frac{dx}{d\theta} = 0$. The y -coordinates of the points corresponding to $\theta = \tan^{-1}\left(\frac{1}{5}\right), \tan^{-1}\left(\frac{1}{5}\right) + \pi$ are $\frac{\sqrt{26}}{26}e^{1/5 \tan^{-1}(1/5)}, \frac{\sqrt{26}}{26}e^{1/5 \tan^{-1}(1/5+1/5\pi)}$, respectively.

The horizontal tangent lines are then $y = \frac{\sqrt{26}}{26}e^{1/5 \tan^{-1}(1/5)}$ and $y = \frac{\sqrt{26}}{26}e^{1/5 \tan^{-1}(1/5+1/5\pi)}$.

Vertical Tangent Lines: Using a CAS to find where $\frac{dx}{d\theta} = 0$ on $-\pi \leq \theta \leq \pi$, we find that $\theta = -\tan^{-1}(5), -\tan^{-1}(5) + \pi$. Neither of these values make $\frac{dy}{d\theta} = 0$. The x -coordinates of the points corresponding to $\theta = -\tan^{-1}(5), -\tan^{-1}(5) + \pi$ are $\frac{\sqrt{26}}{26}e^{-1/5 \tan^{-1}(5)}, \frac{\sqrt{26}}{26}e^{-1/5 \tan^{-1}(5)+1/5\pi}$, respectively. The vertical tangent lines are then

$$x = \frac{\sqrt{26}}{26}e^{-1/5 \tan^{-1}(5)} \text{ and } x = \frac{\sqrt{26}}{26}e^{-1/5 \tan^{-1}(5)+1/5\pi}.$$

61. In Problem 33, we found parametric equations for $r^2 = 4\sin(2\theta)$.

$$x = r \cos \theta = 2\sqrt{\sin(2\theta)} \cos \theta \quad y = r \sin \theta = 2\sqrt{\sin(2\theta)} \sin \theta, \quad \sin(2\theta) > 0.$$

Using a CAS to find the derivatives,

$$\begin{aligned}\frac{dx}{d\theta} &= \frac{2 \cos \theta (4 \cos^2 \theta - 3)}{\sqrt{\sin(2\theta)}} \\ \frac{dy}{d\theta} &= \frac{2 \sin \theta (4 \cos^2 \theta - 1)}{\sqrt{\sin(2\theta)}}.\end{aligned}$$

Horizontal Tangent Lines: Using a CAS to find where $\frac{dy}{d\theta} = 0$ on $0 \leq \theta \leq 2\pi$ where $\sin(2\theta) > 0$, we find that $\theta = \frac{\pi}{3}, \frac{4\pi}{3}$. Neither of these values make $\frac{dx}{d\theta} = 0$. The y -coordinates of the points corresponding to $\theta = \frac{\pi}{3}, \frac{4\pi}{3}$ are $3^{3/4}\frac{\sqrt{2}}{2}$ and $-3^{3/4}\frac{\sqrt{2}}{2}$, respectively. The horizontal tangent lines are then $y = \pm \frac{3^{3/4}}{\sqrt{2}}$.

Vertical Tangent Lines: Using a CAS to find where $\frac{dx}{d\theta} = 0$ on $0 \leq \theta \leq 2\pi$ where $\sin(2\theta) > 0$, we find that $\theta = \frac{\pi}{6}, \frac{7\pi}{6}$. Neither of these values make $\frac{dy}{d\theta} = 0$. The x -coordinates of the points corresponding to $\theta = \frac{\pi}{6}, \frac{7\pi}{6}$ are $3^{3/4}\frac{\sqrt{2}}{2}$ and $-3^{3/4}\frac{\sqrt{2}}{2}$, respectively. The vertical tangent lines are then $x = \pm \frac{3^{3/4}}{\sqrt{2}}$.

62. (a) Answers will vary.

(b) Since $\cos \theta$ is an even function, $\cos \theta = \cos(-\theta)$. So $3 + 2\cos(-\theta) = 3 + 2\cos \theta$ and is symmetric with respect to the polar axis.

63. (a) Answers will vary.

(b) Since $r^2 = (-r)^2$, we have $(-r)^2 = r^2 = 4\sin(2\theta)$ and so the lemniscate is symmetric with respect to the pole.

64. (a) Answers will vary.

(b) Using the angle subtraction formula for cosine,

$$\begin{aligned} 2 \cos(2(\pi - \theta)) &= 2 \cos(2\pi - 2\theta) \\ &= 2 [\cos(2\pi) \cos(2\theta) + \sin(2\pi) \sin(2\theta)] \\ &= 2 \cos(2\theta), \end{aligned}$$

and so the graph is symmetric with respect to the line $\theta = \frac{\pi}{2}$.

Challenge Problems

65. Symmetry with respect to the pole: Substituting $\theta + \pi$ for θ and using the angle addition formula for sine, we have

$$\begin{aligned} r &= \sin(2(\theta + \pi)) = \sin(2\theta + 2\pi) \\ r &= \sin(2\theta) \cos(2\pi) + \sin(2\pi) \cos(2\theta) \\ r &= \sin(2\theta), \end{aligned}$$

and an equivalent equation results implying that the graph is symmetric with respect to the pole.

Symmetry with respect to the polar axis: Substituting $-\theta$ for θ and recalling that $\sin \theta$ is an odd function, we have

$$\begin{aligned} r &= \sin(-2\theta) \\ r &= -\sin(2\theta), \end{aligned}$$

which is not an equivalent equation so the test fails.

66. Following the hint, parametric equations are $x = a \sin^3 \frac{\theta}{3} \cos \theta$ and $y = a \sin^3 \frac{\theta}{3} \sin \theta$. We will use the

arc length formula $s = \int_a^b \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta$ from Section 9.2. Then

$$\begin{aligned} \frac{dx}{d\theta} &= a \sin^2 \frac{\theta}{3} \cos \frac{\theta}{3} \cos \theta - a \sin^3 \frac{\theta}{3} \sin \theta \\ \frac{dy}{d\theta} &= a \sin^2 \frac{\theta}{3} \cos \frac{\theta}{3} \sin \theta + a \sin^3 \frac{\theta}{3} \cos \theta. \end{aligned}$$

Then, after expanding and using the Pythagorean Identity $\cos^2 \alpha + \sin^2 \alpha = 1$ for any angle α ,

$$\begin{aligned} \left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2 &= \left(a \sin^2 \frac{\theta}{3} \cos \frac{\theta}{3} \cos \theta - a \sin^3 \frac{\theta}{3} \sin \theta\right)^2 + \left(a \sin^2 \frac{\theta}{3} \cos \frac{\theta}{3} \sin \theta + a \sin^3 \frac{\theta}{3} \cos \theta\right)^2 \\ &= a^2 \sin^4 \frac{\theta}{3}. \end{aligned}$$

The function $\sin^3 \frac{\theta}{3}$ is traced out exactly once on the interval $[0, 3\pi]$. The period of $\sin^3 \frac{\theta}{3}$ is 6π , but the point (r, θ) for $0 \leq \theta \leq 3\pi$ is the same as the point $(-r, \theta + 3\pi)$. Since $a > 0$, $\sqrt{a^2} = a$ and the arc length is then

$$s = \int_0^{3\pi} a \sin^2 \frac{\theta}{3} d\theta.$$

Making the substitution $u = \frac{\theta}{3}$ so $du = \frac{1}{3} d\theta$, and changing the limits $u = \frac{(0)}{3} = 0$ to $u = \frac{3\pi}{3} = \pi$, we have

$$\begin{aligned} s &= \int_0^\pi 3a \sin^2 u du \\ &= 3a \left[\frac{u}{2} - \frac{\sin 2u}{4} \right]_0^\pi \\ &= \boxed{\frac{3}{2}\pi a}, \end{aligned}$$

where to compute the integral we used Table of Integrals 84.

67. (a)

(b) The graph intersects the pole when $r = 0$. Setting $4 \sin(5\theta) = 0$ we see that $5\theta = \pi n$ for any integer n , or

$$\theta = \frac{n}{5}\pi.$$

We seek the smallest positive value of θ , which is when $n = 1$. So $\alpha = \frac{1}{5}\pi$.

(c) The arc length of the petal is given by

$$s = \int_0^{\pi/5} \sqrt{(4 \sin(5\theta))^2 + (20 \cos(5\theta))^2} d\theta.$$

Using a CAS, we find that $s \approx \boxed{8.404}$.

9.6 Area in Polar Coordinates

Note: Throughout this assignment, we will be integrating $\sin^2(a\theta)$ or $\cos^2(a\theta)$ frequently. To integrate them we use the formulas $\sin^2(a\theta) = \frac{1 - \cos(2a\theta)}{2}$ and $\cos^2(a\theta) = \frac{1 + \cos(2a\theta)}{2}$. With these formulas, we have

$$\begin{aligned}\int \sin^2(a\theta) \, d\theta &= \frac{1}{2}\theta - \frac{1}{4a} \sin(2a\theta) = \frac{1}{2}\theta - \frac{1}{2a} \cos(a\theta) \sin(a\theta) \\ \int \cos^2(a\theta) \, d\theta &= \frac{1}{2}\theta + \frac{1}{4a} \sin(2a\theta) = \frac{1}{2}\theta + \frac{1}{2a} \cos(a\theta) \sin(a\theta)\end{aligned}$$

In each problem where the above equations are used, the problem will be marked with an asterisk (*).

Concepts and Vocabulary

1. The area A of a sector of a circle of radius r and central angle θ is $A = \boxed{\frac{1}{2}r^2\theta}$.

2. **True**.

3. **False**. The area is given by $A = \int_{\alpha}^{\beta} \frac{1}{2} [f(\theta)]^2 \, d\theta$.

4. **True**.

Skill Building

5*. The area of the shaded region in quadrant I equals one-fourth of the area A of the shaded region. The area of the shaded region in quadrant I is equal to the area of the non-shaded region inside the rose in quadrant I which is swept out starting at $\theta = 0$ and, by symmetry, ends at $\theta = \frac{\pi}{4}$. The area of the

non-shaded region in quadrant I is given by $\int_0^{\pi/4} \frac{1}{2} r^2 \, d\theta$, and the area A we seek is 4 times this area,

$$\begin{aligned}A &= 4 \int_0^{\pi/4} \frac{1}{2} r^2 \, d\theta = 2 \int_0^{\pi/4} \cos^2(2\theta) \, d\theta \\ &= \left[\theta + \frac{1}{2} \cos(2\theta) \sin(2\theta) \right]_0^{\pi/4} = \boxed{\frac{\pi}{4}}.\end{aligned}$$

6*. The area A of the shaded region is equal to the area of the non-shaded region in quadrant I. The non-shaded region in quadrant I is swept out beginning with the ray $\theta = 0$ and ending at the point $(0, \theta)$, $0 < \theta < \frac{\pi}{2}$, where θ is the solution of the following equation.

$$\begin{aligned}2 \sin(3\theta) &= 0 \\ \sin(3\theta) &= 0 \\ 3\theta &= n\pi \quad (n \text{ any integer}) \\ \theta &= \frac{n}{3}\pi.\end{aligned}$$

Since $0 < \theta < \frac{\pi}{2}$, it must be that $\theta = \frac{\pi}{3}$. The area of the shaded region is then equal to $\int_0^{\pi/3} \frac{1}{2} r^2 \, d\theta$.

$$\begin{aligned}A &= \int_0^{\pi/3} \frac{1}{2} r^2 \, d\theta = \int_0^{\pi/3} \frac{1}{2} (2 \sin(3\theta))^2 \, d\theta = 2 \int_0^{\pi/3} \sin^2(3\theta) \, d\theta \\ &= \left[\theta - \frac{1}{3} \sin(3\theta) \cos(3\theta) \right]_0^{\pi/3} = \boxed{\frac{\pi}{3}}.\end{aligned}$$

7*. The shaded region is swept out beginning with the ray $\theta = 0$ and ending with the ray $\theta = \pi$. The area A of the shaded region is then equal to $\int_0^\pi \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^\pi \frac{1}{2} r^2 d\theta = \int_0^\pi \frac{1}{2} (2 + 2 \sin \theta)^2 d\theta = 2 \int_0^\pi (1 + 2 \sin \theta + \sin^2 \theta) d\theta \\ &= [-4 \cos \theta + 3\theta - \sin \theta \cos \theta]_0^\pi = \boxed{8 + 3\pi}. \end{aligned}$$

8*. The shaded region is swept out beginning with the ray $\theta = -\frac{\pi}{2}$ and ending with the ray $\theta = \frac{\pi}{2}$. The area S of the shaded region is then equal to $\int_{-\pi/2}^{\pi/2} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_{-\pi/2}^{\pi/2} \frac{1}{2} r^2 d\theta = \int_{-\pi/2}^{\pi/2} \frac{1}{2} (3 - 3 \cos \theta)^2 d\theta = \frac{9}{2} \int_{-\pi/2}^{\pi/2} (1 - 2 \cos \theta + \cos^2 \theta) d\theta \\ &= \left[-9 \sin \theta + \frac{27}{4} \theta + \frac{9}{4} \sin \theta \cos \theta \right]_{-\pi/2}^{\pi/2} = \boxed{\frac{27}{4} \pi - 18}. \end{aligned}$$

9*.

The area A of the shaded region is equal to $\int_0^{\pi/3} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/3} \frac{1}{2} r^2 d\theta = \int_0^{\pi/3} \frac{1}{2} (3 \cos \theta)^2 d\theta = \frac{9}{2} \int_0^{\pi/3} \cos^2 \theta d\theta \\ &= \left[\frac{9}{4} \theta + \frac{9}{4} \cos \theta \sin \theta \right]_0^{\pi/3} = \frac{9\sqrt{3}}{16} + \frac{3\pi}{4} \\ &= \boxed{\frac{3}{16} (3\sqrt{3} + 4\pi)}. \end{aligned}$$

10*.

The area A of the shaded region is equal to $\int_0^{\pi/4} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/4} \frac{1}{2} r^2 d\theta = \int_0^{\pi/4} \frac{1}{2} (3 \sin \theta)^2 d\theta = \frac{9}{2} \int_0^{\pi/4} \sin^2 \theta d\theta \\ &= \left[\frac{9}{4} \theta - \frac{9}{4} \cos \theta \sin \theta \right]_0^{\pi/4} = \boxed{-\frac{9}{8} + \frac{9\pi}{16}}. \end{aligned}$$

11.

[The graph shown is when $a = 1$.] The area A of the shaded region is equal to $\int_0^{2\pi} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{2\pi} \frac{1}{2} r^2 d\theta = \int_0^{2\pi} \frac{1}{2} (a\theta)^2 d\theta = \frac{a^2}{2} \int_0^{2\pi} \theta^2 d\theta \\ &= \left[\frac{a^2}{6} \theta^3 \right]_0^{2\pi} = \boxed{\frac{4\pi^3 a^2}{3}}. \end{aligned}$$

12.

[The graph shown is when $a = 1$.] The area A of the shaded region is equal to $\int_0^{\pi/2} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/2} \frac{1}{2} r^2 d\theta = \int_0^{\pi/2} \frac{1}{2} (e^{a\theta})^2 d\theta \\ &= \left[\frac{1}{4a} e^{2a\theta} \right]_0^{\pi/2} = \boxed{\frac{e^{\pi a} - 1}{4a}}. \end{aligned}$$

13*.

The area A of the shaded region is equal to $\int_0^{2\pi} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{2\pi} \frac{1}{2} r^2 d\theta = \int_0^{2\pi} \frac{1}{2} (1 + \cos \theta)^2 d\theta = \frac{1}{2} \int_0^{2\pi} (1 + 2 \cos \theta + \cos^2 \theta) d\theta \\ &= \left[\frac{3}{4} \theta + \sin \theta + \frac{1}{4} \cos \theta \sin \theta \right]_0^{2\pi} = \boxed{\frac{3\pi}{2}}. \end{aligned}$$

14*.

The area A of the shaded region is equal to $\int_0^{2\pi} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{2\pi} \frac{1}{2} r^2 d\theta = \int_0^{2\pi} \frac{1}{2} (2 - 2 \sin \theta)^2 d\theta = 2 \int_0^{2\pi} (1 - 2 \sin \theta + \sin^2 \theta) d\theta \\ &= [3\theta + 4 \cos \theta - \cos \theta \sin \theta]_0^{2\pi} = \boxed{6\pi}. \end{aligned}$$

15*.

The area A of the shaded region is equal to $\int_0^{2\pi} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{2\pi} \frac{1}{2} r^2 d\theta = \int_0^{2\pi} \frac{1}{2} (3 + \sin \theta)^2 d\theta = \frac{1}{2} \int_0^{2\pi} (9 + 6 \sin \theta + \sin^2 \theta) d\theta \\ &= \left[\frac{19}{4} \theta - 3 \cos \theta - \frac{1}{4} \cos \theta \sin \theta \right]_0^{2\pi} = \boxed{\frac{19\pi}{2}}. \end{aligned}$$

16*.

The area A of the shaded region is equal to $\int_0^{2\pi} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{2\pi} \frac{1}{2} r^2 d\theta = \int_0^{2\pi} \frac{1}{2} (3(2 - \sin \theta))^2 d\theta = \frac{9}{2} \int_0^{2\pi} (4 - 4 \sin \theta + \sin^2 \theta) d\theta \\ &= \left[\frac{81}{4} \theta + 18 \cos \theta - \frac{9}{4} \cos \theta \sin \theta \right]_0^{2\pi} = \boxed{\frac{81\pi}{2}}. \end{aligned}$$

17*.

Exploiting symmetry, we will find the area A of the petal in quadrant I (see the second picture) which is swept out beginning with the ray $\theta = 0$ and ending at the ray $\theta = \frac{\pi}{3}$ and then triple it to find the full area of the rose. The area A of the petal in quadrant I is equal to $\int_0^{\pi/3} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/3} \frac{1}{2} r^2 d\theta = \int_0^{\pi/3} \frac{1}{2} (8 \sin(3\theta))^2 d\theta = 32 \int_0^{\pi/3} \sin^2(3\theta) d\theta \\ &= \left[16\theta - \frac{16}{3} \sin(3\theta) \cos(3\theta) \right]_0^{\pi/3} = \frac{16\pi}{3}. \end{aligned}$$

The total area of the full rose is then $3 \cdot \frac{16\pi}{3} = \boxed{16\pi}$.

18*.

Exploiting symmetry, we will find the area A of the half-petal in quadrant I (see the second picture) which is swept out beginning with the ray $\theta = 0$ and ending at the ray $\theta = \frac{\pi}{8}$ (which is the first angle $\theta > 0$ such that $\cos(4\theta) = 0$) and then multiply it by 16 to get the full area of the rose. The area A of the half-petal in quadrant I is equal to $\int_0^{\pi/8} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/8} \frac{1}{2} r^2 d\theta = \int_0^{\pi/8} \frac{1}{2} (\cos(4\theta))^2 d\theta \\ &= \left[\frac{1}{4} \theta + \frac{1}{16} \sin(4\theta) \cos(4\theta) \right]_0^{\pi/8} = \frac{\pi}{32}. \end{aligned}$$

The total area of the full rose is then $16 \cdot \frac{\pi}{32} = \boxed{\frac{\pi}{2}}$.

19*.

The area A of the petal in quadrant I (see the second picture) is swept out beginning with the ray $\theta = 0$ and ending at the ray $\theta = \frac{\pi}{2}$ so A is equal to $\int_0^{\pi/2} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/2} \frac{1}{2} r^2 d\theta = \int_0^{\pi/2} \frac{1}{2} (4 \sin(2\theta))^2 d\theta = 8 \int_0^{\pi/2} \sin^2(2\theta) d\theta \\ &= [4\theta - 2 \sin(2\theta) \cos(2\theta)]_0^{\pi/2} = \boxed{2\pi}. \end{aligned}$$

20*.

The area A of the half-petal in quadrant I (see the second picture) is swept out beginning with the ray $\theta = 0$ and ending at the ray $\theta = \frac{\pi}{6}$ so A is equal to $\int_0^{\pi/6} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/6} \frac{1}{2} r^2 d\theta = \int_0^{\pi/6} \frac{1}{2} (5 \cos(3\theta))^2 d\theta = \frac{25}{2} \int_0^{\pi/6} \cos^2(3\theta) d\theta \\ &= \left[\frac{25}{4} \theta + \frac{25}{12} \sin(3\theta) \cos(3\theta) \right]_0^{\pi/6} = \frac{25\pi}{24}. \end{aligned}$$

Then a full petal has area $2 \cdot \frac{25\pi}{24} = \boxed{\frac{25\pi}{12}}$.

21.

The area A of the half-petal in quadrant I (see the second picture) is swept out beginning with the ray $\theta = 0$ and ending at the ray $\theta = \frac{\pi}{4}$ so A is equal to $\int_0^{\pi/4} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/4} \frac{1}{2} r^2 d\theta = \int_0^{\pi/4} \frac{1}{2} (4 \cos(2\theta))^2 d\theta = 2 \int_0^{\pi/4} \cos^2(2\theta) d\theta \\ &= [\sin(2\theta)]_0^{\pi/4} = 1. \end{aligned}$$

Then a full petal has area $2 \cdot 1 = \boxed{2}$.

22*.

The area A of the half-petal in quadrant I (see the second picture) is swept out beginning with the ray $\theta = 0$ and ending at the ray $\theta = \frac{\pi}{4}$ so A is equal to $\int_0^{\pi/4} \frac{1}{2} r^2 d\theta$.

$$\begin{aligned} A &= \int_0^{\pi/4} \frac{1}{2} r^2 d\theta = \int_0^{\pi/4} \frac{1}{2} (a^2 \cos(2\theta))^2 d\theta = \frac{a^4}{2} \int_0^{\pi/4} \cos^2(2\theta) d\theta \\ &= \frac{a^4}{2} \left[\frac{1}{2} \theta + \frac{1}{4} \cos(2\theta) \sin(2\theta) \right]_0^{\pi/4} = \frac{a^4 \pi}{16}. \end{aligned}$$

Then a full petal has area $2 \cdot \frac{a^4 \pi}{16} = \boxed{\frac{a^4 \pi}{8}}$.

23*.

Referring to the picture we need to find the intersection points of the two circles, so we set them equal.

$$\begin{aligned} 2 \sin \theta &= 1 \\ \sin \theta &= \frac{1}{2} \\ \theta &= \frac{\pi}{6}, \frac{5\pi}{6}. \end{aligned}$$

Then

$$\begin{aligned} A &= \int_{\pi/6}^{5\pi/6} \frac{1}{2} (2 \sin \theta)^2 d\theta - \int_{\pi/6}^{5\pi/6} \frac{1}{2} (1)^2 d\theta \\ &= \left[-\frac{1}{2} \sin \theta \cos \theta + \frac{1}{2} \theta \right]_{\pi/6}^{5\pi/6} - \left[\frac{1}{2} \theta \right]_{\pi/6}^{5\pi/6} \\ &= \frac{\sqrt{3}}{2} + \frac{2\pi}{3} - \frac{\pi}{3} = \boxed{\frac{\sqrt{3}}{2} + \frac{\pi}{3}}. \end{aligned}$$

24*.

Referring to the picture we need to find the intersection points of the two circles, so we set them equal.

$$\begin{aligned} 4 \cos \theta &= 2 \\ \cos \theta &= \frac{1}{2} \\ \theta &= -\frac{\pi}{3}, \frac{\pi}{3}. \end{aligned}$$

Then

$$\begin{aligned} A &= \int_{-\pi/3}^{\pi/3} \frac{1}{2} (4 \cos \theta)^2 d\theta - \int_{-\pi/3}^{\pi/3} \frac{1}{2} (2)^2 d\theta \\ &= [4 \sin \theta \cos \theta + 4\theta]_{-\pi/3}^{\pi/3} - [2\theta]_{-\pi/3}^{\pi/3} \\ &= 2\sqrt{3} + \frac{8\pi}{3} - \frac{4\pi}{3} = \boxed{2\sqrt{3} + \frac{4\pi}{3}}. \end{aligned}$$

25*.

Referring to the picture we can see that the shaded region is swept out beginning with $\theta = 0$ and ending at $\theta = \frac{\pi}{2}$. Then the area A of the shaded region is

$$\begin{aligned}
 A &= \int_0^{\pi/2} \frac{1}{2}(\sin \theta)^2 d\theta - \int_0^{\pi/2} \frac{1}{2}(1 - \cos \theta)^2 d\theta \\
 &= \frac{1}{2} \int_0^{\pi/2} (\sin^2 \theta - 1 + 2 \cos \theta - \cos^2 \theta) d\theta \\
 &= \frac{1}{2} \int_0^{\pi/2} (-\cos(2\theta) - 1 + 2 \cos \theta) d\theta \\
 &= \frac{1}{2} \left[-\frac{1}{2} \sin(2\theta) - \theta + 2 \sin \theta \right]_0^{\pi/2} \\
 &= \boxed{1 - \frac{\pi}{4}}.
 \end{aligned}$$

26.

Referring to the picture we need to find the intersection points of the polar curves, so we set $r^2 = r^2$.

$$\begin{aligned}
 4 \cos(2\theta) &= (\sqrt{2})^2 \\
 \cos(2\theta) &= \frac{1}{2} \\
 \theta &= -\frac{\pi}{6}, \frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}.
 \end{aligned}$$

Exploiting symmetry we will find the area of the shaded region in quadrant I and then quadruple it to find the full shaded area. The area A in quadrant I is swept out beginning with $\theta = 0$ and ending with $\theta = \frac{\pi}{6}$. Then

$$\begin{aligned}
 A &= \int_0^{\pi/6} \frac{1}{2}(4 \cos(2\theta)) d\theta - \int_0^{\pi/6} \frac{1}{2}(\sqrt{2})^2 d\theta \\
 &= \frac{\sqrt{3}}{2} - \frac{\pi}{6}.
 \end{aligned}$$

The full shaded area is then $4 \cdot \left(\frac{\sqrt{3}}{2} - \frac{\pi}{6} \right) = \boxed{2\sqrt{3} - \frac{2\pi}{3}}$.

27*. Using formula (1) with $f(\theta) = \sin \theta$ and $f'(\theta) = \cos \theta$, the surface area S is

$$\begin{aligned} S &= 2\pi \int_0^{\pi/2} (\sin \theta) \sin \theta \sqrt{[\sin \theta]^2 + [\cos \theta]^2} d\theta \\ &= 2\pi \int_0^{\pi/2} \sin^2 \theta d\theta \\ &= 2\pi \left[\frac{1}{2}\theta - \frac{1}{2}\cos \theta \sin \theta \right]_0^{\pi/2} \\ &= 2\pi \left(\frac{1}{4}\pi \right) = \boxed{\frac{\pi^2}{2}}. \end{aligned}$$

28. Using formula (1) with $f(\theta) = 1 + \cos \theta$ and $f'(\theta) = -\sin \theta$, the surface area S is

$$\begin{aligned} S &= 2\pi \int_0^\pi (1 + \cos \theta) \sin \theta \sqrt{[1 + \cos \theta]^2 + [-\sin \theta]^2} d\theta \\ &= 2\pi \int_0^\pi (1 + \cos \theta) \sin \theta \sqrt{2(1 + \cos \theta)} d\theta = 2\sqrt{2}\pi \int_0^\pi (1 + \cos \theta)^{3/2} \sin \theta d\theta. \end{aligned}$$

Using the substitution $u = 1 + \cos \theta$, then $-du = \sin \theta d\theta$ and the new limits are $u = 1 + \cos(0) = 2$ to $u = 1 + \cos(\pi) = 0$, we have

$$\begin{aligned} S &= 2\sqrt{2}\pi \int_2^0 -u^{3/2} du = 2\sqrt{2}\pi \int_0^2 u^{3/2} du \\ &= 2\sqrt{2}\pi \left[\frac{2}{5}u^{5/2} \right]_0^2 = \boxed{\frac{32\pi}{5}}. \end{aligned}$$

29. Using formula (1) with $f(\theta) = e^\theta$ and $f'(\theta) = e^\theta$, the surface area S is

$$\begin{aligned} S &= 2\pi \int_0^\pi (e^\theta) \sin \theta \sqrt{[e^\theta]^2 + [e^\theta]^2} d\theta = 2\sqrt{2}\pi \int_0^\pi e^{2\theta} \sin \theta d\theta \\ &= 2\sqrt{2}\pi \left[\frac{e^{2\theta}}{5} (2 \sin \theta - \cos \theta) \right]_0^\pi = \boxed{\frac{2\sqrt{2}\pi}{5} (e^{2\pi} + 1)}, \end{aligned}$$

where we used Table of Integrals 125.

30. Using formula (1) with $f(\theta) = 2a \cos \theta$ and $f'(\theta) = -2a \sin \theta$, the surface area S is

$$\begin{aligned} S &= 2\pi \int_0^{\pi/2} (2a \cos \theta) \sin \theta \sqrt{[2a \cos \theta]^2 + [-2a \sin \theta]^2} d\theta = 8a^2\pi \int_0^{\pi/2} \cos \theta \sin \theta d\theta \\ &= 8a^2\pi \left[\frac{1}{2} \sin^2 \theta \right]_0^{\pi/2} = \boxed{4a^2\pi}. \end{aligned}$$

Applications and Extensions

31*. To find the area of the small loop, we need to find the values of θ that sweep out the inner loop. We need to find when the polar curve intersects with the pole, so we set $r = 0$.

$$\begin{aligned} 1 + 2 \cos \theta &= 0 \\ \cos \theta &= -\frac{1}{2} \\ \theta &= \frac{2\pi}{3}, \frac{4\pi}{3}. \end{aligned}$$

The two graphs show the full limaçon and just the small loop (zoomed in).

The area A of the small loop is

$$\begin{aligned}
 A &= \int_{2\pi/3}^{4\pi/3} \frac{1}{2} (1 + 2\cos\theta)^2 d\theta = \frac{1}{2} \int_{2\pi/3}^{4\pi/3} (1 + 4\cos\theta + 4\cos^2\theta) d\theta \\
 &= \left[\frac{3}{2}\theta + 2\sin\theta + \cos\theta \sin\theta \right]_{2\pi/3}^{4\pi/3} = \boxed{\pi - \frac{3\sqrt{3}}{2}}.
 \end{aligned}$$

32*. To find the area of the small loop, we need to find the values of θ that sweep out the inner loop. We need to find when the polar curve intersects with the pole, so we set $r = 0$.

$$\begin{aligned}
 1 + 2\sin\theta &= 0 \\
 \sin\theta &= -\frac{1}{2} \\
 \theta &= \frac{7\pi}{6}, \frac{11\pi}{6}.
 \end{aligned}$$

The two graphs show the full limaçon and just the small loop (zoomed in).

The area A of the small loop is

$$\begin{aligned}
 A &= \int_{7\pi/6}^{11\pi/6} \frac{1}{2} (1 + 2\sin\theta)^2 d\theta = \frac{1}{2} \int_{7\pi/6}^{11\pi/6} (1 + 4\sin\theta + 4\sin^2\theta) d\theta \\
 &= \left[\frac{3}{2}\theta - 2\cos\theta - \cos\theta \sin\theta \right]_{7\pi/6}^{11\pi/6} = \boxed{\pi - \frac{3\sqrt{3}}{2}}.
 \end{aligned}$$

33. The two graphs show the full graph and the loop.

To find the area of loop, we need to find the values of θ that sweep out the loop. We need to find when the polar curve intersects with the pole, so we set $r = 0$.

$$\begin{aligned} 2 - \sec \theta &= 0 \\ \sec \theta &= 2 \\ \theta &= \pm \frac{\pi}{3}. \end{aligned}$$

The area A of the small loop is

$$\begin{aligned} A &= \int_{-\pi/3}^{\pi/3} \frac{1}{2} (2 - \sec \theta)^2 d\theta = \frac{1}{2} \int_{-\pi/3}^{\pi/3} (4 - 4 \sec \theta + \sec^2 \theta) d\theta \\ &= \left[2\theta - 2 \ln |\sec \theta + \tan \theta| + \frac{1}{2} \tan \theta \right]_{-\pi/3}^{\pi/3} \\ &= \left(\frac{2\pi}{3} - 2 \ln (2 + \sqrt{3}) + \frac{\sqrt{3}}{2} \right) - \left(-\frac{2\pi}{3} - 2 \ln (2 - \sqrt{3}) - \frac{\sqrt{3}}{2} \right) \\ &= \frac{4\pi}{3} - 2 \ln \left(\frac{2 + \sqrt{3}}{2 - \sqrt{3}} \right) + \sqrt{3} = \frac{4\pi}{3} - 2 \ln ((2 + \sqrt{3})^2) + \sqrt{3} \\ &= \boxed{\frac{4\pi}{3} - 4 \ln (2 + \sqrt{3}) + \sqrt{3}}. \end{aligned}$$

34.

We need to find when the polar curve intersects with the pole, so we set $r = 0$.

$$\begin{aligned} 5 + \sec \theta &= 0 \\ \cos \theta &= -\frac{1}{5} \\ \theta &= \cos^{-1}\left(-\frac{1}{5}\right), 2\pi - \cos^{-1}\left(-\frac{1}{5}\right). \end{aligned}$$

The area A of the loop is

$$\begin{aligned} A &= \int_{\cos^{-1}(-1/5)}^{2\pi - \cos^{-1}(-1/5)} \frac{1}{2}(5 + \sec \theta)^2 d\theta = \int_{\cos^{-1}(-1/5)}^{2\pi - \cos^{-1}(-1/5)} \left(\frac{25}{2} + 5 \sec \theta + \frac{1}{2} \sec^2 \theta\right) d\theta \\ &= \left[\frac{25}{2}\theta + 5 \ln |\sec \theta + \tan \theta| + \frac{1}{2} \tan \theta\right]_{\cos^{-1}(-1/5)}^{2\pi - \cos^{-1}(-1/5)}. \end{aligned}$$

Since $\sec(2\pi + \theta) = \sec \theta$ and $\tan(2\pi + \theta) = \tan \theta$, when substituting in the upper limit $2\pi - \cos^{-1}\left(-\frac{1}{5}\right)$ to the secant and tangent functions, we need only substitute in $-\cos^{-1}\left(-\frac{1}{5}\right)$. To compute A , we will need to simplify the following expressions using the picture where $\cos \theta = -\frac{1}{5}$ or, equivalently, $\theta = \cos^{-1}\left(-\frac{1}{5}\right)$ which means $\frac{\pi}{2} < \theta < \pi$.

$$\begin{aligned} \sec\left(\cos^{-1}\left(-\frac{1}{5}\right)\right) &= -5 \quad \text{and} \quad \sec\left(-\cos^{-1}\left(-\frac{1}{5}\right)\right) = -5 \\ \tan\left(\cos^{-1}\left(-\frac{1}{5}\right)\right) &= -\sqrt{24} = -2\sqrt{6} \quad \text{and} \quad \tan\left(-\cos^{-1}\left(-\frac{1}{5}\right)\right) = \sqrt{24} = 2\sqrt{6} \end{aligned}$$

So

$$\begin{aligned} A &= \frac{25}{2} \left(2\pi - \cos^{-1}\left(-\frac{1}{5}\right)\right) + 5 \ln \left[\sec\left(-\cos^{-1}\left(-\frac{1}{5}\right)\right) + \tan\left(-\cos^{-1}\left(-\frac{1}{5}\right)\right) \right] + \frac{1}{2} \tan\left(-\cos^{-1}\left(-\frac{1}{5}\right)\right) \\ &\quad - \frac{25}{2} \left(\cos^{-1}\left(-\frac{1}{5}\right)\right) + 5 \ln \left[\sec\left(\cos^{-1}\left(-\frac{1}{5}\right)\right) + \tan\left(\cos^{-1}\left(-\frac{1}{5}\right)\right) \right] + \frac{1}{2} \tan\left(\cos^{-1}\left(-\frac{1}{5}\right)\right) \\ &= \frac{25}{2} \left(2\pi - \cos^{-1}\left(-\frac{1}{5}\right)\right) + 5 \ln |-5 + 2\sqrt{6}| + \frac{1}{2}(2\sqrt{6}) - \frac{25}{2} \cos^{-1}\left(-\frac{1}{5}\right) - 5 \ln |-5 - 2\sqrt{6}| - \frac{1}{2}(-2\sqrt{6}) \\ &= \boxed{25\pi - 25 \cos^{-1}\left(-\frac{1}{5}\right) + 5 \ln \left[\frac{-5 + 2\sqrt{6}}{-5 - 2\sqrt{6}} \right] + 2\sqrt{6}}. \end{aligned}$$

35.

Exploiting symmetry, we will find the area A of the regions in the first and second quadrant, and then double that area. The area in the first two quadrants is swept out starting at the ray $\theta = 0$ and ending at $\theta = \pi$. Then

$$A = \int_0^\pi \frac{1}{2} \left[2 \sin^2 \frac{\theta}{2} \right]^2 d\theta = 2 \int_0^\pi \sin^4 \frac{\theta}{2} d\theta.$$

Using the substitution $u = \frac{\theta}{2}$ and changing the limits of integration,

$$\begin{aligned} A &= 4 \int_0^{\pi/2} \sin^4 u \, du \\ &= 4 \left[-\frac{1}{4} \sin^3 u \cos u - \frac{3}{8} \cos u \sin u + \frac{3}{8} u \right]_0^{\pi/2} = \frac{3\pi}{4}, \end{aligned}$$

where to compute the integral we used Table of Integrals 84 & 90. Then the full shaded region has area equal to $2 \cdot \frac{3\pi}{4} = \boxed{\frac{3\pi}{2}}$.

36.

Exploiting symmetry, we will find the area A of the region in quadrant I and then quadruple it to find the full shaded region. The area in quadrant I is swept out beginning with the ray $\theta = 0$ and ending at $\theta = \frac{\pi}{2}$. Then

$$\begin{aligned} A &= \int_0^{\pi/2} \frac{1}{2} [6 \cos^2 \theta]^2 d\theta = 18 \int_0^{\pi/2} \cos^4 \theta d\theta \\ &= \left[\frac{9}{2} \cos^3 \theta \sin \theta + \frac{27}{4} \cos \theta \sin \theta + \frac{27}{4} \theta \right]_0^{\pi/2} = \boxed{\frac{27\pi}{8}}, \end{aligned}$$

where to compute the integral we use Table of Integrals 85 & 91.

37*.

We need to find the angles that sweep out the shaded region so we set the equations equal.

$$\begin{aligned} 8 \cos \theta &= 2 \sec \theta \\ \cos^2 \theta &= \frac{1}{4} \\ \cos \theta &= \pm \frac{1}{2} \\ \theta &= \pm \frac{\pi}{3}, \pm \frac{2\pi}{3}. \end{aligned}$$

The shaded region is swept out beginning with $\theta = -\frac{\pi}{3}$ and ending at $\theta = \frac{\pi}{3}$. The area A of the shaded region is then

$$\begin{aligned} A &= \int_{-\pi/3}^{\pi/3} \frac{1}{2} (8 \cos \theta)^2 d\theta - \int_{-\pi/3}^{\pi/3} \frac{1}{2} (2 \sec \theta)^2 d\theta = \int_{-\pi/3}^{\pi/3} (32 \cos^2 \theta - 2 \sec^2 \theta) d\theta \\ &= [16 \cos \theta \sin \theta + 16\theta - 2 \tan \theta]_{-\pi/3}^{\pi/3} = \boxed{4\sqrt{3} + \frac{32\pi}{3}}. \end{aligned}$$

38*.

We need to find the angles that sweep out the shaded region so we set the equations equal.

$$\begin{aligned} 10 \sin \theta &= 2 \csc \theta \\ \sin^2 \theta &= \frac{1}{5} \\ \sin \theta &= \pm \frac{1}{\sqrt{5}} \\ \theta &= \pm \sin^{-1} \left(\frac{1}{\sqrt{5}} \right), \pm \sin^{-1} \left(\frac{1}{\sqrt{5}} \right) + \pi. \end{aligned}$$

The shaded region is swept out starting at $\theta = \sin^{-1}\left(\frac{1}{\sqrt{5}}\right)$ and ending at $\theta = \pi - \sin^{-1}\left(\frac{1}{\sqrt{5}}\right)$. The area A of the shaded region is then

$$\begin{aligned} A &= \int_{\sin^{-1}(1/\sqrt{5})}^{\pi - \sin^{-1}(1/\sqrt{5})} \frac{1}{2} (10 \sin \theta)^2 d\theta - \int_{\sin^{-1}(1/\sqrt{5})}^{\pi - \sin^{-1}(1/\sqrt{5})} \frac{1}{2} (2 \csc \theta)^2 d\theta \\ &= \int_{\sin^{-1}(1/\sqrt{5})}^{\pi - \sin^{-1}(1/\sqrt{5})} (50 \sin^2 \theta - 2 \csc^2 \theta) d\theta. \end{aligned}$$

To compute A , we will need to simplify the following expressions using the picture where $\sin \theta = \frac{1}{\sqrt{5}}$ or, equivalently, $\theta = \sin^{-1}\left(\frac{1}{\sqrt{5}}\right)$.

$$\begin{aligned} \cos \sin^{-1}\left(\frac{1}{\sqrt{5}}\right) &= \frac{2}{\sqrt{5}} \\ \cos\left(\pi - \sin^{-1}\left(\frac{1}{\sqrt{5}}\right)\right) &= \cos \pi \cos \sin^{-1}\left(\frac{1}{\sqrt{5}}\right) + \sin \pi \sin \sin^{-1}\left(\frac{1}{\sqrt{5}}\right) = -\frac{2}{\sqrt{5}} \\ \sin \sin^{-1}\left(\frac{1}{\sqrt{5}}\right) &= \frac{1}{\sqrt{5}} \\ \sin\left(\pi - \sin^{-1}\left(\frac{1}{\sqrt{5}}\right)\right) &= \sin \pi \cos \sin^{-1}\left(\frac{1}{\sqrt{5}}\right) - \cos \pi \sin \sin^{-1}\left(\frac{1}{\sqrt{5}}\right) = \frac{1}{\sqrt{5}}. \end{aligned}$$

Then

$$A = [-25 \cos \theta \sin \theta + 25\theta + 2 \cot \theta]_{\sin^{-1}(1/\sqrt{5})}^{\pi - \sin^{-1}(1/\sqrt{5})} = \boxed{12 - 50 \sin^{-1}\left(\frac{1}{\sqrt{5}}\right) + 25\pi}.$$

39*.

We need to find the angles that sweep out the shaded region so we set the equations equal.

$$\begin{aligned} 2 + 2 \cos \theta &= 3 \\ \cos \theta &= \frac{1}{2} \\ \theta &= \pm \frac{\pi}{3}. \end{aligned}$$

The shaded region is swept out beginning with $\theta = -\frac{\pi}{3}$ and ending at $\theta = \frac{\pi}{3}$. The area A of the shaded region is then

$$\begin{aligned} A &= \int_{-\pi/3}^{\pi/3} \frac{1}{2} (2 + 2 \cos \theta)^2 d\theta - \int_{-\pi/3}^{\pi/3} \frac{1}{2} (3)^2 d\theta = \int_{-\pi/3}^{\pi/3} \left(-\frac{5}{2} + 4 \cos \theta + 2 \cos^2 \theta \right) d\theta \\ &= \left[-\frac{3}{2} \theta + 4 \sin \theta + \cos \theta \sin \theta \right]_{-\pi/3}^{\pi/3} = \boxed{\frac{9\sqrt{3}}{2} - \pi}. \end{aligned}$$

40*.

We need to find the angles that sweep out the shaded region so we set the equations equal.

$$\begin{aligned} \sin \theta &= 1 + \cos \theta \\ \sin \theta - \cos \theta &= 1 \\ \theta &= \frac{\pi}{2}, \pi. \end{aligned}$$

The shaded region is swept out beginning with $\theta = \frac{\pi}{2}$ and ending at $\theta = \pi$. The area A of the shaded region is then

$$\begin{aligned} A &= \int_{\pi/2}^{\pi} \frac{1}{2} (\sin \theta)^2 d\theta - \int_{\pi/2}^{\pi} \frac{1}{2} (1 + \cos \theta)^2 d\theta = \int_{\pi/2}^{\pi} \left(\frac{1}{2} \sin^2 \theta - \frac{1}{2} - \cos \theta - \frac{1}{2} \cos^2 \theta \right) d\theta \\ &= \left[-\frac{1}{2} \sin \theta \cos \theta - \frac{1}{2} \theta - \sin \theta \right]_{\pi/2}^{\pi} = \boxed{1 - \frac{\pi}{4}}. \end{aligned}$$

41*.

Exploiting symmetry, we will find the area of the shaded region in quadrant I and then double it to find the full shaded area. Referring to the second picture, the shaded region in quadrant I can be divided by the ray from the pole through the intersection point of the two curves. The angle that represents the ray through the intersection point can be found by setting the equations equal.

$$\begin{aligned} \cos \theta &= 1 - \cos \theta \\ \cos \theta &= \frac{1}{2} \\ \theta &= \frac{\pi}{3}. \end{aligned}$$

The shaded region in quadrant I can then be found by finding the area of the shaded region on $\left[0, \frac{\pi}{3}\right]$ of the cardioid and then adding the area of the shaded region on $\left[\frac{\pi}{3}, \frac{\pi}{2}\right]$ of the circle. This means the area A in quadrant I is

$$\begin{aligned}
 A &= \int_0^{\pi/3} \frac{1}{2}(1 - \cos \theta)^2 d\theta + \int_{\pi/3}^{\pi/2} \frac{1}{2}(\cos \theta)^2 d\theta \\
 &= \int_0^{\pi/3} \left(\frac{1}{2} - \cos \theta + \frac{1}{2} \cos^2 \theta \right) d\theta + \int_{\pi/3}^{\pi/2} \frac{1}{2} \cos^2 \theta d\theta \\
 &= \left[\frac{3}{4}\theta - \sin \theta + \frac{1}{4} \cos \theta \sin \theta \right]_0^{\pi/3} + \left[\frac{1}{4}\theta + \frac{1}{4} \cos \theta \sin \theta \right]_{\pi/3}^{\pi/2} \\
 &= \left[\frac{\pi}{4} - \frac{7\sqrt{3}}{16} \right] + \left[\frac{\pi}{24} - \frac{\sqrt{3}}{16} \right] = \frac{7\pi}{24} - \frac{\sqrt{3}}{2}.
 \end{aligned}$$

Then the full shaded area is

$$2 \cdot \left(\frac{7\pi}{24} - \frac{\sqrt{3}}{2} \right) = \boxed{\frac{7\pi}{12} - \sqrt{3}}.$$

42*.

Exploiting symmetry, we will find the area A inside the (top) circle $r = \sin \theta$ from $\left[0, \frac{\pi}{4}\right]$ and then double it. Then

$$\begin{aligned}
 A &= \int_0^{\pi/4} \frac{1}{2}(\sin \theta)^2 d\theta = \frac{1}{2} \int_0^{\pi/4} \sin^2 \theta d\theta \\
 &= \left[\frac{1}{4}\theta - \frac{1}{4} \sin \theta \cos \theta \right]_0^{\pi/4} = \frac{\pi}{16} - \frac{1}{8}.
 \end{aligned}$$

This means the full area of the shaded region is $2 \cdot \left(\frac{\pi}{16} - \frac{1}{8} \right) = \boxed{\frac{\pi}{8} - \frac{1}{4}}.$

43*.

First we find the intersection points by setting the equations equal.

$$\begin{aligned} 1 + \cos \theta &= 1 + \sin \theta \\ \cos \theta &= \sin \theta \\ \theta &= \frac{\pi}{4}, \frac{5\pi}{4}. \end{aligned}$$

The area A of the shaded region is swept out beginning with the ray $\theta = \frac{\pi}{4}$ and ending with the ray $\theta = \frac{5\pi}{4}$. Then

$$\begin{aligned} A &= \int_{\pi/4}^{5\pi/4} \frac{1}{2}(1 + \sin \theta)^2 d\theta - \int_{\pi/4}^{5\pi/4} \frac{1}{2}(1 + \cos \theta)^2 d\theta = \int_{\pi/4}^{5\pi/4} \left(\sin \theta - \cos \theta + \frac{1}{2} \sin^2 \theta - \frac{1}{2} \cos^2 \theta \right) d\theta \\ &= \left[-\cos \theta - \sin \theta - \frac{1}{2} \sin \theta \cos \theta \right]_{\pi/4}^{5\pi/4} = \boxed{2\sqrt{2}}. \end{aligned}$$

44.

Exploiting symmetry, we will find the area A of the shaded region in quadrant I and then quadruple it to find the full shaded area. First we find the intersection in quadrant I by setting $r^2 = r^2$.

$$\begin{aligned} 8 \cos(2\theta) &= 4 \\ \cos(2\theta) &= \frac{1}{2} \\ 2\theta &= \frac{\pi}{3} \\ \theta &= \frac{\pi}{6}. \end{aligned}$$

Then

$$\begin{aligned} A &= \int_0^{\pi/6} \frac{1}{2} \cdot 8 \cos(2\theta) d\theta - \int_0^{\pi/6} \frac{1}{2}(2)^2 d\theta = \int_0^{\pi/6} (4 \cos(2\theta) - 2) d\theta \\ &= [2 \sin(2\theta) - 2\theta]_0^{\pi/6} = \sqrt{3} - \frac{\pi}{3}. \end{aligned}$$

This means the full shaded region has area $4 \cdot \left(\sqrt{3} - \frac{\pi}{3} \right) = \boxed{4\sqrt{3} - \frac{4\pi}{3}}$.

45. Using the area formula, the enclosed area A is

$$\begin{aligned} A &= \int_0^1 \frac{1}{2}(e^{-\theta})^2 d\theta = \int_0^1 \frac{1}{2}e^{-2\theta} d\theta \\ &= \left[-\frac{1}{4}e^{-2\theta} \right]_0^1 = \boxed{\frac{1 - e^{-2}}{4}}. \end{aligned}$$

46. Using the area formula, the enclosed area A is

$$\begin{aligned} A &= \int_0^1 \frac{1}{2} (e^\theta)^2 d\theta = \int_0^1 \frac{1}{2} e^{2\theta} d\theta \\ &= \left[\frac{1}{4} e^{2\theta} \right]_0^1 = \boxed{\frac{1}{4} e^2 - \frac{1}{4}}. \end{aligned}$$

47. Using the area formula, the area A enclosed is

$$\begin{aligned} A &= \int_1^\pi \frac{1}{2} \left(\frac{1}{\theta} \right)^2 d\theta = \int_1^\pi \frac{1}{2} \theta^{-2} d\theta \\ &= \left[-\frac{1}{2} \theta^{-1} \right]_1^\pi = \boxed{\frac{\pi - 1}{2\pi}}. \end{aligned}$$

48*.

First we find when the polar curve intersects the pole by setting the equation equal to zero.

$$\begin{aligned} 1 + 2 \sin \theta &= 0 \\ \sin \theta &= -\frac{1}{2} \\ \theta &= \frac{7\pi}{6}, \frac{11\pi}{6}. \end{aligned}$$

The left-most graph represents the full curve; the middle graph represents the curve on $-\frac{\pi}{6} \leq \theta \leq \frac{7\pi}{6}$ (notice we chose the ray $\theta = -\frac{\pi}{6}$ and not $\theta = \frac{11\pi}{6}$ so we could start with a ray whose angle was smaller than $\frac{7\pi}{6}$); the right-most graph represents the inner loop of the curve on $\frac{7\pi}{6} \leq \theta \leq \frac{11\pi}{6}$ (zoomed in). The area A we seek is the difference between area B of the middle graph and the area C of the right-most graph. Then

$$\begin{aligned} A &= B - C = \int_{-\pi/6}^{7\pi/6} \frac{1}{2} (1 + 2 \sin \theta)^2 d\theta - \int_{7\pi/6}^{11\pi/6} \frac{1}{2} (1 + 2 \sin \theta)^2 d\theta \\ &= \int_{-\pi/6}^{7\pi/6} \left(\frac{1}{2} + 2 \sin \theta + 2 \sin^2 \theta \right) d\theta - \int_{7\pi/6}^{11\pi/6} \left(\frac{1}{2} + 2 \sin \theta + 2 \sin^2 \theta \right) d\theta \\ &= \left[\frac{3}{2} \theta - 2 \cos \theta - \sin \theta \cos \theta \right]_{-\pi/6}^{7\pi/6} - \left[\frac{3}{2} \theta - 2 \cos \theta - 2 \sin \theta \cos \theta \right]_{7\pi/6}^{11\pi/6} = \left(\frac{3}{2} \sqrt{3} + 2\pi \right) - \left(-\frac{3}{2} \sqrt{3} + \pi \right) \\ &= \boxed{3\sqrt{3} + \pi}. \end{aligned}$$

49.

We need to find when the polar curve intersects with the pole, so we set $r = 0$.

$$\begin{aligned} 2 + \sec \theta &= 0 \\ \cos \theta &= -\frac{1}{2} \\ \theta &= \frac{2\pi}{3}, \frac{4\pi}{3}. \end{aligned}$$

The area A of the loop is

$$\begin{aligned} A &= \int_{2\pi/3}^{4\pi/3} \frac{1}{2} (2 + \sec \theta)^2 d\theta = \int_{2\pi/3}^{4\pi/3} \left(\frac{1}{2} \sec^2 \theta + 2 \sec \theta + 2 \right) d\theta \\ &= \left[\frac{1}{2} \tan \theta + 2 \ln |\sec \theta + \tan \theta| + 2\theta \right]_{2\pi/3}^{4\pi/3} = \sqrt{3} + \frac{4\pi}{3} + 2 \ln \left(\frac{2 - \sqrt{3}}{2 + \sqrt{3}} \right) \\ &= \boxed{\sqrt{3} + \frac{4\pi}{3} - 4 \ln (2 + \sqrt{3})}. \end{aligned}$$

50. By rotating the top half of the polar curve $r = R$ about the polar axis, we have a sphere. If we use formula (1) with $f(\theta) = R$, $f'(\theta) = 0$, and $0 \leq \theta \leq \pi$, then the surface area S of a sphere is

$$\begin{aligned} S &= 2\pi \int_0^\pi R \sin \theta \sqrt{[R]^2 + [0]^2} d\theta = 2\pi R^2 \int_0^\pi \sin \theta d\theta \\ &= 2\pi R^2 [-\cos \theta]_0^\pi = \boxed{4\pi R^2}. \end{aligned}$$

51. (a)

If we rotate the top half of the circle $r = R$ about the polar axis for $T \leq \theta \leq \pi - T$, then we will have the surface of the bead. Using formula (1) with $f(\theta) = R$, $f'(\theta) = 0$, and $T \leq \theta \leq \pi - T$, the surface area S of the bead is

$$\begin{aligned} S &= 2\pi \int_T^{\pi-T} R \sin \theta \sqrt{[R]^2 + [0]^2} d\theta = 2\pi R^2 \int_T^{\pi-T} \sin \theta d\theta \\ &= 2\pi R^2 [-\cos \theta]_T^{\pi-T} = 2\pi R^2 [-\cos(\pi - T) + \cos(T)]. \end{aligned}$$

From the picture, we see that $\cos(T) = \frac{\sqrt{R^2 - a^2}}{R}$ and so $-\cos(\pi - T) = \frac{\sqrt{R^2 - a^2}}{R}$. Then

$$S = 2\pi R^2 \cdot \frac{2\sqrt{R^2 - a^2}}{R} = \boxed{4\pi R\sqrt{R^2 - a^2}}.$$

(b) Answers will vary.

52. (a) Using Problems 50 and 51, we can find the area left by taking the difference between the full surface area of the sphere and subtracting the surface area of the bead. This means the surface area of the plug is

$$4\pi R^2 - 4\pi R\sqrt{R^2 - a^2}.$$

(b) Answers will vary.

53*. We first find where the curve intersects the pole by setting $r = 0$.

$$\begin{aligned}\sec \theta - 2 \cos \theta &= 0 \\ 1 - 2 \cos^2 \theta &= 0 \\ \cos^2 \theta &= \frac{1}{2} \\ \cos \theta &= \pm \frac{\sqrt{2}}{2} \\ \theta &= -\frac{\pi}{4}, \frac{\pi}{4}.\end{aligned}$$

From the picture we see that the shaded region is swept out beginning with $\theta = -\frac{\pi}{4}$ and ending with $\theta = \frac{\pi}{4}$. So the area A of the shaded region is

$$\begin{aligned}A &= \frac{1}{2} \int_{-\pi/4}^{\pi/4} \frac{1}{2} (\sec \theta - 2 \cos \theta)^2 d\theta = \int_{-\pi/4}^{\pi/4} \left(\frac{1}{2} \sec^2 \theta - 2 + 2 \cos^2 \theta \right) d\theta \\ &= \left[\frac{1}{2} \tan \theta - \theta + \sin \theta \cos \theta \right]_{-\pi/4}^{\pi/4} = \boxed{2 - \frac{\pi}{2}}.\end{aligned}$$

54.

(a)

(b) By setting $r = 0$, we see that the curve intersects the pole when $\theta = \cos^{-1}(2/3), 2\pi - \cos^{-1}(2/3)$. The second graph depicts the curve when $2\pi - \cos^{-1}(2/3) \leq \theta \leq 2\pi$. If we find the area A of this piece and double it, we will have the full area of the inner loop. Then using a CAS

$$A = \int_{2\pi - \cos^{-1}(2/3)}^{2\pi} \frac{1}{2} (2 - 3 \cos \theta)^2 d\theta \approx 0.2204,$$

which means the full area of the inner loop is approximately $2 \cdot 0.2204 \approx \boxed{0.441}$.

Challenge Problems

55. The area enclosed by the graph $r\theta = a$ and the rays $\theta = \theta_1$ and $\theta = \theta_2$ is

$$\begin{aligned} \int_{\theta_1}^{\theta_2} \frac{1}{2} \left(\frac{a}{\theta} \right)^2 d\theta &= \frac{a^2}{2} \int_{\theta_1}^{\theta_2} \theta^{-2} d\theta \\ &= \frac{a^2}{2} [-\theta^{-1}]_{\theta_1}^{\theta_2} = \frac{a^2}{2} \left(\frac{1}{\theta_1} - \frac{1}{\theta_2} \right) = \frac{a}{2} \left(\frac{a}{\theta_1} - \frac{a}{\theta_2} \right) \\ &= \frac{a}{2} (r_1 - r_2). \end{aligned}$$

Since $\frac{a}{2}$ is a constant, we see that the area is a constant multiple of (i.e. proportional to) $r_1 - r_2$.

56*.

Exploiting symmetry, we will find the shaded area A in quadrant I and triple it. We must first find the intersection points of the rose and circle in quadrant I.

$$\begin{aligned} 3 \sin(3\theta) &= 1 \\ 3\theta &= \sin^{-1}\left(\frac{1}{3}\right), \pi - \sin^{-1}\left(\frac{1}{3}\right) \\ \theta &= \frac{1}{3} \sin^{-1}\left(\frac{1}{3}\right), \frac{\pi}{3} - \frac{1}{3} \sin^{-1}\left(\frac{1}{3}\right). \end{aligned}$$

Then

$$\begin{aligned} A &= \int_{1/3 \sin^{-1}(1/3)}^{\pi/3 - 1/3 \sin^{-1}(1/3)} \frac{1}{2} (3 \sin(3\theta))^2 d\theta - \int_{1/3 \sin^{-1}(1/3)}^{\pi/3 - 1/3 \sin^{-1}(1/3)} \frac{1}{2} (1)^2 d\theta \\ &= \int_{1/3 \sin^{-1}(1/3)}^{\pi/3 - 1/3 \sin^{-1}(1/3)} \left(\frac{9}{2} \sin^2(3\theta) - \frac{1}{2} \right) d\theta \\ &= \left[-\frac{3}{4} \sin(3\theta) \cos(3\theta) + \frac{7}{4} \theta \right]_{1/3 \sin^{-1}(1/3)}^{\pi/3 - 1/3 \sin^{-1}(1/3)} \\ &= \left[-\frac{3}{8} \sin(6\theta) + \frac{7}{4} \theta \right]_{1/3 \sin^{-1}(1/3)}^{\pi/3 - 1/3 \sin^{-1}(1/3)}. \end{aligned}$$

To compute A , we need to simplify the following expressions using the picture where $\sin \theta = \frac{1}{3}$ or, equivalently,

$$\theta = \sin^{-1}\left(\frac{1}{3}\right).$$

$$\begin{aligned}
\sin\left(6\left(\frac{1}{3}\sin^{-1}\left(\frac{1}{3}\right)\right)\right) &= \sin\left(2\sin^{-1}\left(\frac{1}{3}\right)\right) = 2\sin\left(\sin^{-1}\left(\frac{1}{3}\right)\right)\cos\left(\sin^{-1}\frac{1}{3}\right) \\
&= 2 \cdot \frac{1}{3} \cdot \frac{2\sqrt{2}}{3} = \frac{4\sqrt{2}}{9} \\
\sin\left(6\left(\frac{\pi}{3} - \frac{1}{3}\sin^{-1}\left(\frac{1}{3}\right)\right)\right) &= \sin\left(2\pi - 2\sin^{-1}\left(\frac{1}{3}\right)\right) = \sin(2\pi)\cos\left(2\sin^{-1}\left(\frac{1}{3}\right)\right) - \sin\left(2\sin^{-1}\left(\frac{1}{3}\right)\right)\cos(2\pi) \\
&= -\frac{4\sqrt{2}}{9}.
\end{aligned}$$

Using this, we find that

$$\begin{aligned}
A &= \left[-\frac{3}{8}\left(-\frac{4\sqrt{2}}{9}\right) + \frac{7}{4}\left(\frac{\pi}{3} - \frac{1}{3}\sin^{-1}\left(\frac{1}{3}\right)\right) \right] - \left[-\frac{3}{8}\left(\frac{4\sqrt{2}}{9}\right) + \frac{7}{4}\left(\frac{1}{3}\sin^{-1}\left(\frac{1}{3}\right)\right) \right] \\
&= \boxed{\frac{\sqrt{2}}{3} + \frac{7\pi}{12} - \frac{7}{6}\sin^{-1}\left(\frac{1}{3}\right)}.
\end{aligned}$$

57.

To find the area of the shaded region in the first figure, we will exploit symmetry and find the area A of the shaded region in the second figure and multiply it by eight to find the area we seek. We must first find the intersection point P of the rose and circle.

$$\begin{aligned}
3\sin(2\theta) &= 2 \\
\sin(2\theta) &= \frac{2}{3} \\
2\theta &= \sin^{-1}\left(\frac{2}{3}\right) \\
\theta &= \frac{1}{2}\sin^{-1}\left(\frac{2}{3}\right).
\end{aligned}$$

Then the area A is swept out beginning at $\theta = 0$ and ending at $\theta = \frac{1}{2}\sin^{-1}\left(\frac{2}{3}\right)$, so

$$\begin{aligned}
A &= \int_0^{1/2\sin^{-1}(2/3)} \frac{1}{2}(2)^2 d\theta - \int_0^{1/2\sin^{-1}(2/3)} \frac{1}{2}(3\sin(2\theta))^2 d\theta = \int_0^{1/2\sin^{-1}(2/3)} \left(2 - \frac{9}{2}\sin^2(2\theta)\right) d\theta \\
&= \left[-\frac{1}{4}\theta + \frac{9}{8}\sin(2\theta)\cos(2\theta) \right]_0^{1/2\sin^{-1}(2/3)} = \frac{\sqrt{5}}{4} - \frac{1}{8}\sin^{-1}\left(\frac{2}{3}\right).
\end{aligned}$$

Multiplying this value by eight, we have the area we sought.

$$8\left(\frac{\sqrt{5}}{4} - \frac{1}{8}\sin^{-1}\left(\frac{2}{3}\right)\right) = \boxed{2\sqrt{5} - \sin^{-1}\left(\frac{2}{3}\right)}.$$

9.7 The Polar Equation of a Conic

Concepts and Vocabulary

1. A **(a) parabola** is the set of points P in the plane for which the distance from a fixed point called the focus P equals the distance from a fixed line called the directrix.

2. **Answers will vary.**

3. **In both cases, $e = 1$, so both graphs are parabolas. Answers will vary.**

4. **False**. The polar equation should be $r = \frac{ep}{1 - e \cos \theta}$.

Skill Building

5. Using Table 8,

$$r = \frac{1}{1 + \cos \theta}$$

which means $e = 1$ and $p = 1$ so we have a **parabola** where the directrix is perpendicular to the polar axis 1 unit to the right of the pole.

6. Using Table 8,

$$r = \frac{3}{1 - \sin \theta}$$

which means $e = 1$ and $p = 3$ so we have a **parabola** where the directrix is parallel to the polar axis 3 units below the pole.

7. Using Table 8,

$$r = \frac{4}{2 - 3 \sin \theta} = \frac{2}{1 - \frac{3}{2} \sin \theta}$$

which means $e = \frac{3}{2}$ and $ep = 2$ so $p = \frac{4}{3}$ which means we have a **hyperbola** where the directrix is parallel to the polar axis $\frac{4}{3}$ units below the pole.

8. Using Table 8,

$$r = \frac{2}{1 + 2 \cos \theta}$$

which means $e = 2$ and $ep = 2$ so $p = 1$ which means we have a **hyperbola** where the directrix is perpendicular to the polar axis 1 unit to the right of the pole.

9. Using Table 8,

$$r = \frac{3}{4 - 2 \cos \theta} = \frac{\frac{3}{4}}{1 - \frac{1}{2} \cos \theta}$$

which means $e = \frac{1}{2}$ and $ep = \frac{3}{4}$ so $p = \frac{3}{2}$ which means we have an **ellipse** where the directrix is perpendicular to the polar axis $\frac{3}{2}$ units to the left of the pole.

10. Using Table 8,

$$r = \frac{6}{8 + 2 \cos \theta} = \frac{\frac{3}{4}}{1 + \frac{1}{4} \cos \theta}$$

which means $e = \frac{1}{4}$ and $ep = \frac{3}{4}$ so $p = 3$ which means we have an **ellipse** where the directrix is perpendicular to the polar axis 3 units to the right of the pole.

11. Using Table 8,

$$r = \frac{4}{3 + 3 \sin \theta} = \frac{\frac{4}{3}}{1 + \sin \theta}$$

which means $e = 1$ and $ep = \frac{4}{3}$ so $p = \frac{4}{3}$ which means we have a parabola where the directrix is parallel to the polar axis $\frac{4}{3}$ units above the pole.

12. Using Table 8,

$$r = \frac{1}{6 + 2 \sin \theta} = \frac{\frac{1}{6}}{1 + \frac{1}{3} \sin \theta}$$

which means $e = \frac{1}{3}$ and $ep = \frac{1}{6}$ so $p = \frac{1}{2}$ which means we have an ellipse where the directrix is parallel to the polar axis $\frac{1}{2}$ unit above the pole.

13. (a) Using Table 8,

$$r = \frac{8}{4 + 3 \sin \theta} = \frac{2}{1 + \frac{3}{4} \sin \theta}$$

which means $e = \frac{3}{4}$ and $ep = 2$, so $p = \frac{8}{3}$. Since $e < 1$, this is an ellipse with directrix parallel to the polar axis $\frac{8}{3}$ units above the pole. At $t = 0$ and $t = \pi$, the polar points corresponding to these values are $(0, 2)$ and $(\pi, 2)$, respectively, which are vertices of the ellipse. The y -intercepts are at $\theta = \frac{\pi}{2}$ and $\theta = \frac{3\pi}{2}$, which gives rise to the polar points $\left(\frac{\pi}{2}, \frac{8}{7}\right)$ and $\left(\frac{3\pi}{2}, 8\right)$.

(b) To obtain a rectangular equation of the ellipse, we eliminate the fraction and then square the resulting polar equation.

$$\begin{aligned} r &= \frac{8}{4 + 3 \sin \theta} \\ 4r + 3r \sin \theta &= 8 \\ 4r &= 8 - 3r \sin \theta \\ 16r^2 &= (8 - 3r \sin \theta)^2 \\ 16(x^2 + y^2) &= (8 - 3y)^2 \\ 16x^2 + 16y^2 &= 64 - 48y + 9y^2 \\ 16x^2 + 7\left(y^2 + \frac{48}{7}y\right) &= 64 \\ 16x^2 + 7\left(y + \frac{24}{7}\right)^2 &= 64 + 7\left(\frac{24}{7}\right)^2 \\ \boxed{16x^2 + 7\left(y + \frac{24}{7}\right)^2} &= \boxed{\frac{1024}{7}}. \end{aligned}$$

(c) Parametric equations are

$$x = \frac{8 \cos \theta}{4 + 3 \sin \theta}, \quad y = \frac{8 \sin \theta}{4 + 3 \sin \theta}.$$

14. (a) Using Table 8,

$$r = \frac{10}{5 + 4 \cos \theta} = \frac{2}{1 + \frac{4}{5} \cos \theta}$$

which means $e = \frac{4}{5}$ and $ep = 2$, so $p = \frac{5}{2}$. Since $e < 1$, this is an ellipse with directrix perpendicular to the polar axis $\frac{5}{2}$ units to the right of the pole. At $t = 0$ and $t = \pi$, the polar points corresponding to these values are $\left(0, \frac{10}{9}\right)$ and $(\pi, 10)$, respectively, which are vertices of the ellipse. The y -intercepts are at $\theta = \frac{\pi}{2}$ and $\theta = \frac{3\pi}{2}$, which gives rise to the polar points $\left(\frac{\pi}{2}, 2\right)$ and $\left(\frac{3\pi}{2}, 2\right)$.

(b) To obtain a rectangular equation of the ellipse, we eliminate the fraction and then square the resulting polar equation.

$$\begin{aligned} r &= \frac{10}{5 + 4 \cos \theta} \\ 5r + 4r \cos \theta &= 10 \\ 5r &= 10 - 4r \cos \theta \\ 25r^2 &= (10 - 4r \cos \theta)^2 \\ 25(x^2 + y^2) &= (10 - 4x)^2 \\ 25x^2 + 25y^2 &= 100 - 80x + 16x^2 \\ 9\left(x^2 + \frac{80}{9}x\right) + 25y^2 &= 100 \\ 9\left(x + \frac{40}{9}\right)^2 + 25y^2 &= 100 + 9\left(\frac{40}{9}\right)^2 \\ \boxed{9\left(x + \frac{40}{9}\right)^2 + 25y^2} &= \boxed{\frac{2500}{9}}. \end{aligned}$$

(c) Parametric equations are

$$x = \frac{10 \cos \theta}{5 + 4 \cos \theta}, \quad y = \frac{10 \sin \theta}{5 + 4 \cos \theta}.$$

15. (a) Using Table 8,

$$r = \frac{9}{3 - 6 \cos \theta} = \frac{3}{1 - 2 \cos \theta}$$

which means $e = 2$. Since $e > 1$, this is a hyperbola.

(b) To obtain a rectangular equation of the hyperbola, we eliminate the fraction and then square the resulting polar equation.

$$\begin{aligned}
 r &= \frac{9}{3 - 6 \cos \theta} \\
 3r - 6r \cos \theta &= 9 \\
 3r &= 9 + 6r \cos \theta \\
 9r^2 &= (9 + 6r \cos \theta)^2 \\
 9(x^2 + y^2) &= (9 + 6x)^2 \\
 9x^2 + 9y^2 &= 81 + 108x + 36x^2 \\
 27(x^2 + 4x) - 9y^2 &= -81 \\
 27(x + 2)^2 - 9y^2 &= -81 + 27(4) \\
 \boxed{3(x + 2)^2 - y^2} &= 3.
 \end{aligned}$$

(c) Parametric equations are

$$\boxed{x = \frac{9 \cos \theta}{3 - 6 \cos \theta}, \quad y = \frac{9 \sin \theta}{3 - 6 \cos \theta}}.$$

16. (a) Using Table 8,

$$r = \frac{12}{4 + 8 \sin \theta} = \frac{3}{1 + 2 \sin \theta}$$

which means $e = 2$. Since $e > 1$, this is a hyperbola.

(b) To obtain a rectangular equation of the hyperbola, we eliminate the fraction and then square the

resulting polar equation.

$$\begin{aligned}
 r &= \frac{12}{4 + 8 \sin \theta} \\
 4r &= 12 - 8r \sin \theta \\
 16r^2 &= (12 - 8r \sin \theta)^2 \\
 16(x^2 + y^2) &= (12 - 8y)^2 \\
 16x^2 + 16y^2 &= 144 - 192y + 64y^2 \\
 48y^2 - 192y - 16x^2 &= -144 \\
 48(y^2 - 4y) - 16x^2 &= -144 \\
 48(y - 2)^2 - 16x^2 &= -144 + 48(2)^2 \\
 \boxed{48(y - 2)^2 - 16x^2 &= 48}.
 \end{aligned}$$

(c) Parametric equations are

$$\boxed{x = \frac{12 \cos \theta}{4 + 8 \sin \theta}, \quad y = \frac{12 \sin \theta}{4 + 8 \sin \theta}}.$$

17. (a) Using Table 8,

$$r = \frac{6}{3 - 2 \sin \theta} = \frac{2}{1 - \frac{2}{3} \sin \theta}$$

which means $e = \frac{2}{3}$ and $ep = 2$, so $p = 3$. Since $e < 1$, this is an ellipse with directrix parallel to the polar axis 3 units below the pole. At $t = 0$ and $t = \pi$, the polar points corresponding to these values are $(0, 2)$ and $(\pi, 2)$, respectively, which are vertices of the ellipse. The y -intercepts are at $\theta = \frac{\pi}{2}$ and $\theta = \frac{3\pi}{2}$, which gives rise to the points $\left(\frac{\pi}{2}, 6\right)$ and $\left(\frac{3\pi}{2}, \frac{6}{5}\right)$.

(b) To obtain a rectangular equation of the ellipse, we eliminate the fraction and then square the resulting

polar equation.

$$\begin{aligned}
 3r - 2r \sin \theta &= 6 \\
 9r^2 &= (3r)^2 = (6 + 2r \sin \theta)^2 \\
 9(x^2 + y^2) &= (6 + 2y)^2 \\
 9x^2 + 9y^2 &= 36 + 24y + 4y^2 \\
 9x^2 + 5\left(y^2 - \frac{24}{5}y\right) &= 36 \\
 9x^2 + 5\left(y - \frac{12}{5}\right)^2 &= 36 + 5\left(\frac{12}{5}\right)^2 \\
 \boxed{9x^2 + 5\left(y - \frac{12}{5}\right)^2} &= \frac{324}{5}.
 \end{aligned}$$

(c) Parametric equations are

$$\boxed{x = \frac{6 \cos \theta}{3 - 2 \sin \theta}, \quad y = \frac{6 \sin \theta}{3 - 2 \sin \theta}}.$$

18. (a) Using Table 8,

$$r = \frac{2}{2 - \cos \theta} = \frac{1}{1 - \frac{1}{2} \cos \theta}$$

which means $e = \frac{1}{2}$ and $ep = 1$, so $p = 2$. Since $e < 1$, this is an ellipse with directrix perpendicular to the polar axis 2 units to the left of the pole. At $t = 0$ and $t = \pi$, the polar points corresponding to these values are $(0, 2)$ and $\left(\pi, \frac{2}{3}\right)$, respectively, which are vertices of the ellipse. The y -intercepts are at $\theta = \frac{\pi}{2}$ and $\theta = \frac{3\pi}{2}$, which gives rise to the points $\left(\frac{\pi}{2}, 1\right)$ and $\left(\frac{3\pi}{2}, 1\right)$.

(b) To obtain a rectangular equation of the ellipse, we eliminate the fraction and then square the resulting

polar equation.

$$\begin{aligned}
 2r - r \cos \theta &= 2 \\
 4r^2 &= (2 + r \cos \theta)^2 \\
 4(x^2 + y^2) &= (2 + x)^2 \\
 4x^2 + 4y^2 &= 4 + 4x + x^2 \\
 3x^2 - 4x + 4y^2 &= 4 \\
 3\left(x^2 - \frac{4}{3}x\right) + 4y^2 &= 4 \\
 3\left(x - \frac{2}{3}\right)^2 + 4y^2 &= 4 + 3\left(\frac{2}{3}\right)^2 \\
 \boxed{3\left(x - \frac{2}{3}\right)^2 + 4y^2 = \frac{16}{3}}.
 \end{aligned}$$

(c) Parametric equations are

$$x = \frac{2 \cos \theta}{2 - \cos \theta}, \quad y = \frac{2 \sin \theta}{2 - \cos \theta}.$$

19. (a) Using Table 8,

$$r = \frac{6 \sec \theta}{2 \sec \theta - 1} = \frac{6}{2 - \cos \theta} = \frac{3}{1 - \frac{1}{2} \cos \theta}, \quad \theta \neq \frac{\pi}{2}, \frac{3\pi}{2},$$

which means $e = \frac{1}{2}$ and $ep = 3$, so $p = 6$. Since $e < 1$, this is an ellipse with directrix perpendicular to the polar axis 6 units to the left of the pole. At $t = 0$ and $t = \pi$, the polar points corresponding to these values are $(0, 6)$ and $(\pi, 2)$, respectively, which are vertices of the ellipse. The y -intercepts are undefined since the function is undefined at $\theta = \frac{\pi}{2}$ and $\theta = \frac{3\pi}{2}$.

(b) To obtain a rectangular equation of the hyperbola, we eliminate the fraction and then square the resulting polar equation.

$$\begin{aligned}
 2r - r \cos \theta &= 6 \\
 4r^2 &= (6 + r \cos \theta)^2 \\
 4(x^2 + y^2) &= (6 + x)^2 \\
 4x^2 + 4y^2 &= 36 + 12x + x^2 \\
 3(x^2 - 4x) + 4y^2 &= 36 \\
 3(x - 2)^2 + 4y^2 &= 36 + 3(2)^2 \\
 \boxed{3(x - 2)^2 + 4y^2 = 48}.
 \end{aligned}$$

(c) Parametric equations are

$$x = \frac{6 \cos \theta}{2 - \cos \theta}, \quad y = \frac{6 \sin \theta}{2 - \cos \theta}.$$

20. (a) Using Table 8,

$$r = \frac{3 \csc \theta}{\csc \theta - 1} = \frac{3}{1 - \sin \theta}, \quad \theta \neq 0, \pi, 2\pi,$$

which means $e = 1$. Since $e = 1$, this is a parabola.

(b) To obtain a rectangular equation of the parabola, we eliminate the fraction and then square the resulting polar equation.

$$\begin{aligned} r - r \sin \theta &= 3 \\ r^2 &= (3 + r \sin \theta)^2 \\ x^2 + y^2 &= (3 + y)^2 = 9 + 6y + y^2 \\ \boxed{x^2} &= 9 + 6y. \end{aligned}$$

(c) Parametric equations are

$$\boxed{x = \frac{3}{1 - \sin \theta} \cos \theta, \quad y = \frac{3}{1 - \sin \theta} \sin \theta}.$$

Applications and Extensions

For Problems 21-26, we will use the parametric form of each graph $x = r \cos \theta$ and $y = r \sin \theta$ along with the formula $\frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}}$ to determine the slope at the given value of θ .

21. Parametric equations for $r = \frac{9}{4 - \cos \theta}$ are

$$\begin{aligned} y &= \frac{9 \sin \theta}{4 - \cos \theta} \\ x &= \frac{9 \cos \theta}{4 - \cos \theta}, \end{aligned}$$

so

$$\begin{aligned} \left[\frac{dy}{d\theta} \right]_{\theta=0} &= \left[\frac{(4 - \cos \theta)(9 \cos \theta) - (9 \sin \theta)(\sin \theta)}{(4 - \cos \theta)^2} \right]_{\theta=0} = 3 \\ \left[\frac{dx}{d\theta} \right]_{\theta=0} &= \left[\frac{(4 - \cos \theta)(-9 \sin \theta) - (9 \cos \theta)(\sin \theta)}{(4 - \cos \theta)^2} \right]_{\theta=0} = 0. \end{aligned}$$

Since $\frac{dx}{d\theta} = 0$, this means $\frac{dy}{dx}$ is undefined which means the tangent line at $\theta = 0$ is vertical so the slope is undefined.

22. Parametric equations for $r = \frac{3}{1 - \sin \theta}$ are

$$\begin{aligned} y &= \frac{3 \sin \theta}{1 - \sin \theta} \\ x &= \frac{3 \cos \theta}{1 - \sin \theta}, \end{aligned}$$

so

$$\begin{aligned}\left[\frac{dy}{d\theta}\right]_{\theta=0} &= \left[\frac{(1-\sin\theta)(3\cos\theta) - (3\sin\theta)(-\cos\theta)}{(1-\sin\theta)^2}\right]_{\theta=0} = 3 \\ \left[\frac{dx}{d\theta}\right]_{\theta=0} &= \left[\frac{(1-\sin\theta)(-3\sin\theta) - (3\cos\theta)(-\cos\theta)}{(1-\sin\theta)^2}\right]_{\theta=0} = 3.\end{aligned}$$

Then the slope of the tangent line at $\theta = 0$ is

$$\left[\frac{dy}{dx}\right]_{\theta=0} = \frac{3}{3} = \boxed{1}.$$

23. Parametric equations for $r = \frac{8}{4 + \sin\theta}$ are

$$\begin{aligned}y &= \frac{8\sin\theta}{4 + \sin\theta} \\ x &= \frac{8\cos\theta}{4 + \sin\theta},\end{aligned}$$

so

$$\begin{aligned}\left[\frac{dy}{d\theta}\right]_{\theta=\pi/2} &= \left[\frac{(4 + \sin\theta)(8\cos\theta) - (8\sin\theta)(\cos\theta)}{(4 + \sin\theta)^2}\right]_{\theta=\pi/2} = 0 \\ \left[\frac{dx}{d\theta}\right]_{\theta=\pi/2} &= \left[\frac{(4 + \sin\theta)(-8\sin\theta) - (8\cos\theta)(\cos\theta)}{(4 + \sin\theta)^2}\right]_{\theta=\pi/2} = -\frac{40}{25}.\end{aligned}$$

Then

$$\left[\frac{dy}{dx}\right]_{\theta=\pi/2} = \frac{0}{-40/25} = 0$$

which means the tangent line has slope $\boxed{0}$ at $\theta = \frac{\pi}{2}$.

24. Parametric equations for $r = \frac{10}{5 + 4\sin\theta}$ are

$$\begin{aligned}y &= \frac{10\sin\theta}{5 + 4\sin\theta} \\ x &= \frac{10\cos\theta}{5 + 4\sin\theta},\end{aligned}$$

so

$$\begin{aligned}\left[\frac{dy}{d\theta}\right]_{\theta=\pi} &= \left[\frac{(5 + 4\sin\theta)(10\cos\theta) - (10\sin\theta)(4\cos\theta)}{(5 + 4\sin\theta)^2}\right]_{\theta=\pi} = -2 \\ \left[\frac{dx}{d\theta}\right]_{\theta=\pi} &= \left[\frac{(5 + 4\sin\theta)(-10\sin\theta) - (10\cos\theta)(4\cos\theta)}{(5 + 4\sin\theta)^2}\right]_{\theta=\pi} = -\frac{8}{5}.\end{aligned}$$

Then the slope of the tangent line at $\theta = \pi$ is

$$\frac{dy}{dx} = \frac{-2}{-8/5} = \boxed{\frac{5}{4}}.$$

25. Parametric equations for $r = \frac{4}{2 + \cos\theta}$ are

$$\begin{aligned}y &= \frac{4\sin\theta}{2 + \cos\theta} \\ x &= \frac{4\cos\theta}{2 + \cos\theta},\end{aligned}$$

so

$$\begin{aligned}\left[\frac{dy}{d\theta}\right]_{\theta=\pi} &= \left[\frac{(2+\cos\theta)(4\cos\theta) - (4\sin\theta)(-\sin\theta)}{(2+\cos\theta)^2}\right]_{\theta=\pi} = -4 \\ \left[\frac{dx}{d\theta}\right]_{\theta=\pi} &= \left[\frac{(2+\cos\theta)(-4\sin\theta) - (4\cos\theta)(-\sin\theta)}{(2+\cos\theta)^2}\right]_{\theta=\pi} = 0.\end{aligned}$$

Since $\frac{dx}{d\theta} = 0$, this means $\frac{dy}{dx}$ is undefined which means the tangent line at $\theta = \pi$ is vertical so the slope is undefined.

26. Parametric equations for $r = \frac{6}{3-2\sin\theta}$ are

$$\begin{aligned}y &= \frac{6\sin\theta}{3-2\sin\theta} \\ x &= \frac{6\cos\theta}{3-2\sin\theta},\end{aligned}$$

so

$$\begin{aligned}\left[\frac{dy}{d\theta}\right]_{\theta=\pi/2} &= \left[\frac{(3-2\sin\theta)(6\cos\theta) - (6\sin\theta)(-2\cos\theta)}{(3-2\sin\theta)^2}\right]_{\theta=\pi/2} = 0 \\ \left[\frac{dx}{d\theta}\right]_{\theta=\pi/2} &= \left[\frac{(3-2\sin\theta)(-6\sin\theta) - (6\cos\theta)(-2\cos\theta)}{(3-2\sin\theta)^2}\right]_{\theta=\pi/2} = -6\end{aligned}$$

Then the slope of the tangent line at $\theta = \frac{\pi}{2}$ is

$$\left[\frac{dy}{dx}\right]_{\theta=\pi/2} = \frac{0}{-6} = \boxed{0}.$$

27. It is given that $e = \frac{4}{5}$ and $p = 3$, so using Table 8, we have

$$r = \frac{\frac{4}{5} \cdot 3}{1 - \frac{4}{5} \cos\theta} = \frac{12}{5 - 4 \cos\theta}.$$

28. It is given that $e = \frac{2}{3}$ and $p = 3$, so using Table 8, we have

$$r = \frac{\frac{2}{3} \cdot 3}{1 + \frac{2}{3} \sin\theta} = \frac{6}{3 + 2 \sin\theta}.$$

29. It is given that $e = 1$ and $p = 1$, so using Table 8, we have

$$r = \frac{1 \cdot 1}{1 + \sin\theta} = \frac{1}{1 + \sin\theta}.$$

30. It is given that $e = 1$ and $p = 2$, so using Table 8, we have

$$r = \frac{1 \cdot 2}{1 - \sin\theta} = \frac{2}{1 - \sin\theta}.$$

31. It is given that $e = 6$ and $p = 2$, so using Table 8, we have

$$r = \frac{6 \cdot 2}{1 - 6 \sin\theta} = \frac{12}{1 - 6 \sin\theta}.$$

32. It is given that $e = 5$ and $p = 3$, so using Table 8, we have

$$r = \frac{5 \cdot 3}{1 + 5 \cos \theta} = \frac{15}{1 + 5 \cos \theta}.$$

33. (a) $e = 0.967$.

(b) The shortest distance occurs when r is a minimum which occurs when $\cos \theta = -1$. The shortest distance is then

$$r = \frac{1.155}{1 - 0.967(-1)} \approx 0.587 \text{ AU}.$$

(c) The greatest distance occurs when r is a maximum which occurs when $\cos \theta = 1$. The shortest distance is then

$$r = \frac{1.155}{1 - 0.967(1)} = 35 \text{ AU}.$$

(d)

34. (a) $e = 0.206$.

(b) The shortest distance occurs when r is a minimum which occurs when $\cos \theta = -1$. The shortest distance is then

$$r = \frac{(3.442)10^7}{1 - 0.206(-1)} \approx 28,540,630.182 \text{ miles}.$$

(c) The greatest distance occurs when r is a maximum which occurs when $\cos \theta = 1$. The shortest distance is then

$$r = \frac{(3.442)10^7}{1 - 0.206(1)} \approx 43,350,125.945 \text{ miles}.$$

(c) Answers will vary.

36.

If we drop a perpendicular from point P to the polar axis, the intersection point of the perpendicular and the polar axis is labeled Q . The distance from the pole to Q is $r \cos \theta$. Since the distance from the pole to the directrix D is p , the distance $d(D, P) = p - r \cos \theta$. Then since $d(F, P) = r$, the equation of the conic is

$$\begin{aligned} \frac{d(F, P)}{d(D, P)} &= e \\ \frac{r}{p - r \cos \theta} &= e \\ r &= ep - re \cos \theta \\ r(1 + e \cos \theta) &= ep \\ r &= \frac{ep}{1 + e \cos \theta}. \end{aligned}$$

37.

If we drop a perpendicular from point P to the ray $\theta = \frac{\pi}{2}$, the intersection point of the perpendicular and the ray is labeled Q . The distance from the pole to Q is $r \sin \theta$. Since the distance from the pole to the directrix D is p , the distance $d(D, P) = p - r \sin \theta$. Then since $d(F, P) = r$, the equation of the conic is

$$\begin{aligned} \frac{d(F, P)}{d(D, P)} &= e \\ \frac{r}{p - r \sin \theta} &= e \\ r &= ep - re \sin \theta \\ r(1 + e \sin \theta) &= ep \\ r &= \frac{ep}{1 + e \sin \theta}. \end{aligned}$$

38.

If we drop a perpendicular from point P to the ray $\theta = \frac{\pi}{2}$, the intersection point of the perpendicular and the ray is labeled Q . The distance from the pole to Q is $r \sin \theta$. Since the distance from the pole to the directrix D is p , the distance $d(D, P) = p + r \sin \theta$. Then since $d(F, P) = r$, the equation of the conic is

$$\begin{aligned} \frac{d(F, P)}{d(D, P)} &= e \\ \frac{r}{p + r \sin \theta} &= e \\ r &= ep + re \sin \theta \\ r(1 - e \sin \theta) &= ep \\ r &= \frac{ep}{1 - e \sin \theta}. \end{aligned}$$

Challenge Problems

39. For the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, the value $c = \sqrt{a^2 - b^2}$ is the focal distance from the center and $e = \frac{c}{a}$ is the eccentricity. If we use the parametric equations $x = a \cos \theta$ and $y = b \sin \theta$ for $0 \leq \theta \leq \frac{\pi}{2}$, then this parametrizes the ellipse in the first quadrant. If we rotate this part of the ellipse about the x -axis to find the surface area S , then

$$\begin{aligned} S &= 2\pi \int_0^{\pi/2} y \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta = 2\pi \int_0^{\pi/2} b \sin \theta \sqrt{a^2 \sin^2 \theta + b^2 \cos^2 \theta} d\theta \\ &= 2\pi b \int_0^{\pi/2} \sin \theta \sqrt{a^2(1 - \cos^2 \theta) + b^2 \cos^2 \theta} d\theta \\ &= 2\pi b \int_0^{\pi/2} a \sin \theta \sqrt{1 - \left(\frac{a^2 - b^2}{a^2} \cos^2 \theta\right)} d\theta. \end{aligned}$$

Now we use the fact that $e = \frac{\sqrt{a^2 - b^2}}{a}$. Then

$$\begin{aligned} S &= 2\pi ab \int_0^{\pi/2} \sin \theta \sqrt{1 - e^2 \cos^2 \theta} d\theta \\ &= 2\pi ab \int_e^0 -\frac{1}{e} \sqrt{1 - u^2} du, \end{aligned}$$

where we used the substitution $u = e \cos \theta$ with $du = -e \sin \theta d\theta$ and new limits of integration $u = e \cos(0) = e$ to $u = e \cos(\pi/2) = 0$. To calculate this integral, we use Table of Integrals 62 with $a = 1$.

$$\begin{aligned} S &= \frac{2\pi ab}{e} \int_0^e \sqrt{1 - u^2} du \\ &= \frac{2\pi ab}{e} \left[\frac{u}{2} \sqrt{1 - u^2} + \frac{1}{2} \sin^{-1} u \right]_0^e \\ &= \frac{2\pi ab}{e} \left(\frac{e}{2} \sqrt{1 - e^2} + \frac{1}{2} \sin^{-1} e \right) \\ &= \pi b^2 + \frac{\pi ab}{e} \sin^{-1} e, \end{aligned}$$

where in the last step we used that fact that

$$\sqrt{1 - e^2} = \sqrt{1 - \frac{a^2 - b^2}{a^2}} = \sqrt{\frac{a^2 - a^2 + b^2}{a^2}} = \frac{b}{a}.$$

40. First, let $\theta_0 = 0$. Then the directrix is $r \cos \theta = -d$ or, in rectangular coordinates, $x = -d$, the vertical line parallel to the y -axis d units to the left (since $d > 0$). See the following picture.

We see that $d(D, P) = r \cos \theta + d$, so

$$e = \frac{d(F, P)}{d(D, P)}.$$

Using the Law of Cosines,

$$d(P, F) = \sqrt{r^2 + r_1^2 - 2rr_1 \cos(\theta - \theta_1)}.$$

This means when $\theta_0 = 0$, the general equation for the conic is

$$e = \frac{\sqrt{r^2 + r_1^2 - 2rr_1 \cos(\theta - \theta_1)}}{r \cos \theta + d}.$$

For the general case, rotate this by $-\theta_0$ to yield

$$e = \frac{\sqrt{r^2 + r_1^2 - 2rr_1 \cos(\theta + \theta_0 - \theta_1)}}{r \cos(\theta + \theta_0) + d}.$$

Chapter Review

1. (a) Solving for t in the y equation, we have $t = 1 - y$. Then

$$x = 4(1 - y) - 2$$

$$y = -\frac{1}{4}x + \frac{1}{2}.$$

(b)

(c) There are no restrictions.

2. (a) Solving for t in the y equation, we have $t = 5 - y$. Then

$$x = 2(5 - y)^2 + 6.$$

(b)

(c) There are no restrictions.

3. (a) Since $x = e^t$ and $y = (e^t)^{-1}$, we have $y = \frac{1}{x}$.

(b)

(c) Since $e^t > 0$ and $e^{-t} > 0$, we have $x > 0$ and $y > 0$.

4. (a) Solving for t in the x equation, we have $t = e^x$. Then

$$y = (e^x)^3$$

$$\boxed{y = e^{3x}}.$$

(b)

(c) There are $\boxed{\text{no restrictions}}$.

5. (a) Since $\tan^2 t + 1 = \sec^2 t$, the rectangular equation is

$$\boxed{y + 1 = x}.$$

(b)

(c) On $0 \leq t \leq \frac{\pi}{4}$, $1 \leq \sec t \leq \sqrt{2}$ and $0 \leq \tan t \leq 1$ so

$$1 \leq \sec^2 t \leq 2$$

$$0 \leq \tan^2 t \leq 1.$$

The restrictions on x and y are then

$$\boxed{1 \leq x \leq 2}$$

$$\boxed{0 \leq y \leq 1}.$$

6. (a) Solving for t in the y equation, we have $t = \frac{y-4}{2}$. Then

$$\boxed{x = \left(\frac{y-4}{2}\right)^{3/2}}.$$

(b)

(c) There are no restrictions.

7. (a)

$$\begin{aligned}\frac{dy}{dt} &= 1 \\ \frac{dx}{dt} &= 2t\end{aligned}$$

The slope of the tangent line is

$$\left[\frac{dy}{dx}\right]_{t=1} = \left[\frac{\frac{dy}{dt}}{\frac{dx}{dt}}\right]_{t=1} = \left[\frac{1}{2t}\right]_{t=1} = \frac{1}{2}.$$

The point of tangency is $(x(1), y(1)) = (-3, 1)$. The equation of the tangent line is

$$y - 1 = \frac{1}{2}(x + 3)$$

$$\boxed{y = \frac{1}{2}x + \frac{5}{2}}.$$

(b)

8. (a)

$$\begin{aligned}\frac{dy}{dt} &= -4 \sin t \\ \frac{dx}{dt} &= 3 \cos t\end{aligned}$$

The slope of the tangent line is

$$\left[\frac{dy}{dx}\right]_{t=\pi/4} = \left[\frac{\frac{dy}{dt}}{\frac{dx}{dt}}\right]_{t=\pi/4} = \left[\frac{-4 \sin t}{3 \cos t}\right]_{t=\pi/4} = -\frac{4}{3}.$$

The point of tangency is $\left(x\left(\frac{\pi}{4}\right), y\left(\frac{\pi}{4}\right)\right) = \left(\frac{3\sqrt{2}}{2}, 2\sqrt{2} + 2\right)$. The equation of the tangent line is

$$y - (2\sqrt{2} + 2) = -\frac{4}{3} \left(x - \frac{3\sqrt{2}}{2}\right)$$

$$\boxed{y = -\frac{4}{3}x + 4\sqrt{2} + 2.}$$

(b)

9. (a)

$$\begin{aligned}\frac{dy}{dt} &= \frac{1}{2}(t^2 + 1)^{-1/2}(2t) = t(t^2 + 1)^{-1/2} \\ \frac{dx}{dt} &= -2t^{-3}\end{aligned}$$

The slope of the tangent line is

$$\left[\frac{dy}{dx}\right]_{t=3} = \left[\frac{\frac{dy}{dt}}{\frac{dx}{dt}}\right]_{t=3} = \left[\frac{t(t^2 + 1)^{-1/2}}{-2t^{-3}}\right]_{t=3} = \frac{3/\sqrt{10}}{-2/27} = -\frac{81\sqrt{10}}{20}.$$

The point of tangency is $(x(3), y(3)) = \left(\frac{1}{9}, \sqrt{10}\right)$. The equation of the tangent line is

$$y - \sqrt{10} = -\frac{81\sqrt{10}}{20} \left(x - \frac{1}{9}\right)$$

$$\boxed{y = -\frac{81}{2\sqrt{10}}x + \frac{9}{2\sqrt{10}} + \sqrt{10}.}$$

(b)

10. (a)

$$\begin{aligned}\frac{dy}{dt} &= \frac{1}{(1+t)^2} \\ \frac{dx}{dt} &= \frac{2t+t^2}{(1+t)^2}\end{aligned}$$

The slope of the tangent line is

$$\left[\frac{dy}{dx}\right]_{t=0} = \left[\frac{\frac{dy}{dt}}{\frac{dx}{dt}}\right]_{t=0} = \left[\frac{\frac{1}{(1+t)^2}}{\frac{2t+t^2}{(1+t)^2}}\right]_{t=0},$$

which is undefined, so the tangent line is vertical. The point of tangency is $(x(0), y(0)) = (0, 0)$. The equation of the tangent line is

$$\boxed{x = 0}.$$

(b)

11. Answers will vary. Here are two parameterizations.

$$\boxed{x(t) = t, \quad y(t) = -2t + 4, \quad -\infty < t < \infty}$$

$$\boxed{x(t) = t - 2, \quad y(t) = -2t + 8, \quad -\infty < t < \infty}.$$

12. Answers will vary. Here are two parameterizations.

$$\boxed{x(t) = t, \quad y(t) = 2t, \quad -\infty < t < \infty}$$

$$x(t) = t^3, \quad y(t) = 2t^3, \quad -\infty < t < \infty.$$

13. We eliminate the parameter t by using the Pythagorean Identity $\cos^2 t + \sin^2 t = 1$. Since $\cos t = \frac{x}{2}$ and $\sin t = y$, we have

$$\frac{x^2}{4} + y^2 = 1.$$

The plane curve is below.

When $t = 0$, the object is at the point $(2, 0)$. As t increases, the object moves around the ellipse in a counterclockwise direction, taking $t = 2\pi$ seconds to complete one revolution.

For the graphs of Problems 14-17, see the graph below Problem 17.

14. Converting to rectangular coordinates

$$\begin{aligned} x &= r \cos \theta = 3 \cos \left(\frac{\pi}{6} \right) = \frac{3\sqrt{3}}{2} \\ y &= r \sin \theta = 3 \sin \left(\frac{\pi}{6} \right) = \frac{3}{2}. \end{aligned}$$

The rectangular coordinates are $\left(\frac{3\sqrt{3}}{2}, \frac{3}{2} \right)$.

15. Converting to rectangular coordinates

$$\begin{aligned} x &= r \cos \theta = -2 \cos \left(\frac{4\pi}{3} \right) = 1 \\ y &= r \sin \theta = -2 \sin \left(\frac{4\pi}{3} \right) = \sqrt{3}. \end{aligned}$$

The rectangular coordinates are $(1, \sqrt{3})$.

16. Converting to rectangular coordinates

$$\begin{aligned} x &= r \cos \theta = 3 \cos \left(-\frac{\pi}{2} \right) = 0 \\ y &= r \sin \theta = 3 \sin \left(-\frac{\pi}{2} \right) = -3. \end{aligned}$$

The rectangular coordinates are $(0, -3)$.

17. Converting to rectangular coordinates

$$\begin{aligned}x &= r \cos \theta = -4 \cos \left(-\frac{\pi}{4}\right) = -2\sqrt{2} \\y &= r \sin \theta = -4 \sin \left(-\frac{\pi}{4}\right) = 2\sqrt{2}.\end{aligned}$$

The rectangular coordinates are $\boxed{(-2\sqrt{2}, 2\sqrt{2})}$.

18. Converting to polar coordinates

$$\begin{aligned}r &= \sqrt{2^2 + 0^2} = 2 \\ \theta &= \tan^{-1} \left(\frac{0}{2}\right) = 0.\end{aligned}$$

One pair of polar coordinates is $\boxed{(2, 0)}$. Another pair is $(-2, 0 + \pi) = \boxed{(-2, \pi)}$.

19. Converting to polar coordinates

$$\begin{aligned}r &= \sqrt{3^2 + 4^2} = 5 \\ \theta &= \tan^{-1} \left(\frac{4}{3}\right).\end{aligned}$$

One pair of polar coordinates is $\boxed{\left(5, \tan^{-1} \left(\frac{4}{3}\right)\right) \approx (5, 0.927)}$. Another pair is $\boxed{\left(-5, \tan^{-1} \left(\frac{4}{3}\right) + \pi\right) \approx (-5, 4.068)}$.

20. Noting that the given point is in quadrant II, when we convert to polar coordinates we have

$$\begin{aligned}r &= \sqrt{(-5)^2 + 12^2} = 13 \\ \theta &= \tan^{-1} \left(-\frac{12}{5}\right) + \pi.\end{aligned}$$

One pair of polar coordinates is $\boxed{\left(13, \tan^{-1} \left(-\frac{12}{5}\right) + \pi\right) \approx (13, 1.966)}$. Another pair is

$$\boxed{\left(-13, \tan^{-1} \left(-\frac{12}{5}\right) + 2\pi\right) \approx (-13, 5.107)}.$$

21. Noting that the given point is in quadrant II, when we convert to polar coordinates we have

$$\begin{aligned}r &= \sqrt{(-3)^2 + 3^2} = 3\sqrt{2} \\ \theta &= \tan^{-1} \left(-\frac{3}{3}\right) + \pi = \frac{3\pi}{4}.\end{aligned}$$

One pair of polar coordinates is $\boxed{\left(3\sqrt{2}, \frac{3\pi}{4}\right)}$. Another pair is $\boxed{\left(-3\sqrt{2}, \frac{7\pi}{4}\right)}$.

22. Use the double angle formula for sine, $\sin(2\theta) = 2 \sin \theta \cos \theta$, and multiply the equation through by r^2 .

$$\begin{aligned} r^3 &= 8r \sin(\theta) r \cos(\theta) \\ \left(\sqrt{x^2 + y^2}\right)^3 &= 8xy \\ \sqrt{x^2 + y^2} &= 2x^{1/3}y^{1/3} \\ \boxed{x^2 + y^2} &= 4x^{2/3}y^{2/3}. \end{aligned}$$

23. Using the formulas $r = \sqrt{x^2 + y^2}$ and $\theta = \tan^{-1}\left(\frac{y}{x}\right)$, the equation becomes

$$\begin{aligned} \sqrt{x^2 + y^2} &= e^{\tan^{-1}(y/x)/2} \\ x^2 + y^2 &= e^{\tan^{-1}(y/x)} \\ \frac{y}{x} &= \tan(\ln(x^2 + y^2)) \\ \boxed{y} &= x \tan(\ln(x^2 + y^2)). \end{aligned}$$

24. First clear fractions.

$$\begin{aligned} r + 2r \cos \theta &= 1 \\ \sqrt{x^2 + y^2} + 2x &= 1 \\ x^2 + y^2 &= (1 - 2x)^2 \\ \boxed{-3x^2 + 4x + y^2 - 1} &= 0. \end{aligned}$$

25. Multiply the equation through by r .

$$\begin{aligned} r^2 &= ar - r \sin \theta \\ \boxed{x^2 + y^2} &= a\sqrt{x^2 + y^2} - y. \end{aligned}$$

26. Use the double angle formula for cosine, $\cos(2\theta) = \cos^2 \theta - \sin^2 \theta$, and multiply the equation through by r^2 .

$$\begin{aligned} r^2 &= 4 \cos^2 \theta - 4 \sin^2 \theta \\ r^4 &= 4r^2 \cos^2 \theta - 4r^2 \sin^2 \theta \\ \boxed{(x^2 + y^2)^2} &= 4x^2 - 4y^2. \end{aligned}$$

27.

$$\begin{aligned} \sqrt{x^2 + y^2} &= \tan^{-1}\left(\frac{y}{x}\right) \\ \boxed{y} &= x \tan\left(\sqrt{x^2 + y^2}\right). \end{aligned}$$

28. Using the formulas $r^2 = x^2 + y^2$ and $x = r \cos \theta$, the equation becomes $r^2 = r \cos \theta$, or $\boxed{r = \cos \theta}$.

29. Using the formulas $r^2 = x^2 + y^2$, $x = r \cos \theta$, and $y = r \sin \theta$, the equation becomes

$$\begin{aligned} (r^2)^2 &= (r \cos \theta)^2 - (r \sin \theta)^2 \\ r^4 &= r^2(\cos^2 \theta - \sin^2 \theta) \quad (\text{for } r \neq 0) \\ \boxed{r^2} &= \cos^2 \theta - \sin^2 \theta \quad (\text{for } r \neq 0). \end{aligned}$$

30. Using the formulas $r^2 = x^2 + y^2$, $x = r \cos \theta$, and $y = r \sin \theta$, the equation becomes

$$(r \sin \theta)^2 = r^2 \cos^2 \theta$$

$$\boxed{\sin^2 \theta = \cos^2 \theta}.$$

31. Using the formulas $x = r \cos \theta$ and $y = r \sin \theta$, the equation becomes

$$\frac{(r \cos \theta)^2}{4} + \frac{(r \sin \theta)^2}{9} = 1$$

$$r^2 \left(\frac{\cos^2 \theta}{4} + \frac{\sin^2 \theta}{9} \right) = 1$$

$$r^2 \left(\frac{9 \cos^2 \theta + 4 \sin^2 \theta}{36} \right) = 1$$

$$r = \frac{6}{\sqrt{9 \cos^2 \theta + 4 \sin^2 \theta}}$$

$$\boxed{r = \frac{6\sqrt{9 \cos^2 \theta + 4 \sin^2 \theta}}{9 \cos^2 \theta + 4 \sin^2 \theta}}.$$

32. In rectangular coordinates, the equation is $y = 1$.

33. Multiplying by $r \cos \theta$, the equation becomes $r^2 = 2r \cos \theta$ which in rectangular coordinates is $x^2 + y^2 = 2x$. Upon completing the square, the equation becomes $(x - 1)^2 + y^2 = 1$. We recognize this as a circle centered at $(1, 0)$ with radius 1.

34. Multiplying by r , the equation becomes $r^2 = r \sin \theta$ which in rectangular coordinates is $x^2 + y^2 = y$. Upon completing the square, the equations becomes $x^2 + \left(y - \frac{1}{2}\right)^2 = \frac{1}{4}$. We recognize this as a circle

centered at $\left(0, \frac{1}{2}\right)$ with radius $\frac{1}{2}$.

35. Multiplying by r , the equation becomes $r^2 = -5r \cos \theta$ which in rectangular coordinates is $x^2 + y^2 = -5x$. Upon completing the square, the equation becomes $\left(x + \frac{5}{2}\right)^2 + y^2 = \frac{25}{4}$. We recognize this as a circle centered at $\left(-\frac{5}{2}, 0\right)$ with radius $\frac{5}{2}$.

36. (a) The polar equation $r = 1 - \sin \theta$ contains $\sin \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (1 - \sin \theta, \theta)$, and trace out the graph, beginning at the point $(1, 0)$ and ending at $(1, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(1, 0)$	$\left(\frac{1}{2}, \frac{\pi}{6}\right)$	$\left(1 - \frac{1}{2}\sqrt{2}, \frac{\pi}{4}\right)$	$\left(1 - \frac{1}{2}\sqrt{3}, \frac{\pi}{3}\right)$	$\left(0, \frac{\pi}{2}\right)$	$\left(1 - \frac{1}{2}\sqrt{3}, \frac{2\pi}{3}\right)$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(1 - \frac{1}{2}\sqrt{2}, \frac{3\pi}{4}\right)$	$\left(\frac{1}{2}, \frac{5\pi}{6}\right)$	$(1, \pi)$	$\left(\frac{3}{2}, \frac{7\pi}{6}\right)$	$\left(1 + \frac{1}{2}\sqrt{2}, \frac{5\pi}{4}\right)$	$\left(1 + \frac{1}{2}\sqrt{3}, \frac{4\pi}{3}\right)$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$\left(2, \frac{3\pi}{2}\right)$	$\left(1 + \frac{1}{2}\sqrt{3}, \frac{5\pi}{3}\right)$	$\left(1 + \frac{1}{2}\sqrt{2}, \frac{7\pi}{4}\right)$	$\left(\frac{3}{2}, \frac{11\pi}{6}\right)$	$(1, 2\pi)$

(b) Parametric equations for $r = 1 - \sin \theta$:

$$x = r \cos \theta = (1 - \sin \theta) \cos \theta \quad y = r \sin \theta = (1 - \sin \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

37. (a) The polar equation $r = 4 \cos(2\theta)$ contains $\cos(2\theta)$, which has period π . We construct a table of common values of θ that range from 0 to 2π noting that the values from π to 2π duplicate those from 0 to π .

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(4, 0)$	$(2, \frac{\pi}{6})$	$(0, \frac{\pi}{4})$	$(-2, \frac{\pi}{3})$	$(-4, \frac{\pi}{2})$	$(-2, \frac{2\pi}{3})$
θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(0, \frac{3\pi}{4})$	$(2, \frac{5\pi}{6})$	$(4, \pi)$	$(2, \frac{7\pi}{6})$	$(0, \frac{5\pi}{4})$	$(-2, \frac{4\pi}{3})$
θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π	
(r, θ)	$(-4, \frac{3\pi}{2})$	$(-2, \frac{5\pi}{3})$	$(0, \frac{7\pi}{4})$	$(2, \frac{11\pi}{6})$	$(4, 2\pi)$	

(b) Parametric equations for $r = 4 \cos(2\theta)$:

$$x = r \cos \theta = 4 \cos(2\theta) \cos \theta \quad y = r \sin \theta = 4 \cos(2\theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once starting at $(4, 0)$ and following the arrows in increasing order.

38. (a) The polar equation $r = \frac{1}{2} - \sin \theta$ contains $\sin \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = \left(\frac{1}{2} - \sin \theta, \theta\right)$, and trace out the graph, beginning at the point $\left(\frac{1}{2}, 0\right)$ and ending at $\left(\frac{1}{2}, 2\pi\right)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$\left(\frac{1}{2}, 0\right)$	$\left(0, \frac{\pi}{6}\right)$	$\left(\frac{1}{2} - \frac{1}{2}\sqrt{2}, \frac{\pi}{4}\right)$	$\left(\frac{1}{2} - \frac{1}{2}\sqrt{3}, \frac{\pi}{3}\right)$	$\left(-\frac{1}{2}, \frac{\pi}{2}\right)$	$\left(\frac{1}{2} - \frac{1}{2}\sqrt{3}, \frac{2\pi}{3}\right)$
θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(\frac{1}{2} - \frac{1}{2}\sqrt{2}, \frac{3\pi}{4}\right)$	$\left(0, \frac{5\pi}{6}\right)$	$\left(\frac{1}{2}, \pi\right)$	$\left(1, \frac{7\pi}{6}\right)$	$\left(\frac{1}{2} + \frac{1}{2}\sqrt{2}, \frac{5\pi}{4}\right)$	$\left(\frac{1}{2} + \frac{1}{2}\sqrt{3}, \frac{4\pi}{3}\right)$
θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π	
(r, θ)	$\left(\frac{3}{2}, \frac{3\pi}{2}\right)$	$\left(\frac{1}{2} + \frac{1}{2}\sqrt{3}, \frac{5\pi}{3}\right)$	$\left(\frac{1}{2} + \frac{1}{2}\sqrt{2}, \frac{7\pi}{4}\right)$	$\left(1, \frac{11\pi}{6}\right)$	$\left(\frac{1}{2}, 2\pi\right)$	

(b) Parametric equations for $r = \frac{1}{2} - \sin \theta$:

$$x = r \cos \theta = \left(\frac{1}{2} - \sin \theta\right) \cos \theta \quad y = r \sin \theta = \left(\frac{1}{2} - \sin \theta\right) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

39. (a) The polar equation $r = \frac{4}{1 - 2\cos \theta}$ contains $\cos \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π (excluding the values $\frac{\pi}{3}$ and $\frac{5\pi}{3}$ since r is not defined there) and plot the points (r, θ) .

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(-4, 0)$	$\left(\frac{4}{1 - \sqrt{3}}, \frac{\pi}{6}\right)$	$\left(\frac{4}{1 - \sqrt{2}}, \frac{\pi}{4}\right)$	undefined	$\left(4, \frac{\pi}{2}\right)$	$\left(2, \frac{2\pi}{3}\right)$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(\frac{4}{1+\sqrt{2}}, \frac{3\pi}{4}\right)$	$\left(\frac{4}{1+\sqrt{3}}, \frac{5\pi}{6}\right)$	$\left(\frac{4}{3}, \pi\right)$	$\left(\frac{4}{1+\sqrt{3}}, \frac{7\pi}{6}\right)$	$\left(\frac{4}{1+\sqrt{2}}, \frac{5\pi}{4}\right)$	$\left(2, \frac{4\pi}{3}\right)$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$\left(4, \frac{3\pi}{2}\right)$	undefined	$\left(\frac{4}{1-\sqrt{2}}, \frac{7\pi}{4}\right)$	$\left(\frac{4}{1-\sqrt{3}}, \frac{11\pi}{6}\right)$	$(-4, 2\pi)$

(b) Parametric equations for the polar equation $r = \frac{4}{1 - 2\cos\theta}$ are

$$x = \frac{4\cos\theta}{1 - 2\cos\theta}$$

$$y = \frac{4\sin\theta}{1 - 2\cos\theta}.$$

40. The polar equation $r = 4\sin(3\theta)$ contains $\sin(3\theta)$, which has period $\frac{2\pi}{3}$. So we construct a table of common values for θ that range from $0 \leq \theta \leq 2\pi$, noting that the values $\frac{2\pi}{3} \leq \theta \leq \frac{4\pi}{3}$ and $\frac{4\pi}{3} \leq \theta \leq 2\pi$ repeat the values for $0 \leq \theta \leq \frac{2\pi}{3}$. Then we plot the points and trace out the graph.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	(0, 0)	$\left(4, \frac{\pi}{6}\right)$	$\left(2\sqrt{2}, \frac{\pi}{4}\right)$	$\left(0, \frac{\pi}{3}\right)$	$\left(-4, \frac{\pi}{2}\right)$	$\left(0, \frac{2\pi}{3}\right)$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(2\sqrt{2}, \frac{3\pi}{4}\right)$	$\left(4, \frac{5\pi}{6}\right)$	(0, π)	$\left(-4, \frac{7\pi}{6}\right)$	$\left(-2\sqrt{2}, \frac{5\pi}{4}\right)$	$\left(0, \frac{4\pi}{3}\right)$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$\left(4, \frac{3\pi}{2}\right)$	$\left(0, \frac{5\pi}{3}\right)$	$\left(-2\sqrt{2}, \frac{7\pi}{4}\right)$	$\left(-4, \frac{11\pi}{6}\right)$	(0, 2π)

(b) Parametric equations for $r = 4 \sin(3\theta)$:

$$x = r \cos \theta = 4 \sin(3\theta) \cos \theta \quad y = r \sin \theta = 4 \sin(3\theta) \sin \theta$$

where θ is the parameter.

41. (a) The polar equation $r = 2 - 2 \cos \theta$ contains $\cos \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (2 - 2 \cos \theta, \theta)$, and trace out the graph, beginning at the point $(0, 0)$ and ending at $(0, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(0, 0)$	$(2 - \sqrt{3}, \frac{\pi}{6})$	$(2 - \sqrt{2}, \frac{\pi}{4})$	$(1, \frac{\pi}{3})$	$(2, \frac{\pi}{2})$	$(3, \frac{2\pi}{3})$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(2 + \sqrt{2}, \frac{3\pi}{4})$	$(2 + \sqrt{3}, \frac{5\pi}{6})$	$(4, \pi)$	$(2 + \sqrt{3}, \frac{7\pi}{6})$	$(2 + \sqrt{2}, \frac{5\pi}{4})$	$(3, \frac{4\pi}{3})$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$(2, \frac{3\pi}{2})$	$(1, \frac{5\pi}{3})$	$(2 - \sqrt{2}, \frac{7\pi}{4})$	$(2 - \sqrt{3}, \frac{11\pi}{6})$	$(0, 2\pi)$

(b) Parametric equations for $r = 2 - 2 \cos \theta$:

$$x = r \cos \theta = (2 - 2 \cos \theta) \cos \theta \quad y = r \sin \theta = (2 - 2 \cos \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

42. (a) The polar equation $r = 2 - \sin \theta$ contains $\sin \theta$, which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points $(r, \theta) = (2 - \sin \theta, \theta)$, and trace out the graph, beginning at the point $(2, 0)$ and ending at $(2, 2\pi)$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(2, 0)$	$(\frac{3}{2}, \frac{\pi}{6})$	$(2 - \frac{1}{2}\sqrt{2}, \frac{\pi}{4})$	$(2 - \frac{1}{2}\sqrt{3}, \frac{\pi}{3})$	$(1, \frac{\pi}{2})$	$(2 - \frac{1}{2}\sqrt{3}, \frac{2\pi}{3})$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$(2 - \frac{1}{2}\sqrt{2}, \frac{3\pi}{4})$	$(\frac{3}{2}, \frac{5\pi}{6})$	$(2, \pi)$	$(\frac{5}{2}, \frac{7\pi}{6})$	$(2 + \frac{1}{2}\sqrt{2}, \frac{5\pi}{4})$	$(2 + \frac{1}{2}\sqrt{3}, \frac{4\pi}{3})$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$(3, \frac{3\pi}{2})$	$(2 + \frac{1}{2}\sqrt{3}, \frac{5\pi}{3})$	$(2 + \frac{1}{2}\sqrt{2}, \frac{7\pi}{4})$	$(\frac{5}{2}, \frac{11\pi}{6})$	$(2, 2\pi)$

(b) Parametric equations for $r = 2 - \sin \theta$:

$$x = r \cos \theta = (2 - \sin \theta) \cos \theta \quad y = r \sin \theta = (2 - \sin \theta) \sin \theta$$

where θ is the parameter, and if $0 \leq \theta \leq 2\pi$, then the graph is traced out exactly once in the counterclockwise direction.

43. (a) The polar equation $r = e^{0.5\theta}$ increases in radius as the angle increases. We construct a table of common values of θ that range from 0 to 2π , plot the points (r, θ) , and trace out the graph. All decimals in the table are approximate values of r .

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(1, 0)$	$(1.299, \frac{\pi}{6})$	$(1.481, \frac{\pi}{4})$	$(1.688, \frac{\pi}{3})$	$(2.193, \frac{\pi}{2})$	$(2.850, \frac{2\pi}{3})$

θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(3.248, \frac{3\pi}{4}\right)$	$\left(3.702, \frac{5\pi}{6}\right)$	$(4.810, \pi)$	$\left(6.250, \frac{7\pi}{6}\right)$	$\left(7.124, \frac{5\pi}{4}\right)$	$\left(8.121, \frac{4\pi}{3}\right)$

θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
(r, θ)	$\left(10.551, \frac{3\pi}{2}\right)$	$\left(13.708, \frac{5\pi}{3}\right)$	$\left(15.625, \frac{7\pi}{4}\right)$	$\left(17.811, \frac{11\pi}{6}\right)$	$(23.141, 2\pi)$

(b) Parametric equations for $r = e^{0.5\theta}$:

$$x = r \cos \theta = e^{0.5\theta} \cos \theta \quad y = r \sin \theta = e^{0.5\theta} \sin \theta$$

where θ is the parameter.

44. (a) The equation can be rewritten as $r^2 = \cos^2 \theta$, or $r = \pm \cos \theta$. The equation $r = \cos \theta$ is a circle centered at $\left(\frac{1}{2}, 0\right)$ of radius $\frac{1}{2}$ and the equation $r = -\cos \theta$ is a circle centered at $\left(-\frac{1}{2}, 0\right)$ of radius $\frac{1}{2}$. Put these two graphs together to obtain the graph of the given equation.

(b) Parametric equations for $r = \sqrt{1 - \sin^2 \theta}$:

$$x = r \cos \theta = \sqrt{1 - \sin^2 \theta} \cos \theta \quad y = r \sin \theta = \sqrt{1 - \sin^2 \theta} \sin \theta$$

where θ is the parameter.

45. The equation $r^2 = 1 + \sin^2 \theta$, or $r = \sqrt{1 + \sin^2 \theta}$, contains $\sin \theta$ which has the period 2π . We construct a table of common values of θ that range from 0 to 2π , plot the points (r, θ) .

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$
(r, θ)	$(1, 0)$	$\left(\frac{\sqrt{5}}{2}, \frac{\pi}{6}\right)$	$\left(\frac{\sqrt{6}}{2}, \frac{\pi}{4}\right)$	$\left(\frac{\sqrt{7}}{2}, \frac{\pi}{3}\right)$	$\left(\sqrt{2}, \frac{\pi}{2}\right)$	$\left(\frac{\sqrt{7}}{2}, \frac{2\pi}{3}\right)$
θ	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$
(r, θ)	$\left(\frac{\sqrt{6}}{2}, \frac{3\pi}{4}\right)$	$\left(\frac{\sqrt{5}}{2}, \frac{5\pi}{6}\right)$	$(1, \pi)$	$\left(\frac{\sqrt{5}}{2}, \frac{7\pi}{6}\right)$	$\left(\frac{\sqrt{6}}{2}, \frac{5\pi}{4}\right)$	$\left(\frac{\sqrt{7}}{2}, \frac{4\pi}{3}\right)$
θ	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π	
(r, θ)	$\left(\sqrt{2}, \frac{3\pi}{2}\right)$	$\left(\frac{\sqrt{7}}{2}, \frac{5\pi}{3}\right)$	$\left(\frac{\sqrt{6}}{2}, \frac{7\pi}{4}\right)$	$\left(\frac{\sqrt{5}}{2}, \frac{11\pi}{6}\right)$	$(1, 2\pi)$	

(b) Parametric equations for $r = \sqrt{1 + \sin^2 \theta}$:

$$x = r \cos \theta = \sqrt{1 + \sin^2 \theta} \cos \theta \quad y = r \sin \theta = \sqrt{1 + \sin^2 \theta} \sin \theta$$

where θ is the parameter.

46. (a) Since $e = 1$, this is a parabola.

(b) To obtain a rectangular equation of the parabola, we eliminate the fraction and then square the resulting polar equation.

$$\begin{aligned}
 r &= \frac{2}{1 - \cos \theta} \\
 r - r \cos \theta &= 2 \\
 r &= 2 + r \cos \theta \\
 r^2 &= (2 + r \cos \theta)^2 \\
 x^2 + y^2 &= (2 + x)^2 \\
 x^2 + y^2 &= 4 + 4x + x^2 \\
 \boxed{y^2} &= 4 + 4x.
 \end{aligned}$$

(c) Parametric equations are

$$\boxed{x = \frac{2}{1 - \cos \theta} \cos \theta, \quad y = \frac{2}{1 - \cos \theta} \sin \theta.}$$

47. (a) Since $e = \frac{1}{6} < 1$, this is an ellipse.

(b) To obtain a rectangular equation of the ellipse, we eliminate the fraction and then square the resulting polar equation.

$$\begin{aligned}
 r &= \frac{1}{1 - \frac{1}{6} \cos \theta} \\
 r - \frac{1}{6} r \cos \theta &= 1 \\
 r^2 &= \left(1 + \frac{1}{6} r \cos \theta\right)^2 \\
 x^2 + y^2 &= \left(1 + \frac{1}{6} x\right)^2 \\
 x^2 + y^2 &= 1 + \frac{1}{3} x + \frac{1}{36} x^2 \\
 \frac{35}{36} \left(x^2 - \frac{12}{35} x\right) + y^2 &= 1 \\
 \frac{35}{36} \left(x - \frac{6}{35}\right)^2 + y^2 &= 1 + \frac{35}{36} \left(\frac{6}{35}\right)^2 \\
 \boxed{35 \left(x - \frac{6}{35}\right)^2 + 36 y^2} &= \frac{1296}{35}.
 \end{aligned}$$

(c) Parametric equations are

$$x = \frac{6 \cos \theta}{6 - \cos \theta}, \quad y = \frac{6 \sin \theta}{6 - \cos \theta}.$$

48. For counterclockwise orientation, the ellipse can be parametrized by $x(t) = 4 \cos(\omega t)$, $y(t) = 3 \sin(\omega t)$. If it takes 4 seconds for one revolution, then the period is $\frac{2\pi}{\omega} = 4$, or $\omega = \frac{\pi}{2}$. The parametrization is then

$$x(t) = 4 \cos\left(\frac{\pi}{2}t\right), y(t) = 3 \sin\left(\frac{\pi}{2}t\right), \quad 0 \leq t \leq 4$$

which has counterclockwise orientation, and does indeed start at $(4, 0)$ when $t = 0$.

49. For clockwise orientation, the ellipse can be parametrized by $x(t) = 4 \sin(\omega t)$, $y(t) = 3 \cos(\omega t)$. If it takes 5 seconds for one revolution, then the period is $\frac{2\pi}{\omega} = 5$, or $\omega = \frac{2\pi}{5}$. The parametrization is then

$$x(t) = 4 \sin\left(\frac{2\pi}{5}t\right), y(t) = 3 \cos\left(\frac{2\pi}{5}t\right), \quad 0 \leq t \leq 5$$

which has clockwise orientation, and does indeed start at $(0, 3)$ when $t = 0$.

50. First we find the derivatives.

$$\begin{aligned} \frac{dx}{dt} &= 3t^2 \\ \frac{dy}{dt} &= 4t \end{aligned}$$

Since the only solution to $\frac{dx}{dt} = 0$ and $\frac{dy}{dt} = 0$ is $t = 0$, there are no horizontal nor vertical tangent lines.

51. First we find the derivatives.

$$\begin{aligned} \frac{dx}{dt} &= -\cos t \\ \frac{dy}{dt} &= -3 \sin t \end{aligned}$$

To find the horizontal tangent lines, we set $\frac{dy}{dt} = 0$.

$$\begin{aligned} -3 \sin t &= 0 \\ t &= 0, \pi, 2\pi. \end{aligned}$$

None of these values make $\frac{dx}{dt} = 0$, so we have horizontal tangent lines at each value. The horizontal tangent lines occur at the points

$$\begin{aligned} (x(0), y(0)) = (x(2\pi), y(2\pi)) &= (1, 5) \\ (x(\pi), y(\pi)) &= (1, -1). \end{aligned}$$

To find the vertical tangent lines, we set $\frac{dx}{dt} = 0$.

$$\begin{aligned} -\cos t &= 0 \\ t &= \frac{\pi}{2}, \frac{3\pi}{2}. \end{aligned}$$

None of these values make $\frac{dy}{dt} = 0$, so we have vertical tangent lines at each value. The vertical tangent lines occur at the points

$$\begin{aligned} \left(x\left(\frac{\pi}{2}\right), y\left(\frac{\pi}{2}\right)\right) &= \boxed{(0, 2)} \\ \left(x\left(\frac{3\pi}{2}\right), y\left(\frac{3\pi}{2}\right)\right) &= \boxed{(2, 2)}. \end{aligned}$$

52. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = \frac{1}{\sqrt{1+t^2}} \quad \text{and} \quad \frac{dy}{dt} = \frac{1}{2}(1+t^2)^{-1/2} \cdot 2t = \frac{t}{\sqrt{1+t^2}}$$

The curve is smooth for $0 \leq t \leq 1$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^1 \sqrt{\left(\frac{1}{\sqrt{1+t^2}}\right)^2 + \left(\frac{t}{\sqrt{1+t^2}}\right)^2} dt \\ &= \int_0^1 dt \\ &= [t]_0^1 = \boxed{1}. \end{aligned}$$

53. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = \sec^2 t \quad \text{and} \quad \frac{dy}{dt} = \frac{2}{3} \sec t \sec t \tan t = \frac{2}{3} \sec^2 t \tan t$$

The curve is smooth for $0 \leq t \leq \frac{\pi}{4}$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^{\pi/4} \sqrt{(\sec^2 t)^2 + \left(\frac{2}{3} \sec^2 t \tan t\right)^2} dt \\ &= \int_0^{\pi/4} \sqrt{\sec^4 t \left(1 + \frac{4}{9} \tan^2 t\right)} dt \\ &= \int_0^{\pi/4} \sec^2 t \sqrt{1 + \frac{4}{9} \tan^2 t} dt. \end{aligned}$$

Using the substitution $u = \tan t$, then $du = \sec^2 t$ and the new limits are $u = \tan(0) = 0$ to $u = \tan\left(\frac{\pi}{4}\right) = 1$, then

$$\begin{aligned} s &= \int_0^1 \sqrt{1 + \frac{4}{9}u^2} du = \int_0^1 \frac{2}{3} \sqrt{\frac{9}{4} + u^2} du \\ &= \frac{2}{3} \left[\frac{u}{2} \sqrt{\frac{9}{4} + u^2} + \frac{9/4}{2} \ln \left| u + \sqrt{\frac{9}{4} + u^2} \right| \right]_0^1 \\ &= \boxed{\frac{1}{3} \frac{\sqrt{13}}{2} + \frac{9}{8} \ln \left(1 + \frac{\sqrt{13}}{2} \right) - \frac{9}{8} \ln \left(\frac{\sqrt{13}}{2} \right)}, \end{aligned}$$

where to compute the integral we used Table of Integrals 49 with $a = \frac{3}{2}$.

54. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = e^t \quad \text{and} \quad \frac{dy}{dt} = e^{2t} - \frac{1}{4}$$

The curve is smooth for $0 \leq t \leq 2$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_0^2 \sqrt{(e^t)^2 + \left(e^{2t} - \frac{1}{4}\right)^2} dt = \int_0^2 \sqrt{e^{2t} + e^{4t} - \frac{1}{2}e^{2t} + \frac{1}{16}} dt \\ &= \int_0^2 \sqrt{\frac{1}{16}(16e^{4t} + 8e^{2t} + 1)} dt = \frac{1}{4} \int_0^2 \sqrt{(4e^{2t} + 1)^2} dt \\ &= \frac{1}{4} [2e^{2t} + t]_0^2 = \frac{1}{2}e^4 + \frac{1}{2} - \frac{1}{2} = \boxed{\frac{1}{2}e^4}. \end{aligned}$$

55. The given curve can be parametrized by

$$\begin{aligned} y(t) &= t \\ x(t) &= \frac{1}{2}t^2 - \frac{1}{4}\ln t \end{aligned}$$

on $1 \leq t \leq 2$. We begin by finding the derivatives $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\frac{dx}{dt} = t - \frac{1}{4t} \quad \text{and} \quad \frac{dy}{dt} = 1$$

The curve is smooth for $1 \leq t \leq 2$. Using the arc length formula, we have

$$\begin{aligned} s &= \int_1^2 \sqrt{[1]^2 + \left[t - \frac{1}{4t}\right]^2} dt = \int_1^2 \sqrt{\frac{1}{16}t^{-2} + \frac{1}{2} + t^2} dt \\ &= \int_1^2 \sqrt{\left[\frac{1}{4}t^{-1} + t\right]^2} dt = \int_1^2 \left(\frac{1}{4}t^{-1} + t\right) dt \\ &= \left[\frac{1}{4}\ln|t| + \frac{1}{2}t^2\right]_1^2 = 2 + \frac{1}{4}\ln(2) - \frac{1}{2} \\ &= \boxed{\frac{3}{2} + \frac{1}{4}\ln(2)}. \end{aligned}$$

56. Using the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ from Section 9.5 with $r = 2 \sin \theta$ and $\frac{dr}{d\theta} = 2 \cos \theta$, the arc length is

$$\begin{aligned} s &= \int_0^{\pi} \sqrt{(2 \sin \theta)^2 + (2 \cos \theta)^2} d\theta = \int_0^{\pi} 2 d\theta \\ &= [2\theta]_0^{\pi} = \boxed{2\pi}. \end{aligned}$$

57. Using the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ from Section 9.5 with $r = e^{-\theta}$ and $\frac{dr}{d\theta} = -e^{-\theta}$, the arc length is

$$\begin{aligned} s &= \int_0^{2\pi} \sqrt{(e^{-\theta})^2 + (-e^{-\theta})^2} d\theta = \int_0^{2\pi} \sqrt{2}e^{-\theta} d\theta \\ &= [-\sqrt{2}e^{-\theta}]_0^{2\pi} = \boxed{\sqrt{2}(1 - e^{-2\pi})}. \end{aligned}$$

58. Using the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ from Section 9.5 with $r = 3\theta$ and $\frac{dr}{d\theta} = 3$, the arc length is

$$\begin{aligned} s &= \int_0^{2\pi} \sqrt{(3\theta)^2 + (3)^2} d\theta = \int_0^{2\pi} 3\sqrt{\theta^2 + 1} d\theta \\ &= 3 \left[\frac{\theta}{2} \sqrt{\theta^2 + 1} + \frac{1}{2} \ln \left| \theta + \sqrt{\theta^2 + 1} \right| \right]_0^{2\pi} \\ &= 3 \left[\pi \sqrt{4\pi^2 + 1} + \frac{1}{2} \ln \left(2\pi + \sqrt{4\pi^2 + 1} \right) \right] \\ &= \boxed{3\pi \sqrt{4\pi^2 + 1} + \frac{3}{2} \ln \left(2\pi + \sqrt{4\pi^2 + 1} \right)}, \end{aligned}$$

where we used Table of Integrals 49 to calculate the integral.

59. Using the arc length formula $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$ from Section 9.5 with $r = 2 \sin^2 \frac{\theta}{2}$ and $\frac{dr}{d\theta} = 2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}$, we will exploit symmetry and find the arc length s of the curve from $\theta = 0$ to $\theta = \frac{\pi}{2}$ and then double it. Then

$$\begin{aligned} s &= \int_0^{\pi/2} \sqrt{\left(2 \sin^2 \frac{\theta}{2}\right)^2 + \left(2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}\right)^2} d\theta = \int_0^{\pi/2} \sqrt{4 \sin^4 \frac{\theta}{2} + \left(4 \sin^4 \frac{\theta}{2} \cos^2 \frac{\theta}{2}\right)} d\theta \\ &= \int_0^{\pi/2} 2 \sin \frac{\theta}{2} d\theta = \left[-4 \cos \frac{\theta}{2} \right]_0^{\pi/2} \\ &= 4 - 2\sqrt{2}. \end{aligned}$$

The full arc length is then

$$2(4 - 2\sqrt{2}) = \boxed{8 - 4\sqrt{2}}.$$

60.

We find the intersection points of the curves by setting their equations equal.

$$\begin{aligned} 4 \sin \theta &= 3 \csc \theta \\ \sin^2 \theta &= \frac{3}{4} \\ \sin \theta &= \frac{\sqrt{3}}{2} \\ \theta &= \frac{\pi}{3}, \frac{2\pi}{3}. \end{aligned}$$

In the third step, we only need the positive square root since we are working only in the first and second quadrants, where sine is positive. The area A of the shaded region is swept out beginning with $\theta = \frac{\pi}{3}$ and ending with $\theta = \frac{2\pi}{3}$. Then

$$\begin{aligned} A &= \int_{\pi/3}^{2\pi/3} \frac{1}{2} ((4 \sin \theta)^2 - (3 \csc \theta)^2) d\theta = \int_{\pi/3}^{2\pi/3} \left(8 \sin^2 \theta - \frac{9}{2} \csc^2 \theta \right) d\theta \\ &= \left[4\theta - 4 \sin \theta \cos \theta + \frac{9}{2} \cot \theta \right]_{\pi/3}^{2\pi/3} = \boxed{\frac{4\pi}{3} - \sqrt{3}}. \end{aligned}$$

61.

Exploiting symmetry, we will find the area A of the half-petal in quadrant I (see second figure), and then multiply it by 8 to find the full shaded region (see first figure). The area of the half-petal is swept out starting at $\theta = 0$ and ending at the first intersection point of the curves.

$$\begin{aligned} 4 \cos(2\theta) &= \sqrt{2} \\ 2\theta &= \cos^{-1} \left(\frac{\sqrt{2}}{4} \right) \\ \theta &= \frac{1}{2} \cos^{-1} \left(\frac{\sqrt{2}}{4} \right). \end{aligned}$$

Then

$$\begin{aligned} A &= \int_0^{1/2 \cos^{-1}(\sqrt{2}/4)} \frac{1}{2} ((4 \cos(2\theta))^2 - (\sqrt{2})^2) d\theta = \int_0^{1/2 \cos^{-1}(\sqrt{2}/4)} (8 \cos^2(2\theta) - 1) d\theta \\ &= [3\theta + 2 \cos(2\theta) \sin(2\theta)]_0^{1/2 \cos^{-1}(\sqrt{2}/4)}. \end{aligned}$$

In the following picture, we have $\cos \theta = \frac{\sqrt{2}}{4}$ or, equivalently, $\theta = \cos^{-1} \left(\frac{\sqrt{2}}{4} \right)$.

Then

$$\begin{aligned} \cos \left(\cos^{-1} \left(\frac{\sqrt{2}}{4} \right) \right) &= \frac{\sqrt{2}}{4} \\ \sin \left(\cos^{-1} \left(\frac{\sqrt{2}}{4} \right) \right) &= \frac{\sqrt{14}}{4}. \end{aligned}$$

With these values, we have

$$\begin{aligned} A &= \left[3 \left(\frac{1}{2} \cos^{-1} \left(\frac{\sqrt{2}}{4} \right) \right) + 2 \cos \left(\cos^{-1} \left(\frac{\sqrt{2}}{4} \right) \right) \sin \left(\cos^{-1} \left(\frac{\sqrt{2}}{4} \right) \right) \right] \\ &= \frac{3}{2} \cos^{-1} \left(\frac{\sqrt{2}}{4} \right) + \frac{\sqrt{7}}{4}. \end{aligned}$$

Then the full shaded region has area

$$8 \left(\frac{\sqrt{7}}{4} + \frac{3}{2} \cos^{-1} \left(\frac{\sqrt{2}}{4} \right) \right) = \boxed{2\sqrt{7} + 12 \cos^{-1} \left(\frac{\sqrt{2}}{4} \right)}.$$

62.

Exploiting symmetry, we will find the area of the shaded region in quadrant I and then double it to find the full shaded area. Referring to the second picture, the shaded region in quadrant I can be divided by the ray from the pole through the intersection point of the two curves. The angle that represents the ray through the intersection point can be found by setting the equations equal.

$$\begin{aligned} \cos \theta &= 1 - \cos \theta \\ \cos \theta &= \frac{1}{2} \\ \theta &= \frac{\pi}{3}. \end{aligned}$$

The shaded region in quadrant I can then be found by finding the area of the shaded region on $\left[0, \frac{\pi}{3}\right]$ of the cardioid and then adding the area of the shaded region on $\left[\frac{\pi}{3}, \frac{\pi}{2}\right]$ of the circle. This means the area A in quadrant I is

$$\begin{aligned} A &= \int_0^{\pi/3} \frac{1}{2} (1 - \cos \theta)^2 d\theta + \int_{\pi/3}^{\pi/2} \frac{1}{2} (\cos \theta)^2 d\theta \\ &= \int_0^{\pi/3} \left(\frac{1}{2} - \cos \theta + \frac{1}{2} \cos^2 \theta \right) d\theta + \int_{\pi/3}^{\pi/2} \frac{1}{2} \cos^2 \theta d\theta \\ &= \left[\frac{3}{4} \theta - \sin \theta + \frac{1}{4} \cos \theta \sin \theta \right]_0^{\pi/3} + \left[\frac{1}{4} \theta + \frac{1}{4} \cos \theta \sin \theta \right]_{\pi/3}^{\pi/2} \\ &= \left[\frac{\pi}{4} - \frac{7\sqrt{3}}{16} \right] + \left[\frac{\pi}{24} - \frac{\sqrt{3}}{16} \right] = \frac{7\pi}{24} - \frac{\sqrt{3}}{2}. \end{aligned}$$

Then the full shaded area is

$$2 \left(\frac{7\pi}{24} - \frac{\sqrt{3}}{2} \right) = \boxed{\frac{7\pi}{12} - \sqrt{3}}.$$

63. We start by finding $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\begin{aligned}\frac{dx}{dt} &= \frac{1}{\sqrt{t^2+1}} \\ \frac{dy}{dt} &= \frac{t}{\sqrt{t^2+1}}\end{aligned}$$

Using formula (2) in Section 9.3, the surface area S is

$$\begin{aligned}S &= 2\pi \int_0^1 \sqrt{t^2+1} \sqrt{\left(\frac{1}{\sqrt{1+t^2}}\right)^2 + \left(\frac{t}{\sqrt{1+t^2}}\right)^2} dt = 2\pi \int_0^1 \sqrt{t^2+1} dt \\ &= 2\pi \left[\frac{t}{2} \sqrt{t^2+1} + \frac{1}{2} \ln |t + \sqrt{t^2+1}| \right]_0^1 = \boxed{\pi (\sqrt{2} + \ln(1 + \sqrt{2}))},\end{aligned}$$

where the integral was computed using the Table of Integrals 49.

64. We start by finding $\frac{dx}{dt}$ and $\frac{dy}{dt}$.

$$\begin{aligned}\frac{dx}{dt} &= e^t - 1 \\ \frac{dy}{dt} &= 2e^{t/2}\end{aligned}$$

Using formula (2) in Section 9.3, the surface area S is

$$\begin{aligned}S &= 2\pi \int_0^1 4e^{t/2} \sqrt{(e^t - 1)^2 + (2e^{t/2})^2} dt = 2\pi \int_0^1 4e^{t/2} \sqrt{(e^t + 1)^2} dt = 2\pi \int_0^1 (4e^{3/2t} + 4e^{t/2}) d\theta \\ &= 2\pi \left[\frac{8}{3} e^{3/2t} + 8e^{t/2} \right]_0^1 = \boxed{\frac{16\pi}{3} e^{3/2} + 16\pi e^{1/2} - \frac{64\pi}{3}}.\end{aligned}$$

65. The given curve can be parametrized by

$$\begin{aligned}y(t) &= t \\ x(t) &= t^2 + 1\end{aligned}$$

for $0 \leq t \leq 2$. Using the formula following Example 1 in Section 9.5, the surface area S is

$$S = 2\pi \int_0^2 (t^2 + 1) \sqrt{[1]^2 + [2t]^2} dt = 2\pi \int_0^2 (t^2 + 1) \sqrt{1 + 4t^2} dt.$$

To compute this integral, we use the substitution $t = \frac{\tan u}{2}$ since then $\sqrt{1 + 4t^2} = \sqrt{1 + \tan^2 u} = \sec u$. With this substitution, $dt = \frac{1}{2} \sec^2 u du$, $u = \tan^{-1}(2t)$, and the new limits of integration are $u = \tan^{-1}(2(0)) = 0$ to $u = \tan^{-1}(2(2)) = \tan^{-1}(4)$. Then

$$S = 2\pi \int_0^{\tan^{-1}(4)} \left(\frac{1}{4} \tan^2 u + 1 \right) \cdot \sec u \cdot \frac{1}{2} \sec^2 u du = 2\pi \int_0^{\tan^{-1}(4)} \left(\frac{1}{8} \sec^5 u + \frac{3}{8} \sec^3 u \right) du,$$

where we used the identity $\tan^2 u = \sec^2 u - 1$. From here we use the reduction formula for secant, Table of Integrals 94, multiple times. Then

$$S = 2\pi \left[\frac{1}{32} \tan u \sec^3 u + \frac{3}{64} \tan u \sec u + \frac{3}{64} \ln |\sec u + \tan u| + \frac{3}{16} \tan u \sec u + \frac{3}{16} \ln |\sec u + \tan u| \right]_0^{\tan^{-1}(4)}.$$

If $u = \tan^{-1}(4)$, then $\tan u = 4 = \frac{4}{1}$ so $\sec u = \sqrt{17}$, or $\sec(\tan^{-1}(4)) = \sqrt{17}$. Then

$$\begin{aligned} S &= 2\pi \left[\frac{17\sqrt{17}}{8} + \frac{3\sqrt{17}}{16} + \frac{3}{64} \ln |\sqrt{17} + 4| + \frac{3\sqrt{17}}{4} + \frac{3}{16} \ln |\sqrt{17} + 4| \right] - 2\pi [0] \\ &= \boxed{\frac{49\sqrt{17}\pi}{8} + \frac{15\pi}{32} \ln (\sqrt{17} + 4)}. \end{aligned}$$

66. Using the formula at the end of Section 9.3, the surface area S is

$$S = 2\pi \int_0^\pi \cos \frac{x}{2} \sqrt{1 + \left[-\frac{1}{2} \sin \frac{x}{2}\right]^2} dx.$$

Using the substitution $u = \frac{1}{2} \sin \frac{x}{2}$, then $du = \frac{1}{4} \cos \frac{x}{2} dx$ and the new limits of integration are $u = \frac{1}{2} \sin(0) = 0$ to $u = \frac{1}{2} \sin \frac{\pi}{2} = \frac{1}{2}$, and then

$$\begin{aligned} S &= 8\pi \int_0^{1/2} \sqrt{1 + [-u]^2} du \\ &= 8\pi \left[\frac{u}{2} \sqrt{1 + u^2} + \frac{1}{2} \ln |u + \sqrt{1 + u^2}| \right]_0^{1/2} \\ &= \boxed{\sqrt{5}\pi + 4\pi \ln \left(\frac{1}{2} + \frac{\sqrt{5}}{2} \right)}, \end{aligned}$$

where to compute the integral we used Table of Integrals 49.

67. Using formula (1) from Section 9.6, the surface area S is

$$\begin{aligned} S &= 2\pi \int_0^{\pi/3} 4 \sin \theta \sqrt{[4]^2 + [0]^2} d\theta = 32\pi \int_0^{\pi/3} \sin \theta d\theta \\ &= 32\pi [-\cos \theta]_0^{\pi/3} = \boxed{16\pi}. \end{aligned}$$

Chapter 10: Vectors: Lines, Planes, and Quadric Surfaces in Space

10.1: Rectangular Coordinates in Space

Concepts and Vocabulary

1. True. See objective 1.
2. False. Points on the z -axis have their x - and y -coordinates equal to zero. The point given lies on the y -axis.
3. True. See objective 1.
4. True. It is the plane parallel to the xz -plane, 3 units above that plane.
5. In space, the set of all points a fixed distance R from a fixed point (x_0, y_0, z_0) is called a *sphere*.
6. The equation $x^2 + y^2 + z^2 = 8$ describes a sphere whose center is at the point $(0, 0, 0)$. See the theorem in objective 3.

Skill Building

7.

8.

2

9.

10.

11.

12.

13. Using Figure 3 as a model, the other vertices of the box are $(2, 1, 3)$ with one or more of its components set to zero, so they are $(2, 1, 0)$, $(2, 0, 3)$, $(0, 1, 3)$, $(2, 0, 0)$, $(0, 1, 0)$, and $(0, 0, 3)$.

14. Using Figure 3 as a model, the other vertices of the box are $(4, 2, 2)$ with one or more of its components set to zero, so they are $(4, 2, 0)$, $(4, 0, 2)$, $(0, 2, 2)$, $(4, 0, 0)$, $(0, 2, 0)$, and $(0, 0, 2)$.

15. Each x -coordinate of a vertex must be either 1 or 3; each y -coordinate must be either 2 or 4, and each z -coordinate must be either 3 or 5. Therefore the other six vertices are

$$(1, 2, 5), (1, 4, 3), (3, 2, 3), (3, 4, 3), (3, 2, 5), \text{ and } (1, 4, 5).$$

16. Each x -coordinate of a vertex must be either 5 or 3; each y -coordinate must be either 6 or 8, and each z -coordinate must be either 1 or 2. Therefore the other six vertices are

$$(5, 6, 2), (5, 8, 1), (3, 6, 1), (3, 8, 1), (3, 6, 2), \text{ and } (5, 8, 2).$$

17. Each x -coordinate of a vertex must be either -1 or 4 ; each y -coordinate must be either 0 or 2 , and each z -coordinate must be either 2 or 5 . Therefore the other six vertices are

$$(-1, 0, 5), (-1, 2, 2), (4, 0, 2), (-1, 2, 5), (4, 0, 5), \text{ and } (4, 2, 2).$$

18. Each x -coordinate of a vertex must be either -2 or -6 ; each y -coordinate must be either -3 or 7 , and each z -coordinate must be either 0 or 1 . Therefore the other six vertices are

$$(-2, -3, 1), (-2, 7, 0), (-6, -3, 0), (-2, 7, 1), (-6, -3, 1), \text{ and } (-6, 7, 0).$$

19. x and z are free variables. So this is a plane parallel to the xz plane lying two units to the negative side in the y -direction of that plane (passing through the point $(0, -2, 0)$).

20. x and y are free variables. So this is a plane parallel to the xy plane lying 3 units below it in the z -direction (passing through the point $(0, 0, -3)$).

21. This is the yz plane.

22. x and y are free variables. So this is a plane parallel to the xy plane lying 5 units above it in the z -direction (passing through the point $(0, 0, 5)$).
23. This is a line parallel to the z -axis through the point $(1, 0, 0)$, since it is the set of points of the form $(1, 0, z)$ where z is a free variable.
24. This is the set of points of the form $(x, x, 0)$, where x is a free variable, which is the line $y = x$ in the xy -plane.
25. y and z are free variables. So this is the region of space where $x > -2A$ and the y and z values are any real number.
26. x and z are free variables. So this is the region of space between (and including) the planes $y = 0$ and $y = 4$. The plane $y = 0$ is the xz plane, while the plane $y = 4$ is parallel to $y = 0$ and 4 units in the positive y -direction from that plane.
27. Since $x^2 + y^2 + z^2 = 1$ is the sphere of radius 1 centered at the origin, $x^2 + y^2 + z^2 \leq 1$ is that sphere together with its interior. That is, it is all points whose distance from the origin is at most 1.
28. Since $x^2 + y^2 + z^2 = 25$ is the sphere of radius 5 centered at the origin, $x^2 + y^2 + z^2 \geq 25$ is that sphere together with its exterior. That is, it is all points whose distance from the origin is at least 5.
29. With $P_1 = (3, 2, 5)$ and $P_2 = (-1, 2, 2)$, we have

$$|P_1 P_2| = \sqrt{(3 - (-1))^2 + (2 - 2)^2 + (5 - 2)^2} = \sqrt{16 + 0 + 9} = \boxed{5}.$$

30. With $P_1 = (12, -5, 16)$ and $P_2 = (21, 15, 4)$, we have

$$|P_1 P_2| = \sqrt{(12 - 21)^2 + (-5 - 15)^2 + (16 - 4)^2} = \sqrt{81 + 400 + 144} = \sqrt{625} = \boxed{25}.$$

31. With $P_1 = (-1, 2, -3)$ and $P_2 = (4, -2, 1)$, we have

$$|P_1 P_2| = \sqrt{(-1 - 4)^2 + (2 - (-2))^2 + (-3 - 1)^2} = \sqrt{25 + 16 + 16} = \boxed{\sqrt{57}}.$$

32. With $P_1 = (1.0, 3.2, 4.5)$ and $P_2 = (1.4, 1.0, 6.5)$, we have

$$|P_1 P_2| = \sqrt{(1.0 - 1.4)^2 + (3.2 - 1.0)^2 + (4.5 - 6.5)^2} = \sqrt{0.16 + 4.84 + 4} = \sqrt{9} = \boxed{3}.$$

33. With $P_1 = (4, -2, -2)$ and $P_2 = (3, 2, 1)$, we have

$$|P_1 P_2| = \sqrt{(4 - 3)^2 + (-2 - 2)^2 + (-2 - 1)^2} = \sqrt{1 + 16 + 9} = \boxed{\sqrt{26}}.$$

34. With $P_1 = (2, -3, -3)$ and $P_2 = (4, 1, -1)$, we have

$$|P_1 P_2| = \sqrt{(2 - 4)^2 + (-3 - 1)^2 + (-3 - (-1))^2} = \sqrt{4 + 16 + 4} = \sqrt{24} = \boxed{2\sqrt{6}}.$$

35. Using the theorem in objective 3 giving the equation of a sphere, we get

$$\boxed{(x - 3)^2 + (y - 1)^2 + (z - 1)^2 = 1^2 = 1}.$$

36. Using the theorem in objective 3 giving the equation of a sphere, we get

$$\boxed{(x - 1)^2 + (y - 2)^2 + (z - 2)^2 = 2^2 = 4}.$$

37. Using the theorem in objective 3 giving the equation of a sphere, we get

$$(x - (-1))^2 + (y - 1)^2 + (z - 2)^2 = 3^2, \text{ or } \boxed{(x + 1)^2 + (y - 1)^2 + (z - 2)^2 = 9}.$$

38. Using the theorem in objective 3 giving the equation of a sphere, we get

$$(x - (-3))^2 + (y - 1)^2 + (z - (-1))^2 = 1^2, \text{ or } \boxed{(x + 3)^2 + (y - 1)^2 + (z + 1)^2 = 1}.$$

39. As in the text, we complete the square:

$$\begin{aligned} x^2 + y^2 + z^2 + 2x - 2y &= 2 \\ (x^2 + 2x) + (y^2 - 2y) + z^2 &= 2 \\ (x^2 + 2x + 1) + (y^2 - 2y + 1) + z^2 &= 2 + 1 + 1 \\ (x + 1)^2 + (y - 1)^2 + z^2 &= 4. \end{aligned}$$

This is $\boxed{\text{a sphere with radius } \sqrt{4} = 2 \text{ and center } (-1, 1, 0)}.$

40. As in the text, we complete the square:

$$\begin{aligned} x^2 + y^2 + z^2 + 2x - 2z &= -1 \\ (x^2 + 2x) + y^2 + (z^2 - 2z) &= -1 \\ (x^2 + 2x + 1) + y^2 + (z^2 - 2z + 1) &= -1 + 1 + 1 \\ (x + 1)^2 + y^2 + (z - 1)^2 &= 1. \end{aligned}$$

This is $\boxed{\text{a sphere with radius } \sqrt{1} = 1 \text{ and center } (-1, 0, 1)}.$

41. As in the text, we complete the square:

$$\begin{aligned} x^2 + y^2 + z^2 + 4x - 4y + 2z &= 0 \\ (x^2 + 4x) + (y^2 - 4y) + (z^2 + 2z) &= 0 \\ (x^2 + 4x + 4) + (y^2 - 4y + 4) + (z^2 + 2z + 1) &= 0 + 4 + 4 + 1 \\ (x + 2)^2 + (y - 2)^2 + (z + 1)^2 &= 9. \end{aligned}$$

This is $\boxed{\text{a sphere with radius } \sqrt{9} = 3 \text{ and center } (-2, 2, -1)}.$

42. As in the text, we complete the square:

$$\begin{aligned} x^2 + y^2 + z^2 - 4x &= 0 \\ (x^2 - 4x) + y^2 + z^2 &= 0 \\ (x^2 - 4x + 4) + y^2 + z^2 &= 0 + 4 \\ (x - 2)^2 + y^2 + z^2 &= 4. \end{aligned}$$

This is $\boxed{\text{a sphere with radius } \sqrt{4} = 2 \text{ and center } (2, 0, 0)}.$

43. As in the text, we complete the square:

$$\begin{aligned}
 2x^2 + 2y^2 + 2z^2 - 8x + 5z + 1 &= 0 \\
 x^2 + y^2 + z^2 - 4x + \frac{5}{2}z &= -\frac{1}{2} \\
 (x^2 - 4x) + y^2 + \left(z^2 + \frac{5}{2}z\right) &= -\frac{1}{2} \\
 (x^2 - 4x + 4) + y^2 + \left(z^2 + \frac{5}{2}z + \frac{25}{16}\right) &= -\frac{1}{2} + 4 + \frac{25}{16} \\
 (x - 2)^2 + y^2 + \left(z + \frac{5}{4}\right)^2 &= \frac{81}{16}.
 \end{aligned}$$

This is a sphere with radius $\sqrt{\frac{81}{16}} = \frac{9}{4}$ and center $(2, 0, -\frac{5}{4})$.

44. As in the text, we complete the square:

$$\begin{aligned}
 3x^2 + 3y^2 + 3z^2 + 6x - y - 3 &= 0 \\
 x^2 + y^2 + z^2 + 2x - \frac{1}{3}y &= 1 \\
 (x^2 + 2x) + \left(y^2 - \frac{1}{3}y\right) + z^2 &= 1 \\
 (x^2 + 2x + 1) + \left(y^2 - \frac{1}{3}y + \frac{1}{36}\right) + z^2 &= 1 + 1 + \frac{1}{36} \\
 (x + 1)^2 + \left(y - \frac{1}{6}\right)^2 + z^2 &= \frac{73}{36}.
 \end{aligned}$$

This is a sphere with radius $\sqrt{\frac{73}{36}} = \frac{\sqrt{73}}{6}$ and center $(-1, \frac{1}{6}, 0)$.

Applications and Extensions

45. If the given points are the endpoints of a diameter, then the center of the circle must be the point halfway between the given points, which is

$$P = \left(\frac{-2+2}{2}, \frac{0+6}{2}, \frac{4+8}{2}\right) = (0, 3, 6).$$

The radius of the circle is the distance from P to either of the given points, say $P_1 = (-2, 0, 4)$:

$$R = |PP_1| = \sqrt{(0 - (-2))^2 + (3 - 0)^2 + (6 - 4)^2} = \sqrt{4 + 9 + 4} = \sqrt{17}.$$

So the equation of the sphere is

$$x^2 + (y - 3)^2 + (z - 6)^2 = R^2 = 17.$$

46. If the given points are the endpoints of a diameter, then the center of the circle must be the point halfway between the given points, which is

$$P = \left(\frac{1-3}{2}, \frac{3+1}{2}, \frac{6+4}{2}\right) = (-1, 2, 5).$$

The radius of the circle is the distance from P to either of the given points, say $P_1 = (1, 3, 6)$:

$$R = |PP_1| = \sqrt{(-1 - 1)^2 + (2 - 3)^2 + (5 - 6)^2} = \sqrt{4 + 1 + 1} = \sqrt{6}.$$

So the equation of the sphere is

$$(x+1)^2 + (y-2)^2 + (z-5)^2 = R^2 = 6.$$

47. Since the center is $P = (-3, 2, 1)$ and the sphere passes through the point $P_1 = (4, -1, 3)$, the radius is

$$R = |PP_1| = \sqrt{(-3-4)^2 + (2-(-1))^2 + (1-3)^2} = \sqrt{49+9+4} = \sqrt{62}.$$

Therefore the equation of the sphere is

$$(x-(-3))^2 + (y-2)^2 + (z-1)^2 = R^2, \text{ or } (x+3)^2 + (y-2)^2 + (z-1)^2 = 62.$$

48. Since the center is $P = (0, -3, 4)$ and the sphere passes through the point $P_1 = (2, 1, 1)$, the radius is

$$R = |PP_1| = \sqrt{(0-2)^2 + (-3-1)^2 + (4-1)^2} = \sqrt{4+16+9} = \sqrt{29}.$$

Therefore the equation of the sphere is

$$x^2 + (y-(-3))^2 + (z-4)^2 = R^2, \text{ or } x^2 + (y+3)^2 + (z-4)^2 = 29.$$

49. The point of tangency is on the xy -plane, so it has the form $(x, y, 0)$. The point of tangency must lie directly below the center in the z -direction, so it must be the point $(2, 1, 0)$. Then the radius is

$$|(2, 1, -2) - (2, 1, 0)| = \sqrt{(2-2)^2 + (1-1)^2 + (-2-0)^2} = \sqrt{4} = 2.$$

Therefore the equation of the sphere is

$$(x-2)^2 + (y-1)^2 + (z-(-2))^2 = 2^2, \text{ or } (x-2)^2 + (y-1)^2 + (z+2)^2 = 4.$$

50. The point of tangency is on the yz -plane, so it has the form $(0, y, z)$. It must have the same y and z -coordinates as the given point, since it is tangent to the sphere. Therefore the point of tangency is $(0, 5, 4)$. Then the radius is

$$|(1, 5, 4) - (0, 5, 4)| = \sqrt{(1-0)^2 + (5-5)^2 + (4-4)^2} = 1.$$

Therefore the equation of the sphere is

$$(x-1)^2 + (y-5)^2 + (z-4)^2 = 1^2 = 1.$$

51. (a) Since one vertex is at the origin, one point is $(0, 0, 0)$. The sides are 0.287 nm long, so (measuring in nanometers), three other vertices of the cube are at $(0.287, 0, 0)$, $(0, 0.287, 0)$, and $(0, 0, 0.287)$. The other four vertices of the cube are then

$$(0.287, 0.287, 0), (0, 0.287, 0.287), (0.287, 0, 0.287), (0.287, 0.287, 0.287).$$

Finally, the atom in the center is at the midpoint of the line segment joining the points $(0, 0, 0)$ and $(0.287, 0.287, 0.287)$, so its coordinates must be $(\frac{0.287}{2}, \frac{0.287}{2}, \frac{0.287}{2}) = (0.1435, 0.1435, 0.1435)$.

- (b) The atom that is furthest from the origin is the one at the opposite corner of the cube, with coordinates $(0.287, 0.287, 0.287)$.

- (c) From part (a), the coordinates of the atom at the center are $(0.1435, 0.1435, 0.1435)$.

- (d) The atom in the xz plane that is farthest from the origin is the opposite corner of the square in the xz plane, which is the point $(0.287, 0, 0.287)$. The distance from this atom to the atom in the center is

$$\sqrt{(0.287 - 0.1435)^2 + (0 - 0.1435)^2 + (0.287 - 0.1435)^2} \approx \sqrt{3 \cdot 0.1435^2} \approx 0.249 \text{ nm}.$$

52. If it is an equilateral triangle, then the distance from each of these points to the others must be equal. Let $A = (2, 4, 2)$, $B = (2, 1, 5)$, and $C = (5, 1, 2)$. Then

$$\begin{aligned} |AB| &= \sqrt{(2-2)^2 + (4-1)^2 + (2-5)^2} = \sqrt{0+9+9} = \sqrt{18} = 3\sqrt{2} \\ |AC| &= \sqrt{(2-5)^2 + (4-1)^2 + (2-2)^2} = \sqrt{9+9+0} = \sqrt{18} = 3\sqrt{2} \\ |BC| &= \sqrt{(2-5)^2 + (1-1)^2 + (5-2)^2} = \sqrt{9+0+9} = \sqrt{18} = 3\sqrt{2}. \end{aligned}$$

Since all three sides have length $3\sqrt{2}$, the triangle is equilateral.

53. (a) From the formula in objective 3, the equation of this sphere is

$$(x-4)^2 + (y-0)^2 + (z-(-2))^2 = 5^2 \quad \text{or} \quad \boxed{(x-4)^2 + y^2 + (z+2)^2 = 25}.$$

- (b) Answers will vary.

54. (a) To show this is a right triangle, we must show that the lengths of its sides satisfy the Pythagorean theorem. Let $A = (-2, 6, 0)$, $B = (4, 9, 1)$, and $C = (-3, 2, 18)$. Then

$$\begin{aligned} |AB| &= \sqrt{(-2-4)^2 + (6-9)^2 + (0-1)^2} = \sqrt{36+9+1} = \sqrt{46} \\ |AC| &= \sqrt{(-2-(-3))^2 + (6-2)^2 + (0-18)^2} = \sqrt{1+16+324} = \sqrt{341} \\ |BC| &= \sqrt{(4-(-3))^2 + (9-2)^2 + (1-18)^2} = \sqrt{49+49+289} = \sqrt{387}. \end{aligned}$$

Since $|AB|^2 + |AC|^2 = 46 + 341 = 387 = |BC|^2$, these three points form a right triangle with hypotenuse BC .

- (b) Note that a circle whose diameter is the hypotenuse also passes through the third vertex of the triangle (Euclid: a triangle inscribed in a circle with one edge the diameter is a right triangle). This will be an equator of the desired sphere. Since BC is the hypotenuse, the center of the sphere must be at the point $P = \frac{B+C}{2} = \left(\frac{4-3}{2}, \frac{9+2}{2}, \frac{1+18}{2}\right) = \left(\frac{1}{2}, \frac{11}{2}, \frac{19}{2}\right)$. The radius of the sphere is half the length of the hypotenuse, so

$$R = \frac{1}{2} |BC| = \frac{1}{2} \sqrt{387}.$$

Therefore the equation of the sphere is

$$\left(x - \frac{1}{2}\right)^2 + \left(y - \frac{11}{2}\right)^2 + \left(z - \frac{19}{2}\right)^2 = R^2 = \frac{387}{4}.$$

We can simplify this by multiplying both sides by 4 to get

$$\begin{aligned} 4\left(x - \frac{1}{2}\right)^2 + 4\left(y - \frac{11}{2}\right)^2 + 4\left(z - \frac{19}{2}\right)^2 &= 387 \\ \boxed{(2x-1)^2 + (2y-11)^2 + (2z-19)^2} &= 387. \end{aligned}$$

55. A point on the xy plane has the form $A = (x, y, 0)$, so the distance from the point $P = (4, 2, -1)$ to the xy plane is

$$|PA| = \sqrt{(x-4)^2 + (y-2)^2 + (0-1)^2} = \sqrt{(x-4)^2 + (y-2)^2 + 1}.$$

Now, both $(x-4)^2$ and $(y-2)^2$ are nonnegative, so the distance is at a minimum when they are both zero, which is when $x = 4$ and $y = 2$. So the closest point to P on the xy plane is $(4, 2, 0)$, at a distance of $\boxed{1 \text{ unit}}$ from P .

56. We know how to find the midpoint of a segment in the plane: If (a_1, b_1) and (a_2, b_2) are two points, then the midpoint is $M = \left(\frac{a_1+a_2}{2}, \frac{b_1+b_2}{2}\right)$. Note that the x -coordinate of M is the average of the x -coordinates and the y -coordinate of M is the average of the y -coordinates. Extend this notion to points in space $P_1 = (a_1, b_1, c_1)$ and $P_2 = (a_2, b_2, c_2)$. Each coordinate of the midpoint of the segment between P_1 and P_2 will be the average of the corresponding coordinates, so the point is

$$\left(\frac{a_1 + a_2}{2}, \frac{b_1 + b_2}{2}, \frac{c_1 + c_2}{2}\right).$$

Challenge Problems

57. Let $A = (3, 0, 0)$, $B = (0, 0, 1)$, $C = (-1, -3, 1)$, and $D = (2, 0, 1)$. Let $P = (a, b, c)$ be the center of the sphere, and R its radius. Since both A and B lie on the sphere, we must have

$$\begin{aligned}(3-a)^2 + (0-b)^2 + (0-c)^2 &= R^2 = (0-a)^2 + (0-b)^2 + (1-c)^2 \\ 9 - 6a + a^2 + b^2 + c^2 &= a^2 + b^2 + 1 - 2c + c^2 \\ 9 - 6a &= 1 - 2c \\ 2c &= 6a - 8 \\ c &= 3a - 4.\end{aligned}$$

So $P = (a, b, 3a - 4)$. Now, since both A and C lie on the sphere, we must have

$$\begin{aligned}(3-a)^2 + (0-b)^2 + (0-(3a-4))^2 &= R^2 = (-1-a)^2 + (-3-b)^2 + (1-(3a-4))^2 \\ (9-6a+a^2) + b^2 + (9a^2-24a+16) &= (1+2a+a^2) + (9+6b+b^2) + (5-3a)^2 \\ (9-6a+a^2) + b^2 + (9a^2-24a+16) &= (1+2a+a^2) + (9+6b+b^2) + 25-30a+9a^2 \\ 9-6a-24a+16 &= 1+2a+9+6b+25-30a \\ 2a &= -6b-10 \\ a &= -3b-5.\end{aligned}$$

Since $a = -3b - 5$ and $c = 3a - 4$, we have $c = 3(-3b - 5) - 4 = -9b - 19$. Therefore the center of the sphere is $P = (-3b - 5, b, -9b - 19)$. Finally, we use the fourth point: since both A and D lie on the sphere, we must have

$$\begin{aligned}(3-(-3b-5))^2 + (0-b)^2 + (0-(-9b-19))^2 &= R^2 = (2-(-3b-5))^2 + (0-b)^2 + (1-(-9b-19))^2 \\ (3b+8)^2 + b^2 + (9b+19)^2 &= (3b+7)^2 + b^2 + (9b+20)^2 \\ (9b^2+48b+64) + b^2 + (81b^2+342b+361) &= (9b^2+42b+49) + b^2 + (81b^2+360b+400) \\ 91b^2+390b+425 &= 91b^2+402b+449 \\ 12b &= -24 \\ b &= -2.\end{aligned}$$

So the center of the sphere is $P = (-3b - 5, b, -9b - 19) = (1, -2, -1)$. Then the radius of the sphere is

$$R = |AP| = \sqrt{(3-1)^2 + (0-(-2))^2 + (0-(-1))^2} = \sqrt{4+4+1} = 3.$$

So the equation of the sphere is

$$(x-1)^2 + (y+2)^2 + (z+1)^2 = 9.$$

58. (a) Since $A > 0$, first divide through by A , giving

$$x^2 + y^2 + z^2 + \frac{D}{A}x + \frac{E}{A}y + \frac{F}{A}z = \frac{G}{A}.$$

Now write P for $\frac{D}{A}$, Q for $\frac{E}{A}$, and so forth, giving

$$x^2 + y^2 + z^2 + Px + Qy + Rz = S.$$

This has the same graph as the original equation. Completing the square gives

$$\begin{aligned} (x^2 + Px) + (y^2 + Qy) + (z^2 + Rz) &= S \\ \left(x^2 + Px + \frac{P^2}{4}\right) + \left(y^2 + Qy + \frac{Q^2}{4}\right) + \left(z^2 + Rz + \frac{R^2}{4}\right) &= S + \frac{P^2}{4} + \frac{Q^2}{4} + \frac{R^2}{4} \\ \left(x + \frac{P}{2}\right)^2 + \left(y + \frac{Q}{2}\right)^2 + \left(z + \frac{R}{2}\right)^2 &= S + \frac{P^2}{4} + \frac{Q^2}{4} + \frac{R^2}{4}. \end{aligned}$$

The left-hand side is a sum of three squares, so it is greater than or equal to zero. So if the right-hand side is negative, the equation has no solutions, so the graph is the empty set. If the right-hand side is zero, then the left-hand side is zero when each of the terms is zero, which happens only at the point $\left(-\frac{P}{2}, -\frac{Q}{2}, -\frac{R}{2}\right)$. Therefore the graph consists of a single point. Finally, if the right-hand side is positive, then this equation is the equation of a sphere centered at $\left(-\frac{P}{2}, -\frac{Q}{2}, -\frac{R}{2}\right)$ with radius $\sqrt{S + \frac{P^2}{4} + \frac{Q^2}{4} + \frac{R^2}{4}}$.

(b) See part (a).

10.2: Introduction to Vectors

Concepts and Vocabulary

1. True. See the first sentence of this section.
2. Scalars are quantities that have only magnitude. See the introductory material in this section.
3. The product of a scalar a and a vector $\mathbf{v}$ is called a *scalar multiple* of $\mathbf{v}$.
4. The vectors $-\mathbf{v}$ and $\mathbf{v}$ have the same magnitude ((a)) but point in opposite directions ((d)).

Skill Building

5. (a) Volume is a scalar; it has magnitude, but no direction.
 (b) Speed is a scalar; it has magnitude, but no direction (compare with velocity, in part (h)).
 (c) Force is a vector; one applies an amount of force in a given direction.
 (d) Work is a scalar; it has no direction.
 (e) Mass is a scalar; it has magnitude, but no direction.
 (f) Distance is a scalar. The distance between two things is some number of meters. (Note: one could also say that one object is 3 meters to the northwest of another, in which case this would be a vector, but that is not the usual meaning of the word “distance”.)
 (g) Age is a scalar; it has magnitude, but no direction.
 (h) Velocity is a vector. It measures speed (a magnitude) in a given direction.

13.

14.

15. From the diagram, since the terminal point of $\mathbf{A}$ is at the initial point of $\mathbf{B}$, we see that $\mathbf{A} + \mathbf{B} = \mathbf{F}$, so that $\mathbf{x} = \boxed{\mathbf{A}}$.

16. From the diagram, since the terminal point of $\mathbf{C}$ is at the initial point of $\mathbf{H}$, we see that $\mathbf{C} + \mathbf{H} = \mathbf{K}$, so that $\mathbf{C} = -\mathbf{H} + \mathbf{K}$. Therefore $\mathbf{x} = \boxed{-\mathbf{H}}$.

17. Since the vectors $\mathbf{D}$ and $\mathbf{E}$ have their terminal points at the initial points of $\mathbf{E}$ and $\mathbf{F}$ respectively, we have $\boxed{\mathbf{C} = -\mathbf{D} - \mathbf{E} - \mathbf{F}}$.

18. Since the initial point of $\mathbf{K}$ is the initial point of $\mathbf{C}$, the terminal point of $-\mathbf{K}$ is at the initial point of $\mathbf{C}$. Since the terminal points of $\mathbf{C}$ and $\mathbf{D}$ are the initial points of $\mathbf{D}$ and $\mathbf{E}$ respectively, the initial point of $-\mathbf{K}$ is the initial point of $\mathbf{G}$, and the terminal point of $\mathbf{E}$ is the terminal point of $\mathbf{G}$, we have

$$\boxed{\mathbf{G} = -\mathbf{K} + \mathbf{C} + \mathbf{D} + \mathbf{E}}.$$

19. The initial point of $-\mathbf{D}$ is the initial point of $\mathbf{E}$, and its terminal point is the initial point of $\mathbf{H}$. Further, the terminal point of $\mathbf{H}$ is the initial point of $\mathbf{G}$, and the terminal point of $\mathbf{G}$ is the terminal point of $\mathbf{E}$. Therefore

$$\boxed{\mathbf{E} = -\mathbf{D} + \mathbf{H} + \mathbf{G}}.$$

20. Reversing all of $\mathbf{A}$, $\mathbf{B}$, $\mathbf{C}$, and $\mathbf{D}$ exchanges all of their initial and terminal points; then the initial point of $-\mathbf{D}$ is the initial point of $\mathbf{E}$, and the terminal point of $-\mathbf{A}$ is the terminal point of $\mathbf{E}$, so that

$$\boxed{\mathbf{E} = -\mathbf{D} - \mathbf{C} - \mathbf{B} - \mathbf{A}}.$$

21. $\mathbf{A} + \mathbf{B} = \mathbf{F}$. Then $\mathbf{F} + \mathbf{K} = -\mathbf{G}$. So

$$\mathbf{A} + \mathbf{B} + \mathbf{K} + \mathbf{G} = (\mathbf{A} + \mathbf{B}) + \mathbf{K} + \mathbf{G} = (\mathbf{F} + \mathbf{K}) + \mathbf{G} = -\mathbf{G} + \mathbf{G} = \boxed{\mathbf{0}}.$$

Alternatively, note that following the four vectors in order returns to the original starting point, so their sum must be the zero vector.

22. Following the five vectors in order returns to the original starting point, so their sum must be the zero vector. Alternatively,

$$\mathbf{A} + \mathbf{B} + \mathbf{C} + \mathbf{H} + \mathbf{G} = \mathbf{F} + \mathbf{C} + \mathbf{H} + \mathbf{G} = (\mathbf{F} + \mathbf{C}) + \mathbf{H} + \mathbf{G} = (-\mathbf{G} - \mathbf{H}) + \mathbf{H} + \mathbf{G} = \boxed{\mathbf{0}}.$$

Applications and Extensions

23. Translate $\mathbf{F}_2$ so that its initial point is at the terminal point of $\mathbf{F}_1$; then their sum is the terminal point of the translated vector.

24. Translate $\mathbf{F}_2$ so that its initial point is at the terminal point of $\mathbf{F}_1$; then their sum is the terminal point of the translated vector.

25. (a) A diagram is below, where $\mathbf{p}$ represents the airspeed vector of the airplane, and $\mathbf{w}$ the wind (note that the diagram is not to scale, since it would be very tall):

- (b) To compute the resultant vector, translate $\mathbf{w}$ so that its initial point is at the terminal point of $\mathbf{p}$; then the terminal point of $\mathbf{w}$ is the sum $\mathbf{p} + \mathbf{w}$:

- (c) Answers will vary.

26. (a) A diagram is below, where $\mathbf{p}$ represents the airspeed vector of the airplane, and $\mathbf{w}$ the wind. Note that $\mathbf{p}$ overlaps with $\mathbf{w}$; they have the same initial point of 0.

- (b) To compute the resultant vector, translate $\mathbf{w}$ so that its initial point is at the terminal point of $\mathbf{p}$; then the terminal point of $\mathbf{w}$ is the sum $\mathbf{p} + \mathbf{w}$:

- (c) As a result of the wind, the airplane's groundspeed vector is still due west, since the wind and the airspeed point in the same direction, but the groundspeed is higher than the airspeed.

27. The situation is shown below:

The midpoint of $\overrightarrow{PQ}$ is $\mathbf{v}$ plus one half of the vector from P to Q , so it is $\mathbf{v} + \frac{1}{2}\overrightarrow{PQ}$. But $\overrightarrow{PQ} = \mathbf{w} - \mathbf{v}$, so that the vector from the origin to the midpoint is

$$\mathbf{v} + \frac{1}{2}\overrightarrow{PQ} = \mathbf{v} + \frac{1}{2}(\mathbf{w} - \mathbf{v}) = \boxed{\frac{1}{2}(\mathbf{v} + \mathbf{w})}.$$

28. Expand and simplify:

$$\mathbf{0} = 4\mathbf{v} + a(\mathbf{v} - \mathbf{w}) + b(\mathbf{v} + \mathbf{w}) = 4\mathbf{v} + a\mathbf{v} - a\mathbf{w} + b\mathbf{v} + b\mathbf{w} = (4 + a + b)\mathbf{v} + (b - a)\mathbf{w}.$$

Since this equation must hold for every pair of vectors $\mathbf{v}$ and $\mathbf{w}$, start with $\mathbf{w} = \mathbf{0}$ and $\mathbf{v}$ some nonzero vector. Then $\mathbf{0} = (4 + a + b)\mathbf{v}$, so that $4 + a + b = 0$. Similarly, if we let $\mathbf{v} = \mathbf{0}$ and $\mathbf{w}$ be any nonzero vector, we get $\mathbf{0} = (b - a)\mathbf{w}$, so that $b - a = 0$. So we get the pair of equations $a + b = -4$ and $-a + b = 0$, which have the solution $\boxed{a = b = -2}$.

10.3: Vectors in the Plane and in Space

Concepts and Vocabulary

1. In space, the standard basis vectors are $\mathbf{i} = \langle 1, 0, 0 \rangle$, $\mathbf{j} = \langle 0, 1, 0 \rangle$, and $\mathbf{k} = \langle 0, 0, 1 \rangle$.
2. A vector whose magnitude is 1 is called a *unit* vector.
3. v_1 , v_2 , and v_3 are called the *components* of $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$.
4. True. Since $4 > 0$, $\mathbf{w} = 4\mathbf{v}$ points in the same direction as $\mathbf{v}$.
5. False. The magnitude of a vector $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ is given by $\sqrt{v_1^2 + v_2^2 + v_3^2}$, and similarly for vectors with other numbers of components.
6. True. See the theorem at the beginning of objective 5.
7. Since the magnitude of $\mathbf{v}$ is $\sqrt{1^2 + 1^2 + 1^2} = \sqrt{3}$, the unit vector $\mathbf{u}$ in the direction of $\mathbf{v}$ is

$$\frac{1}{\sqrt{3}}\mathbf{v} = \frac{1}{\sqrt{3}}\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} + \frac{1}{\sqrt{3}}\mathbf{k}.$$

8. False. See the Theorem at the end of objective 3, Magnitude of the Scalar Multiple of a Vector.

Skill Building

9. (a) $\mathbf{v} = \langle 6 - 2, -2 - 3 \rangle = \langle 4, -5 \rangle$ (b) $\mathbf{v} = 4\mathbf{i} - 5\mathbf{j}$.

10. (a) $\mathbf{v} = \langle -3 - 4, 2 - (-1) \rangle = \langle -7, 3 \rangle$ (b) $\mathbf{v} = -7\mathbf{i} + 3\mathbf{j}$.

11. (a) $\mathbf{v} = \langle -1 - 0, 6 - 5 \rangle = \langle -1, 1 \rangle$ (b) $\mathbf{v} = -\mathbf{i} + \mathbf{j}$.

12. (a) $\mathbf{v} = \langle 3 - (-2), 2 - 0 \rangle = \langle 5, 2 \rangle$ (b) $\mathbf{v} = 5\mathbf{i} + 2\mathbf{j}$.

13. (a) $\mathbf{v} = \langle 3 - 6, 0 - 2, 2 - 1 \rangle = \langle -3, -2, 1 \rangle$ (b) $\mathbf{v} = -3\mathbf{i} - 2\mathbf{j} + \mathbf{k}$.

14. (a) $\mathbf{v} = \langle 0 - 4, 5 - 7, 6 - 0 \rangle = \langle -4, -2, 6 \rangle$ (b) $\mathbf{v} = -4\mathbf{i} - 2\mathbf{j} + 6\mathbf{k}$.

15. (a) $\mathbf{v} = \langle 2 - (-1), 0 - 0, 0 - 1 \rangle = \langle 3, 0, -1 \rangle$ (b) $\mathbf{v} = 3\mathbf{i} - \mathbf{k}$.

16. (a) $\mathbf{v} = \langle 2 - 6, 6 - 2, 2 - 2 \rangle = \langle -4, 4, 0 \rangle$ (b) $\mathbf{v} = -4\mathbf{i} + 4\mathbf{j}$.

17. $2\mathbf{v} - \mathbf{w} = 2\langle 3, -1 \rangle - \langle -3, 2 \rangle = \langle 2 \cdot 3 - (-3), 2 \cdot (-1) - 2 \rangle = \langle 9, -4 \rangle$.

18. $\mathbf{v} + 5\mathbf{w} = \langle 3, -1 \rangle + 5\langle -3, 2 \rangle = \langle 3 + 5 \cdot (-3), -1 + 5 \cdot 2 \rangle = \langle -12, 9 \rangle$.

19. $\frac{1}{3}\mathbf{v} + \frac{1}{2}\mathbf{w} = \frac{1}{3}\langle 3, -1 \rangle + \frac{1}{2}\langle -3, 2 \rangle = \langle \frac{1}{3} \cdot 3 + \frac{1}{2} \cdot (-3), \frac{1}{3} \cdot (-1) + \frac{1}{2} \cdot 2 \rangle = \left\langle -\frac{1}{2}, \frac{2}{3} \right\rangle$.

20. $\frac{2}{3}\mathbf{v} - \frac{1}{2}\mathbf{w} = \frac{2}{3}\langle 3, -1 \rangle - \frac{1}{2}\langle -3, 2 \rangle = \langle \frac{2}{3} \cdot 3 - \frac{1}{2} \cdot (-3), \frac{2}{3} \cdot (-1) - \frac{1}{2} \cdot 2 \rangle = \left\langle \frac{7}{2}, -\frac{5}{3} \right\rangle$.

21. $\|\mathbf{v}\| = \sqrt{3^2 + (-1)^2} = \sqrt{10}$.

22. $\|\mathbf{w}\| = \sqrt{(-3)^2 + 2^2} = \sqrt{13}$.

23. Using Problem 17, $\|2\mathbf{v} - \mathbf{w}\| = \|\langle 9, -4 \rangle\| = \sqrt{9^2 + (-4)^2} = \sqrt{97}$.

24. $\|\mathbf{v} + \mathbf{w}\| = \|\langle 3, -1 \rangle + \langle -3, 2 \rangle\| = \|\langle 0, 1 \rangle\| = \sqrt{0^2 + 1^2} = 1$.

25. $3\mathbf{v} - 2\mathbf{w} = 3\langle 3, 0, 8 \rangle - 2\langle -3, -1, 2 \rangle = \langle 3 \cdot 3 - 2 \cdot (-3), 3 \cdot 0 - 2 \cdot (-1), 3 \cdot 8 - 2 \cdot 2 \rangle = \langle 15, 2, 20 \rangle$.

26. $-2\mathbf{v} + \mathbf{w} = -2\langle 3, 0, 8 \rangle + \langle -3, -1, 2 \rangle = \langle -2 \cdot 3 + (-3), -2 \cdot 0 + (-1), -2 \cdot 8 + 2 \rangle = \langle -9, -1, -14 \rangle$.

27.

$$\begin{aligned} 2\mathbf{u} - 3\mathbf{v} + 4\mathbf{w} &= 2\langle 1, 1, -6 \rangle - 3\langle 3, 0, 8 \rangle + 4\langle -3, -1, 2 \rangle \\ &= \langle 2 \cdot 1 - 3 \cdot 3 + 4 \cdot (-3), 2 \cdot 1 - 3 \cdot 0 + 4 \cdot (-1), 2 \cdot (-6) - 3 \cdot 8 + 4 \cdot 2 \rangle \\ &= \langle -19, -2, -28 \rangle. \end{aligned}$$

28.

$$\begin{aligned} \mathbf{u} + 3(\mathbf{v} - 4\mathbf{w}) &= \mathbf{u} + 3\mathbf{v} - 12\mathbf{w} \\ &= \langle 1, 1, -6 \rangle + 3\langle 3, 0, 8 \rangle - 12\langle -3, -1, 2 \rangle \\ &= \langle 1 + 3 \cdot 3 - 12 \cdot (-3), 1 + 3 \cdot 0 - 12 \cdot (-1), -6 + 3 \cdot 8 - 12 \cdot 2 \rangle \\ &= \langle 46, 13, -6 \rangle. \end{aligned}$$

29. $\|\mathbf{u}\| = \sqrt{1^2 + 1^2 + (-6)^2} = \boxed{\sqrt{38}}.$

30. $\|\mathbf{v}\| = \sqrt{3^2 + 0^2 + 8^2} = \boxed{\sqrt{73}}.$

31. First compute $5\mathbf{u} - \mathbf{v} + \mathbf{w}$:

$$\begin{aligned} 5\mathbf{u} - \mathbf{v} + \mathbf{w} &= 5\langle 1, 1, -6 \rangle - \langle 3, 0, 8 \rangle + \langle -3, -1, 2 \rangle \\ &= \langle 5 \cdot 1 - 3 + (-3), 5 \cdot 1 - 0 + (-1), 5 \cdot (-6) - 8 + 2 \rangle = \langle -1, 4, -36 \rangle. \end{aligned}$$

Then $\|5\mathbf{u} - \mathbf{v} + \mathbf{w}\| = \|\langle -1, 4, -36 \rangle\| = \sqrt{(-1)^2 + 4^2 + (-36)^2} = \boxed{\sqrt{1313}}.$

32. Using Problems 29 and 30,

$$\|5\mathbf{u}\| - \|\mathbf{v}\| + \|\mathbf{w}\| = 5\|\mathbf{u}\| - \|\mathbf{v}\| + \sqrt{(-3)^2 + (-1)^2 + 2^2} = \boxed{5\sqrt{38} - \sqrt{73} + \sqrt{14}}.$$

33. $\|4\mathbf{i} - 3\mathbf{j}\| = \sqrt{4^2 + (-3)^2} = \boxed{5}.$

34. $\|\mathbf{i} - 12\mathbf{j}\| = \sqrt{1^2 + (-12)^2} = \boxed{\sqrt{145}}.$

35. $\|\mathbf{i} + \mathbf{j}\| = \sqrt{1^2 + 1^2} = \boxed{\sqrt{2}}.$

36. $\|\mathbf{i} - \mathbf{j}\| = \sqrt{1^2 + (-1)^2} = \boxed{\sqrt{2}}.$

37. $\|4\mathbf{i} + 2\mathbf{j} - \mathbf{k}\| = \sqrt{4^2 + 2^2 + 1^2} = \boxed{\sqrt{21}}.$

38. $\|\mathbf{i} - \mathbf{j} + \mathbf{k}\| = \sqrt{1^2 + (-1)^2 + 1^2} = \boxed{\sqrt{3}}.$

39. $\|\mathbf{j} + \mathbf{k}\| = \sqrt{0^2 + 1^2 + 1^2} = \boxed{\sqrt{2}}.$

40. $\|2\mathbf{i} - \mathbf{k}\| = \sqrt{2^2 + 0^2 + (-1)^2} = \boxed{\sqrt{5}}.$

41. $\|(\cos \theta)\mathbf{i} + (\sin \theta)\mathbf{j}\| = \sqrt{\cos^2 \theta + \sin^2 \theta} = \boxed{1}.$

42. $\|(\cos \theta)\mathbf{i} + (\sin \theta)\mathbf{j} + \mathbf{k}\| = \sqrt{\cos^2 \theta + \sin^2 \theta + 1} = \boxed{\sqrt{2}}.$

43. Since $\|\mathbf{v}\| = \sqrt{5^2 + 12^2} = 13$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|}\mathbf{v} = \left\langle \frac{5}{13}, \frac{12}{13} \right\rangle.$$

The unit vector in the direction opposite to $\mathbf{v}$ is $-\left\langle \frac{5}{13}, \frac{12}{13} \right\rangle = \boxed{\left\langle -\frac{5}{13}, -\frac{12}{13} \right\rangle}.$

44. Since $\|\mathbf{v}\| = \sqrt{3^2 + 4^2} = 5$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|}\mathbf{v} = \left\langle \frac{3}{5}, \frac{4}{5} \right\rangle.$$

The unit vector in the direction opposite to $\mathbf{v}$ is $-\left\langle \frac{3}{5}, \frac{4}{5} \right\rangle = \boxed{\left\langle -\frac{3}{5}, -\frac{4}{5} \right\rangle}.$

45. Since $\|\mathbf{v}\| = \sqrt{2^2 + 1^2} = \sqrt{5}$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|}\mathbf{v} = \boxed{\frac{2}{\sqrt{5}}\mathbf{i} + \frac{1}{\sqrt{5}}\mathbf{j}}.$$

The unit vector in the direction opposite to $\mathbf{v}$ is $\boxed{-\frac{2}{\sqrt{5}}\mathbf{i} - \frac{1}{\sqrt{5}}\mathbf{j}}.$

46. Since $\|\mathbf{v}\| = \sqrt{1^2 + (-1)^2} = \sqrt{2}$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|}\mathbf{v} = \boxed{\frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}}.$$

The unit vector in the direction opposite to $\mathbf{v}$ is $\boxed{-\frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}}.$

47. Since $\|\mathbf{v}\| = \sqrt{\left(\frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2} = \sqrt{\frac{1}{4} + \frac{3}{4}} = 1$, we see that $\boxed{\mathbf{v} \text{ is already a unit vector}}$. The unit vector

in the direction opposite to $\mathbf{v}$ is $-\mathbf{v} = \boxed{-\frac{1}{2}\mathbf{i} - \frac{\sqrt{3}}{2}\mathbf{j}}.$

48. Since $\|\mathbf{v}\| = \sqrt{\left(\frac{\sqrt{2}}{2}\right)^2 + \left(-\frac{\sqrt{2}}{2}\right)^2} = \sqrt{\frac{1}{2} + \frac{1}{2}} = 1$, we see that $\boxed{\mathbf{v} \text{ is already a unit vector}}$. The unit

vector in the direction opposite to $\mathbf{v}$ is $-\mathbf{v} = \boxed{-\frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j}}.$

49. Since $\|\mathbf{v}\| = \sqrt{1^2 + 1^2 + 1^2} = \sqrt{3}$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|}\mathbf{v} = \boxed{\left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle}.$$

The unit vector in the direction opposite to $\mathbf{v}$ is $-\left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle = \boxed{\left\langle -\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}} \right\rangle}.$

50. Since $\|\mathbf{v}\| = \sqrt{1^2 + (-1)^2 + (-1)^2} = \sqrt{3}$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|}\mathbf{v} = \boxed{\left\langle \frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}} \right\rangle}.$$

The unit vector in the direction opposite to $\mathbf{v}$ is $-\left\langle \frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}} \right\rangle = \boxed{\left\langle -\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle}.$

51. Since $\|\mathbf{v}\| = \sqrt{\cos^2 \theta + \sin^2 \theta + (2\sqrt{2})^2} = \sqrt{1 + 8} = 3$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|}\mathbf{v} = \boxed{\frac{1}{3}\cos\theta\mathbf{i} + \frac{1}{3}\sin\theta\mathbf{j} + \frac{2}{3}\sqrt{2}\mathbf{k}}.$$

The unit vector in the direction opposite to $\mathbf{v}$ is $\boxed{-\frac{1}{3}\cos\theta\mathbf{i} - \frac{1}{3}\sin\theta\mathbf{j} - \frac{2}{3}\sqrt{2}\mathbf{k}}.$

52. Since $\|\mathbf{v}\| = \sqrt{\sin^2 \theta + \cos^2 \theta + 1^2} = \sqrt{1+1} = \sqrt{2}$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|} \mathbf{v} = \left[\frac{1}{\sqrt{2}} \sin \theta \mathbf{i} + \frac{1}{\sqrt{2}} \cos \theta \mathbf{j} + \frac{1}{\sqrt{2}} \mathbf{k} \right].$$

The unit vector in the direction opposite to $\mathbf{v}$ is $\left[-\frac{1}{\sqrt{2}} \sin \theta \mathbf{i} - \frac{1}{\sqrt{2}} \cos \theta \mathbf{j} - \frac{1}{\sqrt{2}} \mathbf{k} \right].$

53. Since $\|\mathbf{v}\| = \sqrt{3^2 + (-4)^2 + 12^2} = \sqrt{169} = 13$, the normalization of $\mathbf{v}$ is

$$\frac{1}{\|\mathbf{v}\|} \mathbf{v} = \left[\frac{3}{13} \mathbf{i} - \frac{4}{13} \mathbf{j} + \frac{12}{13} \mathbf{k} \right].$$

The unit vector in the direction opposite to $\mathbf{v}$ is $\left[-\frac{3}{13} \mathbf{i} + \frac{4}{13} \mathbf{j} - \frac{12}{13} \mathbf{k} \right].$

54. Since

$$\|\mathbf{v}\| = \sqrt{\left(\frac{1}{2}\right)^2 + \left(-\frac{1}{2}\right)^2 + \left(\frac{\sqrt{2}}{2}\right)^2} = \sqrt{\frac{1}{4} + \frac{1}{4} + \frac{1}{2}} = 1,$$

$\mathbf{v}$ is already a unit vector. The unit vector in the direction opposite to $\mathbf{v}$ is $-\mathbf{v} = \left[-\frac{1}{2} \mathbf{i} + \frac{1}{2} \mathbf{j} - \frac{\sqrt{2}}{2} \mathbf{k} \right].$

55. $2\mathbf{v} - \mathbf{w} = 2(2\mathbf{i} - 3\mathbf{j}) - (\mathbf{i} + 2\mathbf{j}) = 4\mathbf{i} - 6\mathbf{j} - \mathbf{i} - 2\mathbf{j} = \left[3\mathbf{i} - 8\mathbf{j} \right].$

56. $\mathbf{v} + 5\mathbf{w} = (2\mathbf{i} - 3\mathbf{j}) + 5(\mathbf{i} + 2\mathbf{j}) = 2\mathbf{i} - 3\mathbf{j} + 5\mathbf{i} + 10\mathbf{j} = \left[7\mathbf{i} + 7\mathbf{j} \right].$

57. $\frac{1}{3}\mathbf{v} + \frac{1}{2}\mathbf{w} = \frac{1}{3}(2\mathbf{i} - 3\mathbf{j}) + \frac{1}{2}(\mathbf{i} + 2\mathbf{j}) = \frac{2}{3}\mathbf{i} - \mathbf{j} + \frac{1}{2}\mathbf{i} + \mathbf{j} = \left[\frac{7}{6}\mathbf{i} \right].$

58. $\frac{2}{3}\mathbf{v} - \frac{1}{2}\mathbf{w} = \frac{2}{3}(2\mathbf{i} - 3\mathbf{j}) - \frac{1}{2}(\mathbf{i} + 2\mathbf{j}) = \frac{4}{3}\mathbf{i} - 2\mathbf{j} - \frac{1}{2}\mathbf{i} - \mathbf{j} = \left[\frac{5}{6}\mathbf{i} - 3\mathbf{j} \right].$

59. $\|\mathbf{v} - \mathbf{w}\| = \|(2\mathbf{i} - 3\mathbf{j}) - (\mathbf{i} + 2\mathbf{j})\| = \|\mathbf{i} - 5\mathbf{j}\| = \sqrt{1^2 + 5^2} = \left[\sqrt{26} \right].$

60. $\|\mathbf{v} + \mathbf{w}\| = \|(2\mathbf{i} - 3\mathbf{j}) + (\mathbf{i} + 2\mathbf{j})\| = \|3\mathbf{i} - \mathbf{j}\| = \sqrt{3^2 + 1^2} = \left[\sqrt{10} \right].$

61. $3\mathbf{v} - 2\mathbf{w} = 3(2\mathbf{i} + \mathbf{j} - \mathbf{k}) - 2(6\mathbf{i} + \mathbf{j} + \mathbf{k}) = 9\mathbf{i} + 3\mathbf{j} - 3\mathbf{k} - 12\mathbf{i} - 2\mathbf{j} - 2\mathbf{k} = \left[-3\mathbf{i} + \mathbf{j} - 5\mathbf{k} \right].$

62. $-2\mathbf{v} + \mathbf{w} = -2(3\mathbf{i} + \mathbf{j} - \mathbf{k}) + (6\mathbf{i} + \mathbf{j} + \mathbf{k}) = -6\mathbf{i} - 2\mathbf{j} + 2\mathbf{k} + 6\mathbf{i} + \mathbf{j} + \mathbf{k} = \left[-\mathbf{j} + 3\mathbf{k} \right].$

63. $2\mathbf{u} - 3\mathbf{v} + 4\mathbf{w} = 2(\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}) - 3(2\mathbf{i} + \mathbf{j} - \mathbf{k}) + 4(6\mathbf{i} + \mathbf{j} + \mathbf{k}) = \left[17\mathbf{i} - 3\mathbf{j} + 13\mathbf{k} \right].$

64. $5\mathbf{u} - \mathbf{v} + \mathbf{w} = 5(\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}) - (2\mathbf{i} + \mathbf{j} - \mathbf{k}) + (6\mathbf{i} + \mathbf{j} + \mathbf{k}) = \left[8\mathbf{i} - 10\mathbf{j} + 17\mathbf{k} \right].$

65. $\|\mathbf{v} - \mathbf{w}\| = \|(3\mathbf{i} + \mathbf{j} - \mathbf{k}) - (6\mathbf{i} + \mathbf{j} + \mathbf{k})\| = \|-3\mathbf{i} - 2\mathbf{k}\| = \sqrt{(-3)^2 + (-2)^2} = \left[\sqrt{13} \right].$

66. $\|2\mathbf{v} + \mathbf{w}\| = \|2(3\mathbf{i} + \mathbf{j} - \mathbf{k}) + (6\mathbf{i} + \mathbf{j} + \mathbf{k})\| = \|12\mathbf{i} + 3\mathbf{j} - \mathbf{k}\| = \sqrt{12^2 + 3^2 + (-1)^2} = \left[\sqrt{154} \right].$

67.

$$\begin{aligned} \|\mathbf{u}\| + \|\mathbf{v}\| + \|\mathbf{w}\| &= \|\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}\| + \|3\mathbf{i} + \mathbf{j} - \mathbf{k}\| + \|6\mathbf{i} + \mathbf{j} + \mathbf{k}\| \\ &= \sqrt{1^2 + (-2)^2 + 3^2} + \sqrt{3^2 + 1^2 + (-1)^2} + \sqrt{6^2 + 1^2 + 1^2} \\ &= \left[\sqrt{14} + \sqrt{11} + \sqrt{38} \right]. \end{aligned}$$

$$68. \|\mathbf{u} + \mathbf{v} + \mathbf{w}\| = \|(\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}) + (3\mathbf{i} + \mathbf{j} - \mathbf{k}) + (6\mathbf{i} + \mathbf{j} + \mathbf{k})\| = \|10\mathbf{i} + 3\mathbf{k}\| = \sqrt{10^2 + 3^2} = \boxed{\sqrt{109}}.$$

$$69. \frac{\mathbf{u} + \mathbf{v}}{\|\mathbf{w}\|} = \frac{(\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}) + (3\mathbf{i} + \mathbf{j} - \mathbf{k})}{\|6\mathbf{i} + \mathbf{j} + \mathbf{k}\|} = \frac{4\mathbf{i} - \mathbf{j} + 2\mathbf{k}}{\sqrt{6^2 + 1^2 + 1^2}} = \boxed{\frac{4}{\sqrt{38}}\mathbf{i} - \frac{1}{\sqrt{38}}\mathbf{j} + \frac{2}{\sqrt{38}}\mathbf{k}}.$$

$$70. \frac{\mathbf{u}}{\|\mathbf{v} + \mathbf{w}\|} = \frac{\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}}{\|(3\mathbf{i} + \mathbf{j} - \mathbf{k}) + (6\mathbf{i} + \mathbf{j} + \mathbf{k})\|} = \frac{\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}}{\|9\mathbf{i} + 2\mathbf{j}\|} = \frac{\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}}{\sqrt{9^2 + 2^2}} = \boxed{\frac{1}{\sqrt{85}}\mathbf{i} - \frac{2}{\sqrt{85}}\mathbf{j} + \frac{3}{\sqrt{85}}\mathbf{k}}.$$

71. Since $\frac{3}{2}\mathbf{v} = \frac{3}{2} \cdot 2\mathbf{i} + \frac{3}{2} \cdot 3\mathbf{j} = 3\mathbf{i} + \frac{9}{2}\mathbf{j} = \mathbf{w}$, the two vectors are parallel. Since $\frac{3}{2} > 0$, they point in the same direction.

72. Since $3 \cdot 2 = 6$, but $2 \cdot 2 = 4$ rather than -4 , these two vectors are not parallel: $\mathbf{w}$ is not a scalar multiple of $\mathbf{v}$.

73. Since the first two components of $\mathbf{v}$ are -2 times the corresponding components of $\mathbf{w}$, but the third component is not, these two vectors are not scalar multiples of one another, so they are not parallel.

74. These vectors are not parallel. Their second components are the same, so if one were a multiple of another, the multiple would have to be 1. But they are not equal.

75. These vectors are parallel, since $-3\mathbf{w} = \langle -3 \cdot (-4), -3 \cdot (-1), -3 \cdot 3 \rangle = \langle 12, 3, -9 \rangle = \mathbf{v}$. Since $-3 < 0$, the vectors point in opposite directions.

76. These vectors are not parallel. The first two components of $\mathbf{v}$ are 2 times the corresponding components of $\mathbf{w}$, but this is not the case for the third component.

Applications and Extensions

77. The magnitude of the given vector is $\|2\mathbf{i} - 3\mathbf{j} + 4\mathbf{k}\| = \sqrt{2^2 + (-3)^2 + 4^2} = \sqrt{29}$, so that a unit vector in the direction of the given vector is

$$\frac{2}{\sqrt{29}}\mathbf{i} - \frac{3}{\sqrt{29}}\mathbf{j} + \frac{4}{\sqrt{29}}\mathbf{k}.$$

So a vector of magnitude 4 in that direction is

$$4 \left(\frac{2}{\sqrt{29}}\mathbf{i} - \frac{3}{\sqrt{29}}\mathbf{j} + \frac{4}{\sqrt{29}}\mathbf{k} \right) = \boxed{\frac{8}{\sqrt{29}}\mathbf{i} - \frac{12}{\sqrt{29}}\mathbf{j} + \frac{16}{\sqrt{29}}\mathbf{k}}.$$

78. The magnitude of the given vector is $\|-\mathbf{i} + \mathbf{j} + 2\mathbf{k}\| = \sqrt{(-1)^2 + 1^2 + 2^2} = \sqrt{6}$, so that a unit vector in the direction of the given vector is

$$-\frac{1}{\sqrt{6}}\mathbf{i} + \frac{1}{\sqrt{6}}\mathbf{j} + \frac{2}{\sqrt{6}}\mathbf{k}.$$

So a vector of magnitude 2 in that direction is

$$2 \left(-\frac{1}{\sqrt{6}}\mathbf{i} + \frac{1}{\sqrt{6}}\mathbf{j} + \frac{2}{\sqrt{6}}\mathbf{k} \right) = \boxed{-\frac{2}{\sqrt{6}}\mathbf{i} + \frac{2}{\sqrt{6}}\mathbf{j} + \frac{4}{\sqrt{6}}\mathbf{k}}.$$

79. The magnitudes of the two vectors are

$$\begin{aligned} \|2\mathbf{i} + \mathbf{j} - \mathbf{k}\| &= \sqrt{2^2 + 1^2 + (-1)^2} = \sqrt{6} \\ \|2a\mathbf{i} + \mathbf{j} + \mathbf{k}\| &= \sqrt{(2a)^2 + 1^2 + 1^2} = \sqrt{4a^2 + 2}. \end{aligned}$$

So we want to find a such that $4a^2 + 2 = 6$, so that $4a^2 = 4$ and therefore $a = 1$ or $a = -1$.

80. The given magnitude is

$$\|a\mathbf{i} + (a+1)\mathbf{j} + 2\mathbf{k}\| = \sqrt{a^2 + (a+1)^2 + 4} = \sqrt{2a^2 + 2a + 5}.$$

Since we want the magnitude to be 3, we want $2a^2 + 2a + 5 = 9$, so that $2a^2 + 2a - 4 = 2(a+2)(a-1) = 0$.

So $\boxed{a = 1 \text{ and } a = -2}$ satisfy the given condition.

81. $\mathbf{v} + \mathbf{w} = (2\mathbf{i} + \mathbf{j}) + (x\mathbf{i} + 3\mathbf{j}) = (2+x)\mathbf{i} + 4\mathbf{j}$, so that

$$\|\mathbf{v} + \mathbf{w}\| = \|(2+x)\mathbf{i} + 4\mathbf{j}\| = \sqrt{(2+x)^2 + 4^2} = \sqrt{x^2 + 4x + 20} = 5.$$

So we want $x^2 + 4x + 20 = 25$, or $x^2 + 4x - 5 = (x+5)(x-1) = 0$. Therefore $\boxed{x = 1 \text{ and } x = -5}$ satisfy the given condition.

82. The vector $\mathbf{v} = \langle x - (-3), 4 - 1 \rangle = \langle x + 3, 3 \rangle$, so that $\|\mathbf{v}\| = \sqrt{(x+3)^2 + 3^2} = \sqrt{x^2 + 6x + 18} = 5$. So we want $x^2 + 6x + 18 = 25$, or $x^2 + 6x - 7 = (x+7)(x-1) = 0$. Therefore $\boxed{x = 1 \text{ and } x = -7}$ satisfy the given condition.

83. From the theorem in objective 5, $\mathbf{v}$ satisfies

$$\mathbf{v} = \|\mathbf{v}\| (\cos \theta \mathbf{i} + \sin \theta \mathbf{j}) = 4 (\cos 30^\circ \mathbf{i} + \sin 30^\circ \mathbf{j}) = \boxed{2\sqrt{3}\mathbf{i} + 2\mathbf{j}}.$$

84. From the theorem in objective 5, $\mathbf{v}$ satisfies

$$\mathbf{v} = \|\mathbf{v}\| (\cos \theta \mathbf{i} + \sin \theta \mathbf{j}) = 2(\cos 45^\circ \mathbf{i} + \sin 45^\circ \mathbf{j}) = \boxed{\sqrt{2}\mathbf{i} + \sqrt{2}\mathbf{j}}.$$

85. Since the $\mathbf{i}$ component is twice the $\mathbf{j}$ component, the vector is of the form $\mathbf{v} = 2k\mathbf{i} + k\mathbf{j}$. Then

$$5 = \|\mathbf{v}\| = \sqrt{(2k)^2 + k^2} = \sqrt{5k^2} = |k| \sqrt{5},$$

so that $k = \pm\sqrt{5}$. So the vectors are $\boxed{\pm(2\sqrt{5}\mathbf{i} + \sqrt{5}\mathbf{j})}$.

86. Since the $\mathbf{i}$ component equals the $\mathbf{j}$ component, the vector is of the form $\mathbf{v} = k\mathbf{i} + k\mathbf{j}$. Then

$$5 = \|\mathbf{v}\| = \sqrt{k^2 + k^2} = \sqrt{2k^2} = |k| \sqrt{2},$$

so that $|k| = \frac{5}{\sqrt{2}}$ and therefore $k = \pm\frac{5}{\sqrt{2}} = \pm\frac{5\sqrt{2}}{2}$. So the vectors are $\boxed{\pm\left(\frac{5\sqrt{2}}{2}\mathbf{i} + \frac{5\sqrt{2}}{2}\mathbf{j}\right)}$.

87. From the theorem in objective 5, $\mathbf{v}$ satisfies $\mathbf{v} = \|\mathbf{v}\| (\cos \theta \mathbf{i} + \sin \theta \mathbf{j})$. Since the $\mathbf{j}$ component is 1, we have $\|\mathbf{v}\| \sin 135^\circ = \|\mathbf{v}\| \cdot \frac{\sqrt{2}}{2} = 1$. Therefore $\|\mathbf{v}\| = \sqrt{2}$, so that

$$\mathbf{v} = \sqrt{2}(\cos 135^\circ \mathbf{i} + \sin 135^\circ \mathbf{j}) = \sqrt{2}\left(-\frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j}\right) = \boxed{-\mathbf{i} + \mathbf{j}}.$$

88. From the theorem in objective 5, $\mathbf{v}$ satisfies $\mathbf{v} = \|\mathbf{v}\| (\cos \theta \mathbf{i} + \sin \theta \mathbf{j})$. Since the $\mathbf{i}$ component is -3 , we have $\|\mathbf{v}\| \cos 210^\circ = \|\mathbf{v}\| \cdot \left(-\frac{\sqrt{3}}{2}\right) = -3$, so that $\|\mathbf{v}\| = -3 \cdot \left(-\frac{2}{\sqrt{3}}\right) = 2\sqrt{3}$. Therefore

$$\mathbf{v} = 2\sqrt{3}(\cos 210^\circ \mathbf{i} + \sin 210^\circ \mathbf{j}) = 2\sqrt{3}\left(-\frac{\sqrt{3}}{2}\mathbf{i} - \frac{1}{2}\mathbf{j}\right) = \boxed{-3\mathbf{i} - \sqrt{3}\mathbf{j}}.$$

89. The magnitude of the force is $F = \|\mathbf{F}\| = \sqrt{10^2 + (-15)^2 + 25^2} = \sqrt{950} = 5\sqrt{38}$ N. Using the formula

$$F = ma, \text{ we get } a = \frac{F}{m} = \frac{5\sqrt{38}}{10} = \boxed{\sqrt{\frac{19}{2}} \text{ N/kg}}.$$

90. (a) The new vector will be $\langle 3, -1 \rangle + \mathbf{v} = \langle 3, -1 \rangle + \langle -4, 5 \rangle = \boxed{\langle -1, 4 \rangle}$.

91. (a) The new vertices are

$$\begin{aligned}\langle -3, 0 \rangle + \langle 3, -2 \rangle &= \langle 0, -2 \rangle, & \langle -1, -2 \rangle + \langle 3, -2 \rangle &= \langle 2, -4 \rangle, \\ \langle 3, 1 \rangle + \langle 3, -2 \rangle &= \langle 6, -1 \rangle, & \langle 1, 3 \rangle + \langle 3, -2 \rangle &= \langle 4, 1 \rangle.\end{aligned}$$

Therefore $\boxed{A' = (0, -2), B' = (2, -4), C' = (6, -1), \text{ and } D' = (4, 1)}$.

- (b) Since $\frac{1}{2}\mathbf{v} = \langle \frac{3}{2}, -1 \rangle$, the new vertices are

$$\begin{aligned}\langle -3, 0 \rangle + \left\langle \frac{3}{2}, -1 \right\rangle &= \left\langle -\frac{3}{2}, -1 \right\rangle, & \langle -1, -2 \rangle + \left\langle \frac{3}{2}, -1 \right\rangle &= \left\langle \frac{1}{2}, -3 \right\rangle, \\ \langle 3, 1 \rangle + \left\langle \frac{3}{2}, -1 \right\rangle &= \left\langle \frac{9}{2}, 0 \right\rangle, & \langle 1, 3 \rangle + \left\langle \frac{3}{2}, -1 \right\rangle &= \left\langle \frac{5}{2}, 2 \right\rangle.\end{aligned}$$

Therefore $\boxed{A' = \left(-\frac{3}{2}, -1\right), B' = \left(\frac{1}{2}, -3\right), C' = \left(\frac{9}{2}, 0\right), \text{ and } D' = \left(\frac{5}{2}, 2\right)}$.

92. The plane's velocity relative to the air is $500\mathbf{i}$. The windspeed is 60 towards the northwest, so the wind velocity is

$$\mathbf{v} = \|\mathbf{v}\| (\cos 135^\circ \mathbf{i} + \sin 135^\circ \mathbf{j}) = -30\sqrt{2}\mathbf{i} + 30\sqrt{2}\mathbf{j}.$$

Therefore the ground speed of the airplane is

$$\begin{aligned}\left\| 500\mathbf{i} + (-30\sqrt{2}\mathbf{i} + 30\sqrt{2}\mathbf{j}) \right\| &= \left\| (500 - 30\sqrt{2})\mathbf{i} + 30\sqrt{2}\mathbf{j} \right\| \\ &= \sqrt{(500 - 30\sqrt{2})^2 + (30\sqrt{2})^2} = \boxed{\approx 459.5 \text{ km/h}}.\end{aligned}$$

93. The first leg of the trip has displacement $\mathbf{u} = -200\mathbf{i}$; the second trip is a vector of length 150 at an angle 60° north of west, which is an angle of 120° to the positive x axis, so that vector is

$$\mathbf{v} = \|\mathbf{v}\| (\cos 120^\circ \mathbf{i} + \sin 120^\circ \mathbf{j}) = 150 \left(-\frac{1}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j} \right) = -75\mathbf{i} + 75\sqrt{3}\mathbf{j}.$$

Therefore the position of the airplane is

$$\mathbf{u} + \mathbf{v} = -200\mathbf{i} + (-75\mathbf{i} + 75\sqrt{3}\mathbf{j}) = \boxed{-275\mathbf{i} + 75\sqrt{3}\mathbf{j}}.$$

94. Let $\mathbf{v}$ be the plane's air velocity vector. The vector of the wind is (recall that a northwest wind blows southeast)

$$\mathbf{w} = \|\mathbf{w}\| (\cos(-45^\circ) \mathbf{i} + \sin(-45^\circ) \mathbf{j}) = 20 \left(\frac{\sqrt{2}}{2} \mathbf{i} - \frac{\sqrt{2}}{2} \mathbf{j} \right) = 10\sqrt{2} \mathbf{i} - 10\sqrt{2} \mathbf{j}.$$

Then since the plane's final position after one hour is $-200\mathbf{j}$, its average ground velocity was $-200\mathbf{j}$ mi/h, so we have

$$-200\mathbf{j} = \mathbf{v} + \mathbf{w} = \mathbf{v} + 10\sqrt{2} \mathbf{i} - 10\sqrt{2} \mathbf{j}.$$

Therefore

$$\mathbf{v} = -200\mathbf{j} - (10\sqrt{2} \mathbf{i} - 10\sqrt{2} \mathbf{j}) = (-200 - 10\sqrt{2})\mathbf{i} + 10\sqrt{2} \mathbf{j},$$

so that the average airspeed was

$$\|\mathbf{v}\| = \sqrt{(-200 - 10\sqrt{2})^2 + (10\sqrt{2})^2} \approx 214.6 \text{ mi/h}.$$

95. We have $\mathbf{F}_1 = \langle -2, 0 \rangle$, $\mathbf{F}_2 = \langle 0, -3 \rangle$, $\mathbf{F}_3 = \langle 3, 3 \rangle$, and $\mathbf{F}_4 = \langle -4, 4 \rangle$. Then the total force acting on the object is

$$\mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 + \mathbf{F}_4 = \langle -2, 0 \rangle + \langle 0, -3 \rangle + \langle 3, 3 \rangle + \langle -4, 4 \rangle = \langle -3, 4 \rangle.$$

So the force $\mathbf{F}$ required to keep the object from moving is $-\langle -3, 4 \rangle = \langle 3, -4 \rangle$:

96. The total force being applied to the car is

$$\mathbf{F}_1 + \mathbf{F}_2 = 200\mathbf{i} + 350\mathbf{j} + 100\mathbf{k} + 250\mathbf{i} + 300\mathbf{j} + 150\mathbf{k} = 450\mathbf{i} + 650\mathbf{j} + 250\mathbf{k}.$$

Therefore the opposing force is

$$\mathbf{F}_3 = -(\mathbf{F}_1 + \mathbf{F}_2) = \boxed{-450\mathbf{i} - 650\mathbf{j} - 250\mathbf{k}}.$$

97. Place the origin at the point where the cables meet the object. Let $\mathbf{F}_1$ be the force vector of the right cable (pointing upwards and to the right), and $\mathbf{F}_2$ be the force vector of the left cable (pointing upwards and to the left). Then the two tensions are $\|\mathbf{F}_1\|$ and $\|\mathbf{F}_2\|$. Note that the right-hand cable makes an angle of 25° with the ceiling, so it makes an angle of 25° with the positive x -axis. Likewise, the left-hand cable makes an angle of 40° with the ceiling, so an angle of 40° with the negative x -axis, so it makes an angle of $180^\circ - 40^\circ = 140^\circ$ with the positive x -axis. Then

$$\mathbf{F}_1 = \|\mathbf{F}_1\| (\cos 25^\circ \mathbf{i} + \sin 25^\circ \mathbf{j})$$

$$\mathbf{F}_2 = \|\mathbf{F}_2\| (\cos 140^\circ \mathbf{i} + \sin 140^\circ \mathbf{j})$$

$$\mathbf{F}_3 = -1000\mathbf{j}.$$

For the object to be in equilibrium, the sum of the forces must be zero, so that

$$\begin{aligned}\mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 &= \|\mathbf{F}_1\| (\cos 25^\circ \mathbf{i} + \sin 25^\circ \mathbf{j}) + \|\mathbf{F}_2\| (\cos 140^\circ \mathbf{i} + \sin 140^\circ \mathbf{j}) - 1000\mathbf{j} \\ &= (\|\mathbf{F}_1\| \cos 25^\circ + \|\mathbf{F}_2\| \cos 140^\circ) \mathbf{i} + (\|\mathbf{F}_1\| \sin 25^\circ + \|\mathbf{F}_2\| \sin 140^\circ - 1000) \mathbf{j} = \mathbf{0}.\end{aligned}$$

Considering the $\mathbf{i}$ and $\mathbf{j}$ components separately, we get the two equations in $\|\mathbf{F}_1\|$ and $\|\mathbf{F}_2\|$:

$$\begin{aligned}\cos 25^\circ \|\mathbf{F}_1\| + \cos 140^\circ \|\mathbf{F}_2\| &= 0 \\ \sin 25^\circ \|\mathbf{F}_1\| + \sin 140^\circ \|\mathbf{F}_2\| &= 1000.\end{aligned}$$

Solving the first equation for $\|\mathbf{F}_1\|$ gives

$$\|\mathbf{F}_1\| = -\frac{\cos 140^\circ}{\cos 25^\circ} \|\mathbf{F}_2\|.$$

Substitute this for $\|\mathbf{F}_1\|$ in the second equation, giving

$$\begin{aligned}\sin 25^\circ \left(-\frac{\cos 140^\circ}{\cos 25^\circ} \|\mathbf{F}_2\| \right) + \sin 140^\circ \|\mathbf{F}_2\| &= 1000 \\ (-\tan 25^\circ \cos 140^\circ + \sin 140^\circ) \|\mathbf{F}_2\| &= 1000 \\ \|\mathbf{F}_2\| &= \frac{1000}{-\tan 25^\circ \cos 140^\circ + \sin 140^\circ} \boxed{\approx 1000 \text{ lb}}.\end{aligned}$$

(In fact, this is exactly 1000^1 .) Then

$$\|\mathbf{F}_1\| = -\frac{\cos 140^\circ}{\cos 25^\circ} \|\mathbf{F}_2\| = -\frac{1000 \cos 140^\circ}{\cos 25^\circ} \boxed{\approx 845.237 \text{ lb}}.$$

98. Place the origin at the point where the cables meet the object. Let $\mathbf{F}_1$ be the force vector of the right cable (pointing upwards and to the right), and $\mathbf{F}_2$ be the force vector of the left cable (pointing upwards and to the left). Then the two tensions are $\|\mathbf{F}_1\|$ and $\|\mathbf{F}_2\|$. Note that the right-hand cable makes an angle of 50° with the ceiling, so it makes an angle of 50° with the positive x -axis. Likewise, the left-hand cable makes an angle of 35° with the ceiling, so an angle of 35° with the negative x -axis, so it makes an angle of $180^\circ - 35^\circ = 145^\circ$ with the positive x -axis. Then

$$\begin{aligned}\mathbf{F}_1 &= \|\mathbf{F}_1\| (\cos 50^\circ \mathbf{i} + \sin 50^\circ \mathbf{j}) \\ \mathbf{F}_2 &= \|\mathbf{F}_2\| (\cos 145^\circ \mathbf{i} + \sin 145^\circ \mathbf{j}) \\ \mathbf{F}_3 &= -800\mathbf{j}.\end{aligned}$$

For the object to be in equilibrium, the sum of the forces must be zero, so that

$$\begin{aligned}\mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 &= \|\mathbf{F}_1\| (\cos 50^\circ \mathbf{i} + \sin 50^\circ \mathbf{j}) + \|\mathbf{F}_2\| (\cos 145^\circ \mathbf{i} + \sin 145^\circ \mathbf{j}) - 800\mathbf{j} \\ &= (\|\mathbf{F}_1\| \cos 50^\circ + \|\mathbf{F}_2\| \cos 145^\circ) \mathbf{i} + (\|\mathbf{F}_1\| \sin 50^\circ + \|\mathbf{F}_2\| \sin 145^\circ - 800) \mathbf{j} = \mathbf{0}.\end{aligned}$$

Considering the $\mathbf{i}$ and $\mathbf{j}$ components separately, we get the two equations in $\|\mathbf{F}_1\|$ and $\|\mathbf{F}_2\|$:

$$\begin{aligned}\cos 50^\circ \|\mathbf{F}_1\| + \cos 145^\circ \|\mathbf{F}_2\| &= 0 \\ \sin 50^\circ \|\mathbf{F}_1\| + \sin 145^\circ \|\mathbf{F}_2\| &= 800.\end{aligned}$$

Solving the first equation for $\|\mathbf{F}_1\|$ gives

$$\|\mathbf{F}_1\| = -\frac{\cos 145^\circ}{\cos 50^\circ} \|\mathbf{F}_2\|.$$

¹ $\tan 25^\circ = \tan\left(\frac{50}{2}\right)^\circ = \frac{\sin 50^\circ}{1 + \cos 50^\circ}$. Further, $\cos 140^\circ = -\cos 40^\circ = -\sin 50^\circ$ and $\sin 140^\circ = \sin 40^\circ = \cos 50^\circ$. Putting this all together, we get

$$-\tan 25^\circ \cos 140^\circ + \sin 140^\circ = -\frac{\sin 50^\circ}{1 + \cos 50^\circ}(-\sin 50^\circ) + \cos 50^\circ = \frac{\sin^2 50^\circ + \cos^2 50^\circ + \cos 50^\circ}{1 + \cos 50^\circ} = \frac{1 + \cos 50^\circ}{1 + \cos 50^\circ} = 1.$$

Substitute this for $\|\mathbf{F}_1\|$ in the second equation, giving

$$\sin 50^\circ \left(-\frac{\cos 145^\circ}{\cos 50^\circ} \|\mathbf{F}_2\| \right) + \sin 145^\circ \|\mathbf{F}_2\| = 800$$

$$(-\tan 50^\circ \cos 145^\circ + \sin 145^\circ) \|\mathbf{F}_2\| = 800$$

$$\|\mathbf{F}_2\| = \frac{800}{-\tan 50^\circ \cos 145^\circ + \sin 145^\circ} \approx 516.194 \text{ lb}.$$

Then

$$\|\mathbf{F}_1\| = -\frac{\cos 145^\circ}{\cos 50^\circ} \|\mathbf{F}_2\| \approx -\frac{516.194 \cos 145^\circ}{\cos 50^\circ} \approx 657.825 \text{ lb}.$$

(b) The three forces are

$$\mathbf{A} = 1100\mathbf{i}$$

$$\mathbf{B} = 1050(\cos 120^\circ \mathbf{i} + \sin 120^\circ \mathbf{j}) = 1050 \left(-\frac{1}{2} \mathbf{i} + \frac{\sqrt{3}}{2} \mathbf{j} \right) = -525\mathbf{i} + 525\sqrt{3}\mathbf{j}$$

$$\mathbf{C} = 1000(\cos 240^\circ \mathbf{i} + \sin 240^\circ \mathbf{j}) = 1000 \left(-\frac{1}{2} \mathbf{i} - \frac{\sqrt{3}}{2} \mathbf{j} \right) = -500\mathbf{i} - 500\sqrt{3}\mathbf{j}.$$

The net force is then

$$\mathbf{A} + \mathbf{B} + \mathbf{C} = 1100\mathbf{i} - 525\mathbf{i} + 525\sqrt{3}\mathbf{j} - 500\mathbf{i} - 500\sqrt{3}\mathbf{j} = \boxed{75\mathbf{i} + 25\sqrt{3}\mathbf{j}}.$$

100. Place the x -axis along the ground with the y -axis pointing up. The vector is

$$\mathbf{v} = 100(\cos 20^\circ \mathbf{i} + \sin 20^\circ \mathbf{j}).$$

The force vector is below:

101. Place the x -axis along the ground with the y -axis pointing up. The vector is

$$\mathbf{v} = 40(\cos 30^\circ \mathbf{i} + \sin 30^\circ \mathbf{j}) = 20\sqrt{3}\mathbf{i} + 20\mathbf{j}.$$

Then the force vector is below:

102. With the axes as shown in the diagram, the force exerted by the pulley must be $25\mathbf{i} + 40\mathbf{j}$, so the magnitude of that force, which is the tension, is $\sqrt{25^2 + 40^2} = \sqrt{625 + 1600} = \sqrt{2225} = \boxed{5\sqrt{89} \approx 47.2 \text{ N}}$.
103. (a) The eight vertices of the cube are

$$\begin{aligned} &\boxed{(0, 0, 0), \quad (0, 0.408, 0), \quad (0, 0, 0.408), \quad (0, 0.408, 0.408),} \\ &\boxed{(0.408, 0, 0), \quad (0.408, 0.408, 0), \quad (0.408, 0, 0.408), \quad (0.408, 0.408, 0.408)} \end{aligned}$$

Each of the other atoms is in the center of one of the faces, so two of its coordinates are $\frac{0.408}{2} = 0.204$ and the third is either 0.408 (if it does not lie in one of the coordinate planes) or 0 (if it does). Therefore these six atoms have coordinates

$$\begin{aligned} &\boxed{(0, 0.204, 0.204), \quad (0.204, 0, 0.204), \quad (0.204, 0.204, 0)} \\ &\boxed{(0.408, 0.204, 0.204), \quad (0.204, 0.408, 0.204), \quad (0.204, 0.204, 0.408)} \end{aligned}$$

- (b) (i) The atom furthest from the origin has coordinates $(0.408, 0.408, 0.408)$, so the vector corresponding to that atom is $\boxed{0.408\mathbf{i} + 0.408\mathbf{j} + 0.408\mathbf{k}}$.
- (ii) The xz -plane is the plane $y = 0$, so we are looking for the atom in the center of the face on the plane $y = 0.408$. From part (a), this point has coordinates $(0.204, 0.408, 0.204)$, so its vector is $\boxed{0.204\mathbf{i} + 0.408\mathbf{j} + 0.204\mathbf{k}}$.
- (iii) The xy -plane is the plane $z = 0$, so we are looking for the atom in the center of the face on the plane $z = 0.408$. From part (a), this point has coordinates $(0.204, 0.204, 0.408)$, so its vector is $\boxed{0.204\mathbf{i} + 0.204\mathbf{j} + 0.408\mathbf{k}}$.

(c)

$$\begin{aligned} \|\langle 0.408, 0.408, 0.408 \rangle\| &= \sqrt{0.408^2 + 0.408^2 + 0.408^2} \approx 0.707 \text{ nm}, \\ \|\langle 0.204, 0.408, 0.204 \rangle\| &= \sqrt{0.204^2 + 0.408^2 + 0.204^2} \approx 0.500 \text{ nm}, \\ \|\langle 0.204, 0.204, 0.408 \rangle\| &= \sqrt{0.204^2 + 0.204^2 + 0.408^2} \approx 0.500 \text{ nm}. \end{aligned}$$

104. Let $\mathbf{v}$ be the plane's air velocity vector. The vector of the wind is (recall that an easterly wind blows west) $-50\mathbf{i}$. Then since the plane's velocity with respect to the ground is 250 km/h to the northeast, its velocity vector with respect to the ground is

$$250(\cos 45^\circ \mathbf{i} + \sin 45^\circ \mathbf{j}) = 125\sqrt{2}\mathbf{i} + 125\sqrt{2}\mathbf{j},$$

so that

$$125\sqrt{2}\mathbf{i} + 125\sqrt{2}\mathbf{j} = \mathbf{v} - 50\mathbf{i}.$$

Therefore

$$\mathbf{v} = 125\sqrt{2}\mathbf{i} + 125\sqrt{2}\mathbf{j} + 50\mathbf{i} = (125\sqrt{2} + 50)\mathbf{i} + 125\sqrt{2}\mathbf{j}.$$

Therefore the airspeed of the plane, which is the number we are looking for, is

$$\|\mathbf{v}\| = \sqrt{(125\sqrt{2} + 50)^2 + (125\sqrt{2})^2} \approx 287.537 \text{ km/h}.$$

105. Let $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j}$ represent the velocity vector of the wind. The woman's velocity is $8\mathbf{i}$. We know that $8\mathbf{i} + \mathbf{w}$ is a vector that comes from the north (i.e., it has no $\mathbf{i}$ component). But $8\mathbf{i} + \mathbf{w} = (8 + w_1)\mathbf{i} + w_2\mathbf{j}$, so that $w_1 = -8$ and $\mathbf{w} = -8\mathbf{i} + w_2\mathbf{j}$. Next, if the woman doubles her velocity to $16\mathbf{i}$, then the apparent velocity of the wind is $16\mathbf{i} + \mathbf{w} = 8\mathbf{i} + w_2\mathbf{j}$. Since this is apparently from the northeast, its $\mathbf{i}$ and $\mathbf{j}$ components must be equal, so that $w_2 = 8$. Therefore the velocity of the wind is $-8\mathbf{i} + 8\mathbf{j}$. So the wind is blowing at a speed of $\|-8\mathbf{i} + 8\mathbf{j}\| = 8\sqrt{2}$ from the northwest.

106. Let $\mathbf{u} = \langle u_1, u_2 \rangle$, $\mathbf{v} = \langle v_1, v_2 \rangle$, and $\mathbf{w} = \langle w_1, w_2 \rangle$. Then

Commutative property of vector addition:

$$\mathbf{u} + \mathbf{v} = \langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle = \langle u_1 + v_1, u_2 + v_2 \rangle = \langle v_1 + u_1, v_2 + u_2 \rangle = \langle v_1, v_2 \rangle + \langle u_1, u_2 \rangle = \mathbf{v} + \mathbf{u}.$$

Associative property of vector addition:

$$\begin{aligned} \mathbf{u} + (\mathbf{v} + \mathbf{w}) &= \langle u_1, u_2 \rangle + (\langle v_1, v_2 \rangle + \langle w_1, w_2 \rangle) \\ &= \langle u_1, u_2 \rangle + \langle v_1 + w_1, v_2 + w_2 \rangle \\ &= \langle u_1 + (v_1 + w_1), u_2 + (v_2 + w_2) \rangle \\ &= \langle (u_1 + v_1) + w_1, (u_2 + v_2) + w_2 \rangle \\ &= \langle u_1 + v_1, u_2 + v_2 \rangle + \langle w_1, w_2 \rangle \\ &= (\langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle) + \langle w_1, w_2 \rangle \\ &= (\mathbf{u} + \mathbf{v}) + \mathbf{w}. \end{aligned}$$

Additive identity $\mathbf{0}$:

$$\begin{aligned} \mathbf{v} + \mathbf{0} &= \langle v_1, v_2 \rangle + \langle 0, 0 \rangle = \langle v_1 + 0, v_2 + 0 \rangle = \langle v_1, v_2 \rangle = \mathbf{v} \\ \mathbf{0} + \mathbf{v} &= \langle 0, 0 \rangle + \langle v_1, v_2 \rangle = \langle 0 + v_1, 0 + v_2 \rangle = \langle v_1, v_2 \rangle = \mathbf{v}. \end{aligned}$$

Additive inverse property:

$$\mathbf{v} + (-\mathbf{v}) = \langle v_1, v_2 \rangle + (-\langle v_1, v_2 \rangle) = \langle v_1, v_2 \rangle + \langle -v_1, -v_2 \rangle = \langle v_1 - v_1, v_2 - v_2 \rangle = \langle 0, 0 \rangle = \mathbf{0}.$$

Distributive property of scalar multiplication over vector addition:

$$\begin{aligned} a(\mathbf{u} + \mathbf{v}) &= a(\langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle) \\ &= a\langle u_1 + v_1, u_2 + v_2 \rangle \\ &= \langle a(u_1 + v_1), a(u_2 + v_2) \rangle \\ &= \langle au_1 + av_1, au_2 + av_2 \rangle \\ &= \langle au_1, au_2 \rangle + \langle av_1, av_2 \rangle \\ &= a\langle u_1, u_2 \rangle + a\langle v_1, v_2 \rangle \\ &= a\mathbf{u} + a\mathbf{v}. \end{aligned}$$

Distributive property of scalar multiplication over scalar addition:

$$\begin{aligned} (a + b)\mathbf{v} &= (a + b)\langle v_1, v_2 \rangle \\ &= \langle (a + b)v_1, (a + b)v_2 \rangle \\ &= \langle av_1 + bv_1, av_2 + bv_2 \rangle \\ &= \langle av_1, av_2 \rangle + \langle bv_1, bv_2 \rangle \\ &= a\langle v_1, v_2 \rangle + b\langle v_1, v_2 \rangle \\ &= a\mathbf{v} + b\mathbf{v}. \end{aligned}$$

Linearity property of scalar multiplication:

$$\begin{aligned}
 a(b\mathbf{v}) &= a(b\langle v_1, v_2 \rangle) \\
 &= a\langle bv_1, bv_2 \rangle \\
 &= \langle a(bv_1), a(bv_2) \rangle \\
 &= \langle (ab)v_1, (ab)v_2 \rangle \\
 &= (ab)\langle v_1, v_2 \rangle \\
 &= (ab)\mathbf{v}.
 \end{aligned}$$

Scalar multiplication identity:

$$1\mathbf{v} = 1\langle v_1, v_2 \rangle = \langle 1 \cdot v_1, 1 \cdot v_2 \rangle = \langle v_1, v_2 \rangle = \mathbf{v}.$$

107. Let $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$, $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$, and $\mathbf{w} = \langle w_1, w_2, w_3 \rangle$. Then

Commutative property of vector addition:

$$\begin{aligned}
 \mathbf{u} + \mathbf{v} &= \langle u_1, u_2, u_3 \rangle + \langle v_1, v_2, v_3 \rangle \\
 &= \langle u_1 + v_1, u_2 + v_2, u_3 + v_3 \rangle \\
 &= \langle v_1 + u_1, v_2 + u_2, v_3 + u_3 \rangle \\
 &= \langle v_1, v_2, v_3 \rangle + \langle u_1, u_2, u_3 \rangle \\
 &= \mathbf{v} + \mathbf{u}.
 \end{aligned}$$

Associative property of vector addition:

$$\begin{aligned}
 \mathbf{u} + (\mathbf{v} + \mathbf{w}) &= \langle u_1, u_2, u_3 \rangle + (\langle v_1, v_2, v_3 \rangle + \langle w_1, w_2, w_3 \rangle) \\
 &= \langle u_1, u_2, u_3 \rangle + \langle v_1 + w_1, v_2 + w_2, v_3 + w_3 \rangle \\
 &= \langle u_1 + (v_1 + w_1), u_2 + (v_2 + w_2), u_3 + (v_3 + w_3) \rangle \\
 &= \langle (u_1 + v_1) + w_1, (u_2 + v_2) + w_2, (u_3 + v_3) + w_3 \rangle \\
 &= \langle u_1 + v_1, u_2 + v_2, u_3 + v_3 \rangle + \langle w_1, w_2, w_3 \rangle \\
 &= (\langle u_1, u_2, u_3 \rangle + \langle v_1, v_2, v_3 \rangle) + \langle w_1, w_2, w_3 \rangle \\
 &= (\mathbf{u} + \mathbf{v}) + \mathbf{w}.
 \end{aligned}$$

Additive identity 0:

$$\begin{aligned}
 \mathbf{v} + \mathbf{0} &= \langle v_1, v_2, v_3 \rangle + \langle 0, 0, 0 \rangle = \langle v_1 + 0, v_2 + 0, v_3 + 0 \rangle = \langle v_1, v_2, v_3 \rangle = \mathbf{v} \\
 \mathbf{0} + \mathbf{v} &= \langle 0, 0, 0 \rangle + \langle v_1, v_2, v_3 \rangle = \langle 0 + v_1, 0 + v_2, 0 + v_3 \rangle = \langle v_1, v_2, v_3 \rangle = \mathbf{v}.
 \end{aligned}$$

Additive inverse property:

$$\begin{aligned}
 \mathbf{v} + (-\mathbf{v}) &= \langle v_1, v_2, v_3 \rangle + (-\langle v_1, v_2, v_3 \rangle) \\
 &= \langle v_1, v_2, v_3 \rangle + \langle -v_1, -v_2, -v_3 \rangle \\
 &= \langle v_1 - v_1, v_2 - v_2, v_3 - v_3 \rangle \\
 &= \langle 0, 0, 0 \rangle \\
 &= \mathbf{0}.
 \end{aligned}$$

Distributive property of scalar multiplication over vector addition:

$$\begin{aligned}
 a(\mathbf{u} + \mathbf{v}) &= a(\langle u_1, u_2, u_3 \rangle + \langle v_1, v_2, v_3 \rangle) \\
 &= a\langle u_1 + v_1, u_2 + v_2, u_3 + v_3 \rangle \\
 &= \langle a(u_1 + v_1), a(u_2 + v_2), a(u_3 + v_3) \rangle \\
 &= \langle au_1 + av_1, au_2 + av_2, au_3 + av_3 \rangle \\
 &= \langle au_1, au_2, au_3 \rangle + \langle av_1, av_2, av_3 \rangle \\
 &= a\langle u_1, u_2, u_3 \rangle + a\langle v_1, v_2, v_3 \rangle \\
 &= a\mathbf{u} + a\mathbf{v}.
 \end{aligned}$$

Distributive property of scalar multiplication over scalar addition:

$$\begin{aligned}
(a+b)\mathbf{v} &= (a+b)\langle v_1, v_2, v_3 \rangle \\
&= \langle (a+b)v_1, (a+b)v_2, (a+b)v_3 \rangle \\
&= \langle av_1 + bv_1, av_2 + bv_2, av_3 + bv_3 \rangle \\
&= \langle av_1, av_2, av_3 \rangle + \langle bv_1, bv_2, bv_3 \rangle \\
&= a\langle v_1, v_2, v_3 \rangle + b\langle v_1, v_2, v_3 \rangle \\
&= a\mathbf{v} + b\mathbf{v}.
\end{aligned}$$

Linearity property of scalar multiplication:

$$\begin{aligned}
a(b\mathbf{v}) &= a(b\langle v_1, v_2, v_3 \rangle) \\
&= a\langle bv_1, bv_2, bv_3 \rangle \\
&= \langle a(bv_1), a(bv_2), a(bv_3) \rangle \\
&= \langle (ab)v_1, (ab)v_2, (ab)v_3 \rangle \\
&= (ab)\langle v_1, v_2, v_3 \rangle \\
&= (ab)\mathbf{v}.
\end{aligned}$$

Scalar multiplication identity:

$$1\mathbf{v} = 1\langle v_1, v_2, v_3 \rangle = \langle 1 \cdot v_1, 1 \cdot v_2, 1 \cdot v_3 \rangle = \langle v_1, v_2, v_3 \rangle = \mathbf{v}.$$

108. Let $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$. Computing $\|a\mathbf{v}\|$ gives

$$\begin{aligned}
\|a\mathbf{v}\| &= \|a\langle v_1, v_2, v_3 \rangle\| \\
&= \|\langle av_1, av_2, av_3 \rangle\| \\
&= \sqrt{(av_1)^2 + (av_2)^2 + (av_3)^2} \\
&= \sqrt{a^2(v_1^2 + v_2^2 + v_3^2)} \\
&= |a| \sqrt{v_1^2 + v_2^2 + v_3^2} \\
&= |a| \|\mathbf{v}\|.
\end{aligned}$$

109. Since $\mathbf{i} = \langle 1, 0, 0 \rangle$, $\mathbf{j} = \langle 0, 1, 0 \rangle$, and $\mathbf{k} = \langle 0, 0, 1 \rangle$, we have

$$\begin{aligned}
v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k} &= v_1\langle 1, 0, 0 \rangle + v_2\langle 0, 1, 0 \rangle + v_3\langle 0, 0, 1 \rangle \\
&= \langle v_1 \cdot 1, v_1 \cdot 0, v_1 \cdot 0 \rangle + \langle v_2 \cdot 0, v_2 \cdot 1, v_2 \cdot 0 \rangle + \langle v_3 \cdot 0, v_3 \cdot 0, v_3 \cdot 1 \rangle \\
&= \langle v_1, 0, 0 \rangle + \langle 0, v_2, 0 \rangle + \langle 0, 0, v_3 \rangle \\
&= \langle v_1 + 0 + 0, 0 + v_2 + 0, 0 + 0 + v_3 \rangle \\
&= \langle v_1, v_2, v_3 \rangle.
\end{aligned}$$

Challenge Problems

110. Since $\mathbf{b} + \overrightarrow{BD} = \mathbf{d}$, we have $\boxed{\overrightarrow{BD} = \mathbf{d} - \mathbf{b}}$. Since $\mathbf{c} + \overrightarrow{CD} = \mathbf{d}$, we have $\boxed{\overrightarrow{CD} = \mathbf{d} - \mathbf{c}}$. Finally, since $\mathbf{b} + \overrightarrow{BC} = \mathbf{c}$, we have $\boxed{\overrightarrow{BC} = \mathbf{c} - \mathbf{b}}$.

111. Each face is a parallelogram; they are $ABCD$, $ABFE$, $AEHD$, $BFGC$, $CDHG$, and $EFGH$:

$$\begin{aligned}
 \overrightarrow{AC} &= \overrightarrow{AB} + \overrightarrow{BC} = \overrightarrow{AB} + \overrightarrow{AD} = \mathbf{b} + \mathbf{d} \\
 \overrightarrow{AF} &= \overrightarrow{AB} + \overrightarrow{BF} = \overrightarrow{AB} + \overrightarrow{AE} = \mathbf{b} + \mathbf{e} \\
 \overrightarrow{AG} &= \overrightarrow{AB} + \overrightarrow{BC} + \overrightarrow{CG} = \overrightarrow{AB} + \overrightarrow{AD} + \overrightarrow{BF} = \overrightarrow{AB} + \overrightarrow{AD} + \overrightarrow{AE} = \mathbf{b} + \mathbf{d} + \mathbf{e} \\
 \overrightarrow{FG} &= \overrightarrow{BC} = \overrightarrow{AD} = \mathbf{d} \\
 \overrightarrow{EG} &= \overrightarrow{EF} + \overrightarrow{FG} = \overrightarrow{AB} + \overrightarrow{BC} = \overrightarrow{AB} + \overrightarrow{AD} = \mathbf{b} + \mathbf{d}.
 \end{aligned}$$

112. Let the position vector of P be $\mathbf{r}$. Then $\overrightarrow{P_1P} = \mathbf{r} - \mathbf{r}_1$ and $\overrightarrow{P_1P_2} = \mathbf{r}_2 - \mathbf{r}_1$. If $t = \frac{\overrightarrow{P_1P}}{\overrightarrow{P_1P_2}}$, then $t\overrightarrow{P_1P_2} = \overrightarrow{P_1P}$ and therefore

$$t(\mathbf{r}_2 - \mathbf{r}_1) = \mathbf{r} - \mathbf{r}_1; \text{ rearranging gives } \mathbf{r} = \mathbf{r}_1 + t(\mathbf{r}_2 - \mathbf{r}_1)$$

as desired. Then

$$\begin{aligned}
 \langle x, y, z \rangle &= P = \langle x_1, y_1, z_1 \rangle + t(\langle x_2, y_2, z_2 \rangle - \langle x_1, y_1, z_1 \rangle) \\
 &= \langle x_1, y_1, z_1 \rangle + t \langle x_2 - x_1, y_2 - y_1, z_2 - z_1 \rangle \\
 &= \langle x_1, y_1, z_1 \rangle + \langle t(x_2 - x_1), t(y_2 - y_1), t(z_2 - z_1) \rangle \\
 &= \langle x_1 + t(x_2 - x_1), y_1 + t(y_2 - y_1), z_1 + t(z_2 - z_1) \rangle.
 \end{aligned}$$

113. Suppose $\mathbf{u} = \langle u_1, u_2 \rangle$ and $\mathbf{v} = \langle v_1, v_2 \rangle$. Then we want to show that for any vector $\mathbf{w} = \langle w_1, w_2 \rangle$ there are unique scalars s and t such that

$$\mathbf{w} = \langle w_1, w_2 \rangle = s\mathbf{u} + t\mathbf{v} = s \langle u_1, u_2 \rangle + t \langle v_1, v_2 \rangle = \langle su_1 + tv_1, su_2 + tv_2 \rangle.$$

This amounts to showing that the pair of linear equations in s and t

$$\begin{aligned}
 su_1 + tv_1 &= w_1 \\
 su_2 + tv_2 &= w_2
 \end{aligned}$$

has a unique solution. Multiply the first equation by u_2 and the second by u_1 and subtract, giving

$$t(u_1v_2 - u_2v_1) = u_1w_2 - u_2w_1, \quad \text{so that} \quad t = \frac{u_1w_2 - u_2w_1}{u_1v_2 - u_2v_1}.$$

Note that $u_1v_2 - u_2v_1 \neq 0$ since the two vectors are nonparallel, for if $u_1v_2 = u_2v_1$ then $\frac{u_1}{v_1} = \frac{u_2}{v_2}$ so that $\mathbf{u}$ and $\mathbf{v}$ would be multiples of each other. Therefore t is well-defined, and we can substitute back into the first equation to get

$$\begin{aligned} su_1 + \frac{u_1w_2 - u_2w_1}{u_1v_2 - u_2v_1}v_1 &= w_1 \\ su_1 &= w_1 - \frac{u_1v_1w_2 - u_2v_1w_1}{u_1v_2 - u_2v_1} \\ su_1 &= \frac{u_1v_2w_1 - u_2v_1w_1 - u_1v_1w_2 + u_2v_1w_1}{u_1v_2 - u_2v_1} \\ su_1 &= \frac{u_1(v_2w_1 - v_1w_2)}{u_1v_2 - u_2v_1} \\ s &= \frac{v_2w_1 - v_1w_2}{u_1v_2 - u_2v_1}. \end{aligned}$$

Therefore s and t exist and are unique. Geometrically, this means that any vector in the plane can be written uniquely as a sum of multiples of two fixed nonparallel vectors. The two vectors we normally use, $\mathbf{e}_1$ and $\mathbf{e}_2$, are one example of this.

10.4: The Dot Product

Concepts and Vocabulary

1. False. If $\mathbf{v}$ is any vector, then $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$. This is the Magnitude Property.
2. False. $\mathbf{v} \cdot \mathbf{w} = 0$ if $\mathbf{v}$ and $\mathbf{w}$ are orthogonal, not if they are parallel. This is the Orthogonal Vector theorem.
3. If θ is the angle between two nonzero vectors $\mathbf{v}$ and $\mathbf{w}$, then $\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|}$. This is the Angle Between Vectors theorem.
4. True. See the theorem in objective 4.
5. False. The dot product is sometimes called the *scalar* product.
6. True. The vector parallel to $\mathbf{w}$ is $\text{proj}_{\mathbf{w}} \mathbf{v}$; see the Vector Projection theorem.

Skill Building

7. (a) $\mathbf{v} \cdot \mathbf{w} = 2 \cdot 1 - 3 \cdot (-1) + 1 \cdot 1 = 2 + 3 + 1 = \boxed{6}$.
 (b) Since $\|\mathbf{v}\| = \sqrt{2^2 + 3^2 + 1^2} = \sqrt{14}$ and $\|\mathbf{w}\| = \sqrt{1^2 + 1^2 + 1^2} = \sqrt{3}$, the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is

$$\theta = \cos^{-1} \frac{6}{\sqrt{14}\sqrt{3}} \boxed{\approx 0.388}.$$
8. (a) $\mathbf{v} \cdot \mathbf{w} = -3 \cdot 2 + 2 \cdot 1 - 1 \cdot (-1) = -6 + 2 + 1 = \boxed{-3}$.
 (b) Since $\|\mathbf{v}\| = \sqrt{3^2 + 2^2 + 1^2} = \sqrt{14}$ and $\|\mathbf{w}\| = \sqrt{2^2 + 1^2 + 1^2} = \sqrt{6}$, the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is

$$\theta = \cos^{-1} \left(-\frac{3}{\sqrt{14}\sqrt{6}} \right) \boxed{\approx 1.904}.$$
9. (a) $\mathbf{v} \cdot \mathbf{w} = 1 \cdot 0 - 1 \cdot 1 + 0 \cdot 1 = \boxed{-1}$.
 (b) Since $\|\mathbf{v}\| = \sqrt{1^2 + 1^2 + 0^2} = \sqrt{2}$ and $\|\mathbf{w}\| = \sqrt{0^2 + 1^2 + 1^2} = \sqrt{2}$, the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is

$$\theta = \cos^{-1} \left(-\frac{1}{\sqrt{2}\sqrt{2}} \right) = \cos^{-1} \left(-\frac{1}{2} \right) = \boxed{\frac{2\pi}{3}}.$$

10. (a) $\mathbf{v} \cdot \mathbf{w} = 0 \cdot 1 + 1 \cdot 0 - 1 \cdot 1 = \boxed{-1}$.

(b) Since $\|\mathbf{v}\| = \sqrt{0^2 + 1^2 + 1^2} = \sqrt{2}$ and $\|\mathbf{w}\| = \sqrt{1^2 + 0^2 + 1^2} = \sqrt{2}$, the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is

$$\theta = \cos^{-1} \left(-\frac{1}{\sqrt{2}\sqrt{2}} \right) = \cos^{-1} \left(-\frac{1}{2} \right) = \boxed{\frac{2\pi}{3}}.$$

11. (a) $\mathbf{v} \cdot \mathbf{w} = 3 \cdot (-2) + 1 \cdot (-1) - 1 \cdot 1 = \boxed{-8}$.

(b) Since $\|\mathbf{v}\| = \sqrt{3^2 + 1^2 + 1^2} = \sqrt{11}$ and $\|\mathbf{w}\| = \sqrt{2^2 + 1^2 + 1^2} = \sqrt{6}$, the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is

$$\theta = \cos^{-1} \left(-\frac{8}{\sqrt{11}\sqrt{6}} \right) \boxed{\approx 2.967}.$$

12. (a) $\mathbf{v} \cdot \mathbf{w} = 1 \cdot 4 - 3 \cdot (-1) + 4 \cdot 3 = 4 + 3 + 12 = \boxed{19}$.

(b) Since $\|\mathbf{v}\| = \sqrt{1^2 + 3^2 + 4^2} = \sqrt{26}$ and $\|\mathbf{w}\| = \sqrt{4^2 + 1^2 + 3^2} = \sqrt{26}$, the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is

$$\theta = \cos^{-1} \frac{19}{\sqrt{26}\sqrt{26}} \boxed{\approx 0.751}.$$

13. (a) $\mathbf{v} \cdot \mathbf{w} = 1 \cdot 1 - 1 \cdot 1 = \boxed{0}$.

(b) Since the dot product is zero, the vectors are orthogonal, so the angle between them is $\boxed{\frac{\pi}{2}}$.

14. (a) $\mathbf{v} \cdot \mathbf{w} = 3 \cdot (-6) + 4 \cdot (-8) = -18 - 32 = \boxed{-50}$.

(b) Since $\|\mathbf{v}\| = \sqrt{3^2 + 4^2} = 5$ and $\|\mathbf{w}\| = \sqrt{6^2 + 8^2} = 10$, the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is

$$\theta = \cos^{-1} \left(-\frac{50}{5 \cdot 10} \right) = \cos^{-1}(-1) = \boxed{\pi}.$$

15. For $\mathbf{v}$ and $\mathbf{w}$ to be orthogonal, we must have

$$\mathbf{v} \cdot \mathbf{w} = 2a \cdot 1 + 1 \cdot (-1) - 1 \cdot 1 = 2a - 2 = 0,$$

so that $\boxed{a = 1}$.

16. For $\mathbf{v}$ and $\mathbf{w}$ to be orthogonal, we must have

$$\mathbf{v} \cdot \mathbf{w} = 1 \cdot 1 + 2a \cdot (-1) - 1 \cdot 1 = -2a = 0,$$

so that $\boxed{a = 0}$.

17. For $\mathbf{v}$ and $\mathbf{w}$ to be orthogonal, we must have

$$\mathbf{v} \cdot \mathbf{w} = a \cdot 1 + 1 \cdot a + 1 \cdot 4 = 2a + 4 = 0,$$

so that $\boxed{a = -2}$.

18. For $\mathbf{v}$ and $\mathbf{w}$ to be orthogonal, we must have

$$\mathbf{v} \cdot \mathbf{w} = 1 \cdot 2a - a \cdot 1 + 2 \cdot 1 = a + 2 = 0,$$

so that $\boxed{a = -2}$.

19. (a) We have

$$\|\mathbf{v}\| = \sqrt{3^2 + 6^2 + 2^2} = \sqrt{49} = 7$$

$$\cos \alpha = \frac{v_1}{\|\mathbf{v}\|} = \frac{3}{7}$$

$$\cos \beta = \frac{v_2}{\|\mathbf{v}\|} = -\frac{6}{7}$$

$$\cos \gamma = \frac{v_3}{\|\mathbf{v}\|} = -\frac{2}{7}.$$

$$(b) \quad \mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{7 \left(\frac{3}{7} \mathbf{i} - \frac{6}{7} \mathbf{j} - \frac{2}{7} \mathbf{k} \right)}.$$

20. (a) We have

$$\|\mathbf{v}\| = \sqrt{6^2 + 12^2 + 4^2} = \sqrt{196} = 14$$

$$\cos \alpha = \frac{v_1}{\|\mathbf{v}\|} = -\frac{6}{14} = -\frac{3}{7}$$

$$\cos \beta = \frac{v_2}{\|\mathbf{v}\|} = \frac{12}{14} = \frac{6}{7}$$

$$\cos \gamma = \frac{v_3}{\|\mathbf{v}\|} = \frac{4}{14} = \frac{2}{7}.$$

$$(b) \quad \mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{14 \left(-\frac{3}{7} \mathbf{i} + \frac{6}{7} \mathbf{j} + \frac{2}{7} \mathbf{k} \right)}.$$

21. (a) We have

$$\|\mathbf{v}\| = \sqrt{1^2 + 1^2 + 1^2} = \sqrt{3}$$

$$\cos \alpha = \frac{v_1}{\|\mathbf{v}\|} = \frac{1}{\sqrt{3}}$$

$$\cos \beta = \frac{v_2}{\|\mathbf{v}\|} = \frac{1}{\sqrt{3}}$$

$$\cos \gamma = \frac{v_3}{\|\mathbf{v}\|} = \frac{1}{\sqrt{3}}.$$

$$(b) \quad \mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{\sqrt{3} \left(\frac{1}{\sqrt{3}} \mathbf{i} + \frac{1}{\sqrt{3}} \mathbf{j} + \frac{1}{\sqrt{3}} \mathbf{k} \right)}.$$

22. (a) We have

$$\|\mathbf{v}\| = \sqrt{1^2 + 1^2 + 1^2} = \sqrt{3}$$

$$\cos \alpha = \frac{v_1}{\|\mathbf{v}\|} = \frac{1}{\sqrt{3}}$$

$$\cos \beta = \frac{v_2}{\|\mathbf{v}\|} = -\frac{1}{\sqrt{3}}$$

$$\cos \gamma = \frac{v_3}{\|\mathbf{v}\|} = -\frac{1}{\sqrt{3}}.$$

$$(b) \quad \mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{\sqrt{3} \left(\frac{1}{\sqrt{3}} \mathbf{i} - \frac{1}{\sqrt{3}} \mathbf{j} - \frac{1}{\sqrt{3}} \mathbf{k} \right)}.$$

23. (a) We have

$$\begin{aligned}\|\mathbf{v}\| &= \sqrt{1^2 + 0^2 + 1^2} = \sqrt{2} \\ \cos \alpha &= \frac{v_1}{\|\mathbf{v}\|} = \frac{1}{\sqrt{2}} \\ \cos \beta &= \frac{v_2}{\|\mathbf{v}\|} = 0 \\ \cos \gamma &= \frac{v_3}{\|\mathbf{v}\|} = -\frac{1}{\sqrt{2}}.\end{aligned}$$

$$(b) \quad \mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{\sqrt{2} \left(\frac{1}{\sqrt{2}} \mathbf{i} - \frac{1}{\sqrt{2}} \mathbf{k} \right)}.$$

24. (a) We have

$$\begin{aligned}\|\mathbf{v}\| &= \sqrt{0^2 + 1^2 + 1^2} = \sqrt{2} \\ \cos \alpha &= \frac{v_1}{\|\mathbf{v}\|} = 0 \\ \cos \beta &= \frac{v_2}{\|\mathbf{v}\|} = \frac{1}{\sqrt{2}} \\ \cos \gamma &= \frac{v_3}{\|\mathbf{v}\|} = \frac{1}{\sqrt{2}}.\end{aligned}$$

$$(b) \quad \mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{\sqrt{2} \left(\frac{1}{\sqrt{2}} \mathbf{j} + \frac{1}{\sqrt{2}} \mathbf{k} \right)}.$$

25. (a) We have

$$\begin{aligned}\|\mathbf{v}\| &= \sqrt{3^2 + 5^2 + 2^2} = \sqrt{38} \\ \cos \alpha &= \frac{v_1}{\|\mathbf{v}\|} = \frac{3}{\sqrt{38}} \\ \cos \beta &= \frac{v_2}{\|\mathbf{v}\|} = -\frac{5}{\sqrt{38}} \\ \cos \gamma &= \frac{v_3}{\|\mathbf{v}\|} = \frac{2}{\sqrt{38}}.\end{aligned}$$

$$(b) \quad \mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{\sqrt{38} \left(\frac{3}{\sqrt{38}} \mathbf{i} - \frac{5}{\sqrt{38}} \mathbf{j} + \frac{2}{\sqrt{38}} \mathbf{k} \right)}.$$

26. (a) We have

$$\begin{aligned}\|\mathbf{v}\| &= \sqrt{2^2 + 3^2 + 4^2} = \sqrt{29} \\ \cos \alpha &= \frac{v_1}{\|\mathbf{v}\|} = \frac{2}{\sqrt{29}} \\ \cos \beta &= \frac{v_2}{\|\mathbf{v}\|} = \frac{3}{\sqrt{29}} \\ \cos \gamma &= \frac{v_3}{\|\mathbf{v}\|} = -\frac{4}{\sqrt{29}}.\end{aligned}$$

$$(b) \quad \mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{\sqrt{29} \left(\frac{2}{\sqrt{29}} \mathbf{i} + \frac{3}{\sqrt{29}} \mathbf{j} - \frac{4}{\sqrt{29}} \mathbf{k} \right)}.$$

27. (a) $\text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} = \frac{2 \cdot 1 - 3 \cdot (-1) + 1 \cdot 1}{1 \cdot 1 - 1 \cdot (-1) + 1 \cdot 1} (\mathbf{i} - \mathbf{j} + \mathbf{k}) = \frac{6}{3} (\mathbf{i} - \mathbf{j} + \mathbf{k}) = \boxed{2\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}}.$

(b) Since $\text{proj}_{\mathbf{w}} \mathbf{v}$ is parallel to $\mathbf{w}$, set

$$\begin{aligned} \mathbf{v}_1 &= \text{proj}_{\mathbf{w}} \mathbf{v} = 2\mathbf{i} - 2\mathbf{j} + 2\mathbf{k} \\ \mathbf{v}_2 &= \mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v} = (2\mathbf{i} - 3\mathbf{j} + \mathbf{k}) - (2\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}) = -\mathbf{j} - \mathbf{k}. \end{aligned}$$

28. (a) $\text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} = \frac{-3 \cdot 2 + 2 \cdot 1 - 1 \cdot (-1)}{2 \cdot 2 + 1 \cdot 1 - 1 \cdot (-1)} (2\mathbf{i} + \mathbf{j} - \mathbf{k}) = -\frac{3}{6} (2\mathbf{i} + \mathbf{j} - \mathbf{k}) = \boxed{-\mathbf{i} - \frac{1}{2}\mathbf{j} + \frac{1}{2}\mathbf{k}}.$

(b) Since $\text{proj}_{\mathbf{w}} \mathbf{v}$ is parallel to $\mathbf{w}$, set

$$\begin{aligned} \mathbf{v}_1 &= \text{proj}_{\mathbf{w}} \mathbf{v} = -\mathbf{i} - \frac{1}{2}\mathbf{j} + \frac{1}{2}\mathbf{k} \\ \mathbf{v}_2 &= \mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v} = (-3\mathbf{i} + 2\mathbf{j} - \mathbf{k}) - \left(-\mathbf{i} - \frac{1}{2}\mathbf{j} + \frac{1}{2}\mathbf{k}\right) = -2\mathbf{i} + \frac{5}{2}\mathbf{j} - \frac{3}{2}\mathbf{k}. \end{aligned}$$

29. (a) $\text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} = \frac{1 \cdot 0 - 1 \cdot 1 + 0 \cdot 1}{0 \cdot 0 + 1 \cdot 1 + 1 \cdot 1} (\mathbf{j} + \mathbf{k}) = -\frac{1}{2} (\mathbf{j} + \mathbf{k}) = \boxed{-\frac{1}{2}\mathbf{j} - \frac{1}{2}\mathbf{k}}.$

(b) Since $\text{proj}_{\mathbf{w}} \mathbf{v}$ is parallel to $\mathbf{w}$, set

$$\begin{aligned} \mathbf{v}_1 &= \text{proj}_{\mathbf{w}} \mathbf{v} = -\frac{1}{2}\mathbf{j} - \frac{1}{2}\mathbf{k} \\ \mathbf{v}_2 &= \mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v} = (\mathbf{i} - \mathbf{j}) - \left(-\frac{1}{2}\mathbf{j} - \frac{1}{2}\mathbf{k}\right) = \mathbf{i} - \frac{1}{2}\mathbf{j} + \frac{1}{2}\mathbf{k}. \end{aligned}$$

30. (a) $\text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} = \frac{0 \cdot 1 + 1 \cdot 0 - 1 \cdot 1}{1 \cdot 1 + 0 \cdot 0 + 1 \cdot 1} (\mathbf{i} + \mathbf{k}) = -\frac{1}{2} (\mathbf{i} + \mathbf{k}) = \boxed{-\frac{1}{2}\mathbf{i} - \frac{1}{2}\mathbf{k}}.$

(b) Since $\text{proj}_{\mathbf{w}} \mathbf{v}$ is parallel to $\mathbf{w}$, set

$$\begin{aligned} \mathbf{v}_1 &= \text{proj}_{\mathbf{w}} \mathbf{v} = -\frac{1}{2}\mathbf{i} - \frac{1}{2}\mathbf{k} \\ \mathbf{v}_2 &= \mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v} = (\mathbf{j} - \mathbf{k}) - \left(-\frac{1}{2}\mathbf{i} - \frac{1}{2}\mathbf{k}\right) = \frac{1}{2}\mathbf{i} + \mathbf{j} - \frac{1}{2}\mathbf{k}. \end{aligned}$$

31. (a) $\text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} = \frac{3 \cdot (-2) + 1 \cdot (-1) - 1 \cdot 1}{-2 \cdot (-2) - 1 \cdot (-1) + 1 \cdot 1} (-2\mathbf{i} - \mathbf{j} + \mathbf{k}) = -\frac{4}{3} (-2\mathbf{i} - \mathbf{j} + \mathbf{k}) = \boxed{\frac{8}{3}\mathbf{i} + \frac{4}{3}\mathbf{j} - \frac{4}{3}\mathbf{k}}.$

(b) Since $\text{proj}_{\mathbf{w}} \mathbf{v}$ is parallel to $\mathbf{w}$, set

$$\begin{aligned} \mathbf{v}_1 &= \text{proj}_{\mathbf{w}} \mathbf{v} = \frac{8}{3}\mathbf{i} + \frac{4}{3}\mathbf{j} - \frac{4}{3}\mathbf{k} \\ \mathbf{v}_2 &= \mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v} = (3\mathbf{i} + \mathbf{j} - \mathbf{k}) - \left(\frac{8}{3}\mathbf{i} + \frac{4}{3}\mathbf{j} - \frac{4}{3}\mathbf{k}\right) = \frac{1}{3}\mathbf{i} - \frac{1}{3}\mathbf{j} + \frac{1}{3}\mathbf{k}. \end{aligned}$$

32. (a) $\text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} = \frac{1 \cdot 4 - 3 \cdot (-1) + 4 \cdot 3}{4 \cdot 4 - 1 \cdot (-1) + 3 \cdot 3} (4\mathbf{i} - \mathbf{j} + 3\mathbf{k}) = \frac{19}{26} (4\mathbf{i} - \mathbf{j} + 3\mathbf{k}) = \boxed{\frac{38}{13}\mathbf{i} - \frac{19}{26}\mathbf{j} + \frac{57}{26}\mathbf{k}}.$

(b) Since $\text{proj}_{\mathbf{w}} \mathbf{v}$ is parallel to $\mathbf{w}$, set

$$\begin{aligned} \mathbf{v}_1 &= \text{proj}_{\mathbf{w}} \mathbf{v} = \frac{38}{13}\mathbf{i} - \frac{19}{26}\mathbf{j} + \frac{57}{26}\mathbf{k} \\ \mathbf{v}_2 &= \mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v} = (\mathbf{i} - 3\mathbf{j} + 4\mathbf{k}) - \left(\frac{38}{13}\mathbf{i} - \frac{19}{26}\mathbf{j} + \frac{57}{26}\mathbf{k}\right) = -\frac{25}{13}\mathbf{i} - \frac{59}{26}\mathbf{j} + \frac{47}{26}\mathbf{k}. \end{aligned}$$

33. The angle θ between the vectors satisfies

$$\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|} = \frac{a \cdot 1 + 1 \cdot a + 1 \cdot 1}{\sqrt{a^2 + 2} \sqrt{a^2 + 2}} = \frac{2a + 1}{a^2 + 2}.$$

For θ to equal $\frac{\pi}{3}$, we must have $\frac{2a+1}{a^2+2} = \frac{1}{2}$, so that (clearing fractions) $4a + 2 = a^2 + 2$, or $a^2 - 4a = 0$. Therefore $\boxed{a = 0 \text{ and } a = 4}$ satisfy the given condition.

34. The angle θ between the vectors satisfies

$$\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|} = \frac{a \cdot 1 - 1 \cdot (-1) + 1 \cdot a}{\sqrt{a^2 + 2} \sqrt{a^2 + 2}} = \frac{2a + 1}{a^2 + 2}.$$

For θ to equal $\frac{2\pi}{3}$, we must have $\frac{2a+1}{a^2+2} = -\frac{1}{2}$, so that (clearing fractions) $4a + 2 = -a^2 - 2$, or $a^2 + 4a + 4 = (a + 2)^2 = 0$. The only solution is $\boxed{a = -2}$.

Applications and Extensions

35. The velocity of the plane with respect to the air is $500\mathbf{j}$. The wind, which is blowing toward the southeast at 60 km/h, has a velocity vector of $60(\cos(-45^\circ)\mathbf{i} + \sin(-45^\circ)\mathbf{j}) = 30\sqrt{2}\mathbf{i} - 30\sqrt{2}\mathbf{j}$. Therefore the velocity vector of the plane with respect to the ground is

$$\mathbf{v}_g = 500\mathbf{j} + 30\sqrt{2}\mathbf{i} - 30\sqrt{2}\mathbf{j} = 30\sqrt{2}\mathbf{i} + (500 - 30\sqrt{2})\mathbf{j} \approx 42.426\mathbf{i} + 457.574\mathbf{j}.$$

The speed of the plane with respect to the ground is therefore

$$\|\mathbf{v}_g\| \approx \sqrt{42.426^2 + 457.574^2} \approx 459.536 \text{ km/h}.$$

Its direction is given by the angle θ that it makes with the x axis, which is

$$\theta = \cos^{-1} \frac{\mathbf{v}_g \cdot \mathbf{i}}{\|\mathbf{v}_g\| \|\mathbf{i}\|} \approx \cos^{-1} \frac{30\sqrt{2}}{459.537} \approx 1.478 \approx 84.703^\circ,$$

or about 5.297° east of north.

36. The velocity of the bird with respect to the air is $-12\mathbf{i}$. The wind, which is blowing toward the northwest at 5 km/h, has a velocity vector of $5(\cos 135^\circ\mathbf{i} + \sin 135^\circ\mathbf{j}) = -\frac{5}{2}\sqrt{2}\mathbf{i} + \frac{5}{2}\sqrt{2}\mathbf{j}$. Therefore the velocity vector of the bird with respect to the ground is

$$\mathbf{v}_g = -12\mathbf{i} - \frac{5}{2}\sqrt{2}\mathbf{i} + \frac{5}{2}\sqrt{2}\mathbf{j} = -\left(12 + \frac{5}{2}\sqrt{2}\right)\mathbf{i} + \frac{5}{2}\sqrt{2}\mathbf{j} \approx -15.536\mathbf{i} + 3.536\mathbf{j}.$$

The speed of the bird with respect to the ground is therefore

$$\|\mathbf{v}_g\| \approx \sqrt{15.536^2 + 3.536^2} \approx 15.933 \text{ km/h}.$$

Its direction is given by the angle θ that it makes with the x axis, which is

$$\theta = \cos^{-1} \frac{\mathbf{v}_g \cdot \mathbf{i}}{\|\mathbf{v}_g\| \|\mathbf{i}\|} \approx \cos^{-1} \frac{-12 - \frac{5}{2}\sqrt{2}}{15.933} \approx 2.918 \approx 167.175^\circ.$$

37. Set up a coordinate system with the origin at the point where the boat starts, x -axis pointing directly across the river, and the y -axis pointing up the river, so that the current's velocity is $-5\mathbf{j}$. Let θ be the angle that the boat's velocity with respect to the water makes with the x -axis. Then the boat's velocity with respect to the water is

$$\mathbf{v} = 15(\cos \theta \mathbf{i} + \sin \theta \mathbf{j}),$$

so that the velocity of the boat with respect to the ground is

$$\mathbf{v} - 5\mathbf{j} = 15 \cos \theta \mathbf{i} + (-5 + 15 \sin \theta)\mathbf{j}.$$

Now, we want the velocity of the boat with respect to the ground to be orthogonal to $\mathbf{j}$ (i.e., straight across the river), so we want

$$(15 \cos \theta \mathbf{i} + (-5 + 15 \sin \theta)\mathbf{j}) \cdot \mathbf{j} = -5 + 15 \sin \theta = 0.$$

This gives $\sin \theta = \frac{1}{3}$, so that

$$\theta = \sin^{-1} \frac{1}{3} \approx 0.340 \approx 19.471^\circ.$$

The boat should be pointed about 19.471° upriver from the landing point; this is an angle of about $\boxed{70.529^\circ}$ to the shore.

38. Set up a coordinate system with the origin at the point where the swimmer starts, x -axis pointing directly across the river, and the y -axis pointing up the river, so that the current's velocity is $-1\mathbf{j}$ km/h. Let θ be the angle that the swimmer's velocity with respect to the water makes with the x -axis. Then the swimmer's velocity with respect to the water is

$$\mathbf{v} = 2(\cos \theta \mathbf{i} + \sin \theta \mathbf{j}),$$

so that the velocity of the swimmer with respect to the ground is

$$\mathbf{v} - \mathbf{j} = 2 \cos \theta \mathbf{i} + (-1 + 2 \sin \theta)\mathbf{j}.$$

Now, we want the velocity of the swimmer with respect to the ground to be orthogonal to $\mathbf{j}$ (i.e., straight across the river), so we want

$$(2 \cos \theta \mathbf{i} + (-1 + 2 \sin \theta)\mathbf{j}) \cdot \mathbf{j} = -1 + 2 \sin \theta = 0.$$

This gives $\sin \theta = \frac{1}{2}$, so that

$$\theta = \sin^{-1} \frac{1}{2} = \frac{\pi}{6} = 30^\circ.$$

The swimmer should aim 30° upriver from the landing point, or at an angle of $\boxed{60^\circ}$ to the shore.

39. Let $\mathbf{v}$ be the vertical vector of gravitational force, so that $\mathbf{v} = -5300\mathbf{j}$, and let $\mathbf{w}$ be the vector describing the grade of the street, so that $\mathbf{w} = \cos 8^\circ \mathbf{i} + \sin 8^\circ \mathbf{j}$. Then the force required to keep the car from rolling down the hill is $\text{proj}_{\mathbf{w}} \mathbf{v}$ (the component parallel to $\mathbf{w}$), while the force perpendicular to the street is $\mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v}$.

$$\begin{aligned} \text{proj}_{\mathbf{w}} \mathbf{v} &= \frac{\mathbf{v} \cdot \mathbf{w}}{\mathbf{w} \cdot \mathbf{w}} \mathbf{w} = \frac{-5300 \sin 8^\circ}{\cos^2 8^\circ + \sin^2 8^\circ} (\cos 8^\circ \mathbf{i} + \sin 8^\circ \mathbf{j}) \\ &= -5300 \sin 8^\circ (\cos 8^\circ \mathbf{i} + \sin 8^\circ \mathbf{j}) \approx -730.439\mathbf{i} - 102.657\mathbf{j} \\ \mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v} &= -5300\mathbf{j} - (-730.439\mathbf{i} - 102.657\mathbf{j}) = 730.439\mathbf{i} - 5197.343\mathbf{j}. \end{aligned}$$

So the magnitude of the force required to keep the car from rolling downhill is

$$\|\text{proj}_{\mathbf{w}} \mathbf{v}\| \approx \sqrt{730.439^2 + 102.657^2} \approx 737.618 \text{ lb},$$

and the magnitude of the force perpendicular to the street is

$$\|\mathbf{v} - \text{proj}_{\mathbf{w}} \mathbf{v}\| \approx \sqrt{730.439^2 + 5197.343^2} \approx 5248.420 \text{ lb}.$$

40. The amount of force that Billy must exert is the magnitude of the component of the piano's 250 pound gravitational force vector, which is $\mathbf{v} = -250\mathbf{j}$, in the direction of the ramp. The ramp is described by $\mathbf{w} = \cos 20^\circ \mathbf{i} + \sin 20^\circ \mathbf{j}$, and the component in the direction of the ramp is the projection. So the force required is

$$\begin{aligned}\text{proj}_{\mathbf{w}} \mathbf{v} &= \frac{\mathbf{v} \cdot \mathbf{w}}{\mathbf{w} \cdot \mathbf{w}} \mathbf{w} = \frac{-250 \sin 20^\circ}{\cos^2 20^\circ + \sin^2 20^\circ} (\cos 20^\circ \mathbf{i} + \sin 20^\circ \mathbf{j}) \\ &= -250 \sin 20^\circ (\cos 20^\circ \mathbf{i} + \sin 20^\circ \mathbf{j}) \approx -80.348\mathbf{i} - 29.244\mathbf{j}.\end{aligned}$$

The magnitude of this force is

$$\|\text{proj}_{\mathbf{w}} \mathbf{v}\| = \sqrt{80.348^2 + 29.244^2} \approx 85.505 \text{ lbs}.$$

41. If $\mathbf{F} = 20(\cos 30^\circ \mathbf{i} + \sin 30^\circ \mathbf{j}) = 10\sqrt{3}\mathbf{i} + 10\mathbf{j}$, then the amount of work done in moving the wagon 100 feet horizontally, which has the vector $\overrightarrow{AB} = 100\mathbf{i}$, is

$$\mathbf{F} \cdot \overrightarrow{AB} = (10\sqrt{3}\mathbf{i} + 10\mathbf{j}) \cdot 100\mathbf{i} = 1000\sqrt{3} \approx 1732.051 \text{ ft-lbs}.$$

42. The magnitude of the given direction vector for the force is $\sqrt{2^2 + 2^2 + 1^2} = 3$, so that a unit vector in the direction of the force is $(\frac{2}{3}, \frac{2}{3}, \frac{1}{3})$. Therefore the force is

$$\mathbf{F} = \|\mathbf{F}\| \left(\frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} + \frac{1}{3}\mathbf{k} \right) = 1 \left(\frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} + \frac{1}{3}\mathbf{k} \right) = \frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} + \frac{1}{3}\mathbf{k}.$$

We want to move the object through the vector $\overrightarrow{AB} = \mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$, so that the work is

$$\mathbf{F} \cdot \overrightarrow{AB} = \left(\frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} + \frac{1}{3}\mathbf{k} \right) \cdot (\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}) = \frac{2}{3} \cdot 1 + \frac{2}{3} \cdot 2 + \frac{1}{3} \cdot 2 = \frac{8}{3} \text{ J}.$$

43. The magnitude of the given direction vector for the force is $\sqrt{2^2 + 1^2 + 2^2} = 3$, so that a unit vector in the direction of the force is $(\frac{2}{3}, \frac{1}{3}, \frac{2}{3})$. Therefore the force is

$$\mathbf{F} = \|\mathbf{F}\| \left(\frac{2}{3}\mathbf{i} + \frac{1}{3}\mathbf{j} + \frac{2}{3}\mathbf{k} \right) = 3 \left(\frac{2}{3}\mathbf{i} + \frac{1}{3}\mathbf{j} + \frac{2}{3}\mathbf{k} \right) = 2\mathbf{i} + \mathbf{j} + 2\mathbf{k}.$$

We want to move the object through the vector $\overrightarrow{AB} = 2\mathbf{j}$, so that the work is

$$\mathbf{F} \cdot \overrightarrow{AB} = (2\mathbf{i} + \mathbf{j} + 2\mathbf{k}) \cdot (2\mathbf{j}) = 1 \cdot 2 = 2 \text{ J}.$$

44. Gravity is $\mathbf{v}_g = mg\mathbf{j}$. To move from $(0, b)$ to $(b, 0)$, we are moving along the vector $\overrightarrow{AB}_1 = b\mathbf{i} - b\mathbf{j}$; to move from $(b, 0)$ to $(0, 0)$, we are moving along the vector $\overrightarrow{AB}_2 = -b\mathbf{i}$; to move from $(0, 0)$ to $(0, b)$, we are moving along the vector $\overrightarrow{AB}_3 = b\mathbf{j}$. Therefore the work done by gravity along each side of the triangle is

$$\begin{aligned}W_1 &= \mathbf{v}_g \cdot \overrightarrow{AB}_1 = mg\mathbf{j} \cdot (b\mathbf{i} - b\mathbf{j}) = -mgb \\ W_2 &= \mathbf{v}_g \cdot \overrightarrow{AB}_2 = mg\mathbf{j} \cdot (-b\mathbf{i}) = 0 \\ W_3 &= \mathbf{v}_g \cdot \overrightarrow{AB}_3 = mg\mathbf{j} \cdot (b\mathbf{j}) = mgb.\end{aligned}$$

So the total work done by gravity is $-mgb + 0 + mgb = 0$.

45. (a) The two workers exert force vectors of

$$\begin{aligned}\mathbf{F}_A &= 850(\cos 30^\circ \mathbf{i} + \sin 30^\circ \mathbf{j}) = 425\sqrt{3}\mathbf{i} + 425\mathbf{j} \\ \mathbf{F}_B &= 850(\cos 45^\circ \mathbf{i} + \sin 45^\circ \mathbf{j}) = 425\sqrt{2}\mathbf{i} + 425\sqrt{2}\mathbf{j}.\end{aligned}$$

The work done by each worker in moving the crate from $(0, 0, 0)$ to $(10, 0, 0)$ (i.e., along the vector $10\mathbf{i}$) is therefore

$$\begin{aligned}\mathbf{F}_A \cdot \overrightarrow{AB} &= (425\sqrt{3}\mathbf{i} + 425\mathbf{j}) \cdot 10\mathbf{i} = 4250\sqrt{3} \approx 7361.216 \text{ J} \\ \mathbf{F}_B \cdot \overrightarrow{AB} &= (425\sqrt{2}\mathbf{i} + 425\sqrt{2}\mathbf{j}) \cdot 10\mathbf{i} = 4250\sqrt{2} \approx 6010.408 \text{ J}.\end{aligned}$$

(b) Answers will vary.

46. (a) The force vector applied by the horse is $\mathbf{F} = 725(\cos 15^\circ \mathbf{i} + \sin 15^\circ \mathbf{j})$, and we wish to move the plow through the vector $\overrightarrow{AB} = 15\mathbf{j}$, so the work is

$$\mathbf{F} \cdot \overrightarrow{AB} = 725(\cos 15^\circ \mathbf{i} + \sin 15^\circ \mathbf{j}) \cdot 15\mathbf{j} = \boxed{10875 \sin 15^\circ \approx 2814.657 \text{ J}}.$$

(b) Friction is a force vector equal to $-625\mathbf{j}$, so the work done by friction is

$$-625\mathbf{j} \cdot 15\mathbf{j} = \boxed{-9375 \text{ J}}.$$

(The sign is negative to indicate that this work subtracts from the work done by the horse; it reflects a force in the opposite direction.)

47. Let $A = (2, 2, 2)$, $B = (-1, 3, 3)$, $C = (0, 1, 2)$, and $D = (3, 0, 1)$. Then claim $ABCD$ is a parallelogram. First,

$$\begin{aligned}\overrightarrow{AB} &= \langle -1 - 2, 3 - 2, 3 - 2 \rangle = \langle -3, 1, 1 \rangle & \overrightarrow{BA} &= \langle 3, -1, -1 \rangle \\ \overrightarrow{BC} &= \langle 0 - (-1), 1 - 3, 2 - 3 \rangle = \langle 1, -2, -1 \rangle & \overrightarrow{CB} &= \langle -1, 2, 1 \rangle \\ \overrightarrow{CD} &= \langle 3 - 0, 0 - 1, 1 - 2 \rangle = \langle 3, -1, -1 \rangle & \overrightarrow{DC} &= \langle -3, 1, 1 \rangle \\ \overrightarrow{DA} &= \langle 2 - 3, 2 - 0, 2 - 1 \rangle = \langle -1, 2, 1 \rangle & \overrightarrow{AD} &= \langle 1, -2, -1 \rangle.\end{aligned}$$

Then

$$\begin{aligned}\|\overrightarrow{AB}\| &= \sqrt{3^2 + 1^2 + 1^2} = \sqrt{11} \\ \|\overrightarrow{BC}\| &= \sqrt{1^2 + 2^2 + 1^2} = \sqrt{6} \\ \|\overrightarrow{CD}\| &= \sqrt{3^2 + 1^2 + 1^2} = \sqrt{11} \\ \|\overrightarrow{DA}\| &= \sqrt{1^2 + 2^2 + 1^2} = \sqrt{6}.\end{aligned}$$

Therefore the pairs of opposite sides AB and CD , and BC and DA , are equal in length. The angles between pairs of adjacent sides satisfy

$$\begin{aligned}\cos \angle(\overrightarrow{BA}, \overrightarrow{BC}) &= \frac{\overrightarrow{BA} \cdot \overrightarrow{BC}}{\|\overrightarrow{BA}\| \|\overrightarrow{BC}\|} = \frac{3 \cdot 1 - 1 \cdot (-2) - 1 \cdot (-1)}{\sqrt{11}\sqrt{6}} = \frac{6}{\sqrt{66}} \\ \cos \angle(\overrightarrow{CB}, \overrightarrow{CD}) &= \frac{\overrightarrow{CB} \cdot \overrightarrow{CD}}{\|\overrightarrow{CB}\| \|\overrightarrow{CD}\|} = \frac{-1 \cdot 3 + 2 \cdot (-1) + 1 \cdot (-1)}{\sqrt{6}\sqrt{11}} = -\frac{6}{\sqrt{66}} \\ \cos \angle(\overrightarrow{DC}, \overrightarrow{DA}) &= \frac{\overrightarrow{DC} \cdot \overrightarrow{DA}}{\|\overrightarrow{DC}\| \|\overrightarrow{DA}\|} = \frac{-3 \cdot (-1) + 1 \cdot 2 + 1 \cdot 1}{\sqrt{6}\sqrt{11}} = \frac{6}{\sqrt{66}} \\ \cos \angle(\overrightarrow{AD}, \overrightarrow{AB}) &= \frac{\overrightarrow{AD} \cdot \overrightarrow{AB}}{\|\overrightarrow{AD}\| \|\overrightarrow{AB}\|} = \frac{1 \cdot (-3) - 2 \cdot 1 - 1 \cdot 1}{\sqrt{6}\sqrt{11}} = -\frac{6}{\sqrt{66}}.\end{aligned}$$

So the angles at C and A are equal, and the angles at B and D are equal. Therefore $ABCD$ is indeed a parallelogram.

48. Let $A = (2, 2, 2)$, $B = (2, 0, 1)$, $C = (4, 1, -1)$, and $D = (4, 3, 0)$. Claim $ABCD$ is a rectangle. First,

$$\begin{aligned}\overrightarrow{AB} &= \langle 2 - 2, 0 - 2, 1 - 2 \rangle = \langle 0, -2, -1 \rangle \\ \overrightarrow{BC} &= \langle 4 - 2, 1 - 0, -1 - 1 \rangle = \langle 2, 1, -2 \rangle \\ \overrightarrow{CD} &= \langle 4 - 4, 3 - 1, 0 - (-1) \rangle = \langle 0, 2, 1 \rangle \\ \overrightarrow{DA} &= \langle 2 - 4, 2 - 3, 2 - 0 \rangle = \langle -2, -1, 2 \rangle.\end{aligned}$$

we have

$$\begin{aligned}\|\overrightarrow{AB}\| &= \sqrt{0^2 + 2^2 + 1^2} = \sqrt{5} \\ \|\overrightarrow{BC}\| &= \sqrt{2^2 + 1^2 + 2^2} = 3 \\ \|\overrightarrow{CD}\| &= \sqrt{0^2 + 2^2 + 1^2} = \sqrt{5} \\ \|\overrightarrow{DA}\| &= \sqrt{2^2 + 1^2 + 2^2} = 3.\end{aligned}$$

Therefore opposite sides are equal. Also,

$$\begin{aligned}\overrightarrow{AB} \cdot \overrightarrow{BC} &= 0 \cdot 2 - 2 \cdot 1 - 1 \cdot (-2) = 0 \\ \overrightarrow{BC} \cdot \overrightarrow{CD} &= 2 \cdot 0 + 1 \cdot 2 - 2 \cdot 1 = 0 \\ \overrightarrow{CD} \cdot \overrightarrow{DA} &= 0 \cdot (-2) + 2 \cdot (-1) + 1 \cdot 2 = 0 \\ \overrightarrow{DA} \cdot \overrightarrow{AB} &= -2 \cdot 0 - 1 \cdot (-2) + 2 \cdot (-1) = 0,\end{aligned}$$

so that all four vertices are right angles. Therefore $ABCD$ is a rectangle.

49. Let $A = (-2, 6, 0)$, $B = (4, 9, 1)$, and $C = (-3, 2, 18)$. Then

$$\begin{aligned}\overrightarrow{AB} &= \langle 4 - (-2), 9 - 6, 1 - 0 \rangle = \langle 6, 3, 1 \rangle, \\ \overrightarrow{BC} &= \langle -3 - 4, 2 - 9, 18 - 1 \rangle = \langle -7, -7, 17 \rangle, \\ \overrightarrow{AC} &= \langle -2 - (-3), 6 - 2, 0 - 18 \rangle = \langle 1, 4, -18 \rangle.\end{aligned}$$

Then

$$\overrightarrow{AB} \cdot \overrightarrow{AC} = 6 \cdot 1 + 3 \cdot 4 + 1 \cdot (-18) = 0,$$

so that the angle at A is a right angle, so that ABC is a right triangle.

50. We want the triangle to have its right angle at C , so we must have $\overrightarrow{CB}$ orthogonal to $\overrightarrow{CA}$. Now,

$$\overrightarrow{CB} \cdot \overrightarrow{CA} = \langle -2 - 1, 2 - 2, 1 - c \rangle \cdot \langle 1 - 1, -1 - 2, 0 - c \rangle = \langle -3, 0, 1 - c \rangle \cdot \langle 0, -3, -c \rangle = -c(1 - c).$$

The dot product is zero, meaning that $\overrightarrow{CB}$ and $\overrightarrow{CA}$ are orthogonal, for $\boxed{c = 0 \text{ and } c = 1}$. So these are the desired values of c .

51. Let θ be the angle that the force vector $\mathbf{F}$ makes with the x -axis. Since $\mathbf{F}$ has magnitude one, we have $\mathbf{F} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$. Then the work done by $\mathbf{F}$ is

$$\mathbf{F} \cdot 4\mathbf{i} = 4 \cos \theta = 2,$$

so that $\cos \theta = \frac{1}{2}$ and $\theta = \frac{\pi}{3} = 60^\circ$. The force vector makes an angle of $\boxed{\frac{\pi}{3}}$ with the positive x -axis.

52. If $\mathbf{F}$ is orthogonal to $\mathbf{AB}$, then $\mathbf{F} \cdot \overrightarrow{AB} = 0$, so $\boxed{\text{no work is done by } \mathbf{F}}$.

53. Using the Magnitude Property, we have

$$\left\| \frac{1}{2} \mathbf{u} - \mathbf{w} \right\|^2 = \left(\frac{1}{2} \mathbf{u} - \mathbf{w} \right) \cdot \left(\frac{1}{2} \mathbf{u} - \mathbf{w} \right) = \frac{1}{4} \mathbf{u} \cdot \mathbf{u} - \mathbf{u} \cdot \mathbf{w} + \mathbf{w} \cdot \mathbf{w} = \frac{1}{4} \|\mathbf{u}\|^2 - \mathbf{u} \cdot \mathbf{w} + \|\mathbf{w}\|^2.$$

Since both $\mathbf{u}$ and $\mathbf{w}$ are unit vectors, they each have norm 1, so this simplifies to

$$\frac{1}{4} - \mathbf{u} \cdot \mathbf{w} + 1 = \frac{5}{4} - \mathbf{u} \cdot \mathbf{w} = \frac{5}{4} - \|\mathbf{u}\| \|\mathbf{w}\| \cos \theta = \frac{5}{4} - \cos \theta$$

using the formula for the cosine of the angle between two vectors. Taking square roots gives

$$\left\| \frac{1}{2} \mathbf{u} - \mathbf{w} \right\| = \sqrt{\frac{5}{4} - \cos \theta}.$$

54. The vector projection of $\mathbf{v}$ on $\mathbf{i}$ is

$$\text{proj}_{\mathbf{i}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{i}}{\|\mathbf{i}\|^2} \mathbf{i} = (\mathbf{v} \cdot \mathbf{i}) \mathbf{i},$$

since $\|\mathbf{i}\| = 1$. For the second part, suppose that $\mathbf{v} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$. Then

$$(\mathbf{v} \cdot \mathbf{i}) \mathbf{i} + (\mathbf{v} \cdot \mathbf{j}) \mathbf{j} + (\mathbf{v} \cdot \mathbf{k}) \mathbf{k} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k} = \mathbf{v}.$$

55. We have

$$\begin{aligned} \|\mathbf{v} + \mathbf{w}\|^2 &= (\mathbf{v} + \mathbf{w}) \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{v} \cdot \mathbf{v} + 2\mathbf{v} \cdot \mathbf{w} + \mathbf{w} \cdot \mathbf{w} = \|\mathbf{v}\|^2 + 2\|\mathbf{v}\| \|\mathbf{w}\| \cos \theta + \|\mathbf{w}\|^2, \\ \|\mathbf{v} - \mathbf{w}\|^2 &= (\mathbf{v} - \mathbf{w}) \cdot (\mathbf{v} - \mathbf{w}) = \mathbf{v} \cdot \mathbf{v} - 2\mathbf{v} \cdot \mathbf{w} + \mathbf{w} \cdot \mathbf{w} = \|\mathbf{v}\|^2 - 2\|\mathbf{v}\| \|\mathbf{w}\| \cos \theta + \|\mathbf{w}\|^2 \end{aligned}$$

by the Magnitude Property and the formula for the angle between vectors. Now, since $\theta = \frac{\pi}{3}$, we have $\cos \theta = \frac{1}{2}$, so these simplify to

$$\begin{aligned} \|\mathbf{v} + \mathbf{w}\|^2 &= 2^2 + 2 \cdot 2 \cdot 6 \cdot \frac{1}{2} + 6^2 = 52 \\ \|\mathbf{v} - \mathbf{w}\|^2 &= 2^2 - 2 \cdot 2 \cdot 6 \cdot \frac{1}{2} + 6^2 = 28. \end{aligned}$$

Taking square roots gives

$$\|\mathbf{v} + \mathbf{w}\| = \sqrt{52} = 2\sqrt{13}, \quad \|\mathbf{v} - \mathbf{w}\| = \sqrt{28} = 2\sqrt{7}.$$

56. Compute the dot product and the two magnitudes:

$$\begin{aligned} \mathbf{v} \cdot \mathbf{w} &= \langle 2a, -2, 1 \rangle \cdot \langle b, 2, 2 \rangle = 2ab - 2 \\ \|\mathbf{v}\| &= \sqrt{(2a)^2 + 2^2 + 1^2} = \sqrt{4a^2 + 5} \\ \|\mathbf{w}\| &= \sqrt{b^2 + 2^2 + 2^2} = \sqrt{b^2 + 8}. \end{aligned}$$

Since the vectors are orthogonal, we must have $2ab = 2$, so that $b = \frac{1}{a}$; since they have the same magnitude, we must have $4a^2 + 5 = b^2 + 8$, so that $b^2 = 4a^2 - 3$. Now substitute $b = \frac{1}{a}$ into this equation, giving

$$\left(\frac{1}{a} \right)^2 = 4a^2 - 3, \quad \text{so that} \quad \frac{1}{a^2} = 4a^2 - 3 \quad \text{and then} \quad 4a^4 - 3a^2 - 1 = 0.$$

Now, both $a = 1$ and $a = -1$ are roots of this quartic, so it factors as

$$(4a^4 - 3a^2 - 1) = (a - 1)(a + 1)(4a^2 + 1),$$

and the remaining quadratic has no real roots. So the possible values of a are $a = 1$ or $a = -1$; the corresponding values of b are $b = \frac{1}{1} = 1$ and $b = \frac{1}{-1} = -1$. So either

$$a = b = 1 \quad \text{or} \quad a = b = -1.$$

57. Compute the dot product of $\mathbf{w}$ and $\mathbf{v} - a\mathbf{w}$.

$$\mathbf{w} \cdot (\mathbf{v} - a\mathbf{w}) = \mathbf{w} \cdot \mathbf{v} - a\mathbf{w} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v} - \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} \cdot \mathbf{w}.$$

By the Magnitude Property, $\|\mathbf{w}\|^2 = \mathbf{w} \cdot \mathbf{w}$, so this simplifies to

$$\mathbf{w} \cdot \mathbf{v} - \mathbf{v} \cdot \mathbf{w} = 0$$

since the dot product is commutative. Therefore $\mathbf{w}$ and $\mathbf{v} - a\mathbf{w}$ are orthogonal.

58. The dot product of these two vectors is

$$(\|\mathbf{w}\| \mathbf{v} + \|\mathbf{v}\| \mathbf{w}) \cdot (\|\mathbf{w}\| \mathbf{v} - \|\mathbf{v}\| \mathbf{w}) = \|\mathbf{w}\|^2 \mathbf{v} \cdot \mathbf{v} - \|\mathbf{w}\| \|\mathbf{v}\| \mathbf{v} \cdot \mathbf{w} + \|\mathbf{v}\| \|\mathbf{w}\| \mathbf{w} \cdot \mathbf{v} - \|\mathbf{v}\|^2 \mathbf{w} \cdot \mathbf{w}.$$

By the Magnitude Property, $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$ and similarly for $\mathbf{w}$. Also, $\mathbf{v} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v}$, so this becomes

$$\begin{aligned} \|\mathbf{w}\|^2 \mathbf{v} \cdot \mathbf{v} - \|\mathbf{w}\| \|\mathbf{v}\| \mathbf{v} \cdot \mathbf{w} + \|\mathbf{v}\| \|\mathbf{w}\| \mathbf{w} \cdot \mathbf{v} - \|\mathbf{v}\|^2 \mathbf{w} \cdot \mathbf{w} \\ = \|\mathbf{w}\|^2 \|\mathbf{v}\|^2 - \|\mathbf{w}\| \|\mathbf{v}\| \mathbf{v} \cdot \mathbf{w} + \|\mathbf{v}\| \|\mathbf{w}\| \mathbf{v} \cdot \mathbf{w} - \|\mathbf{v}\|^2 \|\mathbf{w}\|^2 = 0. \end{aligned}$$

Therefore the two vectors are indeed orthogonal.

59. Let θ be the angle between $\mathbf{w}$ and $\mathbf{u}$. Then

$$\cos \theta = \frac{\mathbf{w} \cdot \mathbf{u}}{\|\mathbf{w}\| \|\mathbf{u}\|}, \quad \text{so that} \quad \mathbf{w} \cdot \mathbf{u} = \|\mathbf{w}\| \|\mathbf{u}\| \cos \theta = \|\mathbf{w}\| \cos \theta,$$

since $\mathbf{u}$ is a unit vector. So the dot product is maximized when $\cos \theta = 1$; this means that the angle between $\mathbf{w}$ and $\mathbf{u}$ has cosine 1, so that $\theta = 0$ and therefore $\mathbf{w}$ and $\mathbf{u}$ point in the same direction.

60. Let θ be the angle between $\mathbf{v}$ and $\mathbf{w}$. Then

$$\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|}, \quad \text{so that} \quad \|\mathbf{v}\| \|\mathbf{w}\| \cos \theta = |\mathbf{v} \cdot \mathbf{w}|.$$

But norms are always nonnegative, so we can pull both norms outside of the absolute value sign, giving

$$\|\mathbf{v}\| \|\mathbf{w}\| |\cos \theta| = |\mathbf{v} \cdot \mathbf{w}|.$$

Since $|\cos \theta| \leq 1$, we see that

$$|\mathbf{v} \cdot \mathbf{w}| = \|\mathbf{v}\| \|\mathbf{w}\| |\cos \theta| \leq \|\mathbf{v}\| \|\mathbf{w}\|,$$

which is the Cauchy-Schwarz inequality. This inequality is an equality when $\cos \theta = 1$ or $\cos \theta = -1$; that is, when $\mathbf{v}$ and $\mathbf{w}$ point either in the same direction or in opposite directions.

61. We have

$$\begin{aligned} \|\mathbf{v} + \mathbf{w}\|^2 &= (\mathbf{v} + \mathbf{w}) \cdot (\mathbf{v} + \mathbf{w}) \\ &= \mathbf{v} \cdot \mathbf{v} + 2\mathbf{v} \cdot \mathbf{w} + \mathbf{w} \cdot \mathbf{w} \\ &\leq \mathbf{v} \cdot \mathbf{v} + 2|\mathbf{v} \cdot \mathbf{w}| + \mathbf{w} \cdot \mathbf{w} \\ &\leq \|\mathbf{v}\|^2 + 2\|\mathbf{v}\| \|\mathbf{w}\| + \|\mathbf{w}\|^2 \\ &= (\|\mathbf{v}\| + \|\mathbf{w}\|)^2. \end{aligned}$$

Since norms are nonnegative, we take the square root of both sides, giving

$$\|\mathbf{v} + \mathbf{w}\| \leq \|\mathbf{v}\| + \|\mathbf{w}\|.$$

62. Let $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$. Then

$$\cos \alpha = \frac{v_1}{\|\mathbf{v}\|}, \quad \cos \beta = \frac{v_2}{\|\mathbf{v}\|}, \quad \cos \gamma = \frac{v_3}{\|\mathbf{v}\|}.$$

Then

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = \frac{v_1^2}{\|\mathbf{v}\|^2} + \frac{v_2^2}{\|\mathbf{v}\|^2} + \frac{v_3^2}{\|\mathbf{v}\|^2} = \frac{v_1^2 + v_2^2 + v_3^2}{v_1^2 + v_2^2 + v_3^2} = 1.$$

63. From Problem 62, we know that

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = \cos^2 \frac{\pi}{3} + \cos^2 \frac{\pi}{3} + \cos^2 \gamma = \frac{1}{4} + \frac{1}{4} + \cos^2 \gamma = 1,$$

so that $\cos^2 \gamma = \frac{1}{2}$. Then $\cos \gamma = \frac{\sqrt{2}}{2}$, so that $\boxed{\gamma = \frac{\pi}{4} = 45^\circ}$.

64. From Problem 62, we know that

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = \cos^2 \frac{\pi}{3} + \cos^2 \frac{\pi}{4} + \cos^2 \gamma = \frac{1}{4} + \frac{1}{2} + \cos^2 \gamma = 1,$$

so that $\cos^2 \gamma = \frac{1}{4}$. Then $\cos \gamma = \pm \frac{1}{2}$; since γ is in the first quadrant, we use the plus sign, so that $\gamma = \frac{\pi}{3} = 60^\circ$. Then

$$\mathbf{v} = 3(\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = 3 \left(\frac{1}{2} \mathbf{i} + \frac{\sqrt{2}}{2} \mathbf{j} + \frac{1}{2} \mathbf{k} \right) = \boxed{\frac{3}{2} \mathbf{i} + \frac{3\sqrt{2}}{2} \mathbf{j} + \frac{3}{2} \mathbf{k}}.$$

65. From Problem 62, we know that

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = \cos^2 \frac{\pi}{4} + \cos^2 \beta + \cos^2 \frac{\pi}{3} = \frac{1}{2} + \cos^2 \beta + \frac{1}{4} = 1,$$

so that $\cos^2 \beta = \frac{1}{4}$. Then $\cos \beta = \pm \frac{1}{2}$; since β is in the second quadrant, we use the minus sign, so that $\beta = \frac{2\pi}{3} = 120^\circ$. Then

$$\mathbf{v} = 2(\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = 2 \left(\frac{\sqrt{2}}{2} \mathbf{i} - \frac{1}{2} \mathbf{j} + \frac{1}{2} \mathbf{k} \right) = \boxed{\sqrt{2} \mathbf{i} - \mathbf{j} + \mathbf{k}}.$$

66. Suppose all three direction angles are equal to θ . From Problem 62, we know that

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 3 \cos^2 \theta = 1,$$

so that $\cos^2 \theta = \frac{1}{3}$. Then $\cos \theta = \pm \frac{\sqrt{3}}{3}$; since we want $\mathbf{v}$ to have all positive components, we choose the plus sign in each component. Then

$$\mathbf{v} = 3(\cos \theta \mathbf{i} + \cos \theta \mathbf{j} + \cos \theta \mathbf{k}) = 3 \left(\frac{\sqrt{3}}{3} \mathbf{i} + \frac{\sqrt{3}}{3} \mathbf{j} + \frac{\sqrt{3}}{3} \mathbf{k} \right) = \boxed{\sqrt{3} \mathbf{i} + \sqrt{3} \mathbf{j} + \sqrt{3} \mathbf{k}}.$$

67. From Problem 62, we know that

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = \cos^2 \alpha + \frac{1}{16} + \frac{7}{8} = 1,$$

so that $\cos^2 \alpha = \frac{1}{16}$. Then $\cos \alpha = \frac{1}{4}$ since we are given that $\cos \alpha > 0$. Then

$$\mathbf{v} = \frac{1}{2}(\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \frac{1}{2} \left(\frac{1}{4} \mathbf{i} + \frac{1}{4} \mathbf{j} + \sqrt{\frac{7}{8}} \mathbf{k} \right) = \boxed{\frac{1}{8} \mathbf{i} + \frac{1}{8} \mathbf{j} + \frac{1}{2} \sqrt{\frac{7}{8}} \mathbf{k}}.$$

68. Suppose that $\langle a, b, c \rangle$ is orthogonal to both $\mathbf{v} = \langle 2, -1, 1 \rangle$ and $\mathbf{w} = \langle 4, 2, -1 \rangle$. Then

$$\begin{aligned} 2a - b + c &= 0 \\ 4a + 2b - c &= 0. \end{aligned}$$

Adding these equations gives $6a + b = 0$, so that $b = -6a$. Substitute that value for b back into the first equation to get $2a - (-6a) + c = 8a + c = 0$, so that $c = -8a$. So the vector $\langle a, -6a, -8a \rangle$ is orthogonal to both vectors for any value of a ; for example, with $a = 1$, we get $\langle 1, -6, -8 \rangle$, and

$$\begin{aligned} \langle 2, -1, 1 \rangle \cdot \langle 1, -6, -8 \rangle &= 2 \cdot 1 - 1 \cdot (-6) + 1 \cdot (-8) = 0 \\ \langle 4, 2, -1 \rangle \cdot \langle 1, -6, -8 \rangle &= 4 \cdot 1 + 2 \cdot (-6) - 1 \cdot (-8) = 0. \end{aligned}$$

69. Suppose $\mathbf{v} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$. Then

$$\begin{aligned} \mathbf{v} \cdot \mathbf{i} &= (a\mathbf{i} + b\mathbf{j} + c\mathbf{k}) \cdot \mathbf{i} = a = 0, \\ \mathbf{v} \cdot \mathbf{j} &= (a\mathbf{i} + b\mathbf{j} + c\mathbf{k}) \cdot \mathbf{j} = b = 0, \\ \mathbf{v} \cdot \mathbf{k} &= (a\mathbf{i} + b\mathbf{j} + c\mathbf{k}) \cdot \mathbf{k} = c = 0. \end{aligned}$$

Therefore $a = b = c = 0$, so that $\mathbf{v} = \mathbf{0}$.

70. First take the dot product of $\mathbf{b}$ with both sides of the equation, giving

$$a\mathbf{x} \cdot \mathbf{b} + (\mathbf{x} \cdot \mathbf{b})\mathbf{a} \cdot \mathbf{b} = \mathbf{c} \cdot \mathbf{b}.$$

Now factor out $\mathbf{x} \cdot \mathbf{b}$ from the left-hand side, giving

$$(\mathbf{x} \cdot \mathbf{b})(a + \mathbf{a} \cdot \mathbf{b}) = \mathbf{c} \cdot \mathbf{b}.$$

Since $a + \mathbf{a} \cdot \mathbf{b} \neq 0$, we can divide both sides by that expression, giving

$$\mathbf{x} \cdot \mathbf{b} = \frac{\mathbf{c} \cdot \mathbf{b}}{a + \mathbf{a} \cdot \mathbf{b}}.$$

Next, substitute that value for $\mathbf{x} \cdot \mathbf{b}$ in the original equation, giving

$$a\mathbf{x} + \left(\frac{\mathbf{c} \cdot \mathbf{b}}{a + \mathbf{a} \cdot \mathbf{b}} \right) \mathbf{a} = \mathbf{c},$$

so that (since $a \neq 0$)

$$\mathbf{x} = \frac{1}{a} \left(\mathbf{c} - \left(\frac{\mathbf{c} \cdot \mathbf{b}}{a + \mathbf{a} \cdot \mathbf{b}} \right) \mathbf{a} \right) = \frac{a\mathbf{c} + (\mathbf{a} \cdot \mathbf{b})\mathbf{c} - (\mathbf{c} \cdot \mathbf{b})\mathbf{a}}{a(a + \mathbf{a} \cdot \mathbf{b})}.$$

71. (a) If there were, then

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = \left(\frac{\sqrt{3}}{2} \right)^2 + \left(\frac{\sqrt{2}}{2} \right)^2 + \cos^2 \gamma = \frac{3}{4} + \frac{1}{2} + \cos^2 \gamma > 1.$$

But this contradicts Problem 62, so this is impossible.

(b) Suppose that $\alpha + \beta < \frac{\pi}{2}$. Then $\beta < \frac{\pi}{2} - \alpha$, so that $\sin \beta < \sin \left(\frac{\pi}{2} - \alpha \right) = \cos \alpha$ and therefore $\sin^2 \beta < \cos^2 \alpha$. But then

$$\cos^2 \alpha + \cos^2 \beta = \cos^2 \alpha + 1 - \sin^2 \beta > \cos^2 \alpha + 1 - \cos^2 \alpha = 1.$$

Since $\cos^2 \alpha + \cos^2 \beta > 1$ contradicts Problem 62, this is impossible, so that $\alpha + \beta \geq \frac{\pi}{2}$.

72. (a) Since any three points lie in at least one plane, the terminal points of the three vectors lie in a plane. The lines between those points form the sides of a triangle if the sum of any two of the lengths is greater than the third. The lengths of these lines are

$$\|\mathbf{u} - \mathbf{v}\| = \|4\mathbf{i} - 2\mathbf{j} - 6\mathbf{k}\| = \sqrt{4^2 + 2^2 + 6^2} = \sqrt{56} = 2\sqrt{14} \approx 7.48$$

$$\|\mathbf{v} - \mathbf{w}\| = \|-5\mathbf{i} + 5\mathbf{j} + 10\mathbf{k}\| = \sqrt{5^2 + 5^2 + 10^2} = \sqrt{150} = 5\sqrt{6} \approx 12.25$$

$$\|\mathbf{u} - \mathbf{w}\| = \|\mathbf{-i} + 3\mathbf{j} + 4\mathbf{k}\| = \sqrt{1^2 + 3^2 + 4^2} = \sqrt{26} \approx 5.10.$$

Since the sum of the two shorter sides is $7.48 + 5.10 = 12.58 > 12.25$, these three vectors form a triangle.

- (b) The midpoints of the three sides are:

$$\mathbf{M}_1 \text{ (midpoint of side } \mathbf{u} - \mathbf{v}) : \quad \frac{1}{2}(\mathbf{u} + \mathbf{v}) = \frac{1}{2}(2\mathbf{i} + 4\mathbf{j} + 2\mathbf{k}) = \mathbf{i} + 2\mathbf{j} + \mathbf{k}$$

$$\mathbf{M}_2 \text{ (midpoint of side } \mathbf{v} - \mathbf{w}) : \quad \frac{1}{2}(\mathbf{v} + \mathbf{w}) = \frac{1}{2}(3\mathbf{i} + \mathbf{j} - 2\mathbf{k}) = \frac{3}{2}\mathbf{i} + \frac{1}{2}\mathbf{j} - \mathbf{k}$$

$$\mathbf{M}_3 \text{ (midpoint of side } \mathbf{w} - \mathbf{u}) : \quad \frac{1}{2}(\mathbf{u} + \mathbf{w}) = \frac{1}{2}(7\mathbf{i} - \mathbf{j} - 8\mathbf{k}) = \frac{7}{2}\mathbf{i} - \frac{1}{2}\mathbf{j} - 4\mathbf{k}.$$

Then the lengths of the three medians are

$$\|\mathbf{w} - \mathbf{M}_1\| = \|3\mathbf{i} - 4\mathbf{j} - 7\mathbf{k}\| = \sqrt{3^2 + 4^2 + 7^2} = \sqrt{74}$$

$$\|\mathbf{u} - \mathbf{M}_2\| = \left\| \frac{3}{2}\mathbf{i} + \frac{1}{2}\mathbf{j} - \mathbf{k} \right\| = \sqrt{\left(\frac{3}{2}\right)^2 + \left(\frac{1}{2}\right)^2 + 1^2} = \frac{1}{2}\sqrt{14}$$

$$\|\mathbf{v} - \mathbf{M}_3\| = \left\| -\frac{9}{2}\mathbf{i} + \frac{7}{2}\mathbf{j} + 8\mathbf{k} \right\| = \sqrt{\left(\frac{9}{2}\right)^2 + \left(\frac{7}{2}\right)^2 + 8^2} = \frac{1}{2}\sqrt{386}.$$

73. (a) We have

$$\|\mathbf{u}_r\| = \sqrt{(\cos \theta)^2 + (\sin \theta)^2} = \sqrt{\cos^2 \theta + \sin^2 \theta} = \sqrt{1} = 1$$

$$\|\mathbf{u}_\theta\| = \sqrt{(-\sin \theta)^2 + (\cos \theta)^2} = \sqrt{\sin^2 \theta + \cos^2 \theta} = \sqrt{1} = 1.$$

- (b) Their dot product is

$$\mathbf{u}_r \cdot \mathbf{u}_\theta = (\cos \theta \mathbf{i} + \sin \theta \mathbf{j}) \cdot (-\sin \theta \mathbf{i} + \cos \theta \mathbf{j}) = -\cos \theta \sin \theta + \sin \theta \cos \theta = 0.$$

- (c) The ray from the origin to (r, θ) makes an angle of θ with the positive x -axis, so if regarded as a vector, it is a multiple of $\cos \theta \mathbf{i} + \sin \theta \mathbf{j}$, so it is in the same direction as $\mathbf{u}_r$. For $\mathbf{u}_\theta$, note that

$$\cos\left(\theta + \frac{\pi}{2}\right) = \cos \theta \cos \frac{\pi}{2} - \sin \theta \sin \frac{\pi}{2} = -\sin \theta$$

$$\sin\left(\theta + \frac{\pi}{2}\right) = \sin \theta \cos \frac{\pi}{2} + \cos \theta \sin \frac{\pi}{2} = \cos \theta,$$

so that $\mathbf{r}_\theta = \cos\left(\theta + \frac{\pi}{2}\right) \mathbf{i} + \sin\left(\theta + \frac{\pi}{2}\right) \mathbf{j}$. Therefore it points in the same direction as the ray at an angle of $\theta + \frac{\pi}{2}$ to the x -axis, which is a 90° rotation from $\mathbf{u}_r$.

74. There are many examples. For instance, let $\mathbf{a} = \langle 1, 1 \rangle$, $\mathbf{b} = \langle 2, 3 \rangle$, and $\mathbf{c} = \langle 3, 2 \rangle$. Then

$$\mathbf{a} \cdot \mathbf{b} = 1 \cdot 2 + 1 \cdot 3 = 5 = 1 \cdot 3 + 1 \cdot 2 = \mathbf{a} \cdot \mathbf{c},$$

but neither dot product is zero and $\mathbf{b} \neq \mathbf{c}$. There is no cancellation property for dot products, nor are there any simple rules regarding the relationship among the vectors that gives cancellation in some situations.

75. Since $\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|}$, we have

$$\sin^2 \theta = 1 - \cos^2 \theta = 1 - \left(\frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|} \right)^2 = 1 - \frac{(\mathbf{v} \cdot \mathbf{w})^2}{\|\mathbf{v}\|^2 \|\mathbf{w}\|^2} = \frac{\|\mathbf{v}\|^2 \|\mathbf{w}\|^2 - (\mathbf{v} \cdot \mathbf{w})^2}{\|\mathbf{v}\|^2 \|\mathbf{w}\|^2}.$$

76. From the previous problem,

$$\begin{aligned} \sin^2 \theta &= \frac{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2 - (\mathbf{u} \cdot \mathbf{v})^2}{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2} \\ &= \frac{(u_1^2 + u_2^2 + u_3^2)(v_1^2 + v_2^2 + v_3^2) - (u_1 v_1 + u_2 v_2 + u_3 v_3)^2}{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2} \\ &= \frac{u_1^2 v_1^2 + u_1^2 v_2^2 + u_1^2 v_3^2 + u_2^2 v_1^2 + u_2^2 v_2^2 + u_2^2 v_3^2 + u_3^2 v_1^2 + u_3^2 v_2^2 + u_3^2 v_3^2 - u_1^2 v_1^2 - u_2^2 v_2^2 - u_3^2 v_3^2 - 2u_1 u_2 v_1 v_2 - 2u_1 u_3 v_1 v_3 - 2u_2 u_3 v_2 v_3}{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2} \\ &= \frac{u_1^2 v_2^2 + u_1^2 v_3^2 + u_2^2 v_1^2 + u_2^2 v_3^2 + u_3^2 v_1^2 + u_3^2 v_2^2 - 2u_1 u_2 v_1 v_2 - 2u_1 u_3 v_1 v_3 - 2u_2 u_3 v_2 v_3}{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2} \\ &= \frac{u_2^2 v_3^2 - 2u_2 u_3 v_2 v_3 + u_3^2 v_2^2 + u_1^2 v_3^2 - 2u_1 u_3 v_1 v_3 + u_3^2 v_1^2 + u_1^2 v_2^2 - 2u_1 u_2 v_1 v_2 + u_2^2 v_1^2}{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2} \\ &= \frac{(u_2 v_3 - u_3 v_2)^2 + (u_1 v_3 - u_3 v_1)^2 + (u_1 v_2 - u_2 v_1)^2}{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2} \end{aligned}$$

77. Take the dot product of the given equation first with $\mathbf{u}_1$ and then with $\mathbf{u}_2$, giving the system of equations in c_1 and c_2

$$\begin{aligned} \mathbf{v} \cdot \mathbf{u}_1 &= c_1 \mathbf{u}_1 \cdot \mathbf{u}_1 + c_2 \mathbf{u}_2 \cdot \mathbf{u}_1 \\ \mathbf{v} \cdot \mathbf{u}_2 &= c_1 \mathbf{u}_1 \cdot \mathbf{u}_2 + c_2 \mathbf{u}_2 \cdot \mathbf{u}_2. \end{aligned}$$

To eliminate c_2 from the equations, multiply the first equation by $\mathbf{u}_2 \cdot \mathbf{u}_2$ and the second by $\mathbf{u}_2 \cdot \mathbf{u}_1$, then subtract to get

$$(\mathbf{v} \cdot \mathbf{u}_1)(\mathbf{u}_2 \cdot \mathbf{u}_2) - (\mathbf{v} \cdot \mathbf{u}_2)(\mathbf{u}_2 \cdot \mathbf{u}_1) = c_1((\mathbf{u}_1 \cdot \mathbf{u}_1)(\mathbf{u}_2 \cdot \mathbf{u}_2) - (\mathbf{u}_1 \cdot \mathbf{u}_2)(\mathbf{u}_2 \cdot \mathbf{u}_1)),$$

then solve for c_1 :

$$c_1 = \frac{(\mathbf{v} \cdot \mathbf{u}_1)(\mathbf{u}_2 \cdot \mathbf{u}_2) - (\mathbf{v} \cdot \mathbf{u}_2)(\mathbf{u}_2 \cdot \mathbf{u}_1)}{(\mathbf{u}_1 \cdot \mathbf{u}_1)(\mathbf{u}_2 \cdot \mathbf{u}_2) - (\mathbf{u}_1 \cdot \mathbf{u}_2)(\mathbf{u}_2 \cdot \mathbf{u}_1)} = \frac{(\mathbf{v} \cdot \mathbf{u}_1)(\mathbf{u}_2 \cdot \mathbf{u}_2) - (\mathbf{v} \cdot \mathbf{u}_2)(\mathbf{u}_1 \cdot \mathbf{u}_2)}{(\mathbf{u}_1 \cdot \mathbf{u}_1)(\mathbf{u}_2 \cdot \mathbf{u}_2) - (\mathbf{u}_1 \cdot \mathbf{u}_2)^2}.$$

Substitute this value for c_1 into either equation and solve for c_2 to get

$$c_2 = \frac{(\mathbf{v} \cdot \mathbf{u}_2)(\mathbf{u}_1 \cdot \mathbf{u}_1) - (\mathbf{v} \cdot \mathbf{u}_1)(\mathbf{u}_1 \cdot \mathbf{u}_2)}{(\mathbf{u}_1 \cdot \mathbf{u}_1)(\mathbf{u}_2 \cdot \mathbf{u}_2) - (\mathbf{u}_1 \cdot \mathbf{u}_2)^2}.$$

If $\mathbf{u}_1$ and $\mathbf{u}_2$ are orthogonal unit vectors, then $\mathbf{u}_1 \cdot \mathbf{u}_1 = \mathbf{u}_2 \cdot \mathbf{u}_2 = 1$ and $\mathbf{u}_1 \cdot \mathbf{u}_2 = 0$, so the above equations become

$$c_1 = \mathbf{v} \cdot \mathbf{u}_1, \quad c_2 = \mathbf{v} \cdot \mathbf{u}_2.$$

78. In the plane, if $\mathbf{u} = \langle u_1, u_2 \rangle$, $\mathbf{v} = \langle v_1, v_2 \rangle$, and $\mathbf{w} = \langle w_1, w_2 \rangle$, then

$$\begin{aligned} \mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) &= \langle u_1, u_2 \rangle \cdot \langle v_1 + w_1, v_2 + w_2 \rangle \\ &= \langle u_1(v_1 + w_1), u_2(v_2 + w_2) \rangle \\ &= \langle u_1 v_1 + u_1 w_1, u_2 v_2 + u_2 w_2 \rangle \\ &= \langle u_1 v_1, u_2 v_2 \rangle + \langle u_1 w_1, u_2 w_2 \rangle \\ &= \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}. \end{aligned}$$

In space, if $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$, $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$, and $\mathbf{w} = \langle w_1, w_2, w_3 \rangle$, then

$$\begin{aligned}\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) &= \langle u_1, u_2, u_3 \rangle \cdot \langle v_1 + w_1, v_2 + w_2, v_3 + w_3 \rangle \\ &= \langle u_1(v_1 + w_1), u_2(v_2 + w_2), u_3(v_3 + w_3) \rangle \\ &= \langle u_1v_1 + u_1w_1, u_2v_2 + u_2w_2, u_3v_3 + u_3w_3 \rangle \\ &= \langle u_1v_1, u_2v_2, u_3v_3 \rangle + \langle u_1w_1, u_2w_2, u_3w_3 \rangle \\ &= \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}.\end{aligned}$$

79. In the plane, if $\mathbf{u} = \langle u_1, u_2 \rangle$, $\mathbf{v} = \langle v_1, v_2 \rangle$, and a is a scalar, then

$$\begin{aligned}a(\mathbf{u} \cdot \mathbf{v}) &= a(\langle u_1, u_2 \rangle \cdot \langle v_1, v_2 \rangle) \\ &= a(u_1v_1 + u_2v_2) \\ &= (au_1)v_1 + (au_2)v_2 \\ &= \langle au_1, au_2 \rangle \cdot \langle v_1, v_2 \rangle \\ &= (a \langle u_1, u_2 \rangle) \cdot \langle v_1, v_2 \rangle \\ &= (a\mathbf{u}) \cdot \mathbf{v}.\end{aligned}$$

In space, if $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$, $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$, and a is a scalar, then

$$\begin{aligned}a(\mathbf{u} \cdot \mathbf{v}) &= a(\langle u_1, u_2, u_3 \rangle \cdot \langle v_1, v_2, v_3 \rangle) \\ &= a(u_1v_1 + u_2v_2 + u_3v_3) \\ &= (au_1)v_1 + (au_2)v_2 + (au_3)v_3 \\ &= \langle au_1, au_2, au_3 \rangle \cdot \langle v_1, v_2, v_3 \rangle \\ &= (a \langle u_1, u_2, u_3 \rangle) \cdot \langle v_1, v_2, v_3 \rangle \\ &= (a\mathbf{u}) \cdot \mathbf{v}.\end{aligned}$$

80. In the plane, let $\mathbf{v} = \langle v_1, v_2 \rangle$; then $\mathbf{0} = \langle 0, 0 \rangle$, and

$$\mathbf{0} \cdot \mathbf{v} = \langle 0, 0 \rangle \cdot \langle v_1, v_2 \rangle = 0 \cdot v_1 + 0 \cdot v_2 = 0.$$

In space, let $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$; then $\mathbf{0} = \langle 0, 0, 0 \rangle$, and

$$\mathbf{0} \cdot \mathbf{v} = \langle 0, 0, 0 \rangle \cdot \langle v_1, v_2, v_3 \rangle = 0 \cdot v_1 + 0 \cdot v_2 + 0 \cdot v_3 = 0.$$

81. Let $\mathbf{u} = \langle u_1, u_2 \rangle$ and $\mathbf{v} = \langle v_1, v_2 \rangle$. Then

$$\mathbf{u} \cdot \mathbf{v} = \langle u_1, u_2 \rangle \cdot \langle v_1, v_2 \rangle = u_1v_1 + u_2v_2 = v_1u_1 + v_2u_2 = \langle v_1, v_2 \rangle \cdot \langle u_1, u_2 \rangle = \mathbf{v} \cdot \mathbf{u}.$$

82. Let $\mathbf{v} = \langle v_1, v_2 \rangle$. Then

$$\|\mathbf{v}\|^2 = v_1^2 + v_2^2 = v_1v_1 + v_2v_2 = \langle v_1, v_2 \rangle \cdot \langle v_1, v_2 \rangle = \mathbf{v} \cdot \mathbf{v}.$$

83. Let $\mathbf{u} = \langle u_1, u_2, \dots, u_n \rangle$, $\mathbf{v} = \langle v_1, v_2, \dots, v_n \rangle$, and $\mathbf{w} = \langle w_1, w_2, \dots, w_n \rangle$; let a be a scalar. Then

Magnitude Property:

$$\|\mathbf{v}\|^2 = v_1^2 + v_2^2 + \dots + v_n^2 = v_1v_1 + v_2v_2 + \dots + v_nv_n = \langle v_1, v_2, \dots, v_n \rangle \cdot \langle v_1, v_2, \dots, v_n \rangle = \mathbf{v} \cdot \mathbf{v}.$$

Commutative property:

$$\begin{aligned}\mathbf{u} \cdot \mathbf{v} &= \langle u_1, u_2, \dots, u_n \rangle \cdot \langle v_1, v_2, \dots, v_n \rangle \\ &= u_1v_1 + u_2v_2 + \dots + u_nv_n \\ &= v_1u_1 + v_2u_2 + \dots + v_nu_n \\ &= \langle v_1, v_2, \dots, v_n \rangle \cdot \langle u_1, u_2, \dots, u_n \rangle \\ &= \mathbf{v} \cdot \mathbf{u}.\end{aligned}$$

Distributive property:

$$\begin{aligned}
 \mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) &= \langle u_1, u_2, \dots, u_n \rangle \cdot \langle v_1 + w_1, v_2 + w_2, \dots, v_n + w_n \rangle \\
 &= u_1(v_1 + w_1) + u_2(v_2 + w_2) + \dots + u_n(v_n + w_n) \\
 &= u_1v_1 + u_1w_1 + u_2v_2 + u_2w_2 + \dots + u_nv_n + u_nw_n \\
 &= u_1v_1 + u_2v_2 + \dots + u_nv_n + u_1w_1 + u_2w_2 + \dots + u_nw_n \\
 &= \langle u_1, u_2, \dots, u_n \rangle \cdot \langle v_1, v_2, \dots, v_n \rangle + \langle u_1, u_2, \dots, u_n \rangle \cdot \langle w_1, w_2, \dots, w_n \rangle \\
 &= \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}.
 \end{aligned}$$

Linearity property:

$$\begin{aligned}
 a(\mathbf{u} \cdot \mathbf{v}) &= a(\langle u_1, u_2, \dots, u_n \rangle \cdot \langle v_1, v_2, \dots, v_n \rangle) \\
 &= a(u_1v_1 + u_2v_2 + \dots + u_nv_n) \\
 &= (au_1)v_1 + (au_2)v_2 + \dots + (au_n)v_n \\
 &= \langle au_1, au_2, \dots, au_n \rangle \cdot \langle v_1, v_2, \dots, v_n \rangle \\
 &= (a \langle u_1, u_2, \dots, u_n \rangle) \cdot \langle v_1, v_2, \dots, v_n \rangle \\
 &= (a\mathbf{u}) \cdot \mathbf{v}.
 \end{aligned}$$

Zero-vector property:

$$\mathbf{0} \cdot \mathbf{v} = \langle 0, 0, \dots, 0 \rangle \cdot \langle v_1, v_2, \dots, v_n \rangle = 0v_1 + 0v_2 + \dots + 0v_n = 0.$$

Challenge Problems

84. The angle θ_u between $\mathbf{u}$ and $\mathbf{w}$ satisfies

$$\begin{aligned}
 \cos \theta_u &= \frac{\mathbf{u} \cdot \mathbf{w}}{\|\mathbf{u}\| \|\mathbf{w}\|} \\
 &= \frac{\mathbf{u} \cdot (\|\mathbf{v}\| \mathbf{u} + \|\mathbf{u}\| \mathbf{v})}{\|\mathbf{u}\| \|\mathbf{w}\|} \\
 &= \frac{\|\mathbf{v}\| \mathbf{u} \cdot \mathbf{u} + \|\mathbf{u}\| \mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{w}\|} \\
 &= \frac{\|\mathbf{v}\| \|\mathbf{u}\|^2 + \|\mathbf{u}\| \mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{w}\|} \\
 &= \frac{\|\mathbf{v}\| \|\mathbf{u}\| + \mathbf{u} \cdot \mathbf{v}}{\|\mathbf{w}\|}.
 \end{aligned}$$

The angle θ_v between $\mathbf{v}$ and $\mathbf{w}$ satisfies

$$\begin{aligned}
 \cos \theta_v &= \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|} \\
 &= \frac{\mathbf{v} \cdot (\|\mathbf{v}\| \mathbf{u} + \|\mathbf{u}\| \mathbf{v})}{\|\mathbf{v}\| \|\mathbf{w}\|} \\
 &= \frac{\|\mathbf{v}\| \mathbf{v} \cdot \mathbf{u} + \|\mathbf{u}\| \mathbf{v} \cdot \mathbf{v}}{\|\mathbf{v}\| \|\mathbf{w}\|} \\
 &= \frac{\|\mathbf{v}\| \mathbf{u} \cdot \mathbf{v} + \|\mathbf{u}\| \|\mathbf{v}\|^2}{\|\mathbf{v}\| \|\mathbf{w}\|} \\
 &= \frac{\mathbf{u} \cdot \mathbf{v} + \|\mathbf{u}\| \|\mathbf{v}\|}{\|\mathbf{w}\|}.
 \end{aligned}$$

The two expressions are equal, so that $\cos \theta_u = \cos \theta_v$ and therefore $\theta_u = \theta_v$. Since the two angle are equal, $\mathbf{w}$ bisects the angle between $\mathbf{u}$ and $\mathbf{v}$.

85. Computing the left-hand side gives

$$\begin{aligned}
 \|\mathbf{u} + \mathbf{v}\|^2 - \|\mathbf{u} - \mathbf{v}\|^2 &= (\mathbf{u} + \mathbf{v}) \cdot (\mathbf{u} + \mathbf{v}) - (\mathbf{u} - \mathbf{v}) \cdot (\mathbf{u} - \mathbf{v}) \\
 &= (\mathbf{u} \cdot \mathbf{u} + \mathbf{v} \cdot \mathbf{u} + \mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{v}) - (\mathbf{u} \cdot \mathbf{u} - \mathbf{v} \cdot \mathbf{u} - \mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{v}) \\
 &= 2\mathbf{u} \cdot \mathbf{v} - (-2\mathbf{u} \cdot \mathbf{v}) \\
 &= 4(\mathbf{u} \cdot \mathbf{v}).
 \end{aligned}$$

86. (a) Compute the dot product:

$$(\mathbf{u} + \mathbf{v}) \cdot (\mathbf{u} - \mathbf{v}) = \mathbf{u} \cdot \mathbf{u} + \mathbf{v} \cdot \mathbf{u} - \mathbf{u} \cdot \mathbf{v} - \mathbf{v} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{u} - \mathbf{v} \cdot \mathbf{v} = \|\mathbf{u}\|^2 - \|\mathbf{v}\|^2.$$

Since $\mathbf{u}$ and $\mathbf{v}$ have the same magnitude, this difference is zero, so the two vectors are orthogonal.

(b) In the diagram, the left-hand black diagonal line is $-(-\mathbf{v}) + \mathbf{u} = \mathbf{u} + \mathbf{v}$, and the right-hand black diagonal line is $-\mathbf{v} + \mathbf{u} = \mathbf{u} - \mathbf{v}$. Since those two are orthogonal by part (a), the angle at the terminal point of $\mathbf{u}$ is a right angle.

87. (a) By the theorem in objective 5 of Section 10.3, if $\mathbf{u}$ is any vector in the plane making an angle of θ with the positive x -axis, then $\mathbf{u} = \|\mathbf{u}\|(\cos \theta \mathbf{i} + \sin \theta \mathbf{j})$. Applying this to $\mathbf{v}$ and $\mathbf{w}$, both of which are assumed to be unit vectors, gives

$$\mathbf{v} = \|\mathbf{v}\|(\cos \alpha \mathbf{i} + \sin \alpha \mathbf{j}) = \cos \alpha \mathbf{i} + \sin \alpha \mathbf{j}, \quad \mathbf{w} = \|\mathbf{w}\|(\cos \beta \mathbf{i} + \sin \beta \mathbf{j}) = \cos \beta \mathbf{i} + \sin \beta \mathbf{j}.$$

(b) The angle between $\mathbf{v}$ and $\mathbf{w}$ is $\alpha - \beta$; by the angle formula, since both vectors are unit vectors,

$$\cos(\alpha - \beta) = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|} = (\cos \alpha \mathbf{i} + \sin \alpha \mathbf{j}) \cdot (\cos \beta \mathbf{i} + \sin \beta \mathbf{j}) = \cos \alpha \cos \beta + \sin \alpha \sin \beta.$$

Next consider the vector $\mathbf{w}' = \cos \beta \mathbf{i} - \sin \beta \mathbf{j}$; this is the reflection of $\mathbf{w}$ through the x -axis, so it makes an angle of $-\beta$ with the positive x -axis. So the angle between $\mathbf{v}$ and $\mathbf{w}'$ is $\alpha - (-\beta) = \alpha + \beta$. Again use the angle formula, remembering that both vectors are unit vectors:

$$\cos(\alpha + \beta) = \frac{\mathbf{v} \cdot \mathbf{w}'}{\|\mathbf{v}\| \|\mathbf{w}'\|} = (\cos \alpha \mathbf{i} + \sin \alpha \mathbf{j}) \cdot (\cos \beta \mathbf{i} - \sin \beta \mathbf{j}) = \cos \alpha \cos \beta - \sin \alpha \sin \beta.$$

88. Each of $\mathbf{w}_1$, $\mathbf{w}_2$, and $\mathbf{w}_3$ is a unit vector, since each is equal to a vector divided by its norm. It remains to show that they are mutually orthogonal.

$$\begin{aligned}
 \mathbf{w}_1 \cdot \mathbf{v}_2 &= \mathbf{w}_1 \cdot (\mathbf{u}_2 - (\mathbf{u}_2 \cdot \mathbf{w}_1)\mathbf{w}_1) \\
 &= \mathbf{w}_1 \cdot \mathbf{u}_2 - (\mathbf{u}_2 \cdot \mathbf{w}_1)(\mathbf{w}_1 \cdot \mathbf{w}_1) \\
 &= \mathbf{w}_1 \cdot \mathbf{u}_2 - \mathbf{u}_2 \cdot \mathbf{w}_1 \\
 &= 0.
 \end{aligned}$$

Since $\mathbf{w}_2$ is a scalar multiple of $\mathbf{v}_2$, we see that $\mathbf{w}_1$ and $\mathbf{w}_2$ are orthogonal.

$$\begin{aligned}
 \mathbf{w}_1 \cdot \mathbf{v}_3 &= \mathbf{w}_1 \cdot (\mathbf{u}_3 - (\mathbf{u}_3 \cdot \mathbf{w}_1)\mathbf{w}_1 - (\mathbf{u}_3 \cdot \mathbf{w}_2)\mathbf{w}_2) \\
 &= \mathbf{w}_1 \cdot \mathbf{u}_3 - (\mathbf{u}_3 \cdot \mathbf{w}_1)(\mathbf{w}_1 \cdot \mathbf{w}_1) - (\mathbf{u}_3 \cdot \mathbf{w}_2)(\mathbf{w}_1 \cdot \mathbf{w}_2) \\
 &= \mathbf{w}_1 \cdot \mathbf{u}_3 - (\mathbf{u}_3 \cdot \mathbf{w}_1) \cdot 1 - (\mathbf{u}_3 \cdot \mathbf{w}_2) \cdot 0 \\
 &= \mathbf{w}_1 \cdot \mathbf{u}_3 - \mathbf{u}_3 \cdot \mathbf{w}_1 \\
 &= 0.
 \end{aligned}$$

Since $\mathbf{w}_3$ is a scalar multiple of $\mathbf{v}_3$, we see that $\mathbf{w}_1$ and $\mathbf{w}_3$ are orthogonal.

$$\begin{aligned}
 \mathbf{w}_2 \cdot \mathbf{v}_3 &= \mathbf{w}_2 \cdot (\mathbf{u}_3 - (\mathbf{u}_3 \cdot \mathbf{w}_1)\mathbf{w}_1 - (\mathbf{u}_3 \cdot \mathbf{w}_2)\mathbf{w}_2) \\
 &= \mathbf{w}_2 \cdot \mathbf{u}_3 - (\mathbf{u}_3 \cdot \mathbf{w}_1)(\mathbf{w}_2 \cdot \mathbf{w}_1) - (\mathbf{u}_3 \cdot \mathbf{w}_2)(\mathbf{w}_2 \cdot \mathbf{w}_2) \\
 &= \mathbf{w}_2 \cdot \mathbf{u}_3 - \mathbf{u}_3 \cdot \mathbf{w}_2 \\
 &= 0.
 \end{aligned}$$

Since $\mathbf{w}_3$ is a scalar multiple of $\mathbf{v}_3$, we see that $\mathbf{w}_2$ and $\mathbf{w}_3$ are orthogonal.

89. With $\mathbf{u}_1 = \langle -1, 1, 0 \rangle$, $\mathbf{u}_2 = \langle 2, 0, 1 \rangle$, and $\mathbf{u}_3 = \langle 3, -1, 2 \rangle$, we first get

$$\mathbf{w}_1 = \frac{\mathbf{u}_1}{\|\mathbf{u}_1\|} = \frac{\langle -1, 1, 0 \rangle}{\sqrt{2}} = \left\langle -\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 0 \right\rangle.$$

Next,

$$\mathbf{v}_2 = \mathbf{u}_2 - (\mathbf{u}_2 \cdot \mathbf{w}_1)\mathbf{w}_1 = \langle 2, 0, 1 \rangle + \sqrt{2} \left\langle -\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 0 \right\rangle = \langle 2 - 1, 0 + 1, 1 + 0 \rangle = \langle 1, 1, 1 \rangle$$

$$\mathbf{w}_2 = \frac{\mathbf{v}_2}{\|\mathbf{v}_2\|} = \frac{\langle 1, 1, 1 \rangle}{\sqrt{3}} = \left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle.$$

Finally,

$$\begin{aligned} \mathbf{v}_3 &= \mathbf{u}_3 - (\mathbf{u}_3 \cdot \mathbf{w}_1)\mathbf{w}_1 - (\mathbf{u}_3 \cdot \mathbf{w}_2)\mathbf{w}_2 \\ &= \langle 3, -1, 2 \rangle - (-2\sqrt{2})\mathbf{w}_1 - \frac{4}{\sqrt{3}}\mathbf{w}_2 \\ &= \langle 3, -1, 2 \rangle + \langle -2, 2, 0 \rangle - \left\langle \frac{4}{3}, \frac{4}{3}, \frac{4}{3} \right\rangle \\ &= \left\langle -\frac{1}{3}, -\frac{1}{3}, \frac{2}{3} \right\rangle \\ \mathbf{w}_3 &= \frac{\mathbf{v}_3}{\|\mathbf{v}_3\|} = \frac{\left\langle -\frac{1}{3}, -\frac{1}{3}, \frac{2}{3} \right\rangle}{\sqrt{\frac{1}{9} + \frac{1}{9} + \frac{4}{9}}} = \left\langle -\frac{1}{\sqrt{6}}, -\frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}} \right\rangle. \end{aligned}$$

90. In general,

$$\begin{aligned} \mathbf{v}_k &= \mathbf{u}_k - (\mathbf{u}_k \cdot \mathbf{w}_1)\mathbf{w}_1 - (\mathbf{u}_k \cdot \mathbf{w}_2)\mathbf{w}_2 - \cdots - (\mathbf{u}_k \cdot \mathbf{w}_{k-1})\mathbf{w}_{k-1} \\ \mathbf{w}_k &= \frac{\mathbf{v}_k}{\|\mathbf{v}_k\|}. \end{aligned}$$

Since $(\mathbf{u}_k \cdot \mathbf{w}_i)\mathbf{w}_i$ is just the projection of the vector $\mathbf{u}_k$ on the unit vector $\mathbf{w}_i$, at each step we subtract off the portion of $\mathbf{u}_k$ parallel to each of the preceding $\mathbf{w}_i$, so what is left is orthogonal to all of them.

91. Computing using the Magnitude Property gives

$$g(t) = \|\mathbf{u} - t\mathbf{v}\|^2 = (\mathbf{u} - t\mathbf{v}) \cdot (\mathbf{u} - t\mathbf{v}) = \mathbf{u} \cdot \mathbf{u} - t\mathbf{v} \cdot \mathbf{u} - t\mathbf{u} \cdot \mathbf{v} + t^2\mathbf{v} \cdot \mathbf{v} = \|\mathbf{u}\|^2 - 2t\mathbf{u} \cdot \mathbf{v} + t^2\|\mathbf{v}\|^2.$$

This is a parabola with a positive leading coefficient, so it opens upwards and therefore has a minimum value. That minimum value occurs when the t -derivative of the quadratic is zero, so when $-2\mathbf{u} \cdot \mathbf{v} + 2t\|\mathbf{v}\|^2 = 0$. Solving for t gives

$$t = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2}.$$

The minimum value is then

$$\begin{aligned} g(t) &= \|\mathbf{u}\|^2 - 2\frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2}\mathbf{u} \cdot \mathbf{v} + \left(\frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2}\right)^2 \|\mathbf{v}\|^2 \\ &= \|\mathbf{u}\|^2 - 2\frac{(\mathbf{u} \cdot \mathbf{v})^2}{\|\mathbf{v}\|^2} + \frac{(\mathbf{u} \cdot \mathbf{v})^2}{\|\mathbf{v}\|^2} \\ &= \|\mathbf{u}\|^2 - \frac{(\mathbf{u} \cdot \mathbf{v})^2}{\|\mathbf{v}\|^2}. \end{aligned}$$

Since $g(t) = \|\mathbf{u} - t\mathbf{v}\|^2$, we see that $g(t) \geq 0$ everywhere, so that the minimum value must be nonnegative. That is,

$$\|\mathbf{u}\|^2 - \frac{(\mathbf{u} \cdot \mathbf{v})^2}{\|\mathbf{v}\|^2} \geq 0 \quad \text{so that} \quad \|\mathbf{u}\|^2 \geq \frac{(\mathbf{u} \cdot \mathbf{v})^2}{\|\mathbf{v}\|^2} \quad \text{and then} \quad \|\mathbf{u}\|^2 \|\mathbf{v}\|^2 \geq (\mathbf{u} \cdot \mathbf{v})^2.$$

Taking square roots gives $|\mathbf{u} \cdot \mathbf{v}| \leq \|\mathbf{u}\| \|\mathbf{v}\|$, as desired.

92. Let $\mathbf{u}$ and $\mathbf{v}$ be the vectors in question, and $\mathbf{w}_1$ and $\mathbf{w}_2$ the fixed mutually orthogonal vectors. First suppose that $\mathbf{u}$ and $\mathbf{v}$ are parallel. Then there is some scalar c such that $\mathbf{v} = c\mathbf{u}$. Then let $\mathbf{x}$ be any vector:

$$\text{proj}_{\mathbf{x}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{x}}{\|\mathbf{x}\|^2} \mathbf{x} = \frac{c\mathbf{u} \cdot \mathbf{x}}{\|\mathbf{x}\|^2} \mathbf{x} = c \frac{\mathbf{u} \cdot \mathbf{x}}{\|\mathbf{x}\|^2} \mathbf{x} = c \text{proj}_{\mathbf{x}} \mathbf{u}.$$

Therefore the projections of $\mathbf{u}$ and $\mathbf{v}$ on *any* vector have ratio c , so in particular are proportional for $\mathbf{w}_1$ and $\mathbf{w}_2$.

Now suppose that the projections of $\mathbf{u}$ and $\mathbf{v}$ on $\mathbf{w}_1$ and $\mathbf{w}_2$ are proportional; this means that there is some constant c such that

$$\text{proj}_{\mathbf{w}_1} \mathbf{v} = c \text{proj}_{\mathbf{w}_1} \mathbf{u} \quad \text{and} \quad \text{proj}_{\mathbf{w}_2} \mathbf{v} = c \text{proj}_{\mathbf{w}_2} \mathbf{u}.$$

But the projection of $\mathbf{v}$ on $\mathbf{w}_2$ is the component of $\mathbf{v}$ orthogonal to $\mathbf{w}_1$, since $\mathbf{w}_1$ and $\mathbf{w}_2$ are orthogonal. Similarly, the projection of $\mathbf{u}$ on $\mathbf{w}_2$ is the component of $\mathbf{u}$ orthogonal to $\mathbf{w}_1$. Then we have

$$\begin{aligned} \mathbf{v} &= \text{proj}_{\mathbf{w}_1} \mathbf{v} + (\mathbf{v} - \text{proj}_{\mathbf{w}_1} \mathbf{v}) = \text{proj}_{\mathbf{w}_1} \mathbf{v} + \text{proj}_{\mathbf{w}_2} \mathbf{v} = c \text{proj}_{\mathbf{w}_1} \mathbf{u} + c \text{proj}_{\mathbf{w}_2} \mathbf{u} \\ &= c (\text{proj}_{\mathbf{w}_1} \mathbf{u} + \text{proj}_{\mathbf{w}_2} \mathbf{u}) = c\mathbf{u}, \end{aligned}$$

so that $\mathbf{u}$ and $\mathbf{v}$ are parallel.

93. Let $\mathbf{r} = x\mathbf{i} + y\mathbf{j}$. Then $\mathbf{r} \cdot (\mathbf{i} + \mathbf{j}) = x + y$, so that $\mathbf{r} \cdot (\mathbf{i} + \mathbf{j}) \geq 0$ when $x + y \geq 0$. So the region is the set of points in the plane such that $x + y \geq 0$:

94. Let $\mathbf{r} = \langle x, y, z \rangle$ and $\mathbf{b} = \langle b_1, b_2, b_3 \rangle$. Then

$$(\mathbf{r} - \mathbf{b}) \cdot (\mathbf{r} + \mathbf{b}) = \langle x - b_1, y - b_2, z - b_3 \rangle \cdot \langle x + b_1, y + b_2, z + b_3 \rangle = x^2 - b_1^2 + y^2 - b_2^2 + z^2 - b_3^2 = 0.$$

So this is the surface $x^2 + y^2 + z^2 = b_1^2 + b_2^2 + b_3^2 = \|\mathbf{b}\|^2$, which is a sphere centered at the origin with radius $\|\mathbf{b}\|$. So all points with that magnitude lie on the sphere; in particular, $\mathbf{b}$ and $-\mathbf{b}$ do. Therefore the surface is as claimed. Next, let $\mathbf{r}_0 = \langle x_0, y_0, z_0 \rangle$; then

$$\begin{aligned} (\mathbf{r} - \mathbf{r}_0 - \mathbf{b}) \cdot (\mathbf{r} - \mathbf{r}_0 + \mathbf{b}) &= \langle (x - x_0) - b_1, (y - y_0) - b_2, (z - z_0) - b_3 \rangle \cdot \langle (x - x_0) + b_1, (y - y_0) + b_2, (z - z_0) + b_3 \rangle \\ &= (x - x_0)^2 - b_1^2 + (y - y_0)^2 - b_2^2 + (z - z_0)^2 - b_3^2 = 0. \end{aligned}$$

So this is the surface $(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = b_1^2 + b_2^2 + b_3^2 = \|\mathbf{b}\|^2$, which is a sphere with center $(x_0, y_0, z_0) = \mathbf{r}_0$ and radius $\|\mathbf{b}\|$.

10.5: The Cross Product

Concepts and Vocabulary

1. True. See the discussion in objective 3.
2. False. The cross product of two vectors is zero if and only if the vectors are *parallel*. See item (9) in objective 3.
3. **(b)** is correct; $\mathbf{v} \times \mathbf{w}$ is always orthogonal to both $\mathbf{v}$ and $\mathbf{w}$. See item (6) in objective 3.
4. False. See item (2) in objective 2.
5. **(d)** is correct; see item (9) in objective 3.
6. True, since $\mathbf{w} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{w})$. See item (2) in objective 2.
7. **(c)** is correct; see item (8) in objective 3.
8. False; in fact $\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\| \|\mathbf{w}\| \sin \theta$. See item (7) in objective 3.

Skill Building

$$9. \begin{vmatrix} 3 & 4 \\ 1 & 2 \end{vmatrix} = 3 \cdot 2 - 4 \cdot 1 = 6 - 4 = \boxed{2}.$$

$$10. \begin{vmatrix} -2 & 4 \\ 2 & -1 \end{vmatrix} = -2 \cdot (-1) - 2 \cdot 4 = 2 - 8 = \boxed{-6}.$$

11.

$$\begin{vmatrix} 1 & -2 & 2 \\ 1 & 2 & 1 \\ 2 & 1 & 4 \end{vmatrix} = 1 \begin{vmatrix} 2 & 1 \\ 1 & 4 \end{vmatrix} - (-2) \begin{vmatrix} 1 & 1 \\ 2 & 4 \end{vmatrix} + 2 \begin{vmatrix} 1 & 2 \\ 2 & 1 \end{vmatrix} = 1(2 \cdot 4 - 1 \cdot 1) + 2(1 \cdot 4 - 1 \cdot 2) + 2(1 \cdot 1 - 2 \cdot 2) = \boxed{5}.$$

12.

$$\begin{vmatrix} 7 & 0 & 1 \\ 0 & 2 & 3 \\ 0 & 1 & 3 \end{vmatrix} = 7 \begin{vmatrix} 2 & 3 \\ 1 & 3 \end{vmatrix} - 0 \begin{vmatrix} 0 & 3 \\ 0 & 3 \end{vmatrix} + 1 \begin{vmatrix} 0 & 2 \\ 0 & 1 \end{vmatrix} = 7(2 \cdot 3 - 3 \cdot 1) + 1(0 \cdot 1 - 2 \cdot 0) = \boxed{21}.$$

13. **(a)**

$$\begin{aligned} \mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 1 & -1 \\ 1 & -1 & 1 \end{vmatrix} \\ &= \mathbf{i} \begin{vmatrix} 1 & -1 \\ -1 & 1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 2 & -1 \\ 1 & 1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 2 & 1 \\ 1 & -1 \end{vmatrix} \\ &= (1 \cdot 1 - (-1) \cdot (-1))\mathbf{i} - (2 \cdot 1 - (-1) \cdot 1)\mathbf{j} + (2 \cdot (-1) - 1 \cdot 1)\mathbf{k} \\ &= \boxed{-3\mathbf{j} - 3\mathbf{k}}. \end{aligned}$$

(b) As a check,

$$\begin{aligned} \mathbf{v} \cdot (\mathbf{v} \times \mathbf{w}) &= (2\mathbf{i} + \mathbf{j} - \mathbf{k}) \cdot (-3\mathbf{j} - 3\mathbf{k}) = 2 \cdot 0 + 1 \cdot (-3) - 1 \cdot (-3) = 0 \\ \mathbf{w} \cdot (\mathbf{v} \times \mathbf{w}) &= (\mathbf{i} - \mathbf{j} + \mathbf{k}) \cdot (-3\mathbf{j} - 3\mathbf{k}) = 1 \cdot 0 - 1 \cdot (-3) + 1 \cdot (-3) = 0. \end{aligned}$$

14. (a)

&= \begin{vmatrix} -\sin \theta & 0 \\ \cos \theta & 0 \end{vmatrix} \mathbf{i} - \begin{vmatrix} \cos \theta & 0 \\ \sin \theta & 0 \end{vmatrix} \mathbf{j} + \begin{vmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{vmatrix} \mathbf{k} \\
&= (-\sin \theta \cdot 0 - 0 \cdot \cos \theta) \mathbf{i} - (\cos \theta \cdot 0 - 0 \cdot \sin \theta) \mathbf{j} + (\cos \theta \cos \theta - (-\sin \theta) \sin \theta) \mathbf{k} \\
&= 0\mathbf{i} + 0\mathbf{j} + (\cos^2 \theta + \sin^2 \theta) \mathbf{k} \\
&= \boxed{\mathbf{k}}.
\end{aligned}$$

(b) As a check,

$$\begin{aligned}
\mathbf{v} \cdot (\mathbf{v} \times \mathbf{w}) &= ((\cos \theta) \mathbf{i} - (\sin \theta) \mathbf{j}) \cdot \mathbf{k} = \cos \theta \cdot 0 - \sin \theta \cdot 0 + 0 \cdot 1 = 0 \\
\mathbf{w} \cdot (\mathbf{v} \times \mathbf{w}) &= ((\sin \theta) \mathbf{i} + (\cos \theta) \mathbf{j}) \cdot \mathbf{k} = \sin \theta \cdot 0 + \cos \theta \cdot 0 + 0 \cdot 1 = 0.
\end{aligned}$$

23. Since $\mathbf{u}$ is parallel to itself, $\mathbf{u} \times \mathbf{u} = \boxed{\mathbf{0}}$ by property (9) in objective 3.24. Since $\mathbf{w}$ is parallel to itself, $\mathbf{w} \times \mathbf{w} = \boxed{\mathbf{0}}$ by property (9) in objective 3.

25.

$$\begin{aligned}
\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -3 & 1 & -4 \\ 1 & 1 & -3 \end{vmatrix} \\
&= \begin{vmatrix} 1 & -4 \\ 1 & -3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} -3 & -4 \\ 1 & -3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} -3 & 1 \\ 1 & 1 \end{vmatrix} \mathbf{k} \\
&= (1 \cdot (-3) - (-4) \cdot 1) \mathbf{i} - (-3 \cdot (-3) - (-4) \cdot 1) \mathbf{j} + (-3 \cdot 1 - 1 \cdot 1) \mathbf{k} \\
&= \boxed{\mathbf{i} - 13\mathbf{j} - 4\mathbf{k}}.
\end{aligned}$$

26.

$$\begin{aligned}
\mathbf{u} \times \mathbf{v} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 3 & -4 \\ -3 & 1 & -4 \end{vmatrix} \\
&= \begin{vmatrix} 3 & -4 \\ 1 & -4 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & -4 \\ -3 & -4 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & 3 \\ -3 & 1 \end{vmatrix} \mathbf{k} \\
&= (3 \cdot (-4) - (-4) \cdot 1) \mathbf{i} - (2 \cdot (-4) - (-4) \cdot (-3)) \mathbf{j} + (2 \cdot 1 - 3 \cdot (-3)) \mathbf{k} \\
&= \boxed{-8\mathbf{i} + 20\mathbf{j} + 11\mathbf{k}}.
\end{aligned}$$

27. By property (3) in objective 2, $(3\mathbf{v}) \times \mathbf{w} = 3(\mathbf{v} \times \mathbf{w})$. Then using Problem 25, we get

$$(3\mathbf{v}) \times \mathbf{w} = 3(\mathbf{v} \times \mathbf{w}) = 3(\mathbf{i} - 13\mathbf{j} - 4\mathbf{k}) = \boxed{3\mathbf{i} - 39\mathbf{j} - 12\mathbf{k}}.$$

28. By property (3) in objective 2, $\mathbf{u} \times (-\mathbf{v}) = -1(\mathbf{u} \times \mathbf{v})$. Then using Problem 26, we get

$$\mathbf{u} \times (-\mathbf{v}) = -1(\mathbf{u} \times \mathbf{v}) = -1(-8\mathbf{i} + 20\mathbf{j} + 11\mathbf{k}) = \boxed{8\mathbf{i} - 20\mathbf{j} - 11\mathbf{k}}.$$

29. $\mathbf{v} \times \mathbf{w}$ is orthogonal to both $\mathbf{v}$ and $\mathbf{w}$. From Problem 25, this vector is $\boxed{\mathbf{i} - 13\mathbf{j} - 4\mathbf{k}}$.

30. We must compute $\mathbf{w} \times \mathbf{u}$:

$$\begin{aligned} \mathbf{w} \times \mathbf{u} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 1 & -3 \\ 2 & 3 & -4 \end{vmatrix} \\ &= \begin{vmatrix} 1 & -3 \\ 3 & -4 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 1 & -3 \\ 2 & -4 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 1 & 1 \\ 2 & 3 \end{vmatrix} \mathbf{k} \\ &= (1 \cdot (-4) - (-3) \cdot 3)\mathbf{i} - (1 \cdot (-4) - (-3) \cdot 2)\mathbf{j} + (1 \cdot 3 - 1 \cdot 2)\mathbf{k} \\ &= \boxed{5\mathbf{i} - 2\mathbf{j} + \mathbf{k}}. \end{aligned}$$

The vector $5\mathbf{i} - 2\mathbf{j} + \mathbf{k}$ is orthogonal to both $\mathbf{w}$ and $\mathbf{u}$.

31. We must compute $\mathbf{w} \times (\mathbf{i} + \mathbf{j} - \mathbf{k})$:

$$\begin{aligned} \mathbf{w} \times (\mathbf{i} + \mathbf{j} - \mathbf{k}) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 1 & -3 \\ 1 & 1 & -1 \end{vmatrix} \\ &= \begin{vmatrix} 1 & -3 \\ 1 & -1 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 1 & -3 \\ 1 & -1 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 1 & 1 \\ 1 & 1 \end{vmatrix} \mathbf{k} \\ &= (1 \cdot (-1) - (-3) \cdot 1)\mathbf{i} - (1 \cdot (-1) - (-3) \cdot 1)\mathbf{j} + (1 \cdot 1 - 1 \cdot 1)\mathbf{k} \\ &= \boxed{2\mathbf{i} - 2\mathbf{j}}. \end{aligned}$$

The vector $2\mathbf{i} - 2\mathbf{j}$ is orthogonal to both $\mathbf{w}$ and $\mathbf{i} + \mathbf{j} - \mathbf{k}$.

32. We must compute $\mathbf{u} \times \mathbf{k}$:

$$\begin{aligned} \mathbf{u} \times \mathbf{k} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 3 & -4 \\ 0 & 0 & 1 \end{vmatrix} \\ &= \begin{vmatrix} 3 & -4 \\ 0 & 1 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & -4 \\ 0 & 1 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & 3 \\ 0 & 0 \end{vmatrix} \mathbf{k} \\ &= (3 \cdot 1 - (-4) \cdot 0)\mathbf{i} - (2 \cdot 1 - (-4) \cdot 0)\mathbf{j} + (2 \cdot 0 - 3 \cdot 0)\mathbf{k} \\ &= \boxed{3\mathbf{i} - 2\mathbf{j}}. \end{aligned}$$

The vector $3\mathbf{i} - 2\mathbf{j}$ is orthogonal to both $\mathbf{u}$ and $\mathbf{k}$.

33. Any vector normal to both $\mathbf{u}$ and $\mathbf{v}$ will be normal to the plane containing those vectors, so $\mathbf{u} \times \mathbf{v}$ is such a vector. From Problem 26, $\mathbf{u} \times \mathbf{v} = -8\mathbf{i} + 20\mathbf{j} + 11\mathbf{k}$. Since we want a unit vector, we must normalize this vector:

$$\|\mathbf{u} \times \mathbf{v}\| = \|-8\mathbf{i} + 20\mathbf{j} + 11\mathbf{k}\| = \sqrt{8^2 + 20^2 + 11^2} = \sqrt{585} = 3\sqrt{65}.$$

Therefore a unit vector normal to the plane containing $\mathbf{u}$ and $\mathbf{v}$ is

$$\frac{1}{3\sqrt{65}}(\mathbf{u} \times \mathbf{v}) = \frac{\sqrt{65}}{195}(-8\mathbf{i} + 20\mathbf{j} + 11\mathbf{k}) = \boxed{-\frac{8}{3\sqrt{65}}\mathbf{i} + \frac{20}{3\sqrt{65}}\mathbf{j} + \frac{11}{3\sqrt{65}}\mathbf{k}}.$$

The vector opposite to this vector, which is $\boxed{\frac{8}{3\sqrt{65}}\mathbf{i} - \frac{20}{3\sqrt{65}}\mathbf{j} - \frac{11}{3\sqrt{65}}\mathbf{k}}$, is also a unit vector normal to the plane.

34. Any vector normal to both $\mathbf{u}$ and $\mathbf{w}$ will be normal to the plane containing those vectors, so $\mathbf{w} \times \mathbf{u}$ is such a vector. From Problem 30, $\mathbf{w} \times \mathbf{u} = 5\mathbf{i} - 2\mathbf{j} + \mathbf{k}$. Since we want a unit vector, we must normalize this vector:

$$\|\mathbf{w} \times \mathbf{u}\| = \|5\mathbf{i} - 2\mathbf{j} + \mathbf{k}\| = \sqrt{5^2 + 2^2 + 1^2} = \sqrt{30}.$$

Therefore a unit vector normal to the plane containing $\mathbf{u}$ and $\mathbf{v}$ is

$$\frac{1}{\sqrt{30}}(\mathbf{w} \times \mathbf{u}) = \frac{\sqrt{30}}{30}(5\mathbf{i} - 2\mathbf{j} + \mathbf{k}) = \boxed{\frac{\sqrt{30}}{6}\mathbf{i} - \frac{\sqrt{30}}{15}\mathbf{j} + \frac{\sqrt{30}}{30}\mathbf{k}}.$$

The vector opposite to this vector, which is $\boxed{-\frac{\sqrt{30}}{6}\mathbf{i} + \frac{\sqrt{30}}{15}\mathbf{j} - \frac{\sqrt{30}}{30}\mathbf{k}}$, is also a unit vector normal to the plane.

35. Any vector normal to both $2\mathbf{i} - 6\mathbf{j} - 3\mathbf{k}$ and $4\mathbf{i} + 3\mathbf{j} - \mathbf{k}$ will be normal to the plane containing those vectors, so $(2\mathbf{i} - 6\mathbf{j} - 3\mathbf{k}) \times (4\mathbf{i} + 3\mathbf{j} - \mathbf{k})$ is such a vector:

$$\begin{aligned} (2\mathbf{i} - 6\mathbf{j} - 3\mathbf{k}) \times (4\mathbf{i} + 3\mathbf{j} - \mathbf{k}) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -6 & -3 \\ 4 & 3 & -1 \end{vmatrix} \\ &= \begin{vmatrix} -6 & -3 \\ 3 & -1 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & -3 \\ 4 & -1 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & -6 \\ 4 & 3 \end{vmatrix} \mathbf{k} \\ &= (-6 \cdot (-1) - (-3) \cdot 3)\mathbf{i} - (2 \cdot (-1) - (-3) \cdot 4)\mathbf{j} + (2 \cdot 3 - (-6) \cdot 4)\mathbf{k} \\ &= 15\mathbf{i} - 10\mathbf{j} + 30\mathbf{k}. \end{aligned}$$

Since we want a unit vector, we must normalize the cross product:

$$\|15\mathbf{i} - 10\mathbf{j} + 30\mathbf{k}\| = \sqrt{15^2 + 10^2 + 30^2} = 35.$$

Therefore a unit vector normal to the plane containing $\mathbf{u}$ and $\mathbf{v}$ is

$$\frac{1}{35}(15\mathbf{i} - 10\mathbf{j} + 30\mathbf{k}) = \boxed{\frac{3}{7}\mathbf{i} - \frac{2}{7}\mathbf{j} + \frac{6}{7}\mathbf{k}}.$$

The vector opposite to this vector, which is $\boxed{-\frac{3}{7}\mathbf{i} + \frac{2}{7}\mathbf{j} - \frac{6}{7}\mathbf{k}}$, is also a unit vector normal to the plane.

36. Any vector normal to both $\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ and $3\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ will be normal to the plane containing those vectors, so $(\mathbf{i} + \mathbf{j} - 2\mathbf{k}) \times (3\mathbf{i} + 2\mathbf{j} - \mathbf{k})$ is such a vector:

$$\begin{aligned} (\mathbf{i} + \mathbf{j} - 2\mathbf{k}) \times (3\mathbf{i} + 2\mathbf{j} - \mathbf{k}) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 1 & -2 \\ 3 & 2 & -1 \end{vmatrix} \\ &= \begin{vmatrix} 1 & -2 \\ 2 & -1 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 1 & -2 \\ 3 & -1 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 1 & 1 \\ 3 & 2 \end{vmatrix} \mathbf{k} \\ &= (1 \cdot (-1) - (-2) \cdot 2)\mathbf{i} - (1 \cdot (-1) - (-2) \cdot 3)\mathbf{j} + (1 \cdot 2 - 1 \cdot 3)\mathbf{k} \\ &= 3\mathbf{i} - 5\mathbf{j} - \mathbf{k}. \end{aligned}$$

Since we want a unit vector, we must normalize the cross product:

$$\|3\mathbf{i} - 5\mathbf{j} - \mathbf{k}\| = \sqrt{3^2 + 5^2 + 1^2} = \sqrt{35}.$$

Therefore a unit vector normal to the plane containing $\mathbf{u}$ and $\mathbf{v}$ is

$$\frac{1}{\sqrt{35}}(3\mathbf{i} - 5\mathbf{j} - \mathbf{k}) = \boxed{\frac{3\sqrt{35}}{35}\mathbf{i} - \frac{\sqrt{35}}{7}\mathbf{j} - \frac{\sqrt{35}}{35}\mathbf{k}}.$$

The vector opposite to this vector, which is $\boxed{-\frac{3\sqrt{35}}{35}\mathbf{i} + \frac{\sqrt{35}}{7}\mathbf{j} + \frac{\sqrt{35}}{35}\mathbf{k}}$, is also a unit vector normal to the plane.

37. Two sides are

$$\begin{aligned}\mathbf{v} &= \overrightarrow{PQ} = \langle 2, 1, 1 \rangle - \langle 1, -3, 7 \rangle = \langle 1, 4, -6 \rangle \\ \mathbf{w} &= \overrightarrow{PR} = \langle 6, -1, 2 \rangle - \langle 1, -3, 7 \rangle = \langle 5, 2, -5 \rangle.\end{aligned}$$

The area of the parallelogram with one corner at P and sides PQ and PR is then $\|\mathbf{v} \times \mathbf{w}\|$. Computing $\mathbf{v} \times \mathbf{w}$ gives

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 4 & -6 \\ 5 & 2 & -5 \end{vmatrix} \\ &= \begin{vmatrix} 4 & -6 \\ 2 & -5 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 1 & -6 \\ 5 & -5 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 1 & 4 \\ 5 & 2 \end{vmatrix} \mathbf{k} \\ &= (4 \cdot (-5) - (-6) \cdot 2)\mathbf{i} - (1 \cdot (-5) - (-6) \cdot 5)\mathbf{j} + (1 \cdot 2 - 4 \cdot 5)\mathbf{k} \\ &= -8\mathbf{i} - 25\mathbf{j} - 18\mathbf{k}.\end{aligned}$$

Therefore the area of the parallelogram is

$$\|-8\mathbf{i} - 25\mathbf{j} - 18\mathbf{k}\| = \sqrt{8^2 + 25^2 + 18^2} = \boxed{\sqrt{1013}}.$$

38. Two sides are

$$\begin{aligned}\mathbf{v} &= \overrightarrow{PQ} = \langle 2, 0, -4 \rangle - \langle 0, 1, 1 \rangle = \langle 2, -1, -5 \rangle \\ \mathbf{w} &= \overrightarrow{PR} = \langle -3, -2, 1 \rangle - \langle 0, 1, 1 \rangle = \langle -3, -3, 0 \rangle.\end{aligned}$$

The area of the parallelogram with one corner at P and sides PQ and PR is then $\|\mathbf{v} \times \mathbf{w}\|$. Computing $\mathbf{v} \times \mathbf{w}$ gives

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & -5 \\ -3 & -3 & 0 \end{vmatrix} \\ &= \begin{vmatrix} -1 & -5 \\ -3 & 0 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & -5 \\ -3 & 0 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & -1 \\ -3 & -3 \end{vmatrix} \mathbf{k} \\ &= (-1 \cdot 0 - (-5) \cdot (-3))\mathbf{i} - (2 \cdot 0 - (-5) \cdot (-3))\mathbf{j} + (2 \cdot (-3) - (-1) \cdot (-3))\mathbf{k} \\ &= -15\mathbf{i} + 15\mathbf{j} - 9\mathbf{k}.\end{aligned}$$

Therefore the area of the parallelogram is

$$\|-15\mathbf{i} + 15\mathbf{j} - 9\mathbf{k}\| = \sqrt{15^2 + 15^2 + 9^2} = \sqrt{531} = \boxed{3\sqrt{59}}.$$

39. Two sides are

$$\begin{aligned}\mathbf{v} &= \overrightarrow{PQ} = \langle 2, 1, -7 \rangle - \langle -2, 1, 6 \rangle = \langle 4, 0, -13 \rangle \\ \mathbf{w} &= \overrightarrow{PR} = \langle 4, 1, 1 \rangle - \langle -2, 1, 6 \rangle = \langle 6, 0, -5 \rangle.\end{aligned}$$

The area of the parallelogram with one corner at P and sides PQ and PR is then $\|\mathbf{v} \times \mathbf{w}\|$. Computing $\mathbf{v} \times \mathbf{w}$ gives

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & 0 & -13 \\ 6 & 0 & -5 \end{vmatrix} \\ &= \begin{vmatrix} 0 & -13 \\ 0 & -5 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 4 & -13 \\ 6 & -5 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 4 & 0 \\ 6 & 0 \end{vmatrix} \mathbf{k} \\ &= (0 \cdot (-5) - (-13) \cdot 0) \mathbf{i} - (4 \cdot (-5) - (-13) \cdot 6) \mathbf{j} + (4 \cdot 0 - 0 \cdot 6) \mathbf{k} \\ &= -58\mathbf{j}.\end{aligned}$$

Therefore the area of the parallelogram is

$$\|58\mathbf{j}\| = \sqrt{58^2} = \boxed{58}.$$

40. Two sides are

$$\begin{aligned}\mathbf{v} &= \overrightarrow{PQ} = \langle 2, -5, 3 \rangle - \langle 0, 0, 3 \rangle = \langle 2, -5, 0 \rangle \\ \mathbf{w} &= \overrightarrow{PR} = \langle 1, 1, -2 \rangle - \langle 0, 0, 3 \rangle = \langle 1, 1, -5 \rangle.\end{aligned}$$

The area of the parallelogram with one corner at P and sides PQ and PR is then $\|\mathbf{v} \times \mathbf{w}\|$. Computing $\mathbf{v} \times \mathbf{w}$ gives

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -5 & 0 \\ 1 & 1 & -5 \end{vmatrix} \\ &= \begin{vmatrix} -5 & 0 \\ 1 & -5 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & 0 \\ 1 & -5 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & -5 \\ 1 & 1 \end{vmatrix} \mathbf{k} \\ &= (-5 \cdot (-5) - 0 \cdot 1) \mathbf{i} - (2 \cdot (-5) - 0 \cdot 1) \mathbf{j} + (2 \cdot 1 - (-5) \cdot 1) \mathbf{k} \\ &= 25\mathbf{i} + 10\mathbf{j} + 7\mathbf{k}.\end{aligned}$$

Therefore the area of the parallelogram is

$$\|25\mathbf{i} + 10\mathbf{j} + 7\mathbf{k}\| = \sqrt{25^2 + 10^2 + 7^2} = \sqrt{774} = \boxed{3\sqrt{86}}.$$

41. Two sides are

$$\begin{aligned}\mathbf{v} &= \overrightarrow{PQ} = \langle 5, -3, 0 \rangle - \langle 1, 1, -6 \rangle = \langle 4, -4, 6 \rangle \\ \mathbf{w} &= \overrightarrow{PR} = \langle -2, 4, 1 \rangle - \langle 1, 1, -6 \rangle = \langle -3, 3, 7 \rangle.\end{aligned}$$

The area of the parallelogram with one corner at P and sides PQ and PR is then $\|\mathbf{v} \times \mathbf{w}\|$. Computing $\mathbf{v} \times \mathbf{w}$ gives

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & -4 & 6 \\ -3 & 3 & 7 \end{vmatrix} \\ &= \begin{vmatrix} -4 & 6 \\ 3 & 7 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 4 & 6 \\ -3 & 7 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 4 & -4 \\ -3 & 3 \end{vmatrix} \mathbf{k} \\ &= (-4 \cdot 7 - 6 \cdot 3) \mathbf{i} - (4 \cdot 7 - 6 \cdot (-3)) \mathbf{j} + (4 \cdot 3 - (-4) \cdot (-3)) \mathbf{k} \\ &= -46\mathbf{i} - 46\mathbf{j}.\end{aligned}$$

Therefore the area of the parallelogram is

$$\| -46\mathbf{i} - 46\mathbf{j} \| = \sqrt{46^2 + 46^2} = \boxed{46\sqrt{2}}.$$

42. Two sides are

$$\mathbf{v} = \overrightarrow{PQ} = \langle 1, 1, -5 \rangle - \langle -4, 6, 3 \rangle = \langle 5, -5, -8 \rangle$$

$$\mathbf{w} = \overrightarrow{PR} = \langle 2, 2, 2 \rangle - \langle -4, 6, 3 \rangle = \langle 6, -4, -1 \rangle.$$

The area of the parallelogram with one corner at P and sides PQ and PR is then $\|\mathbf{v} \times \mathbf{w}\|$. Computing $\mathbf{v} \times \mathbf{w}$ gives

$$\begin{aligned} \mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 5 & -5 & -8 \\ 6 & -4 & -1 \end{vmatrix} \\ &= \begin{vmatrix} -5 & -8 \\ -4 & -1 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 5 & -8 \\ 6 & -1 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 5 & -5 \\ 6 & -4 \end{vmatrix} \mathbf{k} \\ &= (-5 \cdot (-1) - (-8) \cdot (-4))\mathbf{i} - (5 \cdot (-1) - (-8) \cdot 6)\mathbf{j} + (5 \cdot (-4) - (-5) \cdot 6)\mathbf{k} \\ &= -27\mathbf{i} - 43\mathbf{j} + 10\mathbf{k}. \end{aligned}$$

Therefore the area of the parallelogram is

$$\| -27\mathbf{i} - 43\mathbf{j} + 10\mathbf{k} \| = \sqrt{27^2 + 43^2 + 10^2} = \boxed{\sqrt{2678}}.$$

43. First plot the points to determine which pairs of points form sides:

We will use

$$\mathbf{v} = \overrightarrow{P_1P_2} = \langle 1, 2, 3 \rangle - \langle 0, 0, 0 \rangle = \langle 1, 2, 3 \rangle$$

$$\mathbf{w} = \overrightarrow{P_1P_4} = \langle 2, -1, 1 \rangle - \langle 0, 0, 0 \rangle = \langle 2, -1, 1 \rangle$$

as the two sides. Then the area of the parallelogram is $\|\mathbf{v} \times \mathbf{w}\|$.

$$\begin{aligned} \mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 3 \\ 2 & -1 & 1 \end{vmatrix} \\ &= \begin{vmatrix} 2 & 3 \\ -1 & 1 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 1 & 3 \\ 2 & 1 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 1 & 2 \\ 2 & -1 \end{vmatrix} \mathbf{k} \\ &= (2 \cdot 1 - 3 \cdot (-1))\mathbf{i} - (1 \cdot 1 - 3 \cdot 2)\mathbf{j} + (1 \cdot (-1) - 2 \cdot 2)\mathbf{k} \\ &= 5\mathbf{i} + 5\mathbf{j} - 5\mathbf{k}. \end{aligned}$$

Therefore the area of the parallelogram is

$$\|5\mathbf{i} + 5\mathbf{j} - 5\mathbf{k}\| = \sqrt{5^2 + 5^2 + 5^2} = \boxed{5\sqrt{3}}.$$

44. First plot the points to determine which pairs of points form sides:

We will use

$$\begin{aligned}\mathbf{v} &= \overrightarrow{P_1P_2} = \langle -1, 2, 0 \rangle - \langle 0, 0, 0 \rangle = \langle -1, 2, 0 \rangle \\ \mathbf{w} &= \overrightarrow{P_1P_4} = \langle 2, 3, -4 \rangle - \langle 0, 0, 0 \rangle = \langle 2, 3, -4 \rangle\end{aligned}$$

as the two sides. Then the area of the parallelogram is $\|\mathbf{v} \times \mathbf{w}\|$.

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 2 & 0 \\ 2 & 3 & -4 \end{vmatrix} \\ &= \begin{vmatrix} 2 & 0 \\ 3 & -4 \end{vmatrix} \mathbf{i} - \begin{vmatrix} -1 & 0 \\ 2 & -4 \end{vmatrix} \mathbf{j} + \begin{vmatrix} -1 & 2 \\ 2 & 3 \end{vmatrix} \mathbf{k} \\ &= (2 \cdot (-4) - 0 \cdot 3)\mathbf{i} - (-1 \cdot (-4) - 0 \cdot 2)\mathbf{j} + (-1 \cdot 3 - 2 \cdot 2)\mathbf{k} \\ &= -8\mathbf{i} - 4\mathbf{j} - 7\mathbf{k}.\end{aligned}$$

Therefore the area of the parallelogram is

$$\|-8\mathbf{i} - 4\mathbf{j} - 7\mathbf{k}\| = \sqrt{8^2 + 4^2 + 7^2} = \boxed{\sqrt{129}}.$$

45. First plot the points to determine which pairs of points form sides:

We will use

$$\begin{aligned}\mathbf{v} &= \overrightarrow{P_1P_2} = \langle 2, 1, -7 \rangle - \langle -2, 1, 6 \rangle = \langle 4, 0, -13 \rangle \\ \mathbf{w} &= \overrightarrow{P_1P_3} = \langle 4, 1, 1 \rangle - \langle -2, 1, 6 \rangle = \langle 6, 0, -5 \rangle\end{aligned}$$

as the two sides. Then the area of the parallelogram is $\|\mathbf{v} \times \mathbf{w}\|$.

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & 0 & -13 \\ 6 & 0 & -5 \end{vmatrix} \\ &= \begin{vmatrix} 0 & -13 \\ 0 & -5 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 4 & -13 \\ 6 & -5 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 4 & 0 \\ 6 & 0 \end{vmatrix} \mathbf{k} \\ &= (0 \cdot (-5) - (-13) \cdot 0) \mathbf{i} - (4 \cdot (-5) - (-13) \cdot 6) \mathbf{j} + (4 \cdot 0 - 0 \cdot 6) \mathbf{k} \\ &= -58\mathbf{j}.\end{aligned}$$

Therefore the area of the parallelogram is

$$\|-58\mathbf{j}\| = \sqrt{58^2} = \boxed{58}.$$

46. First plot the points to determine which pairs of points form sides:

We will use

$$\begin{aligned}\mathbf{v} &= \overrightarrow{P_1P_2} = \langle -1, 2, 2 \rangle - \langle -1, 1, 1 \rangle = \langle 0, 1, 1 \rangle \\ \mathbf{w} &= \overrightarrow{P_1P_4} = \langle -3, 4, -5 \rangle - \langle -1, 1, 1 \rangle = \langle -2, 3, -6 \rangle\end{aligned}$$

as the two sides. Then the area of the parallelogram is $\|\mathbf{v} \times \mathbf{w}\|$.

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 1 & 1 \\ -2 & 3 & -6 \end{vmatrix} \\ &= \begin{vmatrix} 1 & 1 \\ 3 & -6 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 0 & 1 \\ -2 & -6 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 0 & 1 \\ -2 & 3 \end{vmatrix} \mathbf{k} \\ &= (1 \cdot (-6) - 1 \cdot 3) \mathbf{i} - (0 \cdot (-6) - 1 \cdot (-2)) \mathbf{j} + (0 \cdot 3 - 1 \cdot (-2)) \mathbf{k} \\ &= -9\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}.\end{aligned}$$

Therefore the area of the parallelogram is

$$\|-9\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}\| = \sqrt{9^2 + 2^2 + 2^2} = \boxed{\sqrt{89}}.$$

Applications and Extensions

47. Since $\boldsymbol{\omega}$ points in the direction of $\mathbf{i} + \mathbf{j} + \mathbf{k}$, we have $\boldsymbol{\omega} = k\mathbf{i} + k\mathbf{j} + k\mathbf{k}$. Then

$$30 = \omega = \|\boldsymbol{\omega}\| = \sqrt{k^2 + k^2 + k^2} = k\sqrt{3},$$

so that $k = \frac{30}{\sqrt{3}} = 10\sqrt{3}$. Therefore $\boldsymbol{\omega} = 10\sqrt{3}\mathbf{i} + 10\sqrt{3}\mathbf{j} + 10\sqrt{3}\mathbf{k}$. The position of the object is $\mathbf{r} = -\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$, so the velocity of the object is

$$\begin{aligned}\mathbf{v} &= \boldsymbol{\omega} \times \mathbf{r} \\ &= (10\sqrt{3}\mathbf{i} + 10\sqrt{3}\mathbf{j} + 10\sqrt{3}\mathbf{k}) \times (-\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 10\sqrt{3} & 10\sqrt{3} & 10\sqrt{3} \\ -1 & 2 & 3 \end{vmatrix} \\ &= 10\sqrt{3}\mathbf{i} - 40\sqrt{3}\mathbf{j} + 30\sqrt{3}\mathbf{k}.\end{aligned}$$

The object's speed is then

$$\|\mathbf{v}\| = \sqrt{(10\sqrt{3})^2 + (40\sqrt{3})^2 + (30\sqrt{3})^2} = \boxed{10\sqrt{78} \text{ m/s}}.$$

48. ω points in the direction of $3\mathbf{i} + \mathbf{j} - 2\mathbf{k}$; a unit vector in this direction is

$$\frac{1}{\sqrt{3^2 + 1^2 + 2^2}}(3\mathbf{i} + \mathbf{j} - 2\mathbf{k}) = \frac{3}{\sqrt{14}}\mathbf{i} + \frac{1}{\sqrt{14}}\mathbf{j} - \frac{2}{\sqrt{14}}\mathbf{k}.$$

Since the angular speed ω is constant, we have

$$\boldsymbol{\omega} = \omega \left(\frac{3}{\sqrt{14}}\mathbf{i} + \frac{1}{\sqrt{14}}\mathbf{j} - \frac{2}{\sqrt{14}}\mathbf{k} \right).$$

(a) The position of the object is $4\mathbf{i} + 4\mathbf{j}$, so the velocity is

$$\begin{aligned} \mathbf{v} &= \boldsymbol{\omega} \times \mathbf{r} \\ &= \omega \left(\frac{3}{\sqrt{14}}\mathbf{i} + \frac{1}{\sqrt{14}}\mathbf{j} - \frac{2}{\sqrt{14}}\mathbf{k} \right) \times (4\mathbf{i} + 4\mathbf{j}) \\ &= \omega \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{3}{\sqrt{14}} & \frac{1}{\sqrt{14}} & -\frac{2}{\sqrt{14}} \\ 4 & 4 & 0 \end{vmatrix} \\ &= \left(\frac{8}{\sqrt{14}}\mathbf{i} - \frac{8}{\sqrt{14}}\mathbf{j} + \frac{8}{\sqrt{14}}\mathbf{k} \right) \omega. \end{aligned}$$

The object's speed is then

$$\|\mathbf{v}\| = \omega \sqrt{\left(\frac{8}{\sqrt{14}}\right)^2 + \left(\frac{8}{\sqrt{14}}\right)^2 + \left(\frac{8}{\sqrt{14}}\right)^2} = 8\omega \sqrt{\frac{3}{14}} = \frac{8\sqrt{42}}{14} \omega = \boxed{\frac{4\sqrt{42}}{7} \omega}.$$

(b) If $\|\mathbf{v}\| = 8\sqrt{14}$, then

$$8\sqrt{14} = \frac{4\sqrt{42}}{7} \omega, \quad \text{so that} \quad \omega = \frac{56\sqrt{14}}{4\sqrt{42}} = \frac{14}{\sqrt{3}} = \boxed{\frac{14\sqrt{3}}{3} \text{ m/s}}.$$

49. Consider the diagram below:

The triangle whose area we wish to determine is $\triangle ABD$. Draw two additional sides, BC and DC . Then $ABCD$ is a parallelogram: it has two pairs of equal sides, and then $\triangle ABD$ and $\triangle CDB$ have all three pairs of sides equal, so they are congruent. It follows that $\angle BAD = \angle DCB$ and therefore $\angle CBA = \angle ADC$. So $ABCD$ is a parallelogram with sides $\mathbf{v} - \mathbf{u}$ and $\mathbf{w} - \mathbf{u}$, and therefore its area is $\|(\mathbf{v} - \mathbf{u}) \times (\mathbf{w} - \mathbf{u})\|$. Since the two triangles are congruent, each has half the area of the parallelogram, so the area of the triangle in question is

$$\frac{1}{2} \|(\mathbf{v} - \mathbf{u}) \times (\mathbf{w} - \mathbf{u})\|.$$

50. Using Problem 49, the area of the triangle is

$$\begin{aligned} A &= \frac{1}{2} \|(\langle 2, 3, -2 \rangle - \langle 0, 0, 0 \rangle) \times (\langle -1, 1, 4 \rangle - \langle 0, 0, 0 \rangle)\| \\ &= \frac{1}{2} \|\langle 2, 3, -2 \rangle \times \langle -1, 1, 4 \rangle\| \\ &= \frac{1}{2} \left\| \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 3 & -2 \\ -1 & 1 & 4 \end{vmatrix} \right\| \\ &= \frac{1}{2} \left\| \begin{vmatrix} 3 & -2 \\ 1 & 4 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & -2 \\ -1 & 4 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & 3 \\ -1 & 1 \end{vmatrix} \mathbf{k} \right\| \\ &= \frac{1}{2} \|14\mathbf{i} - 6\mathbf{j} + 5\mathbf{k}\| \\ &= \frac{1}{2} \sqrt{14^2 + 6^2 + 5^2} \\ &= \boxed{\frac{1}{2} \sqrt{257}}. \end{aligned}$$

51. (a) Answers will vary.

(b) We have

$$\mathbf{F}_1 = 250\mathbf{j}, \quad \mathbf{F}_2 = 125\sqrt{2}\mathbf{i} + 125\sqrt{2}\mathbf{j}, \quad \mathbf{F}_3 = 250\mathbf{i}.$$

The point Q is $(0.25, 0, 0)$ since the wrench is 0.25 m long. Let $\boldsymbol{\tau}_i$ be the torque due to $\mathbf{F}_i$. Then

$$\boldsymbol{\tau}_1 = (0.25, 0, 0) \times \mathbf{F}_1 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.25 & 0 & 0 \\ 0 & 250 & 0 \end{vmatrix} = \begin{vmatrix} 0 & 0 \\ 250 & 0 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 0.25 & 0 \\ 0 & 0 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 0.25 & 0 \\ 0 & 250 \end{vmatrix} \mathbf{k} = \boxed{62.5\mathbf{k} \text{ N}\cdot\text{m}}$$

$$\boldsymbol{\tau}_2 = (0.25, 0, 0) \times \mathbf{F}_2$$

$$\begin{aligned} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.25 & 0 & 0 \\ 125\sqrt{2} & 125\sqrt{2} & 0 \end{vmatrix} \\ &= \begin{vmatrix} 0 & 0 \\ 125\sqrt{2} & 0 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 0.25 & 0 \\ 125\sqrt{2} & 0 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 0.25 & 0 \\ 125\sqrt{2} & 125\sqrt{2} \end{vmatrix} \mathbf{k} \\ &= \boxed{31.25\sqrt{2}\mathbf{k} \approx 44.19 \text{ N}\cdot\text{m}} \end{aligned}$$

$$\boldsymbol{\tau}_3 = (0.25, 0, 0) \times \mathbf{F}_3 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.25 & 0 & 0 \\ 250 & 0 & 0 \end{vmatrix} = \begin{vmatrix} 0 & 0 \\ 0 & 0 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 0.25 & 0 \\ 250 & 0 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 0.25 & 0 \\ 250 & 0 \end{vmatrix} \mathbf{k} = \boxed{\mathbf{0} \text{ N}\cdot\text{m}}.$$

(We would expect $\boldsymbol{\tau}_3$ to be zero, since the force vector $\mathbf{F}_3$ and $\mathbf{r}$ are parallel, so no turning force is imparted on the wrench.)

(c) Answers will vary.

52. The force vector $\mathbf{F}$ is $-75\mathbf{j}$, since the force of gravity acts downwards. The radial vector through which the force acts has magnitude 0.65 m, so that vector is

$$\mathbf{r} = 0.65(\cos 40^\circ \mathbf{i} + \sin 40^\circ \mathbf{j}).$$

Then the torque is

$$\begin{aligned} \boldsymbol{\tau} &= 0.65(\cos 40^\circ \mathbf{i} + \sin 40^\circ \mathbf{j}) \times (-75\mathbf{j}) \\ &= -75 \cdot 0.65 \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos 40^\circ & \sin 40^\circ & 0 \\ 0 & 1 & 0 \end{vmatrix} \\ &= -48.75 \left(\begin{vmatrix} \sin 40^\circ & 0 \\ 1 & 0 \end{vmatrix} \mathbf{i} - \begin{vmatrix} \cos 40^\circ & 0 \\ 0 & 0 \end{vmatrix} \mathbf{j} + \begin{vmatrix} \cos 40^\circ & \sin 40^\circ \\ 0 & 1 \end{vmatrix} \mathbf{k} \right) \\ &= -48.75 \cdot \cos 40^\circ \boxed{\approx -37.3447 \text{ N}\cdot\text{m}}. \end{aligned}$$

53. We first compute $\mathbf{v} \times \mathbf{B}$:

$$\mathbf{v} \times \mathbf{B} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.0050 & 0.0035 & 0 \\ 0.47 & 0.50 & -0.25 \end{vmatrix} = -0.000875\mathbf{i} + 0.00125\mathbf{j} + 0.000855\mathbf{k}.$$

Then the Lorentz force is

$$\begin{aligned} \mathbf{F} &= q[\mathbf{E} + (\mathbf{v} \times \mathbf{B})] \\ &= 2.5[(0.0064\mathbf{i} - 0.0075\mathbf{j} - 0.0023\mathbf{k}) + (-0.000875\mathbf{i} + 0.00125\mathbf{j} + 0.000855\mathbf{k})] \\ &= 2.5(0.005525\mathbf{i} - 0.00625\mathbf{j} - 0.001445\mathbf{k}) \\ &= \boxed{0.0138125\mathbf{i} - 0.015625\mathbf{j} - 0.0036125\mathbf{k} \text{ N}}. \end{aligned}$$

54. From the text, $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\| \|\mathbf{v}\| \sin \theta$, where θ is the angle between the vectors. If the vectors are orthogonal, $\theta = 90^\circ$, so that $\sin \theta = 1$, and the formula above becomes $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\| \|\mathbf{v}\|$.
55. If $\mathbf{u}$ and $\mathbf{v}$ are orthogonal, then by Problem 54, $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\| \|\mathbf{v}\|$. But $\mathbf{u}$ and $\mathbf{v}$ are unit vectors, so that $\|\mathbf{u}\| = \|\mathbf{v}\| = 1$. It follows that $\|\mathbf{u} \times \mathbf{v}\| = 1$ as well, so that $\mathbf{u} \times \mathbf{v}$ is a unit vector.
56. Let $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ and $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$. Then

$$\begin{aligned}
 (a\mathbf{v}) \times \mathbf{w} &= (av_1\mathbf{i} + av_2\mathbf{j} + av_3\mathbf{k}) \times (w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}) \\
 &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ av_1 & av_2 & av_3 \\ w_1 & w_2 & w_3 \end{vmatrix} \\
 &= \begin{vmatrix} av_2 & av_3 \\ w_2 & w_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} av_1 & av_3 \\ w_1 & w_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} av_1 & av_2 \\ w_1 & w_2 \end{vmatrix} \mathbf{k} \\
 &= (av_2w_3 - av_3w_2)\mathbf{i} - (av_1w_3 + av_3w_1)\mathbf{j} + (av_1w_2 + av_2w_1)\mathbf{k} \\
 &= a((v_2w_3 - v_3w_2)\mathbf{i} - (v_1w_3 + v_3w_1)\mathbf{j} + (v_1w_2 + v_2w_1)\mathbf{k}) \\
 &= a\left(\begin{vmatrix} v_2 & v_3 \\ w_2 & w_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} v_1 & v_3 \\ w_1 & w_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} v_1 & v_2 \\ w_1 & w_2 \end{vmatrix} \mathbf{k}\right) \\
 &= a(\mathbf{v} \times \mathbf{w}).
 \end{aligned}$$

For the second part, we show that $a(\mathbf{v} \times \mathbf{w}) = \mathbf{v} \times (a\mathbf{w})$ using property (2) and the first equality:

$$\mathbf{v} \times (a\mathbf{w}) = -((a\mathbf{w}) \times \mathbf{v}) = -(a(\mathbf{w} \times \mathbf{v})) = a(-(\mathbf{w} \times \mathbf{v})) = a(\mathbf{v} \times \mathbf{w}).$$

57. Let $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$, $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ and $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$. Then

$$\begin{aligned}
 \mathbf{v} \times (\mathbf{w} + \mathbf{u}) &= (v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}) \times ((w_1 + u_1)\mathbf{i} + (w_2 + u_2)\mathbf{j} + (w_3 + u_3)\mathbf{k}) \\
 &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ v_1 & v_2 & v_3 \\ w_1 + u_1 & w_2 + u_2 & w_3 + u_3 \end{vmatrix} \\
 &= \begin{vmatrix} v_2 & v_3 \\ w_2 + u_2 & w_3 + u_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} v_1 & v_3 \\ w_1 + u_1 & w_3 + u_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} v_1 & v_2 \\ w_1 + u_1 & w_2 + u_2 \end{vmatrix} \mathbf{k} \\
 &= (v_2(w_3 + u_3) - v_3(w_2 + u_2))\mathbf{i} - (v_1(w_3 + u_3) - v_3(w_1 + u_1))\mathbf{j} \\
 &\quad + (v_1(w_2 + u_2) - v_2(w_1 + u_1))\mathbf{k} \\
 &= ((v_2w_3 - v_3w_2)\mathbf{i} - (v_1w_3 - v_3w_1)\mathbf{j} + (v_1w_2 - v_2w_1)\mathbf{k}) \\
 &\quad + ((v_2u_3 - v_3u_2)\mathbf{i} - (v_1u_3 - v_3u_1)\mathbf{j} + (v_1u_2 - v_2u_1)\mathbf{k}) \\
 &= \begin{vmatrix} v_2 & v_3 \\ w_2 & w_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} v_1 & v_3 \\ w_1 & w_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} v_1 & v_2 \\ w_1 & w_2 \end{vmatrix} \mathbf{k} \\
 &\quad + \begin{vmatrix} v_2 & v_3 \\ u_2 & u_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} v_1 & v_3 \\ u_1 & u_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} v_1 & v_2 \\ u_1 & u_2 \end{vmatrix} \mathbf{k} \\
 &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ v_1 & v_2 & v_3 \\ u_1 & u_2 & u_3 \end{vmatrix} \\
 &= \mathbf{v} \times \mathbf{w} + \mathbf{v} \times \mathbf{u}.
 \end{aligned}$$

58. Answers will vary.

59. Answers will vary.

60. From Problem 25, $\mathbf{v} \times \mathbf{w} = \mathbf{i} - 13\mathbf{j} - 4\mathbf{k}$, so that

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}) \cdot (\mathbf{i} - 13\mathbf{j} - 4\mathbf{k}) = 2 \cdot 1 + 3 \cdot (-13) - 4 \cdot (-4) = \boxed{-21}.$$

61. From Problem 30, $\mathbf{w} \times \mathbf{u} = 5\mathbf{i} - 2\mathbf{j} + \mathbf{k}$. Then

$$(\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v} = (5\mathbf{i} - 2\mathbf{j} + \mathbf{k}) \cdot (-3\mathbf{i} + \mathbf{j} - 4\mathbf{k}) = 5 \cdot (-3) - 2 \cdot 1 + 1 \cdot (-4) = \boxed{-21}.$$

62. Let $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$, $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ and $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$. Then

$$\begin{aligned} \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) &= \mathbf{u} \cdot \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} \\ &= (u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}) \cdot ((v_2w_3 - v_3w_2)\mathbf{i} - (v_1w_3 - v_3w_1)\mathbf{j} + (v_1w_2 - v_2w_1)\mathbf{k}) \\ &= (u_1v_2w_3 - u_1v_3w_2) - (u_2v_1w_3 - u_2v_3w_1) + (u_3v_1w_2 - u_3v_2w_1) \\ l(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{u} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix} \cdot \mathbf{w} \\ &= ((u_2v_3 - u_3v_2)\mathbf{i} - (u_1v_3 - u_3v_1)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}) \cdot (w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}) \\ &= (u_2v_3w_1 - u_3v_2w_1) - (u_1v_3w_2 - u_3v_1w_2) + (u_1v_2w_3 - u_2v_1w_3). \end{aligned}$$

Rearranging and comparing terms, we see that the two triple scalar products are equal.

63. By Problem 62 and the fact that the dot product is commutative,

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = \mathbf{w} \cdot (\mathbf{u} \times \mathbf{v}),$$

so that the first and third formulas are equal. For the second, apply Problem 64 to $\mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})$ to get

$$\mathbf{w} \cdot (\mathbf{u} \times \mathbf{v}) = (\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v} = \mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}).$$

64. If $\mathbf{x}$ is a nonzero vector, then all vectors orthogonal to $\mathbf{x}$ lie in a single plane. But $\mathbf{v} \times \mathbf{w}$ is orthogonal to $\mathbf{v}$ and to $\mathbf{w}$, so if in addition $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = 0$, then $\mathbf{v} \times \mathbf{w}$ is orthogonal to $\mathbf{u}$ as well, and therefore $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ lie in the same plane.

65. Since $\mathbf{v}'$ is orthogonal to both $\mathbf{w}$ and $\mathbf{u}$, it is parallel to $\mathbf{w} \times \mathbf{u}$, so it is a scalar multiple of that vector, say $\mathbf{v}' = k_v(\mathbf{w} \times \mathbf{u})$. Similarly, $\mathbf{w}' = k_w(\mathbf{u} \times \mathbf{v})$ and $\mathbf{u}' = k_u(\mathbf{v} \times \mathbf{w})$. Then

$$\begin{aligned} \mathbf{v}' \cdot \mathbf{v} &= k_v(\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v} = 1 \quad \text{so that} \quad k_v = \frac{1}{\mathbf{v} \cdot (\mathbf{w} \times \mathbf{u})} \quad \text{and therefore} \quad \mathbf{v}' = \frac{\mathbf{w} \times \mathbf{u}}{\mathbf{v} \cdot (\mathbf{w} \times \mathbf{u})} \\ \mathbf{w}' \cdot \mathbf{w} &= k_w(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = 1 \quad \text{so that} \quad k_w = \frac{1}{\mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})} \quad \text{and therefore} \quad \mathbf{w}' = \frac{\mathbf{u} \times \mathbf{v}}{\mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})} \\ \mathbf{u}' \cdot \mathbf{u} &= k_u(\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u} = 1 \quad \text{so that} \quad k_u = \frac{1}{\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})} \quad \text{and therefore} \quad \mathbf{u}' = \frac{\mathbf{v} \times \mathbf{w}}{\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})}. \end{aligned}$$

66. We first compute $\mathbf{v} \times \mathbf{w}$:

$$\begin{aligned} \mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & -2 & 4 \\ 3 & 6 & -2 \end{vmatrix} \\ &= \begin{vmatrix} -2 & 4 \\ 6 & -2 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 3 & 4 \\ 3 & -2 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 3 & -2 \\ 3 & 6 \end{vmatrix} \mathbf{k} \\ &= (-2 \cdot (-2) - 4 \cdot 6)\mathbf{i} - (3 \cdot (-2) - 4 \cdot 3)\mathbf{j} + (3 \cdot 6 - (-2) \cdot 3)\mathbf{k} \\ &= -20\mathbf{i} + 18\mathbf{j} + 24\mathbf{k}. \end{aligned}$$

Then the volume of the parallelepiped is

$$|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})| = |(2\mathbf{i} + \mathbf{j} - 2\mathbf{k}) \cdot (-20\mathbf{i} + 18\mathbf{j} + 24\mathbf{k})| = |2 \cdot (-20) + 1 \cdot 18 - 2 \cdot 24| = \boxed{70}.$$

67. We first compute $\mathbf{v} \times \mathbf{w}$:

$$\begin{aligned}
 \mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 3 & -8 \\ 1 & 0 & 6 \end{vmatrix} \\
 &= \begin{vmatrix} 3 & -8 \\ 0 & 6 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & -8 \\ 1 & 6 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & 3 \\ 1 & 0 \end{vmatrix} \mathbf{k} \\
 &= (3 \cdot 6 - (-8) \cdot 0) \mathbf{i} - (2 \cdot 6 - (-8) \cdot 1) \mathbf{j} + (2 \cdot 0 - 3 \cdot 1) \mathbf{k} \\
 &= 18\mathbf{i} - 20\mathbf{j} - 3\mathbf{k}
 \end{aligned}$$

Then the volume of the parallelepiped is

$$|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})| = |(8\mathbf{i} - 6\mathbf{j} + 5\mathbf{k}) \cdot (18\mathbf{i} - 20\mathbf{j} - 3\mathbf{k})| = |8 \cdot 18 - 6 \cdot (-20) + 5 \cdot (-3)| = \boxed{249}.$$

68. Let $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$, $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ and $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$. Then

$$\begin{aligned}
 \mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} \\
 &= (v_2w_3 - v_3w_2)\mathbf{i} - (v_1w_3 - v_3w_1)\mathbf{j} + (v_1w_2 - v_2w_1)\mathbf{k} \\
 &= (v_2w_3 - v_3w_2)\mathbf{i} + (v_3w_1 - v_1w_3)\mathbf{j} + (v_1w_2 - v_2w_1)\mathbf{k}.
 \end{aligned}$$

Next,

$$\begin{aligned}
 \mathbf{u} \times (\mathbf{v} \times \mathbf{w}) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_2w_3 - v_3w_2 & v_3w_1 - v_1w_3 & v_1w_2 - v_2w_1 \end{vmatrix} \\
 &= \begin{vmatrix} u_2 & u_3 \\ v_3w_1 - v_1w_3 & v_1w_2 - v_2w_1 \end{vmatrix} \mathbf{i} - \begin{vmatrix} u_1 & u_3 \\ v_2w_3 - v_3w_2 & v_1w_2 - v_2w_1 \end{vmatrix} \mathbf{j} \\
 &\quad + \begin{vmatrix} u_1 & u_2 \\ v_2w_3 - v_3w_2 & v_3w_1 - v_1w_3 \end{vmatrix} \mathbf{k} \\
 &= (u_2v_1w_2 - u_2v_2w_1 - u_3v_3w_1 + u_3v_1w_3)\mathbf{i} \\
 &\quad - (u_1v_1w_2 - u_1v_2w_1 - u_3v_2w_3 + u_3v_3w_2)\mathbf{j} \\
 &\quad + (u_1v_3w_1 - u_1v_1w_3 - u_2v_2w_3 + u_2v_3w_2)\mathbf{k} \\
 &= (u_2v_1w_2 - u_2v_2w_1 - u_3v_3w_1 + u_3v_1w_3)\mathbf{i} \\
 &\quad + (u_1v_2w_1 - u_1v_1w_2 + u_3v_2w_3 - u_3v_3w_2)\mathbf{j} \\
 &\quad + (u_1v_3w_1 - u_1v_1w_3 - u_2v_2w_3 + u_2v_3w_2)\mathbf{k}
 \end{aligned}$$

The other side of the formula is

$$\begin{aligned}
 (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w} &= ((u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}) \cdot (w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}))(v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}) \\
 &\quad - ((u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}) \cdot (v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}))(w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}) \\
 &= (u_1w_1 + u_2w_2 + u_3w_3)(v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}) - (u_1v_1 + u_2v_2 + u_3v_3)(w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}) \\
 &= (u_1v_1w_1 - u_1v_1w_1 + u_2v_1w_2 - u_2v_2w_1 + u_3v_1w_3 - u_3v_3w_1)\mathbf{i} \\
 &\quad + (u_1v_2w_1 - u_1v_1w_2 + u_2v_2w_2 - u_2v_2w_2 + u_3v_2w_3 - u_3v_3w_2)\mathbf{j} \\
 &\quad + (u_1v_3w_1 - u_1v_1w_3 + u_2v_3w_2 - u_2v_2w_3 + u_3v_3w_3 - u_3v_3w_3)\mathbf{k} \\
 &= (u_2v_1w_2 - u_2v_2w_1 + u_3v_1w_3 - u_3v_3w_1)\mathbf{i} \\
 &\quad + (u_1v_2w_1 - u_1v_1w_2 + u_3v_2w_3 - u_3v_3w_2)\mathbf{j} \\
 &\quad + (u_1v_3w_1 - u_1v_1w_3 + u_2v_3w_2 - u_2v_2w_3)\mathbf{k}.
 \end{aligned}$$

The two expressions are the same.

69. Using Problem 68, we have

$$\begin{aligned}
 \mathbf{u} \times (\mathbf{v} \times \mathbf{w}) + \mathbf{v} \times (\mathbf{w} \times \mathbf{u}) + \mathbf{w} \times (\mathbf{u} \times \mathbf{v}) \\
 &= (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w} + (\mathbf{v} \cdot \mathbf{u})\mathbf{w} - (\mathbf{v} \cdot \mathbf{w})\mathbf{u} + (\mathbf{w} \cdot \mathbf{v})\mathbf{u} - (\mathbf{w} \cdot \mathbf{u})\mathbf{v} \\
 &= (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{w} \cdot \mathbf{u})\mathbf{v} + (\mathbf{v} \cdot \mathbf{u})\mathbf{w} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w} + (\mathbf{w} \cdot \mathbf{v})\mathbf{u} - (\mathbf{v} \cdot \mathbf{w})\mathbf{u} \\
 &= \mathbf{0},
 \end{aligned}$$

since the dot product is commutative.

70. We have

$$\begin{aligned}
 (\mathbf{a} \times \mathbf{b}) \cdot (\mathbf{c} \times \mathbf{d}) &= ((\mathbf{a} \times \mathbf{b}) \times \mathbf{c}) \cdot \mathbf{d} && \text{(Problem 62)} \\
 &= -(\mathbf{c} \times (\mathbf{a} \times \mathbf{b})) \cdot \mathbf{d} && \text{(Cross product is anticommutative)} \\
 &= -((\mathbf{c} \cdot \mathbf{b})\mathbf{a} - (\mathbf{c} \cdot \mathbf{a})\mathbf{b}) \cdot \mathbf{d} && \text{(Problem 68)} \\
 &= ((\mathbf{c} \cdot \mathbf{a})\mathbf{b} - (\mathbf{c} \cdot \mathbf{b})\mathbf{a}) \cdot \mathbf{d} && \text{(Algebraic manipulation)} \\
 &= (\mathbf{c} \cdot \mathbf{a})(\mathbf{b} \cdot \mathbf{d}) - (\mathbf{c} \cdot \mathbf{b})(\mathbf{a} \cdot \mathbf{d}) && \text{(Properties of dot product)} \\
 &= (\mathbf{a} \cdot \mathbf{c})(\mathbf{b} \cdot \mathbf{d}) - (\mathbf{a} \cdot \mathbf{d})(\mathbf{b} \cdot \mathbf{c}) && \text{(Dot product and multiplication are commutative)}
 \end{aligned}$$

71. We have

$$\begin{aligned}
 (\mathbf{a} \times \mathbf{b}) \times (\mathbf{c} \times \mathbf{d}) &= [(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{d}]\mathbf{c} - [(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c}]\mathbf{d} && \text{(Problem 68)} \\
 &= [(\mathbf{a} \cdot (\mathbf{b} \times \mathbf{d}))]\mathbf{c} - [(\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}))]\mathbf{d} && \text{(Problem 62)}.
 \end{aligned}$$

72. Consider the following parallelogram with sides $\mathbf{u}$ and $\mathbf{v}$:

The diagonals are perpendicular when $(\mathbf{u} + \mathbf{v}) \cdot (\mathbf{u} - \mathbf{v}) = 0$. But

$$(\mathbf{u} + \mathbf{v}) \cdot (\mathbf{u} - \mathbf{v}) = \mathbf{u} \cdot \mathbf{u} - \mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{u} - \mathbf{v} \cdot \mathbf{v} = \|\mathbf{u}\|^2 - \|\mathbf{v}\|^2$$

since the dot product is commutative. Therefore the diagonals are perpendicular if and only if $\|\mathbf{u}\|^2 = \|\mathbf{v}\|^2$, which happens exactly when $\|\mathbf{u}\| = \|\mathbf{v}\|$; that is, when $\mathbf{u}$ and $\mathbf{v}$ have equal lengths. Therefore the diagonals are perpendicular precisely when the parallelogram is a rhombus.

73. For the altitudes, consider the diagram below:

Given $\triangle ABC$, we draw altitudes BE and AD meeting in H , and then extend CH to meet AB at F . We know that $\overrightarrow{AD}$ is orthogonal to $\overrightarrow{BC}$. But $\overrightarrow{AD}$ and $\overrightarrow{AH}$ are parallel, so that $\overrightarrow{AH}$ is orthogonal to $\overrightarrow{BC}$ as well; that is, $\overrightarrow{AH} \cdot \overrightarrow{BC} = 0$. Also $\overrightarrow{BE}$ is orthogonal to $\overrightarrow{AC}$. But $\overrightarrow{BE}$ and $\overrightarrow{BH}$ are parallel, so that $\overrightarrow{BH}$ is orthogonal to $\overrightarrow{AC}$ as well; that is, $\overrightarrow{BH} \cdot \overrightarrow{AC} = 0$. We must show that $\overrightarrow{CF} \cdot \overrightarrow{AB} = 0$. Use the notation that the vector $\overrightarrow{OX}$ (that is, the point X) may be written $\mathbf{x}$; then

$$\begin{aligned}\overrightarrow{AH} \cdot \overrightarrow{BC} = 0 & \text{ so that } (\mathbf{h} - \mathbf{a}) \cdot (\mathbf{b} - \mathbf{c}) = 0 \text{ and therefore } \mathbf{h} \cdot \mathbf{b} - \mathbf{h} \cdot \mathbf{c} - \mathbf{a} \cdot \mathbf{b} + \mathbf{a} \cdot \mathbf{c} = 0 \\ \overrightarrow{BH} \cdot \overrightarrow{AC} = 0 & \text{ so that } (\mathbf{h} - \mathbf{b}) \cdot (\mathbf{c} - \mathbf{a}) = 0 \text{ and therefore } \mathbf{h} \cdot \mathbf{c} - \mathbf{h} \cdot \mathbf{a} - \mathbf{b} \cdot \mathbf{c} + \mathbf{b} \cdot \mathbf{a} = 0.\end{aligned}$$

Adding these two equations together and canceling like terms gives

$$0 = \mathbf{h} \cdot \mathbf{b} - \mathbf{h} \cdot \mathbf{a} - \mathbf{c} \cdot \mathbf{b} + \mathbf{c} \cdot \mathbf{a} = (\mathbf{h} - \mathbf{c}) \cdot (\mathbf{b} - \mathbf{a}) = \overrightarrow{CH} \cdot \overrightarrow{AB},$$

so that $\overrightarrow{CH}$ and $\overrightarrow{AB}$ are orthogonal. Since $\overrightarrow{CH}$ and $\overrightarrow{CF}$ are parallel, it follows that $\overrightarrow{CF}$ and $\overrightarrow{AB}$ are orthogonal as well. Therefore CF is the third altitudes, so that all the altitudes intersect at the orthocenter H .

For the medians, consider the diagram below:

Here we have drawn all three medians, so that $\overrightarrow{AF} = \overrightarrow{BF}$, $\overrightarrow{BD} = \overrightarrow{DC}$, and $\overrightarrow{AD} = \overrightarrow{EC}$. We have shown the medians meeting at a single point (because they do!), although that is what we want to prove. To prove that they do, we show that any pair of medians intersect at a point that is two thirds of the way along each median. First take AD and BE . Using again the convention that $\mathbf{a} = \overrightarrow{OA}$, the point that is two thirds of the way from B to E along BE is

$$\overrightarrow{OB} + \frac{2}{3}\overrightarrow{BE} = \mathbf{b} + \frac{2}{3}(\mathbf{e} - \mathbf{b}) = \frac{1}{3}\mathbf{b} + \frac{2}{3}\mathbf{e}.$$

However, E is the midpoint of AC , so that

$$\mathbf{e} = \frac{1}{2}(\mathbf{a} + \mathbf{c}).$$

Substituting that into the formula for the intersection point gives

$$\frac{1}{3}\mathbf{b} + \frac{2}{3}\mathbf{e} = \frac{1}{3}\mathbf{b} + \frac{2}{3} \cdot \frac{1}{2}(\mathbf{a} + \mathbf{c}) = \frac{1}{3}(\mathbf{a} + \mathbf{b} + \mathbf{c}).$$

Next take AD and CF . The point that is two thirds of the way from C to F along CF is

$$\overrightarrow{OC} + \frac{2}{3}\overrightarrow{CF} = \mathbf{c} + \frac{2}{3}(\mathbf{f} - \mathbf{c}) = \frac{1}{3}\mathbf{c} + \frac{2}{3}\mathbf{f}.$$

However, F is the midpoint of AB , so that

$$\mathbf{f} = \frac{1}{2}(\mathbf{a} + \mathbf{b}).$$

Substituting that into the formula for the intersection point again gives

$$\frac{1}{3}\mathbf{b} + \frac{2}{3}\mathbf{f} = \frac{1}{3}\mathbf{b} + \frac{2}{3} \cdot \frac{1}{2}(\mathbf{a} + \mathbf{b}) = \frac{1}{3}(\mathbf{a} + \mathbf{b} + \mathbf{c}).$$

So AD , BE , and CF all meet at the point that is the terminal point of the vector $\frac{1}{3}(\mathbf{a} + \mathbf{b} + \mathbf{c})$.

74. Take the dot product of both sides of the given equation with $\mathbf{a}$:

$$(a\mathbf{x} + (\mathbf{x} \times \mathbf{a})) \cdot \mathbf{a} = a\mathbf{x} \cdot \mathbf{a} + (\mathbf{x} \times \mathbf{a}) \cdot \mathbf{a} = \mathbf{b} \cdot \mathbf{a}.$$

Now Problem 62 shows that $(\mathbf{x} \times \mathbf{a}) \cdot \mathbf{a} = \mathbf{x} \cdot (\mathbf{a} \times \mathbf{a}) = \mathbf{0}$ since $\mathbf{a}$ is parallel to itself, so the equation becomes

$$a\mathbf{x} \cdot \mathbf{a} = \mathbf{b} \cdot \mathbf{a}, \text{ so that } \mathbf{x} \cdot \mathbf{a} = \frac{1}{a}\mathbf{b} \cdot \mathbf{a}.$$

Now take the cross product of the left side of the original equation with $\mathbf{a}$:

$$\begin{aligned} (a\mathbf{x} + (\mathbf{x} \times \mathbf{a})) \times \mathbf{a} &= a(\mathbf{x} \times \mathbf{a}) + (\mathbf{x} \times \mathbf{a}) \times \mathbf{a} \\ &= a(\mathbf{x} \times \mathbf{a}) - \mathbf{a} \times (\mathbf{x} \times \mathbf{a}) \\ &= a(\mathbf{x} \times \mathbf{a}) - ((\mathbf{a} \cdot \mathbf{a})\mathbf{x} - (\mathbf{a} \times \mathbf{x})\mathbf{a}) \\ &= a(\mathbf{x} \times \mathbf{a}) - (\mathbf{a} \cdot \mathbf{a})\mathbf{x} + \frac{1}{a}(\mathbf{b} \cdot \mathbf{a})\mathbf{a}. \end{aligned}$$

It follows that the last formula above is equal to the cross product of the right side of the original equation with $\mathbf{a}$, so that

$$a(\mathbf{x} \times \mathbf{a}) - (\mathbf{a} \cdot \mathbf{a})\mathbf{x} + \frac{1}{a}(\mathbf{b} \cdot \mathbf{a})\mathbf{a} = \mathbf{b} \times \mathbf{a}.$$

Solving for $\mathbf{x} \times \mathbf{a}$ gives

$$\mathbf{x} \times \mathbf{a} = \frac{1}{a}\mathbf{b} \times \mathbf{a} + \frac{1}{a}(\mathbf{a} \cdot \mathbf{a})\mathbf{x} - \frac{1}{a^2}(\mathbf{b} \cdot \mathbf{a})\mathbf{a}.$$

We can substitute this expression for $\mathbf{x} \times \mathbf{a}$ in the original equation, giving

$$a\mathbf{x} + \frac{1}{a}\mathbf{b} \times \mathbf{a} + \frac{1}{a}(\mathbf{a} \cdot \mathbf{a})\mathbf{x} - \frac{1}{a^2}(\mathbf{b} \cdot \mathbf{a})\mathbf{a} = \mathbf{b}.$$

Now multiply both sides by a^2 to clear fractions, then solve for $\mathbf{x}$ to get

$$\begin{aligned} \mathbf{x} &= \frac{a^2\mathbf{b} - a(\mathbf{b} \times \mathbf{a}) + (\mathbf{b} \cdot \mathbf{a})\mathbf{a}}{a^3 + a(\mathbf{a} \cdot \mathbf{a})} \\ &= \boxed{\frac{a^2\mathbf{b} + a(\mathbf{a} \times \mathbf{b}) + (\mathbf{a} \cdot \mathbf{b})\mathbf{a}}{a(a^2 + \mathbf{a} \cdot \mathbf{a})}}. \end{aligned}$$

Challenge Problems

75. From Problem 62, the triple scalar product is

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (u_1v_2w_3 - u_1v_3w_2) - (u_2v_1w_3 - u_2v_3w_1) + (u_3v_1w_2 - u_3v_2w_1).$$

Computing the determinant, we get

$$\begin{aligned} \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} &= u_1 \begin{vmatrix} v_2 & v_3 \\ w_2 & w_3 \end{vmatrix} - u_2 \begin{vmatrix} v_1 & v_3 \\ w_1 & w_3 \end{vmatrix} + u_3 \begin{vmatrix} v_1 & v_2 \\ w_1 & w_2 \end{vmatrix} \\ &= u_1(v_2w_3 - v_3w_2) - u_2(v_1w_3 - v_3w_1) + u_3(v_1w_2 - v_2w_1) \\ &= (u_1v_2w_3 - u_1v_3w_2) - (u_2v_1w_3 - u_2v_3w_1) + (u_3v_1w_2 - u_3v_2w_1), \end{aligned}$$

and the two expressions are equal.

76. Consider the diagram preceding Problem 66. The height of the parallelepiped is $\|\mathbf{u}\| \cos \theta$, and the area of the base is $\|\mathbf{v} \times \mathbf{w}\|$. The volume can therefore be computed by an integral from 0 to the height $\|\mathbf{u}\| \cos \theta$ of the area of each cross-section:

$$\int_0^{\|\mathbf{u}\| \cos \theta} \|\mathbf{v} \times \mathbf{w}\| \, dz = [z \|\mathbf{v} \times \mathbf{w}\|]_0^{\|\mathbf{u}\| \cos \theta} = \|\mathbf{u}\| \|\mathbf{v} \times \mathbf{w}\| \cos \theta = |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|$$

by the discussion of the triple scalar product given preceding Problem 60. See also Problem 22 in Section 6.4.

77. To show that the given vector is normal to the plane, it suffices to show that it is orthogonal to any two nonparallel vectors in the plane, say $\mathbf{u}$ and $\mathbf{v}$, since two nonparallel vectors determine a plane. Now,

$$\begin{aligned} (\mathbf{u} \times \mathbf{v} + \mathbf{v} \times \mathbf{w} + \mathbf{w} \times \mathbf{u}) \cdot \mathbf{u} &= -(\mathbf{v} \times \mathbf{u}) \cdot \mathbf{u} + (\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u} + (\mathbf{w} \times \mathbf{u}) \cdot \mathbf{u} \\ &= -\mathbf{v} \cdot (\mathbf{u} \times \mathbf{u}) + (\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u} + \mathbf{w} \cdot (\mathbf{u} \times \mathbf{u}) \\ &= -\mathbf{v} \cdot \mathbf{0} + (\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u} + \mathbf{w} \cdot \mathbf{0} \\ &= (\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u} \\ (\mathbf{u} \times \mathbf{v} + \mathbf{v} \times \mathbf{w} + \mathbf{w} \times \mathbf{u}) \cdot \mathbf{v} &= (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{v} - (\mathbf{w} \times \mathbf{v}) \cdot \mathbf{v} + (\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v} \\ &= \mathbf{u} \cdot (\mathbf{v} \times \mathbf{v}) - \mathbf{w} \cdot (\mathbf{v} \times \mathbf{v}) + (\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v} \\ &= \mathbf{u} \cdot \mathbf{0} - \mathbf{w} \cdot \mathbf{0} + (\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v} \\ &= (\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v}. \end{aligned}$$

However, since $\mathbf{v} \times \mathbf{w}$ is orthogonal to the plane containing $\mathbf{v}$ and $\mathbf{w}$, which also contains $\mathbf{u}$, we see that $(\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u} = 0$; similarly, since $\mathbf{w} \times \mathbf{u}$ is orthogonal to the plane containing $\mathbf{w}$ and $\mathbf{u}$, which also contains $\mathbf{v}$, we see that $(\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v} = 0$. So both of these dot products are zero, and it follows that the given vector is orthogonal to $\mathbf{u}$ and $\mathbf{v}$. Since $\mathbf{w}$ lies in the same plane as $\mathbf{u}$, the given vector is orthogonal to $\mathbf{w}$ as well.

78. A tetrahedron, with one face on the xy -plane, is below:

Let $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ be the vectors from $(0,0,0)$ to each of the three vertices, with $\mathbf{u}$ going to the top vertex. Let θ be the angle that $\mathbf{u}$ makes with the positive z -axis (see the diagram preceding Problem 66 as well). Then the tip of the pyramid has z -coordinate $\|\mathbf{u}\| \cos \theta$. We will compute the volume of this pyramid as an integral along the z coordinate, where the area of each cross-section is a triangle. At the base ($z = 0$), the area is the area of the triangle with sides $\mathbf{v}$ and $\mathbf{w}$, which, from Problem 49, is $\frac{1}{2} \|\mathbf{v} \times \mathbf{w}\|$. Using similar triangles on each face, we see that two of the sides of the cross-sectional triangle at a height z are

$$\left(1 - \frac{z}{\|\mathbf{u}\| \cos \theta}\right) \mathbf{v} \text{ and } \left(1 - \frac{z}{\|\mathbf{u}\| \cos \theta}\right) \mathbf{w}.$$

So again from Problem 49, the area of the cross-sectional triangle at height z is

$$\frac{1}{2} \left(1 - \frac{z}{\|\mathbf{u}\| \cos \theta}\right)^2 \|\mathbf{v} \times \mathbf{w}\|.$$

In what follows, write $h = \|\mathbf{u}\| \cos \theta$ for simplicity. Then the volume of the pyramid is

$$\begin{aligned} \int_0^h \frac{1}{2} \left(1 - \frac{z}{h}\right)^2 \|\mathbf{v} \times \mathbf{w}\| \, dz &= \frac{1}{2} \|\mathbf{v} \times \mathbf{w}\| \int_0^h \left(1 - \frac{2}{h}z + \frac{1}{h^2}z^2\right) \, dz \\ &= \frac{1}{2} \|\mathbf{v} \times \mathbf{w}\| \left[z - \frac{1}{h}z^2 + \frac{1}{3h^2}z^3\right]_0^h \\ &= \frac{1}{2} \|\mathbf{v} \times \mathbf{w}\| \left(h - h + \frac{1}{3}h\right) \\ &= \frac{1}{6} h \|\mathbf{v} \times \mathbf{w}\| \\ &= \frac{1}{6} \|\mathbf{u}\| \|\mathbf{v} \times \mathbf{w}\| \cos \theta \\ &= \frac{1}{6} |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|. \end{aligned}$$

79. (a) The magnitude of the force is $\|\mathbf{F}\| = |q| \|\mathbf{v} \times \mathbf{B}\| = |q| \|\mathbf{v}\| \|\mathbf{B}\| \sin \theta$, from which the magnitude of $\mathbf{v}$ equals

$$\|\mathbf{v}\| = \frac{\|\mathbf{F}\|}{|q| \|\mathbf{B}\| \sin \theta}.$$

For minimum velocity, $\sin \theta$ must be a maximum, so $\sin \theta = 1$ and $\theta = 90^\circ$. That is, the velocity $\mathbf{v}$ is orthogonal to the magnetic field $\mathbf{B}$. Then

$$\|\mathbf{v}\| = \frac{1.63 \times 10^{-13} \text{ N}}{(1.60 \times 10^{-19} \text{ C})(1.20 \text{ T})(1)} = 8.49 \times 10^5 \text{ m/s}.$$

The direction of the force is in the direction of $q\mathbf{v} \times \mathbf{B}$, and since q is positive for a proton, the force $\mathbf{F}$ is in the direction of $\mathbf{v} \times \mathbf{B}$. We know the force $\mathbf{F}$ is horizontal and to the left, and parallel to $-\mathbf{i}$, so $\mathbf{v} \times \mathbf{B}$ is parallel to $-\mathbf{i}$. The field $\mathbf{B}$ points vertically downward and is parallel to $-\mathbf{j}$. Therefore the velocity $\mathbf{v}$ is parallel to $-\mathbf{k}$.

- (b) Answers will vary.

80. Fix axes so that the positive z -axis is pointing to the north and the positive x -axis is pointing to the east; the direction of the positive y -axis is into the earth, determined by the right-hand rule.

- (a) If the electrons move from north to south, their velocity is $-2 \times 10^6 \mathbf{k}$ m/s, and we have

$$\begin{aligned} \mathbf{F}_{\text{mag}} &= q\mathbf{v} \times \mathbf{B} \\ &= 1.6 \times 10^{-19}(-2 \times 10^6 \mathbf{k}) \times (5 \times 10^{-3} \mathbf{k}) \\ &= -1.6 \times 10^{-15} \mathbf{k} \times \mathbf{k} \\ &= \boxed{\mathbf{0}} \end{aligned}$$

since the cross product of parallel vectors is zero.

- (b) If the electrons move from west to east, their velocity is $2 \times 10^6 \mathbf{i}$ m/s, and we have

$$\begin{aligned} \mathbf{F}_{\text{mag}} &= q\mathbf{v} \times \mathbf{B} \\ &= 1.6 \times 10^{-19}(2 \times 10^6 \mathbf{i}) \times (5 \times 10^{-3} \mathbf{k}) \\ &= 1.6 \times 10^{-15} \mathbf{i} \times \mathbf{k} \\ &= \boxed{1.6 \times 10^{-15} \mathbf{j} \text{ N}}. \end{aligned}$$

The resultant force points into the earth.

81. Fix axes so that the positive z -axis is pointing to the north and the positive x -axis is pointing to the east; the direction of the positive y -axis is into the earth, determined by the right-hand rule. The cord lies in the xz plane; suppose it makes an angle θ with the positive x -axis. Its length has magnitude 2, so

$$\mathbf{L} = 2(\cos \theta \mathbf{i} + \sin \theta \mathbf{k}) = 2 \cos \theta \mathbf{i} + 2 \sin \theta \mathbf{k}.$$

The magnetic field $\mathbf{B}$ is given by $\mathbf{B} = 5 \times 10^{-3} \mathbf{k}$, and $I = 5$. Then

$$\begin{aligned} \mathbf{F}_{\text{mag}} &= I\mathbf{L} \times \mathbf{B} \\ &= 5(2 \cos \theta \mathbf{i} + 2 \sin \theta \mathbf{k}) \times (5 \times 10^{-3} \mathbf{k}) \\ &= 0.05(\cos \theta \mathbf{i} \times \mathbf{k} + \sin \theta \mathbf{k} \times \mathbf{k}) \\ &= -0.05 \cos \theta \mathbf{j}. \end{aligned}$$

- (a) The minimum magnitude force is $\boxed{\text{zero}}$; this happens when $\cos \theta = 0$, which is when the cord is at an angle of 90° with the positive x -axis. This means that it is pointing due north and south.
- (b) The maximum magnitude force occurs when $\cos \theta = \pm 1$; when that happens, the magnitude of the force is $\|\mathbf{F}_{\text{mag}}\| = \|\pm 0.05 \mathbf{j}\| = \boxed{0.05 \text{ N}}$. This occurs when the cord is at an angle of 0° (or 180°) with the positive x -axis, so that it is lying due east and west.

- (c) For the magnitude of the force to be half its maximum value, or 0.025, we need $\cos \theta = \pm \frac{1}{2}$, so that $\theta = \pm 60^\circ$ or $\pm 120^\circ$. The cord should be lying at an angle of 60° from east-west, so it should be lying at an angle of $\boxed{30^\circ \text{ from the direction of } \mathbf{B}}$.

10.6: Equations of Lines and Planes in Space

Concepts and Vocabulary

- False. The direction vector of this line is found by looking at the denominators, so one direction vector is $2\mathbf{i} + \mathbf{j} - \mathbf{k}$.
- False. If the lines lie in the same plane, then they are either parallel or they intersect; in either case, they are not skew.
- True. See the discussion in objective 6.
- False. Two planes are parallel if and only if their normal vectors are parallel. However, the normal vector of p_1 is $2\mathbf{i} + 3\mathbf{j} - \mathbf{k}$ and that of p_2 is $6\mathbf{i} + 3\mathbf{j} - 3\mathbf{k}$; these two vectors are not multiples of each other, so are not parallel.
- False. The two planes are parallel, since they each have normal vector $\mathbf{i} + 2\mathbf{j} + \mathbf{k}$, but they are not one unit apart. To see how far apart they are, take the point $(3, 0, 0)$ on the first plane and compute its distance from the second plane using the formula in the text:

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|1 \cdot 3 + 2 \cdot 0 + 1 \cdot 0 - 4|}{\sqrt{1^2 + 2^2 + 1^2}} = \frac{1}{\sqrt{6}}.$$

- Answers will vary.
- Answers will vary.
- Two distinct lines in space that do not intersect and are not parallel are called *skew lines*.

Skill Building

9. (a) Since we are given a direction vector $\mathbf{D} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$ and a point $\mathbf{r}_0 = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ on the line, a vector equation for the line is

$$\mathbf{r} = \mathbf{r}_0 + t\mathbf{D} = (\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) + t(2\mathbf{i} - \mathbf{j} + \mathbf{k}) = \boxed{(1 + 2t)\mathbf{i} + (2 - t)\mathbf{j} + (3 + t)\mathbf{k}}.$$

- (b) From part (a), a set of parametric equations is

$$\boxed{x = 1 + 2t, \quad y = 2 - t, \quad z = 3 + t}.$$

- (c) Solving the equations in part (b) for t gives the symmetric form

$$\boxed{\frac{x - 1}{2} = \frac{y - 2}{-1} = \frac{z - 3}{1}}.$$

10. (a) Since we are given a direction vector $\mathbf{D} = \mathbf{i} + \mathbf{j}$ and a point $\mathbf{r}_0 = 4\mathbf{i} - \mathbf{j} + 6\mathbf{k}$ on the line, a vector equation for the line is

$$\mathbf{r} = \mathbf{r}_0 + t\mathbf{D} = (4\mathbf{i} - \mathbf{j} + 6\mathbf{k}) + t(\mathbf{i} + \mathbf{j}) = \boxed{(4 + t)\mathbf{i} + (-1 + t)\mathbf{j} + 6\mathbf{k}}.$$

- (b) From part (a), a set of parametric equations is

$$\boxed{x = 4 + t, \quad y = -1 + t, \quad z = 6}.$$

(c) Solving the first two equations in part (b) for t gives the symmetric form

$$\boxed{\frac{x-4}{1} = \frac{y+1}{1}, \quad z=6}.$$

11. Answers may vary depending on the choice of $\mathbf{D}$ and $\mathbf{r}_0$.

(a) Since we are given two points, we can compute a direction vector

$$\mathbf{D} = \overrightarrow{P_0P_1} = \langle 4, 2, 1 \rangle - \langle 1, -1, 3 \rangle = \langle 3, 3, -2 \rangle = 3\mathbf{i} + 3\mathbf{j} - 2\mathbf{k}.$$

Using P_0 for the point on the line, we get the vector equation

$$\mathbf{r} = \mathbf{r}_0 + t\mathbf{D} = \mathbf{i} - \mathbf{j} + 3\mathbf{k} + t(3\mathbf{i} + 3\mathbf{j} - 2\mathbf{k}) = \boxed{(1+3t)\mathbf{i} + (-1+3t)\mathbf{j} + (3-2t)\mathbf{k}}.$$

(b) From part (a), a set of parametric equations is

$$\boxed{x = 1 + 3t, \quad y = -1 + 3t, \quad z = 3 - 2t}.$$

(c) Solving the equations in part (b) for t gives the symmetric form

$$\boxed{\frac{x-1}{3} = \frac{y+1}{3} = \frac{z-3}{-2}}.$$

12. Answers may vary depending on the choice of $\mathbf{D}$ and $\mathbf{r}_0$.

(a) Since we are given two points, we can compute a direction vector

$$\mathbf{D} = \overrightarrow{P_0P_1} = \langle 1, -1, 2 \rangle - \langle -2, 3, 0 \rangle = \langle 3, -4, 2 \rangle = 3\mathbf{i} - 4\mathbf{j} + 2\mathbf{k}.$$

Using P_1 for the point on the line, we get the vector equation

$$\mathbf{r} = \mathbf{r}_0 + t\mathbf{D} = \mathbf{i} - \mathbf{j} + 2\mathbf{k} + t(3\mathbf{i} - 4\mathbf{j} + 2\mathbf{k}) = \boxed{(1+3t)\mathbf{i} + (-1-4t)\mathbf{j} + (2+2t)\mathbf{k}}.$$

(b) From part (a), a set of parametric equations is

$$\boxed{x = 1 + 3t, \quad y = -1 - 4t, \quad z = 2 + 2t}.$$

(c) Solving the equations in part (b) for t gives the symmetric form

$$\boxed{\frac{x-1}{3} = \frac{y+1}{-4} = \frac{z-2}{2}}.$$

13. The direction vector of the line

$$\frac{x+1}{5} = \frac{y-2}{4} = \frac{z-3}{-3}$$

is $5\mathbf{i} + 4\mathbf{j} - 3\mathbf{k}$. So we want a line with that direction vector passing through $(-1, 5, 6)$. Such a line has vector form

$$-\mathbf{i} + 5\mathbf{j} + 6\mathbf{k} + t(5\mathbf{i} + 4\mathbf{j} - 3\mathbf{k}),$$

and therefore parametric form

$$\boxed{x = -1 + 5t, \quad y = 5 + 4t, \quad z = 6 - 3t}.$$

14. The direction vector of the line

$$\frac{x+1}{6} = \frac{y+2}{2} = \frac{z}{-1}$$

is $6\mathbf{i} + 2\mathbf{j} - \mathbf{k}$. So we want a line with that direction vector passing through $(1, -2, -3)$. Such a line has vector form

$$\mathbf{i} - 2\mathbf{j} - 3\mathbf{k} + t(6\mathbf{i} + 2\mathbf{j} - \mathbf{k}),$$

and therefore parametric form

$$\boxed{x = 1 + 6t, \quad y = -2 + 2t, \quad z = -3 - t}.$$

15. Answers will vary.

16. Rewriting $x + 1$ as $\frac{x+1}{1}$ and $y + 3$ as $\frac{y+3}{1}$, we get the line

$$\frac{x+1}{1} = \frac{y+3}{1} = \frac{z+4}{2}.$$

A direction vector for this line is the vector whose components are the denominators of the fractions, so it is $\mathbf{D} = \mathbf{i} + \mathbf{j} + 2\mathbf{k}$. This is a vector in the direction of the line. One point on the line is $(-1, -3, -4)$, since then all three numerators are zero so the fractions are equal. To find a second point, take for example $x = 1$; then the equations become

$$\frac{1+1}{1} = 2 = \frac{y+3}{1} = \frac{z+4}{2}.$$

Solving for y and z gives $y = -1$ and $z = 0$. So a second point on the line is $(1, -1, 0)$. Answers may vary depending on the choice of x .

17. For $\mathbf{D} = 2\mathbf{i} + \mathbf{k}$, $a = 2$, $b = 0$, and $c = 1$. So the symmetric equations of the line through $P_0 = (4, 2, 1)$ in direction $\mathbf{D}$ are

$$\boxed{\frac{x-4}{2} = \frac{z-1}{1}, \quad y = 2}.$$

18. For $\mathbf{D} = 2\mathbf{k} - \mathbf{j}$, $a = 0$, $b = -1$, and $c = 2$. So the symmetric equations of the line through $P_0 = (-1, 2, 0)$ in direction $\mathbf{D}$ are

$$\boxed{x = -1, \quad \frac{y-2}{-1} = \frac{z}{2}}.$$

19. The direction vectors of the two given lines are $\mathbf{u} = 2\mathbf{i} + 3\mathbf{j} - 2\mathbf{k}$ and $\mathbf{v} = 3\mathbf{i} + \mathbf{j} + 2\mathbf{k}$. So a vector perpendicular to both of these is

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 3 & -2 \\ 3 & 1 & 2 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 3 & -2 \\ 1 & 2 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 2 & -2 \\ 3 & 2 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 2 & 3 \\ 3 & 1 \end{vmatrix} = 8\mathbf{i} - 10\mathbf{j} - 7\mathbf{k}.$$

We want symmetric equations of a line through $P_0 = (0, 0, 0)$ with direction vector $\mathbf{D} = 8\mathbf{i} - 10\mathbf{j} - 7\mathbf{k}$. Then $a = 8$, $b = -10$, and $c = -7$, so the equations are

$$\boxed{\frac{x}{8} = \frac{y}{-10} = \frac{z}{-7}}.$$

The negative of these equations, which is $\boxed{\frac{x}{-8} = \frac{y}{10} = \frac{z}{7}}$, is also a valid answer.

20. The direction vectors of the two given lines are $\mathbf{u} = 4\mathbf{i} + 2\mathbf{j} + \mathbf{k}$ and $\mathbf{v} = 5\mathbf{i} + 3\mathbf{j} + \mathbf{k}$. So a vector perpendicular to both of these is

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & 2 & 1 \\ 5 & 3 & 1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 2 & 1 \\ 3 & 1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 4 & 1 \\ 5 & 1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 4 & 2 \\ 5 & 3 \end{vmatrix} = -\mathbf{i} + \mathbf{j} + 2\mathbf{k}.$$

We want symmetric equations of a line through $P_0 = (0, 0, 0)$ with direction vector $\mathbf{D} = -\mathbf{i} + \mathbf{j} + 2\mathbf{k}$. Then $a = -1$, $b = 1$, and $c = 2$, so the equations are

$$\boxed{\frac{x}{-1} = \frac{y}{1} = \frac{z}{2}}.$$

21. A vector perpendicular to both $\mathbf{u}$ and $\mathbf{v}$ is

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 4 & -2 \\ -3 & -2 & 1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 4 & -2 \\ -2 & 1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 2 & -2 \\ -3 & 1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 2 & 4 \\ -3 & -2 \end{vmatrix} = 4\mathbf{j} + 8\mathbf{k}.$$

We can divide through by 4 and use instead the vector $\mathbf{D} = \mathbf{j} + 2\mathbf{k}$. Then we want symmetric equations of a line through $P_0 = (1, 2, -1)$ with direction vector $\mathbf{D}$, so that $a = 0$, $b = 1$, and $c = 2$ and therefore the equations are

$$\boxed{x = 1, \quad \frac{y - 2}{1} = \frac{z + 1}{2}}.$$

22. A vector perpendicular to both $\mathbf{u}$ and $\mathbf{v}$ is

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2 & 2 & -3 \\ 4 & 2 & 1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 2 & -3 \\ 2 & 1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} -2 & -3 \\ 4 & 1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} -2 & 2 \\ 4 & 2 \end{vmatrix} = 8\mathbf{i} - 10\mathbf{j} - 12\mathbf{k}.$$

We can divide through by 2 and use instead the vector $\mathbf{D} = 4\mathbf{j} - 5\mathbf{j} - 6\mathbf{k}$. Then we want symmetric equations of a line through $P_0 = (-1, 3, 2)$ with direction vector $\mathbf{D}$, so that $a = 4$, $b = -5$, and $c = -6$ and therefore the equations are

$$\boxed{\frac{x + 1}{4} = \frac{y - 3}{-5} = \frac{z - 2}{-6}}.$$

23. (a) Since the direction vector for ℓ_1 is 3 times the direction vector for ℓ_2 , these lines are parallel.
The graph confirms this result.
- (b)

24. (a) The direction vectors are not multiples of each other, so the lines are not parallel. However, they do intersect since for $t_1 = t_2 = 0$, both lines pass through $(3, 0, 3)$. The graph confirms this result.

(b)

25. (a) The direction vectors are not multiples of each other, so the lines are not parallel. To see if they intersect, we must solve the equation

$$4\mathbf{i} + 3\mathbf{j} + t_1(\mathbf{i} - \mathbf{j} + 6\mathbf{k}) = 4\mathbf{i} + 3\mathbf{j} + 2\mathbf{k} + t_2(\mathbf{i} - \mathbf{j} - 2\mathbf{k}).$$

Looking at the $\mathbf{i}$ component, we have $4\mathbf{i} + t_1\mathbf{i} = 4\mathbf{i} + t_2\mathbf{i}$, so that $t_1 = t_2$. The second component gives $3\mathbf{j} - t_1\mathbf{j} = 3\mathbf{j} - t_2\mathbf{j}$, so that again $t_1 = t_2$. The third component, with $t_1 = t_2$, gives $6t_1\mathbf{k} = 2\mathbf{k} - 2t_1\mathbf{k}$, so that $t_1 = \frac{1}{4}$. So the two lines intersect when $t_1 = t_2 = \frac{1}{4}$, which is at the point

$$4\mathbf{i} + 3\mathbf{j} + \frac{1}{4}(\mathbf{i} - \mathbf{j} + 6\mathbf{k}) = \frac{17}{4}\mathbf{i} + \frac{11}{4}\mathbf{j} + \frac{3}{2}\mathbf{k}.$$

The graph confirms this result.

(b)

26. (a) Since the direction vector for ℓ_1 is -2 times the direction vector for ℓ_2 , these lines are parallel. The graph confirms this result.

(b)

27. (a) The direction vector for ℓ_1 is $2\mathbf{i} + 3\mathbf{j} + 4\mathbf{k}$, while the direction vector for ℓ_2 is $-4\mathbf{i} - 6\mathbf{j} - 8\mathbf{k}$, which is twice that for ℓ_1 . Therefore these lines are parallel. The graph confirms this result.

(b)

28. (a) The direction vector for ℓ_1 is $3\mathbf{i} + 4\mathbf{j} + \mathbf{k}$, while the direction vector for ℓ_2 is $3\mathbf{i} + 4\mathbf{j} + 2\mathbf{k}$. Since these vectors are not multiples of one another, the two lines are not parallel. To see if they intersect, we use the symmetric equations to derive the vector form of the two lines:

$$\ell_1 : 2\mathbf{j} - 4\mathbf{k} + t_1(3\mathbf{i} + 4\mathbf{j} + \mathbf{k}), \quad \ell_2 : -6\mathbf{i} - 2\mathbf{j} + 3\mathbf{k} + t_2(3\mathbf{i} + 4\mathbf{j} + 2\mathbf{k}).$$

To see if these lines intersect, we must see if the system

$$\begin{aligned} 3t_1 &= -6 + 3t_2 \\ 2 + 4t_1 &= -2 + 4t_2 \\ -4 + t_1 &= 3 + 2t_2. \end{aligned}$$

The third equation gives $t_1 = 2t_2 + 7$; substituting into the first equation gives

$$3(2t_2 + 7) = -6 + 3t_2, \text{ so that } 3t_2 = -27 \text{ and therefore } t_2 = -9.$$

Then $t_1 = 2 \cdot (-9) + 7 = -11$; substituting these values into the second equation gives

$$2 + 4 \cdot (-11) = -2 + 4 \cdot (-9), \text{ or } -42 = -38,$$

which is false. So this set of equations has no solution, and the lines are skew. The graph appears to confirm this result.

(b)

29. (a) The direction vector for ℓ_1 is $5\mathbf{i} + 4\mathbf{j} - 3\mathbf{k}$, while the direction vector for ℓ_2 is $6\mathbf{i} + 3\mathbf{j} + 2\mathbf{k}$. Since these vectors are not multiples of one another, the two lines are not parallel. To see if they intersect, we use the symmetric equations to derive the vector form of the two lines:

$$\ell_1 : -\mathbf{i} + 2\mathbf{j} + 3\mathbf{k} + t_1(5\mathbf{i} + 4\mathbf{j} - 3\mathbf{k}), \quad \ell_2 : -\mathbf{i} + 2\mathbf{j} - 3\mathbf{k} + t_2(6\mathbf{i} + 3\mathbf{j} + 2\mathbf{k}).$$

To see if these lines intersect, we must see if the system

$$\begin{aligned} -1 + 5t_1 &= -1 + 6t_2 \\ 2 + 4t_1 &= 2 + 3t_2 \\ 3 - 3t_1 &= -3 + 2t_2. \end{aligned}$$

The first two equations give $5t_1 = 6t_2$ and $4t_1 = 3t_2$, so that $t_1 = t_2 = 0$. But $t_1 = t_2 = 0$ does not satisfy the third equation, so this set of equations has no solution, and the lines are skew. The graph appears to confirm this result.

(b)

30. (a) The direction vector for ℓ_1 is $6\mathbf{i} + 3\mathbf{j} - \mathbf{k}$, while the direction vector for ℓ_2 is $\mathbf{i} + 3\mathbf{j} + 2\mathbf{k}$. Since these vectors are not multiples of one another, the two lines are not parallel. To see if they intersect, we use the symmetric equations to derive the vector form of the two lines:

$$\ell_1 : -5\mathbf{i} + 2\mathbf{j} + 4\mathbf{k} + t_1(6\mathbf{i} + 3\mathbf{j} - \mathbf{k}), \quad \ell_2 : 2\mathbf{j} + 8\mathbf{k} + t_2(\mathbf{i} + 3\mathbf{j} + 2\mathbf{k}).$$

To see if these lines intersect, we must see if the system

$$\begin{aligned} -5 + 6t_1 &= t_2 \\ 2 + 3t_1 &= 2 + 3t_2 \\ 4 - t_1 &= 8 + 2t_2. \end{aligned}$$

The second equation gives $t_1 = t_2$; substituting t_1 for t_2 in the first equation and solving gives $t_1 = 1$, so that $t_2 = 1$. But $t_1 = t_2 = 1$ does not satisfy the third equation. So these lines are skew. The graph appears to confirm this result.

31. The general equation of a plane with normal $\langle a, b, c \rangle$ is $ax + by + cz = d$ for some d . So the equation of this plane is $2x - y + z = d$; substituting $(1, -1, 2)$ for (x, y, z) gives $2 \cdot 1 - 1 \cdot (-1) + 2 = 5 = d$. The equation of the plane is $\boxed{2x - y + z = 5}$.
32. The general equation of a plane with normal $\langle a, b, c \rangle$ is $ax + by + cz = d$ for some d . So the equation of this plane is $x + y - 2z = d$; substituting $(-3, 2, 1)$ for (x, y, z) gives $-3 + 2 - 2 \cdot 1 = -3$. The equation of the plane is $\boxed{x + y - 2z = -3}$.
33. Since the desired plane is parallel to $x + 2y - z = 6$, it is of the form $x + 2y - z = d$. Substituting the given point $(0, 5, -2)$ for (x, y, z) gives $0 + 2 \cdot 5 - (-2) = 12 = d$, so the equation of the plane is $\boxed{x + 2y - z = 12}$.
34. Since the desired plane is parallel to $2x - y + 3z = 10$, it is of the form $2x - y + 3z = d$. Substituting the given point $(1, -2, 0)$ for (x, y, z) gives $2 \cdot 1 - (-2) + 3 \cdot 0 = 4 = d$, so the equation of the plane is $\boxed{2x - y + 3z = 4}$.
35. The direction vector of the given line is determined by looking at the denominators; it is $2\mathbf{i} + 5\mathbf{j} - 2\mathbf{k}$. Since the desired plane is normal to the line, this vector is a normal vector to the plane, so the plane has equation $2x + 5y - 2z = d$. Substituting the given point $(2, 3, -1)$ for (x, y, z) gives $2 \cdot 2 + 5 \cdot 3 - 2 \cdot (-1) = 21 = d$, so the equation of the plane is $\boxed{2x + 5y - 2z = 21}$.
36. The direction vector of the given line is determined by looking at the denominators; it is $3\mathbf{i} + 4\mathbf{j} + 4\mathbf{k}$. Since the desired plane is normal to the line, this vector is a normal vector to the plane, so the plane has equation $3x + 4y + 4z = d$. Substituting the given point $(-1, 2, 3)$ for (x, y, z) gives $3 \cdot (-1) + 4 \cdot 2 + 4 \cdot 3 = 17 = d$, so the equation of the plane is $\boxed{3x + 4y + 4z = 17}$.
37. A normal vector to the xy -plane is $\mathbf{k}$, so that also forms a normal to the desired plane. Therefore, the plane has equation $z = d$ for some d . Since it contains $(0, 0, 4)$, we have $4 = d$ and the equation is $\boxed{z = 4}$.
38. A normal vector to the yz -plane is $\mathbf{i}$, so that also forms a normal to the desired plane. Therefore, the plane has equation $x = d$ for some d . Since it contains $(2, 0, 0)$, we have $2 = d$ and the equation is $\boxed{x = 2}$.

39. A normal vector to the xz -plane is $\mathbf{j}$, so that also forms a normal to the desired plane. Therefore, the plane has equation $y = d$ for some d . Since it contains $(1, -2, 3)$, we have $-2 = d$ and the equation is $\boxed{y = -2}$.

40. A normal vector to the xy -plane is $\mathbf{k}$, so that also forms a normal to the desired plane. Therefore, the plane has equation $z = d$ for some d . Since it contains $(1, -3, 4)$, we have $4 = d$ and the equation is $\boxed{z = 4}$.

41. (a) The vectors $\mathbf{v} = \overrightarrow{P_1P_2} = \mathbf{i} + 2\mathbf{j} - \mathbf{k}$ and $\mathbf{w} = \overrightarrow{P_1P_3} = -\mathbf{i} + \mathbf{j}$ both lie in the plane, so that a normal $\mathbf{N}$ to the plane is

$$\mathbf{N} = \mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & -1 \\ -1 & 1 & 0 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 2 & -1 \\ 1 & 0 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & -1 \\ -1 & 0 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & 2 \\ -1 & 1 \end{vmatrix} = \mathbf{i} + \mathbf{j} + 3\mathbf{k}.$$

Using the point $(0, 0, 0)$ and the normal vector $\mathbf{N}$, the general equation of the plane is

$$1(x - 0) + 1(y - 0) + 3(z - 0) = 0, \quad \text{or} \quad \boxed{x + y + 3z = 0}.$$

(b)

42. (a) The vectors $\mathbf{v} = \overrightarrow{P_1P_2} = 3\mathbf{i} - \mathbf{j} + 2\mathbf{k}$ and $\mathbf{w} = \overrightarrow{P_1P_3} = -3\mathbf{i} + \mathbf{j}$ both lie in the plane, so that a normal $\mathbf{N}$ to the plane is

$$\mathbf{N} = \mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & -1 & 2 \\ -3 & 1 & 0 \end{vmatrix} = \mathbf{i} \begin{vmatrix} -1 & 2 \\ 1 & 0 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 3 & 2 \\ -3 & 0 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 3 & -1 \\ -3 & 1 \end{vmatrix} = -2\mathbf{i} - 6\mathbf{j}.$$

Using the point $(0, 0, 0)$ and the normal vector $\mathbf{N}$, the general equation of the plane is

$$-2(x - 0) - 6(y - 0) = 0, \quad \text{or} \quad -2x - 6y = 0, \quad \text{or} \quad \boxed{x + 3y = 0}.$$

43. (a) The vectors $\mathbf{v} = \overrightarrow{P_1P_2} = 2\mathbf{i} + \mathbf{k}$ and $\mathbf{w} = \overrightarrow{P_1P_3} = 3\mathbf{i} - 3\mathbf{j} - 2\mathbf{k}$ both lie in the plane, so that a normal $\mathbf{N}$ to the plane is

$$\mathbf{N} = \mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 0 & 1 \\ 3 & -3 & -2 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 0 & 1 \\ -3 & -2 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 2 & 1 \\ 3 & -2 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 2 & 0 \\ 3 & -3 \end{vmatrix} = 3\mathbf{i} + 7\mathbf{j} - 6\mathbf{k}.$$

Using the point $(1, 2, 1)$ and the normal vector $\mathbf{N}$, the general equation of the plane is

$$3(x - 1) + 7(y - 2) - 6(z - 1) = 0, \quad \text{or} \quad \boxed{3x + 7y - 6z = 11}.$$

44. (a) The vectors $\mathbf{v} = \overrightarrow{P_1P_2} = 4\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ and $\mathbf{w} = \overrightarrow{P_1P_3} = -\mathbf{i} - 3\mathbf{j}$ both lie in the plane, so that a normal $\mathbf{N}$ to the plane is

$$\mathbf{N} = \mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & 2 & -1 \\ -1 & -3 & 0 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 2 & -1 \\ -3 & 0 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 4 & -1 \\ -1 & 0 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 4 & 2 \\ -1 & -3 \end{vmatrix} = -3\mathbf{i} + 1\mathbf{j} - 10\mathbf{k}.$$

Using the point $(-1, 2, 0)$ and the normal vector $\mathbf{N}$, the general equation of the plane is

$$-3(x - (-1)) + (y - 2) - 10(z - 0) = 0, \quad \text{or} \quad -3x + y - 10z = 5, \quad \text{or} \quad \boxed{3x - y + 10z = -5}.$$

(b)

45. (a) The vectors $\mathbf{v} = \overrightarrow{P_1P_2} = -2\mathbf{i} - 9\mathbf{j} + 2\mathbf{k}$ and $\mathbf{w} = \overrightarrow{P_1P_3} = -5\mathbf{i} - 8\mathbf{j} + 2\mathbf{k}$ both lie in the plane, so that a normal $\mathbf{N}$ to the plane is

$$\mathbf{N} = \mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2 & -9 & 2 \\ -5 & -8 & 2 \end{vmatrix} = \mathbf{i} \begin{vmatrix} -9 & 2 \\ -8 & 2 \end{vmatrix} - \mathbf{j} \begin{vmatrix} -2 & 2 \\ -5 & 2 \end{vmatrix} + \mathbf{k} \begin{vmatrix} -2 & -9 \\ -5 & -8 \end{vmatrix} = -2\mathbf{i} - 6\mathbf{j} - 29\mathbf{k}.$$

Using the point $(1, 0, 0)$ and the normal vector $\mathbf{N}$, the general equation of the plane is

$$-2(x - 1) - 6(y - 0) - 29(z - 0) = 0, \quad \text{or} \quad -2x - 6y - 29z = -2, \quad \text{or} \quad \boxed{2x + 6y + 29z = 2}.$$

(b)

46. (a) The vectors $\mathbf{v} = \overrightarrow{P_1P_2} = 9\mathbf{i} - 3\mathbf{j} + 2\mathbf{k}$ and $\mathbf{w} = \overrightarrow{P_1P_3} = 3\mathbf{i} + 4\mathbf{j} + \mathbf{k}$ both lie in the plane, so that a normal $\mathbf{N}$ to the plane is

$$\mathbf{N} = \mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 9 & -3 & 2 \\ 3 & 4 & 1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} -3 & 2 \\ 4 & 1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 9 & 2 \\ 3 & 1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 9 & -3 \\ 3 & 4 \end{vmatrix} = -11\mathbf{i} - 3\mathbf{j} + 45\mathbf{k}.$$

Using the point $(0, 0, 1)$ and the normal vector $\mathbf{N}$, the general equation of the plane is

$$-11(x - 0) - 3(y - 0) + 45(z - 1) = 0 \quad \text{or} \quad \boxed{-11x - 3y + 45z = 45}.$$

(b)

47. The normals of the two planes are $\mathbf{N}_1 = \mathbf{i} + \mathbf{j} - \mathbf{k}$ and $\mathbf{N}_2 = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$; these vectors are not parallel, so the planes intersect in a line. A direction vector to the line lies in both planes, so it is orthogonal to both normals. Therefore a direction vector for the line is

$$\mathbf{D} = \mathbf{N}_1 \times \mathbf{N}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 1 & -1 \\ 2 & 3 & -4 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 1 & -1 \\ 2 & -4 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & -1 \\ 2 & -4 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & 1 \\ 2 & 3 \end{vmatrix} = -\mathbf{i} + 2\mathbf{j} + \mathbf{k}.$$

To find a point on the line, we need a point that lies on both planes. Set $z = 0$; this gives the equations $x + y = -5$ and $2x + 3y = -1$, which have the solution $x = -14$, $y = 9$. Therefore the point $(-14, 9, 0)$ lies in both planes, so it lies on their line of intersection. So the symmetric equations of the line of intersection are

$$\boxed{\frac{x + 14}{-1} = \frac{y - 9}{2} = \frac{z}{1}}.$$

Answers may vary depending on the specific choice of direction vector and the point on the planes.

48. The normals of the two planes are $\mathbf{N}_1 = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$ and $\mathbf{N}_2 = \mathbf{i} + \mathbf{j} + \mathbf{k}$; these vectors are not parallel, so the planes intersect in a line. A direction vector to the line lies in both planes, so it is orthogonal to both normals. Therefore a direction vector for the line is

$$\mathbf{D} = \mathbf{N}_1 \times \mathbf{N}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & 1 \\ 1 & 1 & 1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} -1 & 1 \\ 1 & 1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 2 & 1 \\ 1 & 1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 2 & -1 \\ 1 & 1 \end{vmatrix} = -2\mathbf{i} - \mathbf{j} + 3\mathbf{k}.$$

To find a point on the line, we need a point that lies on both planes. Set $x = 0$; this gives the equations $-y + z = 2$ and $y + z = 3$, which have the solution $y = \frac{1}{2}$, $z = \frac{5}{2}$. Therefore the point $(0, \frac{1}{2}, \frac{5}{2})$ lies in

both planes, so it lies on their line of intersection. So the symmetric equations of the line of intersection are

$$\frac{x}{-2} = \frac{y - \frac{1}{2}}{-1} = \frac{z - \frac{5}{2}}{3}.$$

Answers may vary depending on the specific choice of direction vector and the point on the planes.

49. The normals of the two planes are $\mathbf{N}_1 = \mathbf{i} - \mathbf{j}$ and $\mathbf{N}_2 = \mathbf{j} - \mathbf{k}$; these vectors are not parallel, so the planes intersect in a line. A direction vector to the line lies in both planes, so it is orthogonal to both normals. Therefore a direction vector for the line is

$$\mathbf{D} = \mathbf{N}_1 \times \mathbf{N}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -1 & 0 \\ 0 & 1 & -1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} -1 & 0 \\ 1 & -1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & 0 \\ 0 & -1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & -1 \\ 0 & 1 \end{vmatrix} = \mathbf{i} + \mathbf{j} + \mathbf{k}.$$

To find a point on the line, we need a point that lies on both planes. Set $z = 0$; this gives the equations $x - y = 2$ and $y = 2$, so that $y = 2$ and $x = 4$. Therefore the point $(4, 2, 0)$ lies in both planes, so it lies on their line of intersection. So the symmetric equations of the line of intersection are

$$\frac{x - 4}{1} = \frac{y - 2}{1} = \frac{z}{1}.$$

Answers may vary depending on the specific choice of direction vector and the point on the planes.

50. The normals of the two planes are $\mathbf{N}_1 = 2\mathbf{i} - 3\mathbf{j} + \mathbf{k}$ and $\mathbf{N}_2 = 2\mathbf{i} - 3\mathbf{j} + 4\mathbf{k}$; these vectors are not parallel, so the planes intersect in a line. A direction vector to the line lies in both planes, so it is orthogonal to both normals. Therefore a direction vector for the line is

$$\mathbf{D} = \mathbf{N}_1 \times \mathbf{N}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -3 & 1 \\ 2 & -3 & 4 \end{vmatrix} = \mathbf{i} \begin{vmatrix} -3 & 1 \\ -3 & 4 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 2 & 1 \\ 2 & 4 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 2 & -3 \\ 2 & -3 \end{vmatrix} = -9\mathbf{i} - 6\mathbf{j}.$$

We can multiply this vector by the nonzero constant $-\frac{1}{3}$ to simplify it to $\mathbf{D} = 3\mathbf{i} + 2\mathbf{j}$. To find a point on the line, we need a point that lies on both planes. Set $y = 0$; this gives the equations $2x + z = 1$ and $2x + 4z = 2$, so that $x = z = \frac{1}{3}$. Therefore the point $(\frac{1}{3}, 0, \frac{1}{3})$ lies in both planes, so it lies on their line of intersection. So the symmetric equations of the line of intersection are

$$\frac{x - \frac{1}{3}}{3} = \frac{y}{2}, \quad z = \frac{1}{3}.$$

Answers may vary depending on the specific choice of direction vector and the point on the planes.

51. Using the formula in the text, we have $A = 2$, $B = -1$, $C = 1$, $D = 1$, and $(x_0, y_0, z_0) = (1, 2, -1)$, so the distance from the point to the plane is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|2 \cdot 1 - 1 \cdot 2 + 1 \cdot (-1) - 1|}{\sqrt{2^2 + 1^2 + 1^2}} = \frac{2}{\sqrt{6}} = \frac{\sqrt{6}}{3}.$$

52. Using the formula in the text, we have $A = 1$, $B = 2$, $C = -3$, $D = 4$, and $(x_0, y_0, z_0) = (-1, 3, -2)$, so the distance from the point to the plane is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|1 \cdot (-1) + 2 \cdot 3 - 3 \cdot (-2) - 4|}{\sqrt{1^2 + 2^2 + 3^2}} = \frac{7}{\sqrt{14}} = \frac{\sqrt{14}}{2}.$$

53. Using the formula in the text, we have $A = -1$, $B = 1$, $C = -3$, $D = 6$, and $(x_0, y_0, z_0) = (2, -1, 1)$, so the distance from the point to the plane is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|-1 \cdot 2 + 1 \cdot (-1) - 3 \cdot 1 - 6|}{\sqrt{1^2 + 1^2 + 3^2}} = \frac{12\sqrt{11}}{11}.$$

54. Using the formula in the text, we have $A = -3$, $B = 2$, $C = 1$, $D = 1$, and $(x_0, y_0, z_0) = (-2, 1, 1)$, so the distance from the point to the plane is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|-3 \cdot (-2) + 2 \cdot 1 + 1 \cdot 1 - 1|}{\sqrt{3^2 + 2^2 + 1^2}} = \frac{8}{\sqrt{14}} = \boxed{\frac{4\sqrt{14}}{7}}.$$

55. Since both planes have normal vector $2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$, they are indeed parallel. To find the distance between them, choose a point on p_1 . To do this, set $x = z = 0$; then $y = -1$ and $(x_0, y_0, z_0) = (0, -1, 0)$ is a point on p_1 . Then using the formula in the text for the distance from a point to a plane, we have from p_2 $A = 2$, $B = 1$, $C = -2$, and $D = 3$, so the distance is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|2 \cdot 0 + 1 \cdot (-1) - 2 \cdot 0 - 3|}{\sqrt{2^2 + 1^2 + 2^2}} = \boxed{\frac{4}{3}}.$$

56. Since both planes have normal vector $\mathbf{i} + 2\mathbf{j} - 2\mathbf{k}$, they are indeed parallel. To find the distance between them, choose a point on p_1 . To do this, set $y = z = 0$; then $x = -3$ and $(x_0, y_0, z_0) = (-3, 0, 0)$ is a point on p_1 . Then using the formula in the text for the distance from a point to a plane, we have from p_2 $A = 1$, $B = 2$, $C = -2$, and $D = 3$, so the distance is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|1 \cdot (-3) + 2 \cdot 0 - 2 \cdot 0 - 3|}{\sqrt{1^2 + 2^2 + 2^2}} = \frac{6}{3} = \boxed{2}.$$

57. Since both planes have normal vector $\mathbf{i} - 2\mathbf{k}$, they are indeed parallel. To find the distance between them, choose a point on p_1 . To do this, set $y = z = 0$; then $x = -1$ and $(x_0, y_0, z_0) = (-1, 0, 0)$ is a point on p_1 . Then using the formula in the text for the distance from a point to a plane, we have for p_2 $A = 1$, $B = 0$, $C = -2$, and $D = 3$, so the distance is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|1 \cdot (-1) + 0 \cdot 0 - 2 \cdot 0 - 3|}{\sqrt{1^2 + 0^2 + 2^2}} = \frac{4}{\sqrt{5}} = \boxed{\frac{4\sqrt{5}}{5}}.$$

58. Since both planes have normal vector $-\mathbf{i} + \mathbf{j} + 2\mathbf{k}$, they are indeed parallel. To find the distance between them, choose a point on p_1 . To do this, set $y = z = 0$; then $x = 4$ and $(x_0, y_0, z_0) = (4, 0, 0)$ is a point on p_1 . Then using the formula in the text for the distance from a point to a plane, we have for p_2 $A = -1$, $B = 1$, $C = 2$, and $D = -1$, so the distance is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|-1 \cdot 4 + 1 \cdot 0 + 2 \cdot 0 - (-1)|}{\sqrt{1^2 + 1^2 + 2^2}} = \frac{3}{\sqrt{6}} = \boxed{\frac{\sqrt{6}}{2}}.$$

59. First convert the symmetric equations for the line to parametric form. The direction vector of the line is $2\mathbf{i} + 4\mathbf{j} + \mathbf{k}$, and the line passes through the point $(1, -3, 1)$. Therefore the parametric equations are

$$x = 1 + 2t, \quad y = -3 + 4t, \quad z = 1 + t.$$

So to find a point (x, y, z) on the line that also lies on the plane, substitute the equations for x , y , and z from the parametric equations into the equation of the plane and solve for t :

$$2x + y - z = 2(1 + 2t) + (-3 + 4t) - (1 + t) = 7t - 2 = 5,$$

so that $t = 1$. It follows that the line intersects the plane when $t = 1$ in the parametric equations; this is the point $(x, y, z) = (1 + 2 \cdot 1, -3 + 4 \cdot 1, 1 + 1) = \boxed{(3, 1, 2)}$.

60. First convert the symmetric equations for the line to parametric form. The direction vector of the line is $2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$, and the line passes through the point $(-1, 3, 4)$. Therefore the parametric equations are

$$x = -1 + 2t, \quad y = 3 + t, \quad z = 4 - 2t.$$

So to find a point (x, y, z) on the line that also lies on the plane, substitute the equations for x , y , and z from the parametric equations into the equation of the plane and solve for t :

$$x + y - 2z = (-1 + 2t) + (3 + t) - 2(4 - 2t) = 7t - 6 = 8,$$

so that $t = 2$. It follows that the line intersects the plane when $t = 2$ in the parametric equations; this is the point $(x, y, z) = (-1 + 2 \cdot 2, 3 + 2, 4 - 2 \cdot 2) = \boxed{(3, 5, 0)}$.

61. First convert the symmetric equations for the line to parametric form. The direction vector of the line is $\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$, and the line passes through the point $(3, -4, 1)$. Therefore the parametric equations are

$$x = 3 + t, \quad y = -4 + 2t, \quad z = 1 + 2t.$$

So to find a point (x, y, z) on the line that also lies on the plane, substitute the equations for x , y , and z from the parametric equations into the equation of the plane and solve for t :

$$2x + 3y + z = 2(3 + t) + 3(-4 + 2t) + (1 + 2t) = 10t - 5 = 5,$$

so that $t = 1$. It follows that the line intersects the plane when $t = 1$ in the parametric equations; this is the point $(x, y, z) = (3 + 1, -4 + 2 \cdot 1, 1 + 2 \cdot 1) = \boxed{(4, -2, 3)}$.

62. First convert the symmetric equations for the line to parametric form. The direction vector of the line is $2\mathbf{i} + \mathbf{j} + 2\mathbf{k}$, and the line passes through the point $(-2, 3, 0)$. Therefore the parametric equations are

$$x = -2 + 2t, \quad y = 3 + t, \quad z = 2t.$$

So to find a point (x, y, z) on the line that also lies on the plane, substitute the equations for x , y , and z from the parametric equations into the equation of the plane and solve for t :

$$x + y - z = (-2 + 2t) + (3 + t) - 2t = t + 1 = 3,$$

so that $t = 2$. It follows that the line intersects the plane when $t = 2$ in the parametric equations; this is the point $(x, y, z) = (-2 + 2 \cdot 2, 3 + 2, 2 \cdot 2) = \boxed{(2, 5, 4)}$.

Applications and Extensions

63. To find a point of intersection of ℓ_1 and ℓ_2 , we must find values of t_1 and t_2 so that all three coordinates are equal. This means that we must solve the simultaneous system

$$\begin{aligned} 2 - t_1 &= 4 - t_2 \\ 4 + 2t_1 &= 3 + t_2 \\ -5 + t_1 &= -13 + 3t_2. \end{aligned}$$

The first two equations simplify to $t_1 - t_2 = -2$ and $2t_1 - t_2 = -1$, which has the solution $t_1 = 1$ and $t_2 = 3$. Note that this pair of values satisfies the third equation, so that the lines do in fact intersect. The point of intersection is found by substituting $t_1 = 1$ into the equation for ℓ_1 (or, alternatively, by substituting $t_2 = 3$ into the equation for ℓ_2):

$$(2 - 1)\mathbf{i} + (4 + 2 \cdot 1)\mathbf{j} + (-5 + 1)\mathbf{k}, \text{ so the intersection point is } \boxed{(1, 6, -4)}.$$

To find the angle between the lines, we need the direction vectors for each line; from the vector form these are $\mathbf{u} = -\mathbf{i} + 2\mathbf{j} + \mathbf{k}$ and $\mathbf{v} = -\mathbf{i} + \mathbf{j} + 3\mathbf{k}$. The angle θ between the lines satisfies

$$\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} = \frac{-1 \cdot (-1) + 2 \cdot 1 + 1 \cdot 3}{\sqrt{1^2 + 2^2 + 1^2} \sqrt{1^2 + 1^2 + 3^2}} = \frac{6}{\sqrt{6}\sqrt{11}} = \frac{\sqrt{66}}{11},$$

so that

$$\theta = \cos^{-1} \frac{\sqrt{66}}{11} = \sin^{-1} \sqrt{\frac{5}{11}} \approx 0.740 \approx 42.392^\circ.$$

64. To find a point of intersection of ℓ_1 and ℓ_2 , we must find values of t_1 and t_2 so that all three coordinates are equal. This means that we must solve the simultaneous system

$$\begin{aligned} 5 + 2t_1 &= 7 + 3t_2 \\ 6 - t_1 &= 5 - 2t_2 \\ 2t_1 &= 2 - t_2. \end{aligned}$$

The third equation gives $t_2 = 2 - 2t_1$; substitute this into the first equation to get $5 + 2t_1 = 7 + 3(2 - 2t_1) = 13 - 6t_1$, so that $t_1 = 1$ and therefore $t_2 = 0$. Note that this pair of values satisfies the second equation, so that the lines do in fact intersect. The point of intersection is found by substituting $t_2 = 0$ into the equation for ℓ_2 (or, alternatively, by substituting $t_1 = 1$ into the equation for ℓ_1):

$$(7 + 3 \cdot 0)\mathbf{i} + (5 - 2 \cdot 0)\mathbf{j} + (2 - 0)\mathbf{k}, \text{ so the intersection point is } \boxed{(7, 5, 2)}.$$

To find the angle between the lines, we need the direction vectors for each line; from the vector form these are $\mathbf{u} = 2\mathbf{i} - \mathbf{j} + 2\mathbf{k}$ and $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j} - \mathbf{k}$. The angle θ between the lines satisfies

$$\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} = \frac{2 \cdot 3 - 1 \cdot (-2) + 2 \cdot (-1)}{\sqrt{2^2 + 1^2 + 2^2} \sqrt{3^2 + 2^2 + 1^2}} = \frac{6}{3\sqrt{14}} = \frac{\sqrt{14}}{7},$$

so that

$$\theta = \cos^{-1} \frac{\sqrt{14}}{7} \boxed{\approx 1.007 \approx 57.688^\circ}.$$

65. To find a point of intersection of ℓ_1 and ℓ_2 , we must find values of t_1 and t_2 so that all three coordinates are equal. This means that we must solve the simultaneous system

$$\begin{aligned} t_1 &= -3 + t_2 \\ 1 + 2t_1 &= 1 - 4t_2 \\ -3 + t_1 &= 2 - 7t_2. \end{aligned}$$

The first equation gives $t_1 = t_2 - 3$; substitute this into the second equation to get $1 + 2(t_2 - 3) = 2t_2 - 5 = 1 - 4t_2$, so that $t_2 = 1$ and therefore $t_1 = -2$. Note that this pair of values satisfies the third equation, so that the lines do in fact intersect. The point of intersection is found by substituting $t_2 = 1$ into the equation for ℓ_2 (or, alternatively, by substituting $t_1 = -2$ into the equation for ℓ_1):

$$(-3 + 1)\mathbf{i} + (1 - 4 \cdot 1)\mathbf{j} + (2 - 7 \cdot 1)\mathbf{k}, \text{ so the intersection point is } \boxed{(-2, -3, -5)}.$$

To find the angle between the lines, we need the direction vectors for each line; from the vector form these are $\mathbf{u} = \mathbf{i} + 2\mathbf{j} + \mathbf{k}$ and $\mathbf{v} = \mathbf{i} - 4\mathbf{j} - 7\mathbf{k}$. The angle θ between the lines satisfies

$$\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} = \frac{1 \cdot 1 + 2 \cdot (-4) + 1 \cdot (-7)}{\sqrt{1^2 + 2^2 + 1^2} \sqrt{1^2 + 4^2 + 7^2}} = -\frac{14}{\sqrt{6}\sqrt{66}} = -\frac{7}{3\sqrt{11}} = -\frac{7\sqrt{11}}{33}.$$

Since this number is negative, the angle we want actually is such that

$$\cos \theta = \frac{7\sqrt{11}}{33} = \frac{7\sqrt{2}}{\sqrt{198}} \text{ and therefore } \sin \theta = \frac{10}{\sqrt{198}},$$

so that

$$\theta = \sin^{-1} \left(\frac{10}{\sqrt{198}} \right) \approx 0.790 \approx 45.298^\circ.$$

66. To find a point of intersection of ℓ_1 and ℓ_2 , we must find values of t_1 and t_2 so that all three coordinates are equal. This means that we must solve the simultaneous system

$$\begin{aligned} 2 - 3t_1 &= -2t_2 \\ 6t_1 &= 1 + t_2 \\ -2 + 5t_1 &= 2t_2. \end{aligned}$$

The second equation gives $t_2 = 6t_1 - 1$; substitute this into the first equation to get $2 - 3t_1 = -2(6t_1 - 1) = -12t_1 + 2$, so that $t_1 = 0$ and therefore $t_2 = -1$. Note that this pair of values satisfies the third equation, so that the lines do in fact intersect. The point of intersection is found by substituting $t_1 = 0$ into the equation for ℓ_1 (or, alternatively, by substituting $t_2 = -1$ into the equation for ℓ_2):

$$(2 - 3 \cdot 0)\mathbf{i} + (6 \cdot 0)\mathbf{j} + (-2 + 5 \cdot 0)\mathbf{k}, \text{ so the intersection point is } \boxed{(2, 0, -2)}.$$

To find the angle between the lines, we need the direction vectors for each line; from the vector form these are $\mathbf{u} = -3\mathbf{i} + 6\mathbf{j} + 5\mathbf{k}$ and $\mathbf{v} = -2\mathbf{i} + \mathbf{j} + 2\mathbf{k}$. The angle θ between the lines satisfies

$$\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} = \frac{-3 \cdot (-2) + 6 \cdot 1 + 5 \cdot 2}{\sqrt{3^2 + 6^2 + 5^2} \sqrt{2^2 + 1^2 + 2^2}} = \frac{22}{3\sqrt{70}} = \frac{11\sqrt{70}}{105},$$

so that

$$\theta = \cos^{-1} \frac{11\sqrt{70}}{105} \approx 0.502 \approx 28.777^\circ.$$

67. (a) Since the line is normal to the plane $2x - y + z - 6 = 0$, its direction vector is parallel to the normal to the plane, which is $2\mathbf{i} - \mathbf{j} + \mathbf{k}$. Since the line contains $(1, 2, -1)$, its parametric equations are

$$x = 1 + 2t, \quad y = 2 - t, \quad z = -1 + t.$$

A graph of the plane and the line, with the point of intersection marked, is below.

68. (a) Since the line is normal to the plane $x + y - z - 3 = 0$, its direction vector is parallel to the normal to the plane, which is $\mathbf{i} + \mathbf{j} - \mathbf{k}$. Since the line contains $(2, 3, -1)$, its parametric equations are

$$\boxed{x = 2 + t, \quad y = 3 + t, \quad z = -1 - t}.$$

A graph of the plane and the line, with the point of intersection marked, is shown in part (b).

69. Both lines pass through (x_1, y_1, z_1) . The direction vector of ℓ_1 is $\mathbf{v} = a_1\mathbf{i} + a_2\mathbf{j} + a_3\mathbf{k}$, and the direction vector of ℓ_2 is $\mathbf{w} = b_1\mathbf{i} + b_2\mathbf{j} + b_3\mathbf{k}$. Then

$$\mathbf{v} \cdot \mathbf{w} = a_1b_1 + a_2b_2 + a_3b_3 = 0,$$

so the direction vectors are orthogonal and therefore the two lines are perpendicular lines through (x_1, y_1, z_1) .

70. The direction vector of ℓ_1 is $\mathbf{v} = a_1\mathbf{i} + a_2\mathbf{j} + a_3\mathbf{k}$, and the direction vector of ℓ_2 is $\mathbf{w} = b_1\mathbf{i} + b_2\mathbf{j} + b_3\mathbf{k}$. Suppose that $r = \frac{a_1}{b_1} = \frac{a_2}{b_2} = \frac{a_3}{b_3}$. Then $\mathbf{v} = r\mathbf{w}$, so that ℓ_1 and ℓ_2 have parallel direction vectors. Since the lines are assumed distinct, they are parallel lines.

71. p_1 has normal $\mathbf{N}_1 = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$, and p_2 has normal $\mathbf{N}_2 = \mathbf{i} + \mathbf{j} + \mathbf{k}$. So the angle θ between the planes satisfies

$$\cos \theta = \frac{|\mathbf{N}_1 \cdot \mathbf{N}_2|}{\|\mathbf{N}_1\| \|\mathbf{N}_2\|} = \frac{|2 \cdot 1 - 1 \cdot 1 + 1 \cdot 1|}{\sqrt{2^2 + 1^2 + 1^2} \sqrt{1^2 + 1^2 + 1^2}} = \frac{2}{3\sqrt{2}} = \frac{\sqrt{2}}{3},$$

so that

$$\theta = \cos^{-1} \frac{\sqrt{2}}{3} \quad \boxed{\approx 1.080 \approx 61.874^\circ}.$$

72. p_1 has normal $\mathbf{N}_1 = \mathbf{i} + \mathbf{j} - \mathbf{k}$, and p_2 has normal $\mathbf{N}_2 = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$. So the angle θ between the planes satisfies

$$\cos \theta = \frac{|\mathbf{N}_1 \cdot \mathbf{N}_2|}{\|\mathbf{N}_1\| \|\mathbf{N}_2\|} = \frac{|1 \cdot 2 + 1 \cdot 3 - 1 \cdot (-4)|}{\sqrt{1^2 + 1^2 + 1^2} \sqrt{2^2 + 3^2 + 4^2}} = \frac{9}{\sqrt{3}\sqrt{29}} = \frac{3\sqrt{87}}{29}$$

so that

$$\theta = \cos^{-1} \frac{3\sqrt{87}}{29} \quad \boxed{\approx 0.266 \approx 15.225^\circ}.$$

73. p_1 has normal $\mathbf{N}_1 = 2\mathbf{i} - 3\mathbf{j} + \mathbf{k}$, and p_2 has normal $\mathbf{N}_2 = 2\mathbf{i} - 3\mathbf{j} + 4\mathbf{k}$. So the angle θ between the planes satisfies

$$\cos \theta = \frac{|\mathbf{N}_1 \cdot \mathbf{N}_2|}{\|\mathbf{N}_1\| \|\mathbf{N}_2\|} = \frac{|2 \cdot 2 - 3 \cdot (-3) + 1 \cdot 4|}{\sqrt{2^2 + 3^2 + 1^2} \sqrt{2^2 + 3^2 + 4^2}} = \frac{17}{\sqrt{14}\sqrt{29}} = \frac{17}{\sqrt{406}}$$

so that

$$\theta = \cos^{-1} \frac{17}{\sqrt{406}} \quad \boxed{\approx 0.567 \approx 32.468^\circ}.$$

74. p_1 has normal $\mathbf{N}_1 = \mathbf{i} - \mathbf{j}$, and p_2 has normal $\mathbf{N}_2 = \mathbf{j} - \mathbf{k}$. So the angle θ between the planes satisfies

$$\cos \theta = \frac{|\mathbf{N}_1 \cdot \mathbf{N}_2|}{\|\mathbf{N}_1\| \|\mathbf{N}_2\|} = \frac{|1 \cdot 0 - 1 \cdot 1 + 0 \cdot (-1)|}{\sqrt{1^2 + 1^2} \sqrt{1^2 + 1^2}} = \frac{1}{2}.$$

so that

$$\theta = \cos^{-1} \frac{1}{2} = \boxed{\frac{\pi}{3} = 60^\circ}.$$

75. p_1 has normal $\mathbf{N}_1 = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$, and p_2 has normal $\mathbf{N}_2 = 4\mathbf{i} - \mathbf{j} + 6\mathbf{k}$. So the angle θ between the planes satisfies

$$\cos \theta = \frac{|\mathbf{N}_1 \cdot \mathbf{N}_2|}{\|\mathbf{N}_1\| \|\mathbf{N}_2\|} = \frac{|2 \cdot 4 - 1 \cdot (-1) + 1 \cdot 6|}{\sqrt{2^2 + 1^2 + 1^2} \sqrt{4^2 + 1^2 + 6^2}} = \frac{15}{\sqrt{6} \sqrt{53}} = \frac{15}{\sqrt{318}},$$

so that

$$\theta = \cos^{-1} \frac{15}{\sqrt{318}} \boxed{\approx 0.571 \approx 32.737^\circ}.$$

76. p_1 has normal $\mathbf{N}_1 = \mathbf{i} + \mathbf{j} - \mathbf{k}$, and p_2 has normal $\mathbf{N}_2 = 2\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}$. So the angle θ between the planes satisfies

$$\cos \theta = \frac{|\mathbf{N}_1 \cdot \mathbf{N}_2|}{\|\mathbf{N}_1\| \|\mathbf{N}_2\|} = \frac{|1 \cdot 2 + 1 \cdot (-2) - 1 \cdot 2|}{\sqrt{1^2 + 1^2 + 1^2} \sqrt{2^2 + 2^2 + 2^2}} = \frac{2}{6} = \frac{1}{3},$$

so that

$$\theta = \cos^{-1} \frac{1}{3} \boxed{\approx 1.231 \approx 70.529^\circ}.$$

77. (a) Both paths are lines; the first is a line with direction vector $\mathbf{v} = \mathbf{i} - \mathbf{j} - \mathbf{k}$ through $(0, 0, 1)$, while the second is a line with direction vector $\mathbf{w} = \mathbf{i} + 2\mathbf{j} + 4\mathbf{k}$ through $(-3, 0, 4)$.

- (b) The acute angle θ between the paths satisfies

$$\cos \theta = \frac{|\mathbf{v} \cdot \mathbf{w}|}{\|\mathbf{v}\| \|\mathbf{w}\|} = \frac{|1 \cdot 1 - 1 \cdot 2 - 1 \cdot 4|}{\sqrt{1^2 + 1^2 + 1^2} \sqrt{1^2 + 2^2 + 4^2}} = \frac{5}{\sqrt{63}} = \frac{5}{3\sqrt{7}},$$

so that

$$\theta = \cos^{-1} \frac{5}{3\sqrt{7}} \boxed{\approx 0.889 \approx 50.954^\circ}.$$

- (c) Parametrize the first path using t_1 : $t_1\mathbf{i} - t_1\mathbf{j} + (1 - t_1)\mathbf{k}$, and parametrize the second path using t_2 : $(t_2 - 3)\mathbf{i} + 2t_2\mathbf{j} + (4t_2 - 1)\mathbf{k}$. Then to see if the paths intersect, we must see if there is a solution to the simultaneous system

$$\begin{aligned} t_1 &= -3 + t_2 \\ -t_1 &= 2t_2 \\ 1 - t_1 &= -1 + 4t_2. \end{aligned}$$

The second equation tells us that $t_1 = -2t_2$; substituting into the first equation gives $-2t_2 = -3 + t_2$, so that $t_2 = 1$ and therefore $t_1 = -2$. These values of t_1 and t_2 also satisfy the third equation, so the paths do intersect, at the point

$$(t_1, -t_1, 1 - t_1) = \boxed{(-2, 2, 3)}.$$

- (d) The objects will not collide. Explanations may vary.

78. Complete the squares on each equation:

$$x^2 + y^2 + z^2 - 2x - 4y + 4z = 8$$

$$(x^2 - 2x + 1) + (y^2 - 4y + 4) + (z^2 + 4z + 4) = 8 + 1 + 4 + 4$$

$$(x - 1)^2 + (y - 2)^2 + (z + 2)^2 = 17$$

$$x^2 + y^2 + z^2 + 2x + 6y + 4z = 20$$

$$(x^2 + 2x + 1) + (y^2 + 6y + 9) + (z^2 + 4z + 4) = 20 + 1 + 9 + 4$$

$$(x + 1)^2 + (y + 3)^2 + (z + 2)^2 = 34.$$

The centers of the spheres are $P_1 = (1, 2, -2)$ and $P_2 = (-1, -3, -2)$. Therefore a direction vector for the line passing through these two points is

$$\mathbf{D} = \overrightarrow{P_1 P_2} = (-1 - 1)\mathbf{i} + (-3 - 2)\mathbf{j} + (-2 - (-2))\mathbf{k} = -2\mathbf{i} - 5\mathbf{j}.$$

Since the line passes through $(1, 2, -2)$, the symmetric equations for the line are

$$\boxed{\frac{x-1}{-2} = \frac{y-2}{-5}, \quad z = -2}.$$

Answers may vary.

79. The direction vector of ℓ_1 is $\mathbf{D}_1 = -\mathbf{i} + \mathbf{j} + 2\mathbf{k}$, and the direction vector of ℓ_2 is $\mathbf{D}_2 = \mathbf{i} - \mathbf{j} + \mathbf{k}$. A vector perpendicular to both of these direction vectors is

$$\mathbf{D} = \mathbf{D}_1 \times \mathbf{D}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 1 & 2 \\ 1 & -1 & 1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 1 & 2 \\ -1 & 1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} -1 & 2 \\ 1 & 1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} -1 & 1 \\ 1 & -1 \end{vmatrix} = 3\mathbf{i} + 3\mathbf{j}.$$

Since the desired line is perpendicular to both of the given lines, it has direction vector $\mathbf{D}$.

The two lines intersect when (parametrizing ℓ_1 with t_1 and ℓ_2 with t_2)

$$\begin{aligned} 1 - t_1 &= 1 + t_2 \\ t_1 &= -t_2 \\ -1 + 2t_1 &= -1 + t_2. \end{aligned}$$

The first two equations both give $t_1 = -t_2$; substituting into the third equation gives $-1 - 2t_2 = -1 + t_2$, so that $t_2 = 0$ and therefore $t_1 = 0$. The two lines intersect when $t_1 = t_2 = 0$, at the point $(1 - 0, 0, 2 \cdot 0 - 1) = (1, 0, -1)$.

Then the line through $(1, 0, -1)$ with direction vector $3\mathbf{i} + 3\mathbf{j}$ has parametric equation

$$\boxed{x = 1 + 3t, \quad y = 3t, \quad z = -1}.$$

Answers may vary.

80. Intuitively, to see that this surface is a plane, start in two dimensions. There, the set of points equidistant from two points is a line. Now rotate that picture through the third dimension; the result is the set of points in space equidistant from the two points, and is a plane.

(a) If the distances are to be the same, then we must have

$$\begin{aligned} \sqrt{(x-1)^2 + (y-3)^2 + (z-0)^2} &= \sqrt{(x+1)^2 + (y-1)^2 + (z-2)^2} \\ x^2 - 2x + 1 + y^2 - 6y + 9 + z^2 &= x^2 + 2x + 1 + y^2 - 2y + 1 + z^2 - 4z + 4 \\ -2x - 6y + 10 &= 2x - 2y - 4z + 6 \\ 4x + 4y - 4z &= 4 \\ \boxed{x + y - z} &= 1. \end{aligned}$$

(b) One point on the plane must be the midpoint of the segment between the two points, which is

$$\left(\frac{1-1}{2}, \frac{3+1}{2}, \frac{0+2}{2} \right) = (0, 2, 1).$$

That segment must be normal to the plane (think about the two-dimensional model), so a normal vector to the plane is $(1 - (-1))\mathbf{i} + (3 - 1)\mathbf{j} + (0 - 2)\mathbf{k} = 2\mathbf{i} + 2\mathbf{j} - 2\mathbf{k}$. Therefore an equation of the plane is

$$2(x - 0) + 2(y - 2) - 2(z - 1) = 0, \quad \text{or} \quad 2x + 2y - 2z = 2, \quad \text{or} \quad \boxed{x + y - z = 1}.$$

81. The normals of the two planes are $\mathbf{N}_1 = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$ and $\mathbf{N}_2 = \mathbf{i} - \mathbf{j} + 3\mathbf{k}$; these vectors are not parallel, so the planes intersect in a line. A direction vector to the line lies in both planes, so it is orthogonal to both normals. Therefore a direction vector for the line is

$$\mathbf{D} = \mathbf{N}_1 \times \mathbf{N}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 1 & -1 \\ 1 & -1 & 3 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 1 & -1 \\ -1 & 3 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 2 & -1 \\ 1 & 3 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 2 & 1 \\ 1 & -1 \end{vmatrix} = 2\mathbf{i} - 7\mathbf{j} - 3\mathbf{k}.$$

To find a point on the line, we need a point that lies on both planes. Set $z = 0$; this gives the equations $2x + y = 6$ and $x - y = 4$, which have the solution $x = \frac{10}{3}$, $y = -\frac{2}{3}$. Therefore the point $(\frac{10}{3}, -\frac{2}{3}, 0)$ lies in both planes, so it lies on their line of intersection. So the symmetric equations of the line of intersection are

$$\boxed{\frac{x - \frac{10}{3}}{2} = \frac{y + \frac{2}{3}}{-7} = \frac{z}{-3}}.$$

Answers may vary depending on the specific choice of point.

82. If the line is to be parallel to the given plane, it will be orthogonal to the normal to that plane. Therefore the line is orthogonal to both $\mathbf{u} = \mathbf{i} + 2\mathbf{j} - \mathbf{k}$ and to $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j} - \mathbf{k}$. So a direction vector for the line is

$$\mathbf{D} = \mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & -1 \\ 2 & 3 & -1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 2 & -1 \\ 3 & -1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & -1 \\ 2 & -1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & 2 \\ 2 & 3 \end{vmatrix} = \mathbf{i} - \mathbf{j} - \mathbf{k}.$$

Since the line passes through $(2, 0, -3)$, its symmetric equations are

$$\boxed{\frac{x - 2}{1} = \frac{y}{-1} = \frac{z + 3}{-1}}.$$

83. First determine the equations of the line and the plane. For the line, it has direction vector $(2 - 0)\mathbf{i} + (1 - 2)\mathbf{j} + (-3 - (-2))\mathbf{k} = 2\mathbf{i} - \mathbf{j} - \mathbf{k}$ and passes through $(0, 2, -2)$, so it has parametric equations

$$x = 2t, \quad y = 2 - t, \quad z = -2 - t.$$

To determine an equation for the plane, we first find a normal vector. The three points given allow us to find two vectors that lie in the plane:

$$(1 - 0)\mathbf{i} + (3 - 4)\mathbf{j} + (-2 - (-2))\mathbf{k} = \mathbf{i} - \mathbf{j} \quad \text{and} \quad (2 - 0)\mathbf{i} + (2 - 4)\mathbf{j} + (-3 - (-2))\mathbf{k} = 2\mathbf{i} - 2\mathbf{j} - \mathbf{k}.$$

A normal vector to the plane is then the cross product of these two vectors:

$$\mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -1 & 0 \\ 2 & -2 & -1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} -1 & 0 \\ -2 & -1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & 0 \\ 2 & -1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & -1 \\ 2 & -2 \end{vmatrix} = \mathbf{i} + \mathbf{j}.$$

Since the plane passes through $(0, 4, -2)$, it has equation

$$1(x - 0) + 1(y - 4) + 0(z + 2) = 0, \quad \text{or} \quad x + y = 4.$$

To find a point (x, y, z) on the line that also lies on the plane, substitute the equations for x , y , and z from the parametric equations into the equation of the plane and solve for t :

$$x + y = 2t + (2 - t) = t + 2 = 4,$$

so that $t = 2$. It follows that the line intersects the plane when $t = 2$ in the parametric equations; this is the point $(x, y, z) = (2 \cdot 2, 2 - 2, -2 - 2) = \boxed{(4, 0, -4)}$.

84. Since the plane contains the two given points, the vector $(2-1)\mathbf{i} + (2-0)\mathbf{j} + (-1-1)\mathbf{k} = \mathbf{i} + 2\mathbf{j} - 2\mathbf{k}$ lies in the plane. Next, since the plane is parallel to the given line, the direction vector for that line, which is $-\mathbf{i} + \mathbf{j} + 2\mathbf{k}$, also lies in the plane. We take the cross product of these two vectors to get a normal vector to the plane:

$$\mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & -2 \\ -1 & 1 & 2 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 2 & -2 \\ 1 & 2 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & -2 \\ -1 & 2 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & 2 \\ -1 & 1 \end{vmatrix} = 6\mathbf{i} + 3\mathbf{k}.$$

Since the plane passes through $(1, 0, 1)$, an equation of the plane is

$$6(x-1) + 0(y-0) + 3(z-1) = 0, \quad \text{or} \quad 6x + 3z = 9, \quad \text{or} \quad \boxed{2x + z = 3}.$$

85. Since the desired plane is tangent to the sphere, the radius of the sphere must be the distance from the center to the plane, so a normal vector to the desired plane is the vector from the center of the circle, $(1, -2, 2)$ to the given point $(2, -1, 0)$, which is $(1-2)\mathbf{i} + (-2-(-1))\mathbf{j} + (2-0)\mathbf{k} = -\mathbf{i} - \mathbf{j} + 2\mathbf{k}$. The plane passes through the point $(2, -1, 0)$, so its equation is

$$-(x-2) - (y+1) + 2(z-0) = 0, \quad \text{or} \quad -x - y + 2z = -1, \quad \text{or} \quad \boxed{x + y - 2z = 1}.$$

86. Since the desired sphere is tangent to the plane, the radius of the sphere must be the distance from the center of the sphere, $(x_0, y_0, z_0) = (-2, 1, 5)$ to the plane. Using the formula for the distance from a point to a plane, we have $A = 1$, $B = 2$, $C = -2$, and $D = 8$, so the distance, which is the radius of the sphere, is

$$r = \frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|1 \cdot (-2) + 2 \cdot 1 - 2 \cdot 5 - 8|}{\sqrt{1^2 + 2^2 + 2^2}} = \frac{18}{3} = 6.$$

Since the radius of the sphere is 6 and its center is at $(-2, 1, 5)$, its equation is

$$\boxed{(x+2)^2 + (y-1)^2 + (z-5)^2 = 36}.$$

87. From the symmetric equations, parametric equations for the two lines are

$$\begin{aligned} \ell_1: \quad x &= 2 + t_1, & y &= -1 + 2t_1, & z &= 1 + 2t_1 \\ \ell_2: \quad x &= -1 + t_2, & y &= -8 + 3t_2, & z &= -3t_2. \end{aligned}$$

The point of intersection of the lines is found by solving the simultaneous system

$$\begin{aligned} 2 + t_1 &= -1 + t_2 \\ -1 + 2t_1 &= -8 + 3t_2 \\ 1 + 2t_1 &= -3t_2. \end{aligned}$$

The second equation gives $2t_1 = 3t_2 - 7$, while the third gives $2t_1 = -3t_2 - 1$. Therefore $3t_2 - 7 = -3t_2 - 1$, so that $t_2 = 1$ and then $t_1 = -2$. Note that this pair of values satisfies the first equation as well, so that in fact the two lines do intersect. The point of intersection (x_0, y_0, z_0) is found by substituting $t_2 = 1$ into the equation for ℓ_2 (or alternatively, by substituting $t_1 = -2$ into the equation for ℓ_1):

$$x_0 = -1 + 1, \quad y_0 = -8 + 3 \cdot 1, \quad z_0 = -3 \cdot 1 \quad \text{so that} \quad (x_0, y_0, z_0) = (0, -5, -3).$$

A direction vector for the desired line must be of the given lines, which are $\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$ and $\mathbf{i} + 3\mathbf{j} - 3\mathbf{k}$, so we find a direction vector by computing the cross product of these vectors:

$$\mathbf{d} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 2 \\ 1 & 3 & -3 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 2 & 2 \\ 3 & -3 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & 2 \\ 1 & -3 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & 2 \\ 1 & 3 \end{vmatrix} = -12\mathbf{i} + 5\mathbf{j} + \mathbf{k}.$$

Since the line we are seeking passes through the point of intersection, $(0, -5, -3)$, symmetric equations for the line are

$$\boxed{\frac{x}{-12} = \frac{y+5}{5} = \frac{z+3}{1}}.$$

Challenge Problems

88. Let $ax + by + cz = 0$ be the desired plane $\mathcal{P}$. Then it has normal vector $\mathbf{n} = \langle a, b, c \rangle$; since this plane is orthogonal to a plane with normal vector $\langle 1, -2, -1 \rangle$, these two vectors must be orthogonal, so that $\langle a, b, c \rangle \cdot \langle 1, -2, -1 \rangle = a - 2b - c = 0$ and therefore $a = 2b + c$. Now, we wish $\mathbf{n}$ to form a 60° angle with the positive y -axis, $\mathbf{j}$, so that

$$\frac{\mathbf{n} \cdot \mathbf{j}}{\|\mathbf{n}\| \|\mathbf{j}\|} = \frac{b}{\sqrt{a^2 + b^2 + c^2}} = \frac{1}{2}.$$

Simplifying gives $\sqrt{a^2 + b^2 + c^2} = 2b$, so that $4b^2 = a^2 + b^2 + c^2$. Now substitute $2b + c$ for a in this equation, giving

$$4b^2 = (2b + c)^2 + b^2 + c^2 = 4b^2 + 4bc + c^2 + b^2 + c^2, \text{ so that } 2c^2 + 4bc + b^2 = 0.$$

Treating this as a quadratic in c and solving gives

$$c = \frac{-4b \pm \sqrt{16b^2 - 8b^2}}{4} = -b \pm \frac{|b|\sqrt{2}}{2}.$$

Then b must be nonzero; otherwise $c = 0$ and then $a = 2b + c = 0$ as well, so that $\mathcal{P}$ is not defined. Since we can scale all of a , b , and c by any nonzero factor in the equation for $\mathcal{P}$, choose $b = 1$. This gives two solutions:

$$\begin{aligned} c &= -1 + \frac{\sqrt{2}}{2}, & a &= 2b + c = 1 + \frac{\sqrt{2}}{2}, \\ c &= -1 - \frac{\sqrt{2}}{2}, & a &= 2b + c = 1 - \frac{\sqrt{2}}{2}. \end{aligned}$$

So there are two such planes:

$$\left(1 + \frac{\sqrt{2}}{2}\right)x + y + \left(-1 + \frac{\sqrt{2}}{2}\right)z = 0 \text{ and } \left(1 - \frac{\sqrt{2}}{2}\right)x + y + \left(-1 - \frac{\sqrt{2}}{2}\right)z = 0.$$

89. (a) The plane has normal vector $\langle A, B, C \rangle$, so this is a direction vector for the line through $P_0 = (x_0, y_0, z_0)$. Therefore the line has parametric equations

$$x = x_0 + At, \quad y = y_0 + Bt, \quad z = z_0 + Ct.$$

- (b) If (x, y, z) lies on the line, then it satisfies the parametric equations; solving for the term involving t gives $x - x_0 = At$, $y - y_0 = Bt$, and $z - z_0 = Ct$. Since it also lies on the plane, we can find the needed value of t by substituting the parametric equations for x , y , and z into the equation of the plane and solving for t :

$$\begin{aligned} A(x_0 + At) + B(y_0 + Bt) + C(z_0 + Ct) &= D \\ A^2t + B^2t + C^2t &= D - Ax_0 - By_0 - Cz_0 \\ t &= \frac{D - Ax_0 - By_0 - Cz_0}{A^2 + B^2 + C^2} = \frac{-(Ax_0 + By_0 + Cz_0) + D}{A^2 + B^2 + C^2}. \end{aligned}$$

- (c) Since the line through P_0 is normal to the plane, the length of the segment from P_0 to the plane, meeting the plane at P , is in fact the distance to the plane, since if Q is any other point on the plane then $\triangle P_0PQ$ is a right triangle with hypotenuse P_0Q , so that $P_0Q > P_0P$. Therefore this

is the distance from P_0 to P ; call it d . But then

$$\begin{aligned}
 d &= \sqrt{(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2} \\
 &= \sqrt{\left(A \left(\frac{-(Ax_0 + By_0 + Cz_0) + D}{A^2 + B^2 + C^2} \right)\right)^2 + \left(B \left(\frac{-(Ax_0 + By_0 + Cz_0) + D}{A^2 + B^2 + C^2} \right)\right)^2 + \left(C \left(\frac{-(Ax_0 + By_0 + Cz_0) + D}{A^2 + B^2 + C^2} \right)\right)^2} \\
 &= \sqrt{(A^2 + B^2 + C^2) \cdot \frac{(-(Ax_0 + By_0 + Cz_0) + D)^2}{(A^2 + B^2 + C^2)^2}} \\
 &= \sqrt{\frac{(-(Ax_0 + By_0 + Cz_0) + D)^2}{A^2 + B^2 + C^2}} \\
 &= \frac{|-(Ax_0 + By_0 + Cz_0) + D|}{\sqrt{A^2 + B^2 + C^2}} \\
 &= \frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}}.
 \end{aligned}$$

90. Since the planes are parallel, the distance between them is the distance from any point on the first plane to the second plane. Let $P = (x_0, y_0, z_0)$ lie on the first plane, so that $Ax_0 + By_0 + Cz_0 = D_1$. Then using the formula for the distance from a point to a plane, the distance from P_0 to the second plane is

$$d = \frac{|Ax_0 + By_0 + Cz_0 - D_2|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|D_1 - D_2|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|D_2 - D_1|}{\sqrt{A^2 + B^2 + C^2}}.$$

91. The plane p_1 containing A with direction vectors $\mathbf{D}_1$ and $\mathbf{D}_2$, and the plane p_2 containing B with the same direction vectors are parallel, since they have the same normal vector $\mathbf{D}_1 \times \mathbf{D}_2$. Also p_1 contains the first skew line, and p_2 the second. So the distance between the skew lines is the distance between these parallel planes. Suppose the two planes have equations

$$rx + sy + tz = u_1, \quad rx + sy + tz = u_2,$$

and that $A = (a_0, a_1, a_2)$ lies on the first plane and $B = (b_0, b_1, b_2)$ on the second. The normal vector $\langle r, s, t \rangle$ to both planes is therefore $\mathbf{D}_1 \times \mathbf{D}_2$. Then the distance between the planes is, from Problem 90,

$$\begin{aligned}
 d &= \frac{|D_2 - D_1|}{\sqrt{A^2 + B^2 + C^2}} \\
 &= \frac{|u_2 - u_1|}{\sqrt{r^2 + s^2 + t^2}} \\
 &= \frac{|(rb_0 + sb_1 + tb_2) - (ra_0 + ra_1 + ra_2)|}{\|\mathbf{D}_1 \times \mathbf{D}_2\|} \\
 &= \frac{|r(b_0 - a_0) + s(b_1 - a_1) + t(b_2 - a_2)|}{\|\mathbf{D}_1 \times \mathbf{D}_2\|} \\
 &= \frac{\overrightarrow{AB} \cdot (\mathbf{D}_1 \times \mathbf{D}_2)}{\|\mathbf{D}_1 \times \mathbf{D}_2\|} \\
 &= \frac{\mathbf{w} \cdot (\mathbf{D}_1 \times \mathbf{D}_2)}{\|\mathbf{D}_1 \times \mathbf{D}_2\|} \\
 &= \left\| \frac{\mathbf{w} \cdot (\mathbf{D}_1 \times \mathbf{D}_2)}{\|\mathbf{D}_1 \times \mathbf{D}_2\|^2} (\mathbf{D}_1 \times \mathbf{D}_2) \right\| \\
 &= \|\text{proj}_{\mathbf{D}_1 \times \mathbf{D}_2} \mathbf{w}\|
 \end{aligned}$$

where $\mathbf{w} = \overrightarrow{AB}$.

92. Applying Problem 91, we see that the first line has direction vector $\mathbf{D}_1 = 2\mathbf{i} + 3\mathbf{j} + \mathbf{k}$ and contains the point $(3, 0, 0)$, while the second line has direction vector $\mathbf{D}_2 = \mathbf{i} - 2\mathbf{j} - \mathbf{k}$ and contains the point $(0, -1, 2)$. Then $\mathbf{w} = (0 - 3, -1 - 0, 2 - 0) = (-3, -1, 2)$, and the cross product is

$$\mathbf{D}_1 \times \mathbf{D}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 3 & 1 \\ 1 & -2 & -1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 3 & 1 \\ -2 & -1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 2 & 1 \\ 1 & -1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 2 & 3 \\ 1 & -2 \end{vmatrix} = -\mathbf{i} + 3\mathbf{j} - 7\mathbf{k}.$$

Therefore the distance between the lines is

$$\frac{|\mathbf{w} \cdot (\mathbf{D}_1 \times \mathbf{D}_2)|}{\|\mathbf{D}_1 \times \mathbf{D}_2\|} = \frac{|-3 \cdot (-1) - 1 \cdot 3 + 2 \cdot (-7)|}{\sqrt{1^2 + 3^2 + 7^2}} = \boxed{\frac{14}{\sqrt{59}}}.$$

93. To find points on each line at which the distance is a minimum, use the fact that ℓ_1 and ℓ_2 are each perpendicular to the shortest line joining them. The first line ℓ_1 has direction vector $\mathbf{D}_1 = \mathbf{i} + \mathbf{j} + \mathbf{k}$ and contains the point $(1, 2, -6)$, while the second line ℓ_2 has direction vector $\mathbf{D}_2 = 2\mathbf{i} - 3\mathbf{j} + \mathbf{k}$ and contains the point $(1, -2, 10)$. Therefore the vector equations for the two lines are

$$\ell_1 : (1 + t_1, 2 + t_1, -6 + t_1), \quad \ell_2 : (1 + 2t_2, -2 - 3t_2, 10 + t_2).$$

So if P and Q are any points on ℓ_1 and ℓ_2 respectively, then

$$P = (1 + t_1, 2 + t_1, -6 + t_1), \quad Q = (1 + 2t_2, -2 - 3t_2, 10 + t_2), \quad \overrightarrow{PQ} = (2t_2 - t_1, -3t_2 - t_1 - 4, t_2 - t_1 + 16).$$

If P and Q are the closest points on the two lines, then $\overrightarrow{PQ}$ must be perpendicular to both ℓ_1 and ℓ_2 ; that is, it must be perpendicular to the direction vectors of ℓ_1 and ℓ_2 , so that

$$\begin{aligned} \overrightarrow{PQ} \cdot \vec{D}_1 &= (2t_2 - t_1) \cdot 1 + (-3t_2 - t_1 - 4) \cdot 1 + (t_2 - t_1 + 16) \cdot 1 = -3t_1 + 12 = 0 \\ \overrightarrow{PQ} \cdot \vec{D}_2 &= (2t_2 - t_1) \cdot 2 + (-3t_2 - t_1 - 4) \cdot (-3) + (t_2 - t_1 + 16) \cdot 1 = 14t_2 + 28 = 0. \end{aligned}$$

The first of these gives $t_1 = 4$; the second gives $t_2 = -2$. So the points on the two lines whose distance from each other is the shortest are

$$\ell_1 : (1 + 4, 2 + 4, -6 + 4) = \boxed{(5, 6, -2)}, \quad \ell_2 : (1 + 2 \cdot (-2), -2 - 3 \cdot (-2), 10 - 2) = \boxed{(-3, 4, 8)}.$$

It follows that the shortest distance between the lines is the distance between these two points, which is

$$\sqrt{(5 - (-3))^2 + (6 - 4)^2 + (-2 - 8)^2} = \sqrt{8^2 + 2^2 + 10^2} = \sqrt{168} = \boxed{2\sqrt{42}}.$$

10.7: Quadric Surfaces

Concepts and Vocabulary

- (c) is correct. The trace in the xy -plane is found by setting $z = 0$, which gives $\frac{x^2}{2} - \frac{y^2}{3} = 1$.
- The intercepts are $(\pm 4, 0, 0)$ and $(0, 0, -4)$.
- True. See the discussion in the text.
- (b) is correct; this is an elliptic cone. See the definition in the text.
- The quadric surface $y^2 - x^2 = 4$ is called a *hyperbolic cylinder*. See the discussion in the text.
- The trace in the xz -plane is $z = -\frac{x^2}{5^2}$, and the trace in the yz -plane is $z = \frac{y^2}{2^2}$. Therefore $(0, 0, 0)$ is a local maximum for the first trace, and a local minimum for the second trace, so it is a *saddle point*.

Skill Building

7. (a) This is an elliptic paraboloid; in fact, since $a = b = 1$, it is a paraboloid of revolution.
- (b) The only intercept is the origin. The trace in the xy -plane has equation $x^2 + y^2 = 0$, so it consists only of the origin; the trace in the xz -plane is the parabola $z = x^2$; the trace in the yz -plane is the parabola $z = y^2$. The z -axis is the axis of the surface.

8. (a) This is a hyperbolic paraboloid.
- (b) The only intercept is the origin. The trace in the xy -plane has equation $x^2 - y^2 = (x - y)(x + y) = 0$, so it consists of the two lines $y = x$ and $y = -x$. The trace in the xz -plane is the parabola $z = x^2$; the trace in the yz -plane is the parabola $z = -y^2$.

9. (a) Divide through by 4 to put the equation into standard form: $\frac{x^2}{1^2} + \frac{y^2}{2^2} + \frac{z^2}{1^2} = 1$. This is an ellipsoid of revolution (since two of the denominators are the same).
- (b) The intercepts are $(\pm 1, 0, 0)$, $(0, \pm 2, 0)$, and $(0, 0, \pm 1)$. The trace in the xy -plane has equation $x^2 + \frac{y^2}{4} = 1$, which is an ellipse. The trace in the xz -plane is $x^2 + z^2 = 1$, which is a circle of radius 1. The trace in the yz -plane is $\frac{y^2}{4} + z^2 = 1$, which is also an ellipse.

(c)

10. (a) Putting this equation into standard form gives $\frac{x^2}{(1/\sqrt{2})^2} + y^2 + z^2 = 1$. This is an ellipsoid of revolution (since two of the denominators are the same).

(b) The intercepts are $(\pm \frac{1}{\sqrt{2}}, 0, 0)$, $(0, \pm 1, 0)$, and $(0, 0, \pm 1)$. The trace in the xy -plane has equation $\frac{x^2}{(1/\sqrt{2})^2} + y^2 = 1$, which is an ellipse. The trace in the xz -plane is $\frac{x^2}{(1/\sqrt{2})^2} + z^2 = 1$, which is also an ellipse. The trace in the yz -plane is $y^2 + z^2 = 1$, which is a circle of radius 1.

(c)

11. (a) Putting this equation into standard form gives $z^2 = x^2 + \frac{y^2}{(1/\sqrt{2})^2}$. This is an elliptic cone.
- (b) The only intercept is the origin. The trace in the xy -plane has equation $x^2 + \frac{y^2}{(1/\sqrt{2})^2} = 0$, which has only the solution $(0, 0)$, so the trace in the xy -plane is the origin. The trace in the xz -plane is $z^2 = x^2$, or $(z - x)(z + x) = 0$, so it consists of the pair of lines $z = x$ and $z = -x$. The trace in the yz -plane is $z^2 = \frac{y^2}{(1/\sqrt{2})^2}$; after simplification this becomes $z^2 = 2y^2$, so $(z - \sqrt{2}y)(z + \sqrt{2}y) = 0$, so it consists of the pair of lines $z = \pm \sqrt{2}y$. The z -axis is the axis of the cone.

12. (a) Putting this equation into its standard form by dividing through by 2 gives $x^2 + \frac{y^2}{(1/\sqrt{2})^2} - z^2 = 1$. This is a hyperboloid of one sheet.

- (b) The x -intercepts are ± 1 . The y -intercepts are solutions to $\frac{y^2}{(1/\sqrt{2})^2} = 1$, which are $y = \pm \frac{1}{\sqrt{2}}$. There are no z -intercepts, since the equation becomes $-z^2 = 1$ upon setting x and y to zero. Therefore the intercepts are $(\pm 1, 0, 0)$ and $(0, \pm \frac{1}{\sqrt{2}}, 0)$. The trace in the xy -plane has equation $x^2 + \frac{y^2}{(1/\sqrt{2})^2} = 1$, which is an ellipse. The trace in the xz -plane is $x^2 - z^2 = (x - z)(x + z) = 0$, so it consists of the pair of lines $z = x$ and $z = -x$. The trace in the yz -plane is $\frac{y^2}{(1/\sqrt{2})^2} - z^2 = 1$, which is a hyperbola. The z -axis is the axis of the hyperboloid.

13. (a) Putting this equation into standard form gives $z^2 = \frac{1}{4}x$. This is a parabolic cylinder.
- (b) The only x -intercept is 0. The y -intercept is found by setting $x = z = 0$, which gives the equation $0 = 0$, so every value of y is a y -intercept. The only z -intercept is 0. Therefore the intercepts are $(0, y, 0)$, where y is a free variable. The trace in the xy -plane has equation $x = 0$, so it is the y -axis. The trace in the xz -plane is $z^2 = \frac{1}{4}x$, which is a parabola. The trace in the yz -plane is $z = 0$, so y is a free variable and the trace is the y -axis. y is the free variable in the surface.

14. (a) This is an elliptic cylinder; in fact, it is a circular cylinder since $a = b = 1$.
- (b) The intercepts are $(\pm 1, 0, 0)$ and $(0, \pm 1, 0)$. (Setting $x = y = 0$ in the equation gives $0 = 1$, so there are no z -intercepts.) The trace in the xy -plane is the circle $x^2 + y^2 = 1$. The trace in the xz -plane is $y^2 = 1$, so it consists of the two lines $y = 1$ and $y = -1$. The trace in the yz -plane is $x^2 = 1$, so it consists of the two lines $x = 1$ and $x = -1$. The z -axis is the axis of the cylinder.

15. (a) Divide through by 4 to put this equation into standard form, giving

$$\frac{x^2}{2^2} + \frac{y^2}{(1/\sqrt{2})^2} - \frac{z^2}{2^2} = -1.$$

This is a hyperboloid of two sheets.

- (b) The x -intercepts are the solutions to $x^2 = -4$, which do not exist, so there are no x -intercepts. The y -intercepts are the solutions to $2y^2 = -4$, which do not exist, so there are no y -intercepts either. The z -intercept is found by setting $x = y = 0$ in the equation, giving $-z^2 = -4$, so the z -intercepts are ± 2 . Therefore the intercepts are $(0, 0, \pm 2)$. The trace in the xy -plane is the

equation $x^2 + 2y^2 = -4$, which has no solutions, so the trace is empty. However, if $z = k$ with $|k| > 2$, then the trace in the plane $z = k$ parallel to the xy -plane is the ellipse $x^2 + 2y^2 = k^2$. The trace in the xz -plane is $x^2 - z^2 = -4$, or $z^2 - x^2 = 4$, which is a hyperbola. The trace in the yz -plane is $2y^2 - z^2 = -4$, or $z^2 - 2y^2 = 4$, which is also a hyperbola. The z -axis is the axis of the hyperboloid.

(c)

16. (a) This is a hyperbolic cylinder; in standard form is it $\frac{y^2}{2^2} - \frac{x^2}{2^2} = 1$.

(b) The x -intercepts are the solutions to $-x^2 = 4$, which do not exist, so there are no x -intercepts. The y -intercepts are the solutions to $y^2 = 4$, so the y -intercepts are ± 2 . The z -intercepts are found by setting $x = y = 0$ in the equation, giving $0 = 4$, which has no solutions. So there are no z -intercepts. Therefore the only intercepts are $(0, \pm 2, 0)$. The trace in the xy -plane is the equation $y^2 - x^2 = 4$, which is a hyperbola. The trace in the xz -plane is $-x^2 = 4$, which is empty. The trace in the yz -plane is $y^2 = 4$, so it consists of the two lines $y = 2$ and $y = -2$. z is the free variable in the surface.

(c)

17. (a) This is a parabolic cylinder.

(b) The only x -intercept is 0, as is the only y -intercept. The z -intercepts are found by setting $x = y = 0$ in the equation, giving $0 = 0$, so any value of z is a z -intercept. Therefore the intercepts are $(0, 0, z)$ where z is a free variable. The trace in the xy -plane is the equation $2x = y^2$, which is a parabola. The trace in the xz -plane is $2x = 0$, so $x = 0$ and the trace is the z -axis. The trace in the yz -plane is $y^2 = 0$, so $y = 0$ and the trace is again the z -axis. z is the free variable in the surface.

(c)

18. (a) This is a hyperbolic cylinder; in standard form it is $\frac{y^2}{(1/2)^2} - x^2 = 1$.

(b) The x -intercept consists of solutions to $-x^2 = 1$; since there are none, there are no x -intercepts. The y -intercept is solutions to $4y^2 = 1$, so it is $\pm \frac{1}{2}$. The z -intercepts are found by setting $x = y = 0$ in the equation, giving $0 = 1$, so there are no z -intercepts. Therefore the intercepts are $(0, \pm \frac{1}{2}, 0)$. The trace in the xy -plane is the equation $4y^2 - x^2 = 1$, which is a hyperbola. The trace in the xz -plane is $-x^2 = 1$, which is empty. The trace in the yz -plane is $4y^2 = 1$, so it consists of the lines $y = \pm \frac{1}{2}$.

(c)

19. This is the equation of a hyperbolic paraboloid, so it is either **A** or **C**. The xy trace of this equation is the equation $4y^2 - x^2 = (2y - x)(2y + x) = 0$, so it consists of the two lines $x = 2y$ and $x = -2y$. This matches **C** but not **A**.
20. This is the equation of an elliptic paraboloid, so it must be **F**.
21. This is the equation of a hyperboloid of one sheet, so it must be **B**.
22. This is the equation of an ellipsoid, so it must be **D**.
23. This is the equation of a parabolic cylinder, so it must be **E**.
24. This is the equation of a hyperbolic paraboloid, so it is either **A** or **C**. The xz trace of this equation is $x^2 - z^2 = (x - z)(x + z) = 0$, so it consists of the two lines $z = x$ and $z = -x$. This matches **A** but not **C**.
25. This is the equation of an elliptic paraboloid, $z = -3x^2 - 4y^2$ (this paraboloid opens down rather than up). It must correspond to graph **L**.
26. Completing the square gives $3x^2 + (2y + 1)^2 = 1$. This is an elliptic cylinder with axis along the z -axis, centered at $(0, -\frac{1}{2})$, which matches graph **I**.
27. Subtracting 1 from both sides gives $3x^2 + 2y^2 - (z - 2)^2 = -1$, which is a hyperboloid of two sheets that has been shifted up by 2 units. This corresponds to graph **K**.
28. This is the equation of a hyperbolic paraboloid, so it must correspond to graph **H**.
29. Completing the square gives $x^2 + 2y^2 - (z - 2)^2 = 0$, or $(z - 2)^2 = x^2 + 2y^2$. This is an elliptic cone with axis along the z -axis, shifted up by 2 units, which matches graph **J**.
30. This is the equation of an ellipsoid of revolution, which matches graph **G**.

Applications and Extensions

31. Answers may vary.
32. As defined in the text, a cylinder is a quadric surface in which one of the variables is missing, so it looks like the planar curve defined by the equation, extended through all possible values of the missing variable. Here x is missing, so this is a cylinder oriented along the x -axis, whose trace in the yz -plane is a sine curve.

33.

Challenge Problem

34. Following the hint, if we rewrite the equation as shown, then it factors as

$$\left(\frac{x}{a} - \frac{z}{c}\right) \left(\frac{x}{a} + \frac{z}{c}\right) = \left(1 - \frac{y}{b}\right) \left(1 + \frac{y}{b}\right), \quad \text{so that} \quad \frac{\frac{x}{a} + \frac{z}{c}}{1 - \frac{y}{b}} = \frac{1 + \frac{y}{b}}{\frac{x}{a} - \frac{z}{c}}.$$

If $P = (x_0, y_0, z_0)$ lies on the one-sheeted hyperboloid, then x_0 , y_0 , and z_0 , satisfy the equation above. Call that common ratio h_P . Now consider the two planes

$$\frac{x}{a} + \frac{z}{c} = h_P \left(1 - \frac{y}{b}\right) \quad \text{and} \quad \frac{x}{a} - \frac{z}{c} = \frac{1}{h_P} \left(1 + \frac{y}{b}\right).$$

The point P lies on both of these planes by construction, so that the planes are not parallel and therefore intersect in a line. Additionally, if (x_1, y_1, z_1) is any point on that line of intersection, so that it lies on both planes, then multiplying the two equations gives

$$\left(\frac{x_1}{a} - \frac{z_1}{c}\right) \left(\frac{x_1}{a} + \frac{z_1}{c}\right) = \left(1 - \frac{y_1}{b}\right) \left(1 + \frac{y_1}{b}\right), \quad \text{so that} \quad \frac{x_1^2}{a^2} - \frac{z_1^2}{c^2} = 1 - \frac{y_1^2}{b^2},$$

and therefore (x_1, y_1, z_1) lies on the surface. So the line of intersection of these two planes lies completely in the surface and contains P .

Now, the equations can be regrouped differently:

$$\left(\frac{x}{a} - \frac{z}{c}\right) \left(\frac{x}{a} + \frac{z}{c}\right) = \left(1 - \frac{y}{b}\right) \left(1 + \frac{y}{b}\right), \quad \text{so that} \quad \frac{\frac{x}{a} + \frac{z}{c}}{1 + \frac{y}{b}} = \frac{1 - \frac{y}{b}}{\frac{x}{a} - \frac{z}{c}}.$$

Again, if $P = (x_0, y_0, z_0)$ lies on the one-sheeted hyperboloid, then x_0 , y_0 , and z_0 , satisfy the equation above. Call that common ratio k_P . Now consider the two planes

$$\frac{x}{a} + \frac{z}{c} = k_P \left(1 + \frac{y}{b}\right) \quad \text{and} \quad \frac{x}{a} - \frac{z}{c} = \frac{1}{k_P} \left(1 - \frac{y}{b}\right).$$

Again the point P lies on both of these planes by construction, so that the planes are not parallel and therefore intersect in a line. Additionally, if (x_1, y_1, z_1) is any point on that line of intersection, so that it lies on both planes, then multiplying the two equations gives the same product as before, so that again (x_1, y_1, z_1) lies on the surface, so that the entire line of intersection lies on the surface.

The only remaining point is to show that these two lines are in fact distinct lines. To do that it suffices to show that they have distinct direction vectors. The direction vector to each line is the cross product of the normal vectors of the two planes, so we get for direction vectors

$$\begin{aligned} \mathbf{d}_1 &= \left\langle \frac{1}{a}, \frac{h_P}{b}, \frac{1}{c} \right\rangle \times \left\langle \frac{1}{a}, -\frac{h_P}{b}, -\frac{1}{c} \right\rangle = \left\langle 0, \frac{2}{ac}, -\frac{2h_P}{ab} \right\rangle \\ \mathbf{d}_2 &= \left\langle \frac{1}{a}, -\frac{k_P}{b}, \frac{1}{c} \right\rangle \times \left\langle \frac{1}{a}, \frac{k_P}{b}, -\frac{1}{c} \right\rangle = \left\langle 0, \frac{2}{ac}, \frac{2k_P}{ab} \right\rangle. \end{aligned}$$

Since the second components are identical, these two vectors are parallel if and only if $-\frac{2h_P}{ab} = \frac{2k_P}{ab}$, so if and only if

$$\frac{\frac{x_0}{a} + \frac{z_0}{c}}{1 - \frac{y_0}{b}} = h_P = -k_P = -\frac{\frac{x_0}{a} + \frac{z_0}{c}}{1 + \frac{y_0}{b}}.$$

The numerators are identical, so these two are equal if and only if $1 - \frac{y_0}{b} = -(1 + \frac{y_0}{b}) = -1 - \frac{y_0}{b}$, which is impossible. So the direction vectors are different and the lines are distinct.

Chapter Review

- The other vertices of the box are the other points whose x -coordinates are 1 or 2, whose y -coordinates are 0 or 3, and whose z -coordinates are 2 or 4:

$$(1, 0, 4), (1, 3, 2), (1, 3, 4), (2, 0, 2), (2, 3, 2), (2, 0, 4).$$

- The set of points satisfying $y = 3$ is a plane parallel to the xz -plane and lying 3 units above it.

- (a) $\mathbf{v} = \overrightarrow{P_1P_2} = \langle 7 - 5, 1 - 0, 3 - (-2) \rangle = \langle 2, 1, 5 \rangle$.

- (b) $\mathbf{v} = 2\mathbf{i} + \mathbf{j} + 5\mathbf{k}$.

- The magnitude is

$$\|\mathbf{v}\| = \sqrt{1^2 + 2^2 + 3^2} = \sqrt{1 + 4 + 9} = \sqrt{14}.$$

- The distance between the points is

$$\|\langle 7, 5, 1 \rangle - \langle 1, 2, 3 \rangle\| = \sqrt{(7-1)^2 + (5-2)^2 + (1-3)^2} = \sqrt{6^2 + 3^2 + 2^2} = \sqrt{49} = 7.$$

- $(x-1)^2 + (y-2)^2 + (z-3)^2 = 4^2 = 16$.

- Completing the square, we get

$$\begin{aligned} x^2 + y^2 + z^2 - 4x + 8y &= 5 \\ (x^2 - 4x + 4) + (y^2 + 8y + 16) + z^2 &= 5 + 4 + 16 \\ (x-2)^2 + (y+4)^2 + z^2 &= 25 = 5^2, \end{aligned}$$

so that this sphere has center $(2, -4, 0)$ and radius 5.

- We have

$$\begin{aligned} 3\mathbf{v} - 2\mathbf{w} &= 3\langle -2, -1, 3 \rangle - 2\langle 5, 4, -2 \rangle \\ &= \langle 3 \cdot (-2) - 2 \cdot 5, 3 \cdot (-1) - 2 \cdot 4, 3 \cdot 3 - 2 \cdot (-2) \rangle = \langle -16, -11, 13 \rangle. \end{aligned}$$

- First compute

$$\mathbf{v} + \mathbf{w} = 2\mathbf{i} + 3\mathbf{j} - \mathbf{k} + (-\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}) = \mathbf{i} + \mathbf{j} + 2\mathbf{k}.$$

Then

$$\|\mathbf{v} + \mathbf{w}\| = \|\mathbf{i} + \mathbf{j} + 2\mathbf{k}\| = \sqrt{1^2 + 1^2 + 2^2} = \sqrt{6}.$$

10. The magnitude of
- $\mathbf{v}$
- is

$$\|\mathbf{v}\| = \sqrt{4^2 + 12^2 + 3^2} = \sqrt{169} = 13,$$

so that a unit vector in the direction of $\mathbf{v}$ is

$$\boxed{\frac{1}{13}\mathbf{v} = \frac{4}{13}\mathbf{i} + \frac{12}{13}\mathbf{j} - \frac{3}{13}\mathbf{k}}.$$

11. Since the angle between
- $\mathbf{v}$
- and the positive
- x
- axis is
- 120°
- , we have

$$\mathbf{v} = \|\mathbf{v}\| (\cos 120^\circ \mathbf{i} + \sin 120^\circ \mathbf{j}) = 25 \left(-\frac{1}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j} \right) = \boxed{-\frac{25}{2}\mathbf{i} + \frac{25\sqrt{3}}{2}\mathbf{j}}.$$

12. Multiply the second equation by 3 giving
- $6\mathbf{w} + 3\mathbf{v} = 3\mathbf{i} + 3\mathbf{j}$
- . Now add it to the first equation, giving
- $7\mathbf{w} = 5\mathbf{i} + 4\mathbf{j} - \mathbf{k}$
- , so that
- $\mathbf{w} = \frac{5}{7}\mathbf{i} + \frac{4}{7}\mathbf{j} - \frac{1}{7}\mathbf{k}$
- . Now substitute this back into the first equation, giving

$$\begin{aligned} \mathbf{w} - 3\mathbf{v} &= 2\mathbf{i} + \mathbf{j} - \mathbf{k} \\ \frac{5}{7}\mathbf{i} + \frac{4}{7}\mathbf{j} - \frac{1}{7}\mathbf{k} - 3\mathbf{v} &= 2\mathbf{i} + \mathbf{j} - \mathbf{k} \\ 3\mathbf{v} &= \frac{5}{7}\mathbf{i} + \frac{4}{7}\mathbf{j} - \frac{1}{7}\mathbf{k} - (2\mathbf{i} + \mathbf{j} - \mathbf{k}) \\ 3\mathbf{v} &= -\frac{9}{7}\mathbf{i} - \frac{3}{7}\mathbf{j} + \frac{6}{7}\mathbf{k} \\ \mathbf{v} &= \boxed{-\frac{3}{7}\mathbf{i} - \frac{1}{7}\mathbf{j} + \frac{2}{7}\mathbf{k}}. \end{aligned}$$

13. (a) We get

$$\begin{aligned} \|\mathbf{v}\| &= \sqrt{5^2 + 8^2 + 2^2} = \sqrt{93} \\ \cos \alpha &= \frac{v_1}{\|\mathbf{v}\|} = \frac{5}{\sqrt{93}} \\ \cos \beta &= \frac{v_2}{\|\mathbf{v}\|} = \frac{8}{\sqrt{93}} \\ \cos \gamma &= \frac{v_3}{\|\mathbf{v}\|} = -\frac{2}{\sqrt{93}}. \end{aligned}$$

- (b) From part (a), we have

$$\mathbf{v} = \|\mathbf{v}\| (\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}) = \boxed{\sqrt{93} \left(\frac{5}{\sqrt{93}}\mathbf{i} + \frac{8}{\sqrt{93}}\mathbf{j} - \frac{2}{\sqrt{93}}\mathbf{k} \right)}.$$

14. The vector projection of
- $\mathbf{v}$
- onto
- $\mathbf{w}$
- is

$$\begin{aligned} \text{proj}_{\mathbf{w}} \mathbf{v} &= \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|} \mathbf{w} = \frac{3 \cdot 5 + 1 \cdot (-1) - 2 \cdot 1}{\sqrt{3^2 + 1^2 + 2^2} \sqrt{5^2 + 1^2 + 1^2}} \mathbf{w} \\ &= \frac{12}{\sqrt{14}\sqrt{27}} \mathbf{w} = \frac{4}{\sqrt{42}} \mathbf{w} = \frac{20}{\sqrt{42}} \mathbf{i} - \frac{4}{\sqrt{42}} \mathbf{j} + \frac{4}{\sqrt{42}} \mathbf{k}. \end{aligned}$$

Since the projection is parallel to $\mathbf{w}$, we let

$$\mathbf{v}_1 = \text{proj}_{\mathbf{w}} \mathbf{v} = \frac{20}{\sqrt{42}} \mathbf{i} - \frac{4}{\sqrt{42}} \mathbf{j} + \frac{4}{\sqrt{42}} \mathbf{k},$$

and then

$$\mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1 = \left(3 - \frac{20}{\sqrt{42}} \right) \mathbf{i} + \left(1 + \frac{4}{\sqrt{42}} \right) \mathbf{j} - \left(2 + \frac{4}{\sqrt{42}} \right) \mathbf{k}.$$

15. The work done is the dot product of the force applied and the vector along which the object is moved:

$$\mathbf{F} \cdot \mathbf{u} = 2 \cdot 3 - 1 \cdot 2 - 1 \cdot (-5) = \boxed{9 \text{ J}}.$$

16. The force along the x -axis is $12\mathbf{i}$, along the y -axis is $16\mathbf{j}$, and along the z -axis is $15\mathbf{k}$, so the total force is

$$\boxed{\mathbf{F} = 12\mathbf{i} + 16\mathbf{j} + 15\mathbf{k}, \text{ with a magnitude of } \sqrt{12^2 + 16^2 + 15^2} = 25}.$$

17. The angle θ between the vectors satisfies

$$\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} = \frac{1 \cdot 2 + 2 \cdot (-3) + 3 \cdot (-1)}{\sqrt{1^2 + 2^2 + 3^2} \sqrt{2^2 + 3^2 + 1^2}} = \frac{-7}{14} = -\frac{1}{2},$$

so that

$$\theta = \cos^{-1} \left(-\frac{1}{2} \right) = \boxed{\frac{2\pi}{3} = 120^\circ}.$$

18. The sides emanating from A are

$$\overrightarrow{AB} = \mathbf{u} = \langle 2 - 1, -1 - 0, 1 - 1 \rangle = \langle 1, -1, 0 \rangle, \quad \overrightarrow{AC} = \mathbf{v} = \langle -2 - 1, 1 - 0, 0 - 1 \rangle = \langle -3, 1, -1 \rangle,$$

so the angle θ between those sides satisfies

$$\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} = \frac{1 \cdot (-3) - 1 \cdot 1 + 0 \cdot (-1)}{\sqrt{1^2 + 1^2 + 0^2} \sqrt{3^2 + 1^2 + 1^2}} = -\frac{4}{\sqrt{22}},$$

so that

$$\theta = \cos^{-1} \left(-\frac{4}{\sqrt{22}} \right) \approx 2.592 \approx 148.518^\circ.$$

19. To find the distance between the planes, choose a point on p_1 . To do this, set $y = z = 0$; then $x = 1$ and $(x_0, y_0, z_0) = (1, 0, 0)$ is a point on p_1 . Then using the formula in the text for the distance from a point to a plane, we have from p_2 $A = -2$, $B = -2$, $C = 2$, and $D = 2$, so the distance is

$$\frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|-2 \cdot 1 - 2 \cdot 0 + 2 \cdot 0 - 2|}{\sqrt{2^2 + 2^2 + 2^2}} = \frac{4}{\sqrt{12}} = \boxed{\frac{2}{\sqrt{3}}}.$$

20. $\boldsymbol{\omega}$ points in the direction of $2\mathbf{i} + 3\mathbf{j} + 6\mathbf{k}$; a unit vector in this direction is

$$\frac{1}{\sqrt{2^2 + 3^2 + 6^2}}(2\mathbf{i} + 3\mathbf{j} + 6\mathbf{k}) = \frac{2}{7}\mathbf{i} + \frac{3}{7}\mathbf{j} + \frac{6}{7}\mathbf{k}.$$

Since the angular speed ω is constant, we have

$$\boldsymbol{\omega} = \omega \left(\frac{2}{7}\mathbf{i} + \frac{3}{7}\mathbf{j} + \frac{6}{7}\mathbf{k} \right).$$

The position of the object is $\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$, so the velocity is

$$\begin{aligned} \mathbf{v} &= \boldsymbol{\omega} \times \mathbf{r} \\ &= \omega \left(\frac{2}{7}\mathbf{i} + \frac{3}{7}\mathbf{j} + \frac{6}{7}\mathbf{k} \right) \times (\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) \\ &= \omega \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{2}{7} & \frac{3}{7} & \frac{6}{7} \\ 1 & 2 & 3 \end{vmatrix} \\ &= \left(-\frac{3}{7}\mathbf{i} + \frac{1}{7}\mathbf{k} \right) \omega. \end{aligned}$$

The object's speed is then

$$\|\mathbf{v}\| = \omega \sqrt{\left(\frac{3}{7}\right)^2 + \left(\frac{1}{7}\right)^2} = \boxed{\frac{\sqrt{10}}{7}\omega \text{ m/s}}.$$

21. These lines both pass through the point $(1, 0, -1)$ (when $t = 0$ in each case). ℓ has direction vector $\langle -1, 1, 2 \rangle$, and m has direction vector $\langle 1, -1, 1 \rangle$. Therefore we are looking for a line through $(1, 0, -1)$ with direction vector perpendicular to both of these. We find that vector by taking the cross product:

$$\mathbf{d} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 1 & 2 \\ 1 & -1 & 1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 1 & 2 \\ -1 & 1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} -1 & 2 \\ 1 & 1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} -1 & 1 \\ 1 & -1 \end{vmatrix} = 3\mathbf{i} + 3\mathbf{j}.$$

So the line perpendicular to the given lines has parametric equations

$$\boxed{x = 1 + 3t, \quad y = 3t, \quad z = -1}.$$

Answers may vary depending on specific choices for the direction vector and the point.

22. Using parametric equations, we get

$$\boxed{x = 1 + 2t, \quad y = 2 - t, \quad z = 3 - 4t}.$$

23. The two vectors are orthogonal when their dot product is zero:

$$\mathbf{v} \cdot \mathbf{w} = (2\mathbf{i} - \mathbf{j} - 4\mathbf{k}) \cdot (a\mathbf{i} + a\mathbf{j} + 3\mathbf{k}) = 2a - a - 12 = a - 12.$$

This is zero when $\boxed{a = 12}$, so this is the value of a for which the vectors are orthogonal.

24. Since we are given two endpoints of a diameter, the center of the sphere is the midpoint of the segment between those two points, which is

$$\left(\frac{2-2}{2}, \frac{2+6}{2}, \frac{-3+5}{2} \right) = (0, 4, 1).$$

The radius of the sphere is therefore the distance from the center to either of the points; we use the first point:

$$r = \sqrt{(2-0)^2 + (2-4)^2 + (-3-1)^2} = \sqrt{4+4+16} = \sqrt{24},$$

so that the equation of the sphere is

$$\boxed{x^2 + (y-4)^2 + (z-1)^2 = 24}.$$

The sphere is below.

25. The normals of the two planes are $\mathbf{N}_1 = \mathbf{i} - \mathbf{j} + \mathbf{k}$ and $\mathbf{N}_2 = 2\mathbf{i} + 2\mathbf{j} - \mathbf{k}$; these vectors are not parallel, so the planes intersect in a line. A direction vector to the line lies in both planes, so it is orthogonal to both normals. Therefore a direction vector for the line is

$$\mathbf{D} = \mathbf{N}_1 \times \mathbf{N}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -1 & 1 \\ 2 & 2 & -1 \end{vmatrix} = \mathbf{i} \begin{vmatrix} -1 & 1 \\ 2 & -1 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & 1 \\ 2 & -1 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & -1 \\ 2 & 2 \end{vmatrix} = -\mathbf{i} + 3\mathbf{j} + 4\mathbf{k}.$$

To find a point on the line, we need a point that lies on both planes. Set $z = 0$; this gives the equations $x - y = 3$ and $2x + 2y = 1$, which have the solution $x = \frac{7}{4}$, $y = -\frac{5}{4}$. Therefore the point $(\frac{7}{4}, -\frac{5}{4}, 0)$ lies in both planes, so it lies on their line of intersection. So the parametric equations of the line of intersection are

$$\boxed{x = \frac{7}{4} - t, \quad y = -\frac{5}{4} + 3t, \quad z = 4t}.$$

Answers may vary depending on specific choices for the direction vector and the point.

26. Since the plane passes through the three given points, the vectors

$$\langle 0, b, 0 \rangle - \langle a, 0, 0 \rangle = \langle -a, b, 0 \rangle, \quad \text{and} \quad \langle 0, 0, c \rangle - \langle a, 0, 0 \rangle = \langle -a, 0, c \rangle$$

both lie in the plane. Therefore a normal vector to the plane is the cross product of these two vectors:

$$\mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -a & b & 0 \\ -a & 0 & c \end{vmatrix} = \mathbf{i} \begin{vmatrix} b & 0 \\ 0 & c \end{vmatrix} - \mathbf{j} \begin{vmatrix} -a & 0 \\ -a & c \end{vmatrix} + \mathbf{k} \begin{vmatrix} -a & b \\ -a & 0 \end{vmatrix} = bc\mathbf{i} + ac\mathbf{j} + ab\mathbf{k}.$$

Since the plane passes through $(a, 0, 0)$, its equation is

$$bc(x - a) + acy + abz = 0, \quad \text{or} \quad \boxed{bcx + acy + abz = abc}.$$

27.

28. From the symmetric equations, both lines have direction vector $\langle 6, 3, 7 \rangle$, so they are either the same line or they are parallel. The parametric equations of ℓ_1 are

$$x = -5 + 6t, \quad y = 2 + 3t, \quad z = -4 + 7t.$$

The two lines are the same if $(-5, -1, 2)$, which lies on ℓ_2 , also lies on ℓ_1 . But $-5 = -5 + 6t$ implies that $t = 0$, so that $y = 2$ and $z = -4$. Therefore this point is not on ℓ_1 , so the lines are parallel.

29. The direction vector of the given line is $\langle 2, 3, 1 \rangle$, so this is the normal $\mathbf{N}$ to the desired plane. Since the plane contains $(2, -1, 4)$, its equation is $2(x - 2) + 3(y - (-1)) + 1(z - 4) = 0$, which simplifies to the general equation

$$\boxed{2x + 3y + z = 5}.$$

30. Since the direction vectors $\mathbf{d}_1 = \langle 1, 3, 1 \rangle$ and $\mathbf{d}_2 = \langle 2, 3, 1 \rangle$ are not multiples of one another, they are not parallel, so the lines are not parallel. To see if they intersect, convert the equation for ℓ_2 to its parametric form, using s as the parameter:

$$\ell_2: \quad x = -3 + 2s, \quad y = 3 + 3s, \quad z = s.$$

If these lines intersect, then the equations

$$t + 1 = 2s - 3$$

$$3t = 3s + 3$$

$$t - 1 = s$$

have a solution. The third equation gives $s = t - 1$; substitute into the first equation to get $t + 1 = 2(t - 1) - 3 = 2t - 5$, so that $t = 6$ and then $s = 5$. These values of s and t also satisfy the second equation, so the lines do intersect. The point of intersection may be found by substituting $s = 5$ into the equations for ℓ_2 to get the point $(7, 18, 5)$.

31. Since the plane contains the two given lines, it contains their direction vectors $\mathbf{d}_1 = \langle 1, 2, 2 \rangle$ and $\mathbf{d}_2 = \langle 1, 3, -3 \rangle$. A line normal to this plane must be normal to both of these direction vectors, so it is parallel to their cross product, which will therefore be a direction vector for the line:

$$\mathbf{d} = \mathbf{d}_1 \times \mathbf{d}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 2 \\ 1 & 3 & -3 \end{vmatrix} = \mathbf{i} \begin{vmatrix} 2 & 2 \\ 3 & -3 \end{vmatrix} - \mathbf{j} \begin{vmatrix} 1 & 2 \\ 1 & -3 \end{vmatrix} + \mathbf{k} \begin{vmatrix} 1 & 2 \\ 1 & 3 \end{vmatrix} = -12\mathbf{i} + 5\mathbf{j} + \mathbf{k}.$$

We need a point on the line, which is the point of intersection of the two given lines. To find their point of intersection, convert each set of symmetric equations to parametric equations:

$$\begin{aligned}\ell_1: \quad x &= 2 + t, & y &= -1 + 2t, & z &= 1 + 2t \\ \ell_2: \quad x &= -1 + s, & y &= -8 + 3s, & z &= -3s.\end{aligned}$$

The intersection point is found by solving the three equations

$$\begin{aligned}2 + t &= -1 + s \\ -1 + 2t &= -8 + 3s \\ 1 + 2t &= -3s.\end{aligned}$$

The first equation gives $t = s - 3$; substitute into the second equation to get $-1 + 2(s - 3) = -8 + 3s$, so that $2s - 7 = 3s - 8$, or $s = 1$. Then $t = -2$, and this pair of values also satisfies the third equation. The point of intersection may then be found by substituting $s = 1$ into ℓ_2 (or substituting $t = -2$ into ℓ_1):

$$x = -1 + 1 = 0, \quad y = -8 + 3 \cdot 1 = -5, \quad z = -3 \cdot 1 = -3,$$

so the point of intersection is $(0, -5, -3)$. Combining this with the direction vector above, the symmetric equations of the desired line are

$$\boxed{\frac{x}{-12} = \frac{y + 5}{5} = \frac{z + 3}{1}}.$$

32. A direction vector for the line is $\overrightarrow{P_1P_2} = \langle 5, 3, 6 \rangle - \langle 4, 0, 7 \rangle = \langle 1, 3, -1 \rangle$. Since it passes through the point $(4, 0, 7)$, its symmetric equations are

$$\boxed{\frac{x - 4}{1} = \frac{y}{3} = \frac{z - 7}{-1}}.$$

33. (a) This is a hyperbolic cylinder.

(b) The x -intercepts are solutions to $\frac{x^2}{4} = 1$, so they are ± 2 . The y -intercepts are solutions to $-\frac{y^2}{9} = 1$, which has no solutions, so there are no y -intercepts. The z -intercepts are found by setting $x = y = 0$ in the equation, giving $0 = 1$, so there are no z -intercepts. Therefore the only intercepts are $(\pm 2, 0, 0)$. The trace in the xy -plane is the original equation, which is a hyperbola. The trace in the xz -plane is $\frac{x^2}{4} = 1$, or $x^2 = 4$, so it consists of the two lines $x = \pm 2$. The trace in the yz -plane is $-\frac{y^2}{9} = 1$, so it is empty.

(c)

34. (a) This is a hyperboloid of two sheets.

- (b) The x -intercepts are the solutions to $x^2 = -1$, which do not exist, so there are no x -intercepts. The y -intercepts are the solutions to $y^2 = -1$, which do not exist, so there are no y -intercepts either. The z -intercepts are found by setting $x = y = 0$ in the equation, giving $-\frac{z^2}{4} = -1$, so the z -intercepts are ± 2 . Therefore the only intercepts are $(0, 0, \pm 2)$. The trace in the xy -plane is the equation $x^2 + y^2 = -1$, which has no solutions, so the trace is empty. The trace in the xz -plane is $x^2 - \frac{z^2}{4} = -1$, or $z^2 - 4x^2 = 4$, which is a hyperbola. The trace in the yz -plane is $y^2 - \frac{z^2}{4} = -1$, or $z^2 - 4y^2 = 4$, which is also a hyperbola. The z -axis is the axis of the hyperboloid.

(c)

35. (a) This is a hyperbolic paraboloid.

- (b) The only intercept is the origin. The trace in the xy -plane has equation $\frac{x^2}{4} - \frac{y^2}{9} = 0$, so it consists of the two lines $3x = 2y$ and $3x = -2y$. The trace in the xz -plane is the parabola

$z = \frac{1}{4}x^2$; the trace in the yz -plane is the parabola $z = -\frac{1}{9}y^2$.

36. (a) This is an elliptic cone.

(b) The only intercept is the origin. The trace in the xy -plane has equation $\frac{x^2}{4} + \frac{y^2}{9} = 0$, which has only the solution $(0, 0)$, so the trace in the xy -plane is the origin. The trace in the xz -plane is $z^2 = \frac{x^2}{4}$, or $(2z - x)(2z + x) = 0$, so it consists of the pair of lines $2z = x$ and $2z = -x$. The trace in the yz -plane is $z^2 = \frac{y^2}{9}$; after simplification this becomes $9z^2 = y^2$, so $(3z - y)(3z + y) = 0$, so it consists of the pair of lines $3z = \pm y$. The z -axis is the axis of the cone.

37. (a) This is an ellipsoid.

(b) The intercepts are $(\pm 2, 0, 0)$, $(0, \pm 3, 0)$, and $(0, 0, \pm 1)$. The trace in the xy -plane has equation $\frac{x^2}{4} + \frac{y^2}{9} = 1$, which is an ellipse. The trace in the xz -plane is $\frac{x^2}{4} + z^2 = 1$, which is also an ellipse. The trace in the yz -plane is $\frac{y^2}{9} + z^2 = 1$, which is also an ellipse.

(c)

Vector Functions

11.1 Vector Functions and Their Derivatives

Concepts and Vocabulary

1. The components of $\mathbf{r}(t)$ are $x(t) = 4t + 1$, $y(t) = \sqrt{4 - t}$, and $z(t) = 1$. Since $x(t)$ is defined for all real numbers, $y(t)$ is defined for all real numbers $t \leq 4$, and $z(t)$ is defined for all real numbers, the domain of $\mathbf{r}(t)$ is the intersection of these three domains, or $\boxed{\{t \mid t \leq 4\}}$.
2. False. For a vector function to be continuous at t_0 , all of its component functions must be continuous at t_0 .
3. True. By the theorem on differentiating a vector function, if $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ and if $x(t)$, $y(t)$, and $z(t)$ are each differentiable real functions, then $\mathbf{r}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}$.
4. True. Since the dot product of two vectors is a scalar function, the derivative of the dot product must also be a scalar function.
5. False. By the scalar multiplication formula, $\frac{d}{dt}[f(t)\mathbf{r}(t)] = \left[\frac{d}{dt}f(t)\right]\mathbf{r}(t) + f(t)\left[\frac{d}{dt}\mathbf{r}(t)\right]$.
6. By the cross product formula, $\frac{d}{dt}(\mathbf{u} \times \mathbf{v}) = \mathbf{u}' \times \mathbf{v} + \mathbf{u} \times \mathbf{v}'$.

Skill Building

7. $\mathbf{r}(1) = (1)^2\mathbf{i} - (2)(1)\mathbf{j} = \boxed{\mathbf{i} - 2\mathbf{j}}$
8. $\mathbf{r}(2) = (2)^3\mathbf{i} + (2)(2)\mathbf{j} = \boxed{8\mathbf{i} + 4\mathbf{j}}$
9. $\mathbf{v}\left(\frac{\pi}{4}\right) = \sin \frac{\pi}{4}\mathbf{i} - \cos \frac{\pi}{4}\mathbf{j} = \boxed{\frac{\sqrt{2}}{2}\mathbf{i} - \frac{\sqrt{2}}{2}\mathbf{j}}$
10. $\mathbf{v}(0) = \tan(0)\mathbf{i} + \cos(2 \cdot 0)\mathbf{j} = 0\mathbf{i} + 1\mathbf{j} = \boxed{\mathbf{j}}$
11. $\mathbf{u}(0) = e^{(2)(0)}\mathbf{i} + (0)^2\mathbf{j} - 2\mathbf{k} = \boxed{\mathbf{i} - 2\mathbf{k}}$
12. $\mathbf{u}(1) = \ln(1)\mathbf{i} - \mathbf{j} + (1)^3\mathbf{k} = 0\mathbf{i} - \mathbf{j} + \mathbf{k} = \boxed{-\mathbf{j} + \mathbf{k}}$
13. $\mathbf{g}(4) = 4\mathbf{i} - \cos\left(\frac{4\pi}{4}\right)\mathbf{j} + (2)(4)\mathbf{k} = 4\mathbf{i} - (-1)\mathbf{j} + 8\mathbf{k} = \boxed{4\mathbf{i} + \mathbf{j} + 8\mathbf{k}}$
14. $\mathbf{f}(1) = \sin\left(\frac{3\pi(1)}{4}\right)\mathbf{i} + 3\mathbf{j} - 3(1)^2\mathbf{k} = \boxed{\frac{\sqrt{2}}{2}\mathbf{i} + 3\mathbf{j} - 3\mathbf{k}}$
15. Since all three component functions, $x(t) = \cos t$, $y(t) = \sin t$, and $z(t) = 2$, are defined for all real numbers, the domain of the vector function $\mathbf{r}(t)$ is $\boxed{\text{all real numbers}}$.

16. Since all three component functions, $x(t) = \cos(2t)$, $y(t) = \sin t$, and $z(t) = 2t$, are defined for all real numbers, the domain of the vector function $\mathbf{r}(t)$ is $\boxed{\text{all real numbers}}$.
17. Both $y(t) = t$ and $z(t) = -1$ are defined for all real numbers, and $x(t) = \sqrt{t}$ is defined for all real numbers $t \geq 0$. The domain of the vector function $\mathbf{f}(t)$ is the intersection of these three sets, $\boxed{\{t \mid t \geq 0\}}$.
18. Both $x(t) = t^2$ and $z(t) = -t$ are defined for all real numbers, and $y(t) = \frac{1}{\sqrt{t}}$ is defined for $t > 0$. The domain of the vector function $\mathbf{r}(t)$ is the intersection of these three sets, $\boxed{\{t \mid t > 0\}}$.
19. Both $x(t) = \frac{(t^2+1)}{t}$ and $z(t) = -\frac{2}{t}$ are defined for $t \neq 0$, and $y(t) = 3t$ is defined for all real numbers. The domain of the vector function $\mathbf{u}(t)$ is the intersection of these three sets, $\boxed{\{t \mid t \neq 0\}}$.
20. Both $x(t) = e^t$ and $y(t) = 5 + 3t$ are defined for all real numbers, and $z(t) = -\frac{2}{t}$ is defined for $t \neq 0$. The domain of the vector function $\mathbf{v}(t)$ is the intersection of these three sets, $\boxed{\{t \mid t \neq 0\}}$.
21. Both $y(t) = t + 1$ and $z(t) = 4t$ are defined for all real numbers, and $x(t) = \ln t$ is defined for $t > 0$. The domain of the vector function $\mathbf{v}(t)$ is the intersection of these three sets, $\boxed{\{t \mid t > 0\}}$.
22. $x(t) = \sqrt{t}$ is defined for $t \geq 0$, $y(t) = \ln t$ is defined for $t > 0$, and $z(t) = t$ is defined for all real numbers. The domain of the vector function $\mathbf{v}(t)$ is the intersection of these three sets, $\boxed{\{t \mid t > 0\}}$.
23. The parametric equations for the curve C are $x(t) = 2t$ and $y(t) = t^2$, $t \geq 0$. We can eliminate the parameter by solving for t in $x = 2t$. Then we substitute $t = \frac{x}{2}$, $x \geq 0$ into y and we get $y = \frac{x^2}{4}$ for $x \geq 0$. This equation represents the right side of a parabola that opens upward with its vertex at the origin. Noting that both $x(t)$ and $y(t)$ increase as t increases gives the orientation.

24. The parametric equations for the curve C are $x(t) = t^2$ and $y(t) = -4t$, $t \leq 0$. We can eliminate the parameter by solving for t in $y = -4t$. Then we substitute $t = -\frac{y}{4}$, $y \geq 0$ into x and we get $x = \frac{y^2}{16}$ for $y \geq 0$. This equation represents the top side of a parabola that opens to the right with its vertex at the origin. Noting that for $t \leq 0$, both $x(t)$ and $y(t)$ decrease as t increases gives the orientation.

25. Since $x(t) = t$ and $y(t) = 0$ for $-1 \leq t \leq 1$, the graph is the line segment $y = 0$ for $-1 \leq x \leq 1$. The orientation is to the right since x increases as t increases.

26. Since $x(t) = 0$ and $y(t) = t$ for $-1 \leq t \leq 1$, the graph is the line segment $x = 0$ for $-1 \leq y \leq 1$. The orientation is upward since y increases as t increases.

27. Since $x(t) = t$ and $y(t) = t$, C is the line $y = x$. As t increases, both x and y increase.

28. Since $x(t) = 3t$ and $y(t) = 2t$, we solve for t in $x = 3t$ to get $t = \frac{x}{3}$. Substituting t into $y = 2t$, we get $y = \frac{2}{3}x$, so C is the line $y = \frac{2}{3}x$. As t increases, both x and y increase.

29. Since $x(t) = 3t$ and $y(t) = -2t$, we solve for t in $x = 3t$ to get $t = \frac{x}{3}$. Substituting t into $y = -2t$, we get $y = -\frac{2}{3}x$, so C is the line $y = -\frac{2}{3}x$. As t increases, x increases and y decreases.

30. The parametric equations for the curve C are $x(t) = t$ and $y(t) = t^2$. We can eliminate the parameter by substituting $t = x$ into y to get $y = x^2$. This equation represents a parabola that opens upward with its vertex at the origin. Noting that $x(t)$ increases as t increases gives the orientation.

31. The components of $\mathbf{r}(t)$ are $x(t) = \cos t$ and $y(t) = -\sin t$, $0 \leq t \leq \frac{\pi}{2}$. Since $x^2 + y^2 = \cos^2 t + \sin^2 t = 1$, the vector function $\mathbf{r}(t)$ traces out part of a circle with its center at the origin and radius 1. For $0 \leq t \leq \frac{\pi}{2}$, $0 \leq \cos t \leq 1$ and $-1 \leq -\sin t \leq 0$, so $0 \leq x \leq 1$ and $-1 \leq y \leq 0$, which means that this curve is in quadrant IV. On $0 \leq t \leq \frac{\pi}{2}$, both x and y decrease as t increases.

32. The components of $\mathbf{r}(t)$ are $x(t) = \cos t$ and $y(t) = \sin t$, $0 \leq t \leq \frac{\pi}{2}$. For $x^2 + y^2 = \cos^2 t + \sin^2 t = 1$, the vector function $\mathbf{r}(t)$ traces out part of a circle with its center at the origin and radius 1. Since $0 \leq t \leq \frac{\pi}{2}$, $0 \leq \cos t \leq 1$ and $0 \leq \sin t \leq 1$, so $0 \leq x \leq 1$ and $0 \leq y \leq 1$, which means that this curve is in quadrant I. On $0 \leq t \leq \frac{\pi}{2}$, x decreases and y increases as t increases.

33. The components of $\mathbf{r}(t)$ are $x(t) = \sin^2 t$ and $y(t) = \cos^2 t$, $0 \leq t \leq \frac{\pi}{2}$. Since $x + y = \sin^2 t + \cos^2 t = 1$, or $y = 1 - x$, $0 \leq x \leq 1$, the vector function $\mathbf{r}(t)$ traces out the line segment $y = 1 - x$ from $x = 0$ to $x = 1$. On $0 \leq t \leq \frac{\pi}{2}$, x increases and y decreases as t increases.

34. The components of $\mathbf{r}(t)$ are $x(t) = \sin^2 t$ and $y(t) = -\cos^2 t$, $0 \leq t \leq \frac{\pi}{2}$. Since $x - y = \sin^2 t + \cos^2 t = 1$, or $y = x - 1$, $0 \leq x \leq 1$, the vector function $\mathbf{r}(t)$ traces out the line segment $y = x - 1$ from $x = 0$ to $x = 1$. On $0 \leq t \leq \frac{\pi}{2}$, both x and y increase as t increases.

35. For $0 \leq t \leq 4\pi$, $x(t) = \sin t$ oscillates between -1 and 1 , and $y(t) = t^2$ increases from 0 to $16\pi^2$. Using the computer algebra system MapleTM, we get the graph below.

36. The components of $\mathbf{r}(t)$ are $x(t) = \sin^3 t$ and $y(t) = \cos^3 t$, so $-1 \leq x \leq 1$ and $-1 \leq y \leq 1$. Using the computer algebra system MapleTM, we get the graph of an astroid, seen below.

37. For $0 \leq t \leq 2\pi$, $x(t) = t^2$, so $0 \leq x \leq 4\pi^2 \approx 39.5$, and $y(t) = \cos t$ is between -1 and 1 . The graph that meets these criteria is D.
38. For $0 \leq t \leq 2\pi$, $x(t) = \cos t$ is between -1 and 1 , and $y(t) = t^2$, so $0 \leq y \leq 4\pi^2 \approx 39.5$. The graph that meets these criteria is A.
39. For $0 \leq t \leq 2\pi$, $x(t) = \sqrt{t}$, so $0 \leq x \leq \sqrt{2\pi} \approx 2.5$, and $y(t) = \cos t$ is between -1 and 1 . The graph that meets these criteria is C.
40. For $0 \leq t \leq 2\pi$, $x(t) = \cos t$ is between -1 and 1 , and $y(t) = -t$, so $-6.28 \approx -2\pi \leq y \leq 0$. The graph that meets these criteria is B.
41. The graph was generated using the computer algebra system MapleTM.

42. The graph was generated using the computer algebra system MapleTM.

43. The graph was generated using the computer algebra system MapleTM.

44. The graph was generated using the computer algebra system MapleTM.

45. The graph was generated using the computer algebra system MapleTM.

46. The graph was generated using the computer algebra system MapleTM.

47. The graph was generated using the computer algebra system Maple™.

48. The graph was generated using the computer algebra system Maple™.

49. Both $x(t) = t^2$ and $z(t) = \sin t$ are continuous for all real numbers, and $y(t) = \frac{2}{1-t^2}$ is continuous for $t \neq \pm 1$. The vector function $\mathbf{r}(t)$ is continuous at the intersection of these three sets, $\boxed{\{t \mid t \neq \pm 1\}}$.
50. The component function $x(t) = \ln t$ is continuous for $t > 0$, and $y(t) = e^{-t}$ is continuous for all real numbers. The vector function $\mathbf{r}(t)$ is continuous at the intersection of these sets, $\boxed{\{t \mid t > 0\}}$.
51. The component function $x(t) = \sec t$ is continuous for $t \neq \frac{(2k+1)\pi}{2}$ and $y(t) = -\cos t$ is continuous for all real numbers. The vector function $\mathbf{r}(t)$ is continuous at the intersection of these sets, $\boxed{\left\{t \mid t \neq \frac{(2k+1)\pi}{2}\right\}}$.
52. The component function $x(t) = \sqrt{t+1}$ is continuous for $t \geq -1$, $y(t) = \tan t$ is continuous for $t \neq \frac{(2k+1)\pi}{2}$, and $z(t) = -\frac{\sin t - 1}{t}$ is continuous for $t \neq 0$. The vector function $\mathbf{r}(t)$ is continuous at the intersection of these sets, $\boxed{\left\{t \mid t \geq -1, t \neq 0, t \neq \frac{(2k+1)\pi}{2}\right\}}$.
53. The component function $x(t) = \frac{t}{t+1}$ is continuous for $t \neq -1$ and $y(t) = -t$ is continuous for all real numbers. The vector function $\mathbf{r}(t)$ is continuous at the intersection of these sets, $\boxed{\{t \mid t \neq -1\}}$.
54. Both component functions, $x(t) = \frac{t}{t^2+1}$ and $y(t) = t$, are continuous for all real numbers, so the vector function $\mathbf{r}(t)$ is continuous for $\boxed{\text{all real numbers}}$.
55. The component functions $x(t) = \sin t$ and $z(t) = 1$ are continuous for all real numbers, and $y(t) = -\tan t$ is continuous for $t \neq \frac{(2k+1)\pi}{2}$. The vector function $\mathbf{r}(t)$ is continuous at the intersection of these sets, $\boxed{\left\{t \mid t \neq \frac{(2k+1)\pi}{2}\right\}}$.

56. The component function $x(t) = \sec t$ is continuous for $t \neq \frac{(2k+1)\pi}{2}$, $y(t) = \csc t$ is continuous for $t \neq k\pi$, and $z(t) = 1$ is continuous for all real numbers. Since $x(t)$ is continuous except for odd multiples of $\frac{\pi}{2}$ and $y(t)$ is continuous except for even multiples of $\frac{\pi}{2}$, the vector function $\mathbf{r}(t)$ is continuous at the intersection of these sets, $\left\{ t \mid t \neq \frac{k}{2}\pi \right\}$.

57. Find the derivatives of each component.

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{8\mathbf{i} - 6t^2\mathbf{j}} \\ \mathbf{r}''(t) &= \boxed{8\mathbf{i} - 12t\mathbf{j}}\end{aligned}$$

58. Find the derivatives of each component.

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{8\mathbf{i} + 12t^2\mathbf{j}} \\ \mathbf{r}''(t) &= \boxed{24t\mathbf{j}}\end{aligned}$$

59. Find the derivatives of each component. Since $4\sqrt{t} = 4t^{1/2}$, $\frac{d}{dt}(4\sqrt{t}) = 2t^{-1/2} = \frac{2}{\sqrt{t}} = \frac{2\sqrt{t}}{t}$, and $\frac{d}{dt}(2t^{-1/2}) = -t^{-3/2} = -\frac{1}{t^{3/2}}$,

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{\frac{2\sqrt{t}}{t}\mathbf{i} + 2e^t\mathbf{j}} \\ \mathbf{r}''(t) &= \boxed{-\frac{1}{t^{3/2}}\mathbf{i} + 2e^t\mathbf{j}}\end{aligned}$$

60. Find the derivatives of each component. We can rewrite $\sqrt[3]{t} = t^{1/3}$, so $\frac{d}{dt}(\sqrt[3]{t}) = \frac{1}{3}t^{-2/3} = \frac{1}{3t^{2/3}}$ and $\frac{d}{dt}(\frac{1}{3}t^{-2/3}) = -\frac{2}{9}t^{-5/3} = -\frac{2}{9t^{5/3}}$. By the Chain Rule, $\frac{d}{dt}(e^{3t}) = 3e^{3t}$. Then

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{3e^{3t}\mathbf{i} + \frac{1}{3t^{2/3}}\mathbf{j}} \\ \mathbf{r}''(t) &= \boxed{9e^{3t}\mathbf{i} - \frac{2}{9t^{5/3}}\mathbf{j}}\end{aligned}$$

61. Find the derivatives of each component.

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{\mathbf{j} + 2t\mathbf{k}} \\ \mathbf{r}''(t) &= \boxed{2\mathbf{k}}\end{aligned}$$

62. Find the derivatives of each component.

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{\mathbf{k}} \\ \mathbf{r}''(t) &= \boxed{\mathbf{0}}\end{aligned}$$

63. Find the derivatives of each component.

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{2t\mathbf{i} + 3t^2\mathbf{j} - \mathbf{k}} \\ \mathbf{r}''(t) &= \boxed{2\mathbf{i} + 6t\mathbf{j}}\end{aligned}$$

64. Find the derivatives of each component.

$$\mathbf{r}'(t) = \boxed{\mathbf{i} - 6t\mathbf{j} + \mathbf{k}}$$

$$\mathbf{r}''(t) = \boxed{-6\mathbf{j}}$$

65. Find the derivatives of each component. Using the Chain Rule, $\frac{d}{dt}(\sin^2 t) = 2(\sin t)(\cos t) = \sin(2t)$ and $\frac{d}{dt}(-\cos^2 t) = -2(\cos t)(-\sin t) = 2\sin t \cos t = \sin(2t)$. The Chain Rule gives $\frac{d}{dt}(\sin(2t)) = \cos(2t)(2) = 2\cos(2t)$

$$\mathbf{r}'(t) = \boxed{\sin(2t)\mathbf{i} + \sin(2t)\mathbf{j}}$$

$$\mathbf{r}''(t) = \boxed{2\cos(2t)\mathbf{i} + 2\cos(2t)\mathbf{j}}$$

66. Find the derivatives of each component. Using the Chain Rule, $\frac{d}{dt}(\sin(2t)) = 2\cos(2t)$, and $\frac{d}{dt}(-\cos(2t)) = 2\sin(2t)$.

$$\mathbf{r}'(t) = \boxed{2\cos(2t)\mathbf{i} + 2\sin(2t)\mathbf{j}}$$

$$\mathbf{r}''(t) = \boxed{-4\sin(2t)\mathbf{i} + 4\cos(2t)\mathbf{j}}$$

67. By a property of logarithmic functions, $-\ln(e^{t^2+t}) = -(t^2 + t)$. Using the Chain Rule gives

$$\frac{d}{dt}(5e^{t^2+t}) = 5e^{t^2+t}(2t + 1),$$

and the Product Rule gives

$$\frac{d}{dt}[5e^{t^2+t}(2t + 1)] = 5e^{t^2+t}(2t + 1)(2t + 1) + 5e^{t^2+t}(2).$$

We can now factor out a $5e^{t^2+t}$ and then FOIL to get

$$\frac{d}{dt}[5e^{t^2+t}(2t + 1)] = 5e^{t^2+t}(4t^2 + 4t + 1 + 2) = 5e^{t^2+t}(4t^2 + 4t + 3).$$

Find the derivatives of each component.

$$\mathbf{r}'(t) = \boxed{5e^{t^2+t}(2t + 1)\mathbf{i} - (2t + 1)\mathbf{j}}$$

$$\mathbf{r}''(t) = \boxed{5e^{t^2+t}(4t^2 + 4t + 3)\mathbf{i} - 2\mathbf{j}}$$

68. Find the derivatives of each component. Using the Chain Rule,

$$\begin{aligned}\mathbf{r}'(t) &= \cos(3t^3 - t)(9t^2 - 1)\mathbf{i} - 2\cos(3t^3 - t)(-\sin(3t^3 - t))(9t^2 - 1)\mathbf{j} \\ &= \boxed{(9t^2 - 1)\cos(3t^3 - t)\mathbf{i} + (9t^2 - 1)\sin[2(3t^3 - t)]\mathbf{j}}\end{aligned}$$

Using the Product Rule,

$$\begin{aligned}\frac{d}{dt}[(9t^2 - 1)\cos(3t^3 - t)] &= (9t^2 - 1)(-\sin(3t^3 - t))(9t^2 - 1) + (18t)\cos(3t^3 - t) \\ &= -(9t^2 - 1)^2\sin(3t^3 - t) + 18t\cos(3t^3 - t)\end{aligned}$$

and

$$\begin{aligned}\frac{d}{dt}[(9t^2 - 1)\sin[2(3t^3 - t)]] &= (9t^2 - 1)\cos[2(3t^3 - t)](2)(9t^2 - 1) + (18t)\sin[2(3t^3 - t)] \\ &= 2(9t^2 - 1)^2\cos[2(3t^3 - t)] + 18t\sin[2(3t^3 - t)],\end{aligned}$$

so

$$\mathbf{r}''(t) = \boxed{[-(9t^2 - 1)^2\sin(3t^3 - t) + 18t\cos(3t^3 - t)]\mathbf{i} + [2(9t^2 - 1)^2\cos[2(3t^3 - t)] + 18t\sin[2(3t^3 - t)]]\mathbf{j}}$$

69. Find the derivatives of each component. Using the Product Rule,

$$\begin{aligned}\mathbf{r}'(t) &= (-e^t \sin t + e^t \cos t)\mathbf{i} + (e^t \cos t + e^t \sin t)\mathbf{j} + \mathbf{k} \\ &= \boxed{e^t(\cos t - \sin t)\mathbf{i} + e^t(\cos t + \sin t)\mathbf{j} + \mathbf{k}} \\ \mathbf{r}''(t) &= [e^t(-\sin t - \cos t) + e^t(\cos t - \sin t)]\mathbf{i} + [e^t(-\sin t + \cos t) + e^t(\cos t + \sin t)]\mathbf{j} \\ &= \boxed{-2e^t \sin t \mathbf{i} + 2e^t \cos t \mathbf{j}}\end{aligned}$$

70. Find the derivatives of each component. Using the Product Rule,

$$\begin{aligned}\mathbf{r}'(t) &= (-e^{-t} \sin t - e^{-t} \cos t)\mathbf{i} + (e^{-t} \cos t - e^{-t} \sin t)\mathbf{j} - \mathbf{k} \\ &= \boxed{-e^{-t}(\sin t + \cos t)\mathbf{i} + e^{-t}(\cos t - \sin t)\mathbf{j} - \mathbf{k}}\end{aligned}$$

By the Product Rule, $\frac{d}{dt}(-e^{-t}(\sin t + \cos t)) = -e^{-t}(\cos t - \sin t) + e^{-t}(\sin t + \cos t) = 2e^{-t} \sin t$ and $\frac{d}{dt}(e^{-t}(\cos t - \sin t)) = e^{-t}(-\sin t - \cos t) - e^{-t}(\cos t - \sin t) = -2e^{-t} \cos t$, so

$$\mathbf{r}''(t) = \boxed{2e^{-t} \sin t \mathbf{i} - 2e^{-t} \cos t \mathbf{j}}$$

71. Find the derivatives of each component.

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{(1 - 3t^2)\mathbf{i} + (1 + 3t^2)\mathbf{j} - \mathbf{k}} \\ \mathbf{r}''(t) &= \boxed{-6t\mathbf{i} + 6t\mathbf{j}}\end{aligned}$$

72. Find the derivatives of each component.

$$\begin{aligned}\mathbf{r}'(t) &= \boxed{(2t - 1)\mathbf{i} + (2t + 1)\mathbf{j} + \mathbf{k}} \\ \mathbf{r}''(t) &= \boxed{2\mathbf{i} + 2\mathbf{j}}\end{aligned}$$

73. The derivatives of $\mathbf{u}(t) = t^2\mathbf{i} - t\mathbf{j}$ and $\mathbf{v}(t) = t\mathbf{i} + t^2\mathbf{j}$ are $\mathbf{u}'(t) = 2t\mathbf{i} - \mathbf{j}$ and $\mathbf{v}'(t) = \mathbf{i} + 2t\mathbf{j}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned}[\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\ &= [2t\mathbf{i} - \mathbf{j}] \cdot [t\mathbf{i} + t^2\mathbf{j}] + [t^2\mathbf{i} - t\mathbf{j}] \cdot [\mathbf{i} + 2t\mathbf{j}] \\ &= 2t^2 - t^2 + t^2 - 2t^2 \\ &= \boxed{0}\end{aligned}$$

74. The derivatives of $\mathbf{u}(t) = t^3\mathbf{i} + t\mathbf{j}$ and $\mathbf{v}(t) = t\mathbf{i} - 2t\mathbf{j}$ are $\mathbf{u}'(t) = 3t^2\mathbf{i} + \mathbf{j}$ and $\mathbf{v}'(t) = \mathbf{i} - 2\mathbf{j}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned}[\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\ &= [3t^2\mathbf{i} + \mathbf{j}] \cdot [t\mathbf{i} - 2t\mathbf{j}] + [t^3\mathbf{i} + t\mathbf{j}] \cdot [\mathbf{i} - 2\mathbf{j}] \\ &= 3t^3 - 2t + t^3 - 2t \\ &= \boxed{4t^3 - 4t}\end{aligned}$$

75. The derivatives of $\mathbf{u}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j}$ and $\mathbf{v}(t) = t\mathbf{i} - t^2\mathbf{j}$ are $\mathbf{u}'(t) = e^t\mathbf{i} - e^{-t}\mathbf{j}$ and $\mathbf{v}'(t) = \mathbf{i} - 2t\mathbf{j}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned}[\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\ &= [e^t\mathbf{i} - e^{-t}\mathbf{j}] \cdot [t\mathbf{i} - t^2\mathbf{j}] + [e^t\mathbf{i} + e^{-t}\mathbf{j}] \cdot [\mathbf{i} - 2t\mathbf{j}] \\ &= \boxed{te^t + t^2e^{-t} + e^t - 2te^{-t}}\end{aligned}$$

76. The derivatives of $\mathbf{u}(t) = t\mathbf{i} + 4\sqrt{t}\mathbf{j}$ and $\mathbf{v}(t) = 2t\mathbf{i} - t^2\mathbf{j}$ are $\mathbf{u}'(t) = \mathbf{i} + \frac{2\sqrt{t}}{t}\mathbf{j}$ and $\mathbf{v}'(t) = 2\mathbf{i} - 2t\mathbf{j}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned} [\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\ &= \left[\mathbf{i} + \frac{2\sqrt{t}}{t}\mathbf{j} \right] \cdot [2t\mathbf{i} - t^2\mathbf{j}] + [t\mathbf{i} + 4\sqrt{t}\mathbf{j}] \cdot [2\mathbf{i} - 2t\mathbf{j}] \\ &= 2t - 2t^{3/2} + 2t - 8t^{3/2} \\ &= \boxed{4t - 10t^{3/2}} \end{aligned}$$

77. The derivatives of $\mathbf{u}(t) = \sin(\omega t)\mathbf{i} + \cos(\omega t)\mathbf{j}$ and $\mathbf{v}(t) = \mathbf{i} + \mathbf{j}$ are $\mathbf{u}'(t) = \omega \cos(\omega t)\mathbf{i} - \omega \sin(\omega t)\mathbf{j}$ and $\mathbf{v}'(t) = \mathbf{0}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned} [\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\ &= [\omega \cos(\omega t)\mathbf{i} - \omega \sin(\omega t)\mathbf{j}] \cdot [\mathbf{i} + \mathbf{j}] + [\sin(\omega t)\mathbf{i} + \cos(\omega t)\mathbf{j}] \cdot [\mathbf{0}] \\ &= \boxed{\omega \cos(\omega t) - \omega \sin(\omega t)} \end{aligned}$$

78. The derivatives of $\mathbf{u}(t) = \sin^2 t\mathbf{i} - \cos^2 t\mathbf{j}$ and $\mathbf{v}(t) = \mathbf{i} - \mathbf{j}$ are $\mathbf{u}'(t) = 2\sin t \cos t\mathbf{i} - 2(\cos t)(-\sin t)\mathbf{j} = \sin(2t)\mathbf{i} + \sin(2t)\mathbf{j}$ and $\mathbf{v}'(t) = \mathbf{0}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned} [\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\ &= [\sin(2t)\mathbf{i} + \sin(2t)\mathbf{j}] \cdot [\mathbf{i} - \mathbf{j}] + [\sin^2 t\mathbf{i} - \cos^2 t\mathbf{j}] \cdot [\mathbf{0}] \\ &= \sin(2t) - \sin(2t) \\ &= \boxed{0} \end{aligned}$$

79. The derivatives of $\mathbf{u}(t) = 2t\mathbf{i} + t^2\mathbf{j} - 5\mathbf{k}$ and $\mathbf{v}(t) = t^2\mathbf{i} + 2t\mathbf{j} + \mathbf{k}$ are $\mathbf{u}'(t) = 2\mathbf{i} + 2t\mathbf{j}$ and $\mathbf{v}'(t) = 2t\mathbf{i} + 2\mathbf{j}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned} [\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\ &= [2\mathbf{i} + 2t\mathbf{j}] \cdot [t^2\mathbf{i} + 2t\mathbf{j} + \mathbf{k}] + [2t\mathbf{i} + t^2\mathbf{j} - 5\mathbf{k}] \cdot [2t\mathbf{i} + 2\mathbf{j}] \\ &= 2t^2 + 4t^2 + 0 + 4t^2 + 2t^2 + 0 \\ &= \boxed{12t^2} \end{aligned}$$

To find $\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)]$, we use the cross product formula.

$$\begin{aligned} [\mathbf{u}(t) \times \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t) \\ &= [2\mathbf{i} + 2t\mathbf{j}] \times [t^2\mathbf{i} + 2t\mathbf{j} + \mathbf{k}] + [2t\mathbf{i} + t^2\mathbf{j} - 5\mathbf{k}] \times [2t\mathbf{i} + 2\mathbf{j}] \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 2t & 0 \\ t^2 & 2t & 1 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2t & t^2 & -5 \\ 2t & 2 & 0 \end{vmatrix} \\ &= [2t\mathbf{i} - 2\mathbf{j} + [(2)(2t) - (t^2)(2t)]\mathbf{k}] + [10\mathbf{i} - 10t\mathbf{j} + [(2t)(2) - (2t)(t^2)]\mathbf{k}] \\ &= \boxed{(2t + 10)\mathbf{i} - (10t + 2)\mathbf{j} + (8t - 4t^3)\mathbf{k}} \end{aligned}$$

80. The derivatives of $\mathbf{u}(t) = t^3\mathbf{i} - t^2\mathbf{j} + t\mathbf{k}$ and $\mathbf{v}(t) = t\mathbf{i} - t^2\mathbf{j} + t^3\mathbf{k}$ are $\mathbf{u}'(t) = 3t^2\mathbf{i} - 2t\mathbf{j} + \mathbf{k}$ and $\mathbf{v}'(t) = \mathbf{i} - 2t\mathbf{j} + 3t^2\mathbf{k}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned} [\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\ &= [3t^2\mathbf{i} - 2t\mathbf{j} + \mathbf{k}] \cdot [t\mathbf{i} - t^2\mathbf{j} + t^3\mathbf{k}] + [t^3\mathbf{i} - t^2\mathbf{j} + t\mathbf{k}] \cdot [\mathbf{i} - 2t\mathbf{j} + 3t^2\mathbf{k}] \\ &= 3t^3 + 2t^3 + t^3 + t^3 + 2t^3 + 3t^3 \\ &= \boxed{12t^3} \end{aligned}$$

To find $\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)]$, we use the cross product formula.

$$\begin{aligned}
 [\mathbf{u}(t) \times \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t) \\
 &= [3t^2\mathbf{i} - 2t\mathbf{j} + \mathbf{k}] \times [t\mathbf{i} - t^2\mathbf{j} + t^3\mathbf{k}] + [t^3\mathbf{i} - t^2\mathbf{j} + t\mathbf{k}] \times [\mathbf{i} - 2t\mathbf{j} + 3t^2\mathbf{k}] \\
 &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3t^2 & -2t & 1 \\ t & -t^2 & t^3 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ t^3 & -t^2 & t \\ 1 & -2t & 3t^2 \end{vmatrix} \\
 &= [(-2t^4 + t^2)\mathbf{i} - (3t^5 - t)\mathbf{j} + (-3t^4 + 2t^2)\mathbf{k}] + [(-3t^4 + 2t^2)\mathbf{i} - (3t^5 - t)\mathbf{j} + (-2t^4 + t^2)\mathbf{k}] \\
 &= (-5t^4 + 3t^2)\mathbf{i} + (-6t^5 + 2t)\mathbf{j} + (-5t^4 + 3t^2)\mathbf{k} \\
 &= \boxed{t^2(-5t^2 + 3)\mathbf{i} + 2t(-3t^4 + 1)\mathbf{j} + t^2(-5t^2 + 3)\mathbf{k}}
 \end{aligned}$$

81. The derivatives of $\mathbf{u}(t) = \cos(2t)\mathbf{i} + \sin(2t)\mathbf{j} + \mathbf{k}$ and $\mathbf{v}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + \mathbf{k}$ are $\mathbf{u}'(t) = -2\sin(2t)\mathbf{i} + 2\cos(2t)\mathbf{j}$ and $\mathbf{v}'(t) = -\sin t\mathbf{i} + \cos t\mathbf{j}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned}
 [\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\
 &= [-2\sin(2t)\mathbf{i} + 2\cos(2t)\mathbf{j}] \cdot [\cos t\mathbf{i} + \sin t\mathbf{j} + \mathbf{k}] + [\cos(2t)\mathbf{i} + \sin(2t)\mathbf{j} + \mathbf{k}] \cdot [-\sin t\mathbf{i} + \cos t\mathbf{j}] \\
 &= -2\sin(2t)\cos t + 2\cos(2t)\sin t - \cos(2t)\sin t + \sin(2t)\cos t \\
 &= \boxed{-\sin(2t)\cos t + \cos(2t)\sin t}
 \end{aligned}$$

To find $\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)]$, we use the cross product formula.

$$\begin{aligned}
 [\mathbf{u}(t) \times \mathbf{v}(t)]' &= \mathbf{u}'(t) \times \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t) \\
 &= [-2\sin(2t)\mathbf{i} + 2\cos(2t)\mathbf{j}] \times [\cos t\mathbf{i} + \sin t\mathbf{j} + \mathbf{k}] + [\cos(2t)\mathbf{i} + \sin(2t)\mathbf{j} + \mathbf{k}] \times [-\sin t\mathbf{i} + \cos t\mathbf{j}] \\
 &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2\sin(2t) & 2\cos(2t) & 0 \\ \cos t & \sin t & 1 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos(2t) & \sin(2t) & 1 \\ -\sin t & \cos t & 0 \end{vmatrix}
 \end{aligned}$$

Since

$$\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2\sin(2t) & 2\cos(2t) & 0 \\ \cos t & \sin t & 1 \end{vmatrix} = 2\cos(2t)\mathbf{i} + 2\sin(2t)\mathbf{j} + (-2\sin(2t)\sin t - 2\cos(2t)\cos t)\mathbf{k}$$

and

$$\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos(2t) & \sin(2t) & 1 \\ -\sin t & \cos t & 0 \end{vmatrix} = -\cos t\mathbf{i} - \sin t\mathbf{j} + (\cos(2t)\cos t + \sin(2t)\sin t)\mathbf{k},$$

$$[\mathbf{u}(t) \times \mathbf{v}(t)]' = \boxed{(2\cos(2t) - \cos t)\mathbf{i} + (2\sin(2t) - \sin t)\mathbf{j} + (-\sin(2t)\sin t - \cos(2t)\cos t)\mathbf{k}}.$$

82. The derivatives of $\mathbf{u}(t) = e^{2t}\mathbf{i} + e^{-2t}\mathbf{j} + t\mathbf{k}$ and $\mathbf{v}(t) = e^{-t}\mathbf{i} + e^{-2t}\mathbf{j} - t\mathbf{k}$ are $\mathbf{u}'(t) = 2e^{2t}\mathbf{i} - 2e^{-2t}\mathbf{j} + \mathbf{k}$ and $\mathbf{v}'(t) = -e^{-t}\mathbf{i} - 2e^{-2t}\mathbf{j} - \mathbf{k}$. To find $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$, we use the dot product formula.

$$\begin{aligned}
 [\mathbf{u}(t) \cdot \mathbf{v}(t)]' &= \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t) \\
 &= [2e^{2t}\mathbf{i} - 2e^{-2t}\mathbf{j} + \mathbf{k}] \cdot [e^{-t}\mathbf{i} + e^{-2t}\mathbf{j} - t\mathbf{k}] + [e^{2t}\mathbf{i} + e^{-2t}\mathbf{j} + t\mathbf{k}] \cdot [-e^{-t}\mathbf{i} - 2e^{-2t}\mathbf{j} - \mathbf{k}] \\
 &= 2e^t - 2e^{-4t} - t - e^t - 2e^{-4t} - t \\
 &= \boxed{e^t - 4e^{-4t} - 2t}
 \end{aligned}$$

To find $\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)]$, we use the cross product formula.

$$\begin{aligned} [\mathbf{u}(t) \times \mathbf{v}(t)]' &= \mathbf{u}'(t) \times \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t) \\ &= [2e^{2t}\mathbf{i} - 2e^{-2t}\mathbf{j} + \mathbf{k}] \times [e^{-t}\mathbf{i} + e^{-2t}\mathbf{j} - t\mathbf{k}] + [e^{2t}\mathbf{i} + e^{-2t}\mathbf{j} + t\mathbf{k}] \times [-e^{-t}\mathbf{i} - 2e^{-2t}\mathbf{j} - \mathbf{k}] \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2e^{2t} & -2e^{-2t} & 1 \\ e^{-t} & e^{-2t} & -t \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ e^{2t} & e^{-2t} & t \\ -e^{-t} & -2e^{-2t} & -1 \end{vmatrix} \end{aligned}$$

Since

$$\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2e^{2t} & -2e^{-2t} & 1 \\ e^{-t} & e^{-2t} & -t \end{vmatrix} = (2te^{-2t} - e^{-2t})\mathbf{i} - (-2te^{2t} - e^{-t})\mathbf{j} + (2 + 2e^{-3t})\mathbf{k}$$

and

$$\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ e^{2t} & e^{-2t} & t \\ -e^{-t} & -2e^{-2t} & -1 \end{vmatrix} = (-e^{-2t} + 2te^{-2t})\mathbf{i} - (-e^{2t} + te^{-t})\mathbf{j} + (-2 + e^{-3t})\mathbf{k},$$

$$[\mathbf{u}(t) \times \mathbf{v}(t)]' = \boxed{(4te^{-2t} - 2e^{-2t})\mathbf{i} + (2te^{2t} + e^{-t} + e^{2t} - te^{-t})\mathbf{j} + 3e^{-3t}\mathbf{k}}.$$

Applications and Extensions

83. (a) Find the derivative of each component. Since $\frac{d}{dt} \cos(\omega t) = -\omega \sin(\omega t)$ and $\frac{d}{dt} \sin(\omega t) = \omega \cos(\omega t)$,

$$\frac{d\mathbf{u}}{dt} = \boxed{-\omega \sin(\omega t)\mathbf{i} + \omega \cos(\omega t)\mathbf{j}}$$

(b)

$$\begin{aligned} \left\| \frac{d\mathbf{u}}{dt} \right\| &= \sqrt{(-\omega \sin(\omega t))^2 + (\omega \cos(\omega t))^2} = \sqrt{\omega^2 \sin^2(\omega t) + \omega^2 \cos^2(\omega t)} \\ &= \sqrt{\omega^2 (\sin^2(\omega t) + \cos^2(\omega t))} = \sqrt{\omega^2} = \boxed{|\omega|} \end{aligned}$$

84. Differentiating $\mathbf{v}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$ gives $\frac{d\mathbf{v}}{dt} = \mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k}$ and $\frac{d^2\mathbf{v}}{dt^2} = 2\mathbf{j} + 6t\mathbf{k}$.

$$\left\| \frac{d^2\mathbf{v}}{dt^2} \right\| = \sqrt{2^2 + (6t)^2} = \sqrt{4 + 36t^2} = \boxed{2\sqrt{1 + 9t^2}}$$

85. Since $\mathbf{f}(t) = \sin t\mathbf{i} - \cos t\mathbf{j}$, $\mathbf{f}'(t) = \cos t\mathbf{i} + \sin t\mathbf{j}$ and $\mathbf{f}''(t) = -\sin t\mathbf{i} + \cos t\mathbf{j}$. The vectors $\mathbf{f}(t)$ and $\mathbf{f}''(t)$ are parallel since $\mathbf{f}(t) = -\mathbf{f}''(t)$.

86. Since $\mathbf{f}(t) = e^{3t}\mathbf{i} + e^{-3t}\mathbf{j}$, $\mathbf{f}'(t) = 3e^{3t}\mathbf{i} - 3e^{-3t}\mathbf{j}$ and $\mathbf{f}''(t) = 9e^{3t}\mathbf{i} + 9e^{-3t}\mathbf{j}$. The vectors $\mathbf{f}(t)$ and $\mathbf{f}''(t)$ are parallel since $\mathbf{f}(t) = \frac{1}{9}\mathbf{f}''(t)$.

87. The component functions for $\mathbf{r}(t)$ are $x(t) = t$ and $y(t) = t^2$. Substituting $t = x$ into y gives $y = x^2$. This equation represents a parabola that opens upward with its vertex at the origin. Noting that x increases as t increases gives the orientation. For $t = 0$, $\mathbf{r}(0) = \mathbf{0}$, and since $\mathbf{r}'(t) = \mathbf{i} + 2t\mathbf{j}$, $\mathbf{r}'(0) = \mathbf{i}$.

88. The component functions for $\mathbf{r}(t)$ are $x(t) = 2t^2$ and $y(t) = -t$. We can eliminate the parameter by solving for t in $y = -t$. Then we substitute $t = -y$ into x to get $x = 2y^2$. This equation represents a parabola that opens to the right with its vertex at the origin. Noting that y decreases as t increases gives the orientation. For $t = 0$, $\mathbf{r}(0) = \mathbf{0}$, and since $\mathbf{r}'(t) = 4t\mathbf{i} - \mathbf{j}$, $\mathbf{r}'(0) = -\mathbf{j}$.

89. The component functions for $\mathbf{r}(t)$ are $x(t) = t$ and $y(t) = e^t$. Substituting $t = x$ into y gives $y = e^x$. This equation represents the natural exponential function. Noting that both x and y increase as t increases gives the orientation. For $t = 0$, $\mathbf{r}(0) = \mathbf{j}$, and since $\mathbf{r}'(t) = \mathbf{i} + e^t\mathbf{j}$, $\mathbf{r}'(0) = \mathbf{i} + \mathbf{j}$.

90. The component functions for $\mathbf{r}(t)$ are $x(t) = t$ and $y(t) = \ln(1 + t)$. Substituting $t = x$ into y gives $y = \ln(1 + x)$. This equation represents the natural logarithmic function shifted one unit to the left. Noting that both x and y increase as t increases gives the orientation. For $t = 0$, $\mathbf{r}(0) = \mathbf{0}$, and since $\mathbf{r}'(t) = \mathbf{i} + \frac{1}{1+t}\mathbf{j}$, $\mathbf{r}'(0) = \mathbf{i} + \mathbf{j}$.

91. The components of $\mathbf{r}(t)$ are $x(t) = 3 \sin t$ and $y(t) = -3 \cos t$. Since $x^2 + y^2 = 9 \sin^2 t + 9 \cos^2 t = 9$, the vector function $\mathbf{r}(t)$ traces out a circle with its center at the origin and radius 3. Note that $\mathbf{r}(0) = -3\mathbf{j}$, $\mathbf{r}(\frac{\pi}{2}) = 3\mathbf{i}$, and $\mathbf{r}(\pi) = 3\mathbf{j}$, so the orientation is counterclockwise. For $t = 0$, $\mathbf{r}(0) = -3\mathbf{j}$, and since $\mathbf{r}'(t) = 3 \cos t \mathbf{i} + 3 \sin t \mathbf{j}$, $\mathbf{r}'(0) = 3\mathbf{i}$.

92. The components of $\mathbf{r}(t)$ are $x(t) = 4 \sin t$ and $y(t) = 4 \cos t$. Since $x^2 + y^2 = 16 \sin^2 t + 16 \cos^2 t = 16$, the vector function $\mathbf{r}(t)$ traces out a circle with its center at the origin and radius 4. Note that $\mathbf{r}(0) = 4\mathbf{j}$, $\mathbf{r}(\frac{\pi}{2}) = 4\mathbf{i}$, and $\mathbf{r}(\pi) = -4\mathbf{j}$, so the orientation is clockwise. For $t = 0$, $\mathbf{r}(0) = 4\mathbf{j}$, and since $\mathbf{r}'(t) = 4 \cos t \mathbf{i} - 4 \sin t \mathbf{j}$, $\mathbf{r}'(0) = 4\mathbf{i}$.

93. The components of $\mathbf{r}(t)$ are $x(t) = 2 \cos t$ and $y(t) = -3 \sin t$, which means $\frac{x}{2} = \cos t$ and $-\frac{y}{3} = \sin t$. Since $(\frac{x}{2})^2 + (-\frac{y}{3})^2 = 1$, the vector function $\mathbf{r}(t)$ traces out an ellipse with its center at the origin, its major axis along the y -axis, and its intercepts are $(-2, 0)$, $(2, 0)$, $(0, -3)$, and $(0, 3)$. Note that

$\mathbf{r}(0) = 2\mathbf{i}$, $\mathbf{r}(\frac{\pi}{2}) = -3\mathbf{j}$, and $\mathbf{r}(\pi) = -2\mathbf{i}$, so the orientation is clockwise. For $t = 0$, $\mathbf{r}(0) = 2\mathbf{i}$, and since $\mathbf{r}'(t) = -2\sin t\mathbf{i} - 3\cos t\mathbf{j}$, $\mathbf{r}'(0) = -3\mathbf{j}$.

94. The components of $\mathbf{r}(t)$ are $x(t) = -\cos t$ and $y(t) = 2\sin t$, which means $-x = \cos t$ and $\frac{y}{2} = \sin t$. Since $(-x)^2 + (\frac{y}{2})^2 = 1$, the vector function $\mathbf{r}(t)$ traces out an ellipse with its center at the origin, its major axis along the y -axis, and its intercepts are $(-1, 0)$, $(1, 0)$, $(0, -2)$, and $(0, 2)$. Note that $\mathbf{r}(0) = -\mathbf{i}$, $\mathbf{r}(\frac{\pi}{2}) = 2\mathbf{j}$, and $\mathbf{r}(\pi) = \mathbf{i}$, so the orientation is clockwise. For $t = 0$, $\mathbf{r}(0) = -\mathbf{i}$, and since $\mathbf{r}'(t) = \sin t\mathbf{i} + 2\cos t\mathbf{j}$, $\mathbf{r}'(0) = 2\mathbf{j}$.

95. (a) The component functions for $\mathbf{r}(t)$ are $x(t) = (1-t^2)$ and $y(t) = t^2$. We can eliminate the parameter substituting $t^2 = y$ into x to get $x = 1 - y$ or $y = 1 - x$ for $y \geq 0$. This equation represents a ray with its vertex at $(1, 0)$, a slope of -1 and an intercept of 1 . For $t < 0$, x increases while y decreases, so the orientation is downward and right. For $t > 0$, x decreases while y increases, so the orientation is upward and left.
- (b) The graph of $\mathbf{r}(t)$ is below.

96. (a) The component functions for $\mathbf{r}(t)$ are $x(t) = t^2$ and $y(t) = 4t^2 - t^4$. We can eliminate the parameter substituting $x = t^2$ into y to get $y = 4x - x^2$ for $x \geq 0$. This equation represents a parabola that opens downward. Its axis of symmetry is the vertical line $x = -\frac{b}{2a} = -\frac{4}{(2)(-1)} = 2$. For $t < 0$, x decreases as t increases, so the orientation is along the parabola toward the origin. For $t > 0$, x increases as t increases, so the orientation is along the parabola away from the origin.
- (b) The graph of $\mathbf{r}(t)$ is below.

97. (a) The component functions for $\mathbf{r}(t)$ are $x(t) = \sin^2 t$ and $y(t) = \tan t$ for $0 < t < \frac{\pi}{2}$, so $y^2 = \tan^2 t = \frac{\sin^2 t}{\cos^2 t}$. Since $\sin^2 t + \cos^2 t = 1$, $\cos^2 t = 1 - \sin^2 t$, so we can rewrite y , eliminate the parameter, and solve for y .

$$\begin{aligned} y^2 &= \frac{\sin^2 t}{\cos^2 t} = \frac{\sin^2 t}{1 - \sin^2 t} \\ &= \frac{x}{1 - x} \quad \text{for } 0 < x < 1, \text{ so} \\ y &= \sqrt{\frac{x}{1 - x}} \quad \text{for } 0 < x < 1 \end{aligned}$$

On the interval $(0, \frac{\pi}{2})$, as t increases, y increases.

- (b) The graph of $\mathbf{r}(t)$ is below.

98. (a) The component functions for $\mathbf{r}(t)$ are $x(t) = e^t$ and $y(t) = e^{-t} = \frac{1}{e^t}$. We can eliminate the parameter substituting $x = e^t$ into y to get $y = \frac{1}{x}$ for $x > 0$. This equation represents the graph of the reciprocal function for $x > 0$. As t increases, x increases and y decreases.
- (b) The graph of $\mathbf{r}(t)$ is below.

99. Let $\mathbf{u}(t) = x_1(t)\mathbf{i} + y_1(t)\mathbf{j} + z_1(t)\mathbf{k}$ and $\mathbf{v}(t) = x_2(t)\mathbf{i} + y_2(t)\mathbf{j} + z_2(t)\mathbf{k}$. Then

$$\begin{aligned}\mathbf{u}(t) + \mathbf{v}(t) &= (x_1(t)\mathbf{i} + y_1(t)\mathbf{j} + z_1(t)\mathbf{k}) + (x_2(t)\mathbf{i} + y_2(t)\mathbf{j} + z_2(t)\mathbf{k}) \\ &= (x_1(t) + x_2(t))\mathbf{i} + (y_1(t) + y_2(t))\mathbf{j} + (z_1(t) + z_2(t))\mathbf{k}\end{aligned}$$

We use the Sum Rule to get

$$\begin{aligned}\frac{d}{dt}[\mathbf{u}(t) + \mathbf{v}(t)] &= \frac{d}{dt}[(x_1(t) + x_2(t))\mathbf{i} + (y_1(t) + y_2(t))\mathbf{j} + (z_1(t) + z_2(t))\mathbf{k}] \\ &= (x_1'(t) + x_2'(t))\mathbf{i} + (y_1'(t) + y_2'(t))\mathbf{j} + (z_1'(t) + z_2'(t))\mathbf{k}.\end{aligned}$$

Rearranging terms gives

$$\begin{aligned}&(x_1'(t) + x_2'(t))\mathbf{i} + (y_1'(t) + y_2'(t))\mathbf{j} + (z_1'(t) + z_2'(t))\mathbf{k} \\ &= (x_1'(t)\mathbf{i} + y_1'(t)\mathbf{j} + z_1'(t)\mathbf{k}) + (x_2'(t)\mathbf{i} + y_2'(t)\mathbf{j} + z_2'(t)\mathbf{k}) \\ &= \mathbf{u}'(t) + \mathbf{v}'(t)\end{aligned}$$

■

100. Let $\mathbf{u}(t) = x_1(t)\mathbf{i} + y_1(t)\mathbf{j} + z_1(t)\mathbf{k}$ and $\mathbf{v}(t) = x_2(t)\mathbf{i} + y_2(t)\mathbf{j} + z_2(t)\mathbf{k}$. Then

$$\begin{aligned}\mathbf{u}(t) \cdot \mathbf{v}(t) &= (x_1(t)\mathbf{i} + y_1(t)\mathbf{j} + z_1(t)\mathbf{k}) \cdot (x_2(t)\mathbf{i} + y_2(t)\mathbf{j} + z_2(t)\mathbf{k}) \\ &= x_1(t)x_2(t) + y_1(t)y_2(t) + z_1(t)z_2(t).\end{aligned}$$

We use the Product Rule to get

$$\begin{aligned}\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)] &= \frac{d}{dt}[x_1(t)x_2(t) + y_1(t)y_2(t) + z_1(t)z_2(t)] \\ &= x_1'(t)x_2(t) + x_1(t)x_2'(t) + y_1'(t)y_2(t) + y_1(t)y_2'(t) + z_1'(t)z_2(t) + z_1(t)z_2'(t).\end{aligned}$$

Rearranging terms gives

$$\begin{aligned}& x_1'(t)x_2(t) + x_1(t)x_2'(t) + y_1'(t)y_2(t) + y_1(t)y_2'(t) + z_1'(t)z_2(t) + z_1(t)z_2'(t) \\ &= [x_1'(t)x_2(t) + y_1'(t)y_2(t) + z_1'(t)z_2(t)] + [x_1(t)x_2'(t) + y_1(t)y_2'(t) + z_1(t)z_2'(t)]\end{aligned}$$

Since

$$x_1'(t)x_2(t) + y_1'(t)y_2(t) + z_1'(t)z_2(t) = \mathbf{u}'(t) \cdot \mathbf{v}(t)$$

and

$$x_1(t)x_2'(t) + y_1(t)y_2'(t) + z_1(t)z_2'(t) = \mathbf{u}(t) \cdot \mathbf{v}'(t),$$

$$\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)] = \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t).$$

■

101. Let $\mathbf{u}(t) = x_1(t)\mathbf{i} + y_1(t)\mathbf{j} + z_1(t)\mathbf{k}$ and $\mathbf{v}(t) = x_2(t)\mathbf{i} + y_2(t)\mathbf{j} + z_2(t)\mathbf{k}$. Then

$$\begin{aligned}\mathbf{u}(t) \times \mathbf{v}(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ x_1(t) & y_1(t) & z_1(t) \\ x_2(t) & y_2(t) & z_2(t) \end{vmatrix} \\ &= [y_1(t)z_2(t) - y_2(t)z_1(t)]\mathbf{i} - [x_1(t)z_2(t) - x_2(t)z_1(t)]\mathbf{j} + [x_1(t)y_2(t) - x_2(t)y_1(t)]\mathbf{k}\end{aligned}$$

and

$$\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)] = \frac{d}{dt}[(y_1(t)z_2(t) - y_2(t)z_1(t))\mathbf{i} - (x_1(t)z_2(t) - x_2(t)z_1(t))\mathbf{j} + (x_1(t)y_2(t) - x_2(t)y_1(t))\mathbf{k}]$$

We use the Product Rule for each component and rearrange terms.

$$\begin{aligned}\frac{d}{dt}[y_1(t)z_2(t) - y_2(t)z_1(t)] &= y_1'(t)z_2(t) + y_1(t)z_2'(t) - y_2'(t)z_1(t) - y_2(t)z_1'(t) \\ &= [y_1'(t)z_2(t) - y_2'(t)z_1(t)] + [y_1(t)z_2'(t) - y_2(t)z_1'(t)] \\ \frac{d}{dt}[x_1(t)z_2(t) - x_2(t)z_1(t)] &= x_1'(t)z_2(t) + x_1(t)z_2'(t) - x_2'(t)z_1(t) - x_2(t)z_1'(t) \\ &= [x_1'(t)z_2(t) - x_2'(t)z_1(t)] + [x_1(t)z_2'(t) - x_2(t)z_1'(t)] \\ \frac{d}{dt}[x_1(t)y_2(t) - x_2(t)y_1(t)] &= x_1'(t)y_2(t) + x_1(t)y_2'(t) - x_2'(t)y_1(t) - x_2(t)y_1'(t) \\ &= [x_1'(t)y_2(t) - x_2'(t)y_1(t)] + [x_1(t)y_2'(t) - x_2(t)y_1'(t)].\end{aligned}$$

Notice that

$$[y_1'(t)z_2(t) - y_2'(t)z_1(t)]\mathbf{i} - [x_1'(t)z_2(t) - x_2'(t)z_1(t)]\mathbf{j} + [x_1'(t)y_2(t) - x_2'(t)y_1(t)]\mathbf{k} = \mathbf{u}'(t) \times \mathbf{v}(t)$$

and

$$[y_1(t)z_2'(t) - y_2(t)z_1'(t)]\mathbf{i} - [x_1(t)z_2'(t) - x_2(t)z_1'(t)]\mathbf{j} + [x_1(t)y_2'(t) - x_2(t)y_1'(t)]\mathbf{k} = \mathbf{u}(t) \times \mathbf{v}'(t)$$

so

$$\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)] = \mathbf{u}'(t) \times \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t)$$

■

102. Let $\mathbf{v}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$. Then $\mathbf{v}(f(t)) = x(f(t))\mathbf{i} + y(f(t))\mathbf{j} + z(f(t))\mathbf{k}$, so

$$\frac{d}{dt}[\mathbf{v}(f(t))] = \frac{d}{dt}[x(f(t))\mathbf{i} + y(f(t))\mathbf{j} + z(f(t))\mathbf{k}]$$

By the Chain Rule, $\frac{d}{dt}[x(f(t))] = x'(f(t))f'(t)$, $\frac{d}{dt}[y(f(t))] = y'(f(t))f'(t)$, and $\frac{d}{dt}[z(f(t))] = z'(f(t))f'(t)$. Then

$$\begin{aligned}\frac{d}{dt}[\mathbf{v}(f(t))] &= x'(f(t))f'(t)\mathbf{i} + y'(f(t))f'(t)\mathbf{j} + z'(f(t))f'(t)\mathbf{k} \\ &= f'(t)[x'(f(t))\mathbf{i} + y'(f(t))\mathbf{j} + z'(f(t))\mathbf{k}] \\ &= f'(t)\mathbf{v}'(f(t)) = \mathbf{v}'(f(t))f'(t)\end{aligned}$$

■

103. Answers will vary. Suppose $\mathbf{u}(t) = 3t\mathbf{i} - \mathbf{j} + t^2\mathbf{k}$ and $\mathbf{v}(t) = t\mathbf{i} + 2\mathbf{j}$. Then $\mathbf{u}'(t) = 3\mathbf{i} + 2t\mathbf{k}$ and $\mathbf{v}'(t) = \mathbf{i}$. By the Cross Product Formula,

$$\begin{aligned}\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)] &= \mathbf{u}'(t) \times \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t) \\ &= [3\mathbf{i} + 2t\mathbf{k}] \times [t\mathbf{i} + 2\mathbf{j}] + [3t\mathbf{i} - \mathbf{j} + t^2\mathbf{k}] \times [\mathbf{i}] \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & 0 & 2t \\ t & 2 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3t & -1 & t^2 \\ 1 & 0 & 0 \end{vmatrix} \\ &= [-4t\mathbf{i} + 2t^2\mathbf{j} + 6\mathbf{k}] + [t^2\mathbf{j} + \mathbf{k}] \\ &= -4t\mathbf{i} + 3t^2\mathbf{j} + 7\mathbf{k}\end{aligned}$$

and

$$\begin{aligned}\frac{d}{dt}[\mathbf{v}(t) \times \mathbf{u}(t)] &= \mathbf{v}'(t) \times \mathbf{u}(t) + \mathbf{v}(t) \times \mathbf{u}'(t) \\ &= [\mathbf{i}] \times [3t\mathbf{i} - \mathbf{j} + t^2\mathbf{k}] + [t\mathbf{i} + 2\mathbf{j}] \times [3\mathbf{i} + 2t\mathbf{k}] \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 0 & 0 \\ 3t & -1 & t^2 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ t & 2 & 0 \\ 3 & 0 & 2t \end{vmatrix} \\ &= [-t^2\mathbf{j} - \mathbf{k}] + [4t\mathbf{i} - 2t^2\mathbf{j} - 6\mathbf{k}] \\ &= 4t\mathbf{i} - 3t^2\mathbf{j} - 7\mathbf{k}.\end{aligned}$$

Since $-4t\mathbf{i} + 3t^2\mathbf{j} + 7\mathbf{k} \neq 4t\mathbf{i} - 3t^2\mathbf{j} - 7\mathbf{k}$, $\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)] \neq \frac{d}{dt}[\mathbf{v}(t) \times \mathbf{u}(t)]$, which means the derivative of the cross product of these two vectors is not commutative. In fact, $\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)] = -\frac{d}{dt}[\mathbf{v}(t) \times \mathbf{u}(t)]$.

104. Let $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$. Then $\mathbf{r}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}$ and $\mathbf{r}''(t) = x''(t)\mathbf{i} + y''(t)\mathbf{j} + z''(t)\mathbf{k}$. By the Cross Product Formula,

$$\begin{aligned}[\mathbf{r}(t) \times \mathbf{r}'(t)]' &= \mathbf{r}'(t) \times \mathbf{r}'(t) + \mathbf{r}(t) \times \mathbf{r}''(t) \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ x'(t) & y'(t) & z'(t) \\ x'(t) & y'(t) & z'(t) \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ x(t) & y(t) & z(t) \\ x''(t) & y''(t) & z''(t) \end{vmatrix}\end{aligned}$$

The determinants can be rewritten as

$$\begin{aligned}\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ x'(t) & y'(t) & z'(t) \\ x'(t) & y'(t) & z'(t) \end{vmatrix} &= [y'(t)z'(t) - y'(t)z'(t)]\mathbf{i} - [x'(t)z'(t) - x'(t)z'(t)]\mathbf{j} + [x'(t)y'(t) - x'(t)y'(t)]\mathbf{k} \\ &= \mathbf{0}\end{aligned}$$

and

$$\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ x(t) & y(t) & z(t) \\ x''(t) & y''(t) & z''(t) \end{vmatrix} = [y(t)z''(t) - y''(t)z(t)]\mathbf{i} - [x(t)z''(t) - x''(t)z(t)]\mathbf{j} + [x(t)y''(t) - x''(t)y(t)]\mathbf{k} \\ = \mathbf{r}(t) \times \mathbf{r}''(t),$$

which means that $[\mathbf{r}(t) \times \mathbf{r}'(t)]' = \mathbf{r}(t) \times \mathbf{r}''(t)$. ■

105. Let $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ and $\mathbf{L} = L_1\mathbf{i} + L_2\mathbf{j} + L_3\mathbf{k}$.

Suppose $\lim_{t \rightarrow t_0} \mathbf{r}(t) = \mathbf{L}$. Then $\lim_{t \rightarrow t_0} x(t) = L_1$, $\lim_{t \rightarrow t_0} y(t) = L_2$, and $\lim_{t \rightarrow t_0} z(t) = L_3$, which means that for any $\epsilon > 0$, there are numbers δ_1 , δ_2 , and δ_3 so that

$$\begin{aligned} \text{whenever } 0 < |t - t_0| < \delta_1 \text{ then } |x(t) - L_1| &< \frac{\epsilon}{\sqrt{3}}, \\ \text{whenever } 0 < |t - t_0| < \delta_2 \text{ then } |y(t) - L_2| &< \frac{\epsilon}{\sqrt{3}}, \text{ and} \\ \text{whenever } 0 < |t - t_0| < \delta_3 \text{ then } |z(t) - L_3| &< \frac{\epsilon}{\sqrt{3}}. \end{aligned}$$

Equivalently,

$$\begin{aligned} \text{whenever } 0 < |t - t_0| < \delta_1 \text{ then } (x(t) - L_1)^2 &< \frac{\epsilon^2}{3}, \\ \text{whenever } 0 < |t - t_0| < \delta_2 \text{ then } (y(t) - L_2)^2 &< \frac{\epsilon^2}{3}, \text{ and} \\ \text{whenever } 0 < |t - t_0| < \delta_3 \text{ then } (z(t) - L_3)^2 &< \frac{\epsilon^2}{3}. \end{aligned}$$

Adding terms we have

$$(x(t) - L_1)^2 + (y(t) - L_2)^2 + (z(t) - L_3)^2 < \frac{\epsilon^2}{3} + \frac{\epsilon^2}{3} + \frac{\epsilon^2}{3} = \epsilon^2$$

or

$$\sqrt{(x(t) - L_1)^2 + (y(t) - L_2)^2 + (z(t) - L_3)^2} < \epsilon.$$

Let $\epsilon > 0$ be given, and let $\delta = \min\{\delta_1, \delta_2, \delta_3\}$. Then whenever $0 < |t - t_0| < \delta$,

$$\sqrt{(x(t) - L_1)^2 + (y(t) - L_2)^2 + (z(t) - L_3)^2} = \|\mathbf{r}(t) - \mathbf{L}\| < \epsilon.$$

Therefore, if $\lim_{t \rightarrow t_0} \mathbf{r}(t) = \mathbf{L}$, $\lim_{t \rightarrow t_0} \|\mathbf{r}(t) - \mathbf{L}\| = 0$. ■

Conversely, suppose $\lim_{t \rightarrow t_0} \|\mathbf{r}(t) - \mathbf{L}\| = 0$. Then for any $\epsilon > 0$, there is a number $\delta > 0$ such that whenever $0 < |t - t_0| < \delta$, $\|\mathbf{r}(t) - \mathbf{L}\| < \epsilon$. Since by definition

$$\|\mathbf{r}(t) - \mathbf{L}\| = \sqrt{(x(t) - L_1)^2 + (y(t) - L_2)^2 + (z(t) - L_3)^2} < \epsilon,$$

and since

$$\begin{aligned} |x(t) - L_1| &\leq \sqrt{(x(t) - L_1)^2 + (y(t) - L_2)^2 + (z(t) - L_3)^2} \\ |y(t) - L_2| &\leq \sqrt{(x(t) - L_1)^2 + (y(t) - L_2)^2 + (z(t) - L_3)^2}, \text{ and} \\ |z(t) - L_3| &\leq \sqrt{(x(t) - L_1)^2 + (y(t) - L_2)^2 + (z(t) - L_3)^2}, \end{aligned}$$

$\lim_{t \rightarrow t_0} x(t) = L_1$, $\lim_{t \rightarrow t_0} y(t) = L_2$, and $\lim_{t \rightarrow t_0} z(t) = L_3$. Therefore, if $\lim_{t \rightarrow t_0} \|\mathbf{r}(t) - \mathbf{L}\| = 0$, $\lim_{t \rightarrow t_0} \mathbf{r}(t) = \mathbf{L}$. ■

106. Since $\|\mathbf{r}(t)\| = \sqrt{(x(t))^2 + (y(t))^2 + (z(t))^2}$, the Chain Rule gives

$$\begin{aligned} \frac{d}{dt} \|\mathbf{r}(t)\| &= \frac{1}{2} [(x(t))^2 + (y(t))^2 + (z(t))^2]^{-1/2} (2x(t)x'(t) + 2y(t)y'(t) + 2z(t)z'(t)) \\ &= \frac{x(t)x'(t) + y(t)y'(t) + z(t)z'(t)}{\sqrt{(x(t))^2 + (y(t))^2 + (z(t))^2}} \\ &= \frac{\mathbf{r}(t) \cdot \mathbf{r}'(t)}{\|\mathbf{r}(t)\|} \end{aligned}$$

if $\mathbf{r}(t) \neq \mathbf{0}$. Now if $\mathbf{r}(t)$ is constant, $\frac{d}{dt} \|\mathbf{r}(t)\| = 0$ and so $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$ for $\mathbf{r}(t) \neq \mathbf{0}$. Conversely, if $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$, $\frac{d}{dt} \|\mathbf{r}(t)\| = 0$, which implies that $\|\mathbf{r}(t)\|$ is constant.

Challenge Problems

107. By the Quotient Rule,

$$\frac{d}{dt} \frac{\mathbf{r}(t)}{\|\mathbf{r}(t)\|} = \frac{\|\mathbf{r}(t)\| \mathbf{r}'(t) - \mathbf{r}(t) \frac{d}{dt} \|\mathbf{r}(t)\|}{\|\mathbf{r}(t)\|^2}$$

for $\mathbf{r}(t) \neq \mathbf{0}$. Let $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$. Then

$$\|\mathbf{r}(t)\| = \sqrt{(x(t))^2 + (y(t))^2 + (z(t))^2}$$

and

$$\mathbf{r}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}.$$

Using the Chain Rule,

$$\begin{aligned} \frac{d}{dt} \|\mathbf{r}(t)\| &= \frac{1}{2} ((x(t))^2 + (y(t))^2 + (z(t))^2)^{-1/2} (2x(t)x'(t) + 2y(t)y'(t) + 2z(t)z'(t)) \\ &= ((x(t))^2 + (y(t))^2 + (z(t))^2)^{-1/2} (x(t)x'(t) + y(t)y'(t) + z(t)z'(t)). \end{aligned}$$

Note that $x(t)x'(t) + y(t)y'(t) + z(t)z'(t) = \mathbf{r}(t) \cdot \mathbf{r}'(t)$, so

$$\frac{d}{dt} \|\mathbf{r}(t)\| = \|\mathbf{r}(t)\|^{-1} (\mathbf{r}(t) \cdot \mathbf{r}'(t)) = \frac{\mathbf{r}(t) \cdot \mathbf{r}'(t)}{\|\mathbf{r}(t)\|}.$$

Substituting $\frac{d}{dt} \|\mathbf{r}(t)\|$ into the equation from the Quotient Rule,

$$\begin{aligned} \frac{d}{dt} \frac{\mathbf{r}(t)}{\|\mathbf{r}(t)\|} &= \frac{\|\mathbf{r}(t)\| \mathbf{r}'(t) - \mathbf{r}(t) \frac{\mathbf{r}(t) \cdot \mathbf{r}'(t)}{\|\mathbf{r}(t)\|}}{\|\mathbf{r}(t)\|^2} \\ &= \frac{\mathbf{r}'(t)}{\|\mathbf{r}(t)\|} - \frac{\mathbf{r}(t) \cdot \mathbf{r}'(t)}{\|\mathbf{r}(t)\|^3} \mathbf{r}(t) \end{aligned}$$

108. (a) Answers may vary. As $t \rightarrow -\infty$, the curve C approaches the origin since $\lim_{t \rightarrow -\infty} e^t = 0$, $-1 \leq \sin t \leq 1$, and $-1 \leq \cos t \leq 1$. The curve spirals upward exponentially as $t \rightarrow \infty$.

(b) We know $\sin^2 t + \cos^2 t = 1$, so $e^{2t} \sin^2 t + e^{2t} \cos^2 t = e^{2t}$, or $x^2 + y^2 = z^2$. The curve lies on a cone given by $x^2 + y^2 = z^2$.

11.2 Unit Tangent and Principal Unit Normal Vectors; Arc Length

Concepts and Vocabulary

1. False. The tangent line to the curve at t_0 contains the point P_0 but has direction $\mathbf{r}'(t_0)$.
2. False. A curve traced out by $\mathbf{r}(t)$ is smooth if $\mathbf{r}'(t)$ exists and is continuous on (a, b) and if $\mathbf{r}'(t) \neq \mathbf{0}$ on (a, b) .
3. False. $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$
4. False. $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$
5. True by the theorem about arc length of a vector function.
6. True by definition of the principal unit normal vector.

Skill Building

7. (a) $\mathbf{r}'(t) = \mathbf{i} - 2t\mathbf{j}$ so $\mathbf{r}'(1) = \boxed{\mathbf{i} - 2\mathbf{j}}$
 (b) and (c)

8. (a) $\mathbf{r}'(t) = \mathbf{i} - 3t^2\mathbf{j}$ so $\mathbf{r}'(-1) = \boxed{\mathbf{i} - 3\mathbf{j}}$
 (b) and (c)

9. (a) $\mathbf{r}'(t) = 2t\mathbf{i} - \mathbf{j}$ so $\mathbf{r}'(1) = \boxed{2\mathbf{i} - \mathbf{j}}$
 (b) and (c)

10. (a) $\mathbf{r}'(t) = 3t^2\mathbf{i} + 3\mathbf{j}$ so $\mathbf{r}'(1) = \boxed{3\mathbf{i} + 3\mathbf{j}}$
 (b) and (c)

11. (a) $\mathbf{r}'(t) = 4\mathbf{i} - \frac{1}{2\sqrt{t}}\mathbf{j}$ so $\mathbf{r}'(1) = \boxed{4\mathbf{i} - \frac{1}{2}\mathbf{j}}$
 (b) and (c)

12. (a) $\mathbf{r}'(t) = \frac{1}{2\sqrt{t}}\mathbf{i} + \frac{1}{2}\mathbf{j}$ so $\mathbf{r}'(4) = \boxed{\frac{1}{4}\mathbf{i} + \frac{1}{2}\mathbf{j}}$
 (b) and (c)

13. (a) $\mathbf{r}'(t) = e^t\mathbf{i} - e^{-t}\mathbf{j}$ so $\mathbf{r}'(0) = \boxed{\mathbf{i} - \mathbf{j}}$
 (b) and (c)

14. (a) $\mathbf{r}'(t) = 2e^{2t}\mathbf{i} - e^{-t}\mathbf{j}$ so $\mathbf{r}'(0) = \boxed{2\mathbf{i} - \mathbf{j}}$

(b) and (c)

15. $\mathbf{r}'(t) = -3\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ so $\mathbf{r}'(0) = \boxed{-3\mathbf{i} + 2\mathbf{j} - \mathbf{k}}$

16. $\mathbf{r}'(t) = \mathbf{i} - \mathbf{j} + 3\mathbf{k}$ so $\mathbf{r}'(0) = \boxed{\mathbf{i} - \mathbf{j} + 3\mathbf{k}}$

17. $\mathbf{r}'(t) = -2\sin(2t)\mathbf{i} + 2\cos(2t)\mathbf{j}$ so $\mathbf{r}'(\frac{\pi}{4}) = \boxed{-2\mathbf{i}}$

18. $\mathbf{r}'(t) = -\sin t\mathbf{j} + \cos t\mathbf{k}$ so $\mathbf{r}'(\frac{\pi}{6}) = \boxed{-\frac{1}{2}\mathbf{j} + \frac{\sqrt{3}}{2}\mathbf{k}}$

19. $\mathbf{r}'(t) = -2\sin t\mathbf{i} + 2\cos t\mathbf{k}$ so $\mathbf{r}'(\frac{\pi}{6}) = \boxed{-\mathbf{i} + \sqrt{3}\mathbf{k}}$

20. $\mathbf{r}'(t) = -4\sin(2t)\mathbf{i} + 4\cos(2t)\mathbf{j}$ so $\mathbf{r}'(\frac{\pi}{2}) = \boxed{-4\mathbf{j}}$

21. $\mathbf{r}'(t) = (-e^t \sin t + e^t \cos t)\mathbf{i} + (e^t \cos t + e^t \sin t)\mathbf{j} + e^t\mathbf{k}$ so $\mathbf{r}'(0) = \boxed{\mathbf{i} + \mathbf{j} + \mathbf{k}}$

22. $\mathbf{r}'(t) = (-e^{-t} \sin t - e^{-t} \cos t)\mathbf{i} + (e^{-t} \cos t - e^{-t} \sin t)\mathbf{j} + e^{-t}\mathbf{k}$ so $\mathbf{r}'(0) = \boxed{-\mathbf{i} + \mathbf{j} + \mathbf{k}}$

23. The tangent vectors are tangent to C and follow the orientation of C , and the normal vectors are orthogonal to the tangent vectors and point into the curve. See the figure below, which is not drawn to scale.

24. The tangent vectors are tangent to C and follow the orientation of C , and the normal vectors are orthogonal to the tangent vectors and point into the curve. See the figure below, which is not drawn to scale.

25. The tangent vectors are tangent to C and follow the orientation of C , and the normal vectors are orthogonal to the tangent vectors and point into the curve. See the figure below, which is not drawn to scale.

26. The tangent vectors are tangent to C and follow the orientation of C , and the normal vectors are orthogonal to the tangent vectors and point into the curve. See the figure below, which is not drawn to scale.

27. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} + 2t\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{1^2 + (2t)^2} = \sqrt{1 + 4t^2}.$$

Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \frac{\mathbf{i} + 2t\mathbf{j}}{\sqrt{1 + 4t^2}} \quad \text{and} \quad \mathbf{T}(1) = \boxed{\frac{\sqrt{5}}{5}\mathbf{i} + \frac{2\sqrt{5}}{5}\mathbf{j}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = \frac{(2\mathbf{j})(\sqrt{1 + 4t^2}) - (\mathbf{i} + 2t\mathbf{j})(\frac{1}{2})(1 + 4t^2)^{-1/2}(8t)}{(1 + 4t^2)}.$$

We can multiply the numerator and the denominator by $\sqrt{1 + 4t^2}$ to simplify.

$$\mathbf{T}'(t) = \frac{(2\mathbf{j})(1 + 4t^2) - (4t)(\mathbf{i} + 2t\mathbf{j})}{(1 + 4t^2)^{3/2}} = \frac{(2 + 8t^2)\mathbf{j} - 4t\mathbf{i} - 8t^2\mathbf{j}}{(1 + 4t^2)^{3/2}} = \frac{-4t\mathbf{i} + 2\mathbf{j}}{(1 + 4t^2)^{3/2}}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{16t^2 + 4}{(1 + 4t^2)^3}} = \sqrt{\frac{4(4t^2 + 1)}{(1 + 4t^2)^3}} = \frac{2}{1 + 4t^2}.$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{-4t\mathbf{i} + 2\mathbf{j}}{(1 + 4t^2)^{3/2}}}{\frac{2}{1 + 4t^2}} = \frac{-2t\mathbf{i} + \mathbf{j}}{(1 + 4t^2)^{1/2}}, \quad \text{and so} \quad \mathbf{N}(1) = \boxed{-\frac{2\sqrt{5}}{5}\mathbf{i} + \frac{\sqrt{5}}{5}\mathbf{j}}.$$

28. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} - 3t^2\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{1 + 9t^4}.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = \frac{\mathbf{i} - 3t^2\mathbf{j}}{\sqrt{1 + 9t^4}} \quad \text{and} \quad \mathbf{T}(-1) = \boxed{\frac{\sqrt{10}}{10}\mathbf{i} - \frac{3\sqrt{10}}{10}\mathbf{j}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = \frac{-6t\mathbf{j}\sqrt{1 + 9t^4} - (\mathbf{i} - 3t^2\mathbf{j})(\frac{1}{2})(1 + 9t^4)^{-1/2}(36t^3)}{(1 + 9t^4)}.$$

We can multiply the numerator and the denominator by $\sqrt{1 + 9t^4}$ to simplify.

$$\mathbf{T}'(t) = \frac{-6t\mathbf{j}(1 + 9t^4) - (\mathbf{i} - 3t^2\mathbf{j})(18t^3)}{(1 + 9t^4)^{3/2}} = \frac{(-6t)[(1 + 9t^4)\mathbf{j} + 3t^2\mathbf{i} - 9t^4\mathbf{j}]}{(1 + 9t^4)^{3/2}} = \frac{-(6t)(3t^2\mathbf{i} + \mathbf{j})}{(1 + 9t^4)^{3/2}}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{(-6t)^2(9t^4 + 1)}{(1 + 9t^4)^3}} = \frac{6t}{1 + 9t^4}.$$

$$\text{Since } \mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|},$$

$$\mathbf{N}(t) = \frac{\frac{-(6t)(3t^2\mathbf{i} + \mathbf{j})}{(1 + 9t^4)^{3/2}}}{\frac{6t}{1 + 9t^4}} = \frac{-(3t^2\mathbf{i} + \mathbf{j})}{\sqrt{1 + 9t^4}} \quad \text{and} \quad \mathbf{N}(-1) = \boxed{-\frac{3\sqrt{10}}{10}\mathbf{i} - \frac{\sqrt{10}}{10}\mathbf{j}}.$$

29. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2t\mathbf{i} - \mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4t^2 + 1}.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = \frac{2t\mathbf{i} - \mathbf{j}}{\sqrt{4t^2 + 1}} \quad \text{and} \quad \mathbf{T}(1) = \boxed{\frac{2\sqrt{5}}{5}\mathbf{i} - \frac{\sqrt{5}}{5}\mathbf{j}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = \frac{[2\sqrt{4t^2 + 1} - (2t)(\frac{1}{2})(4t^2 + 1)^{-1/2}(8t)]\mathbf{i} + \frac{1}{2}(4t^2 + 1)^{-1/2}(8t)\mathbf{j}}{4t^2 + 1}.$$

We can multiply the numerator and the denominator by $\sqrt{4t^2 + 1}$ to simplify.

$$\mathbf{T}'(t) = \frac{[2(4t^2 + 1) - 8t^2]\mathbf{i} + 4t\mathbf{j}}{(4t^2 + 1)^{3/2}} = \frac{2\mathbf{i} + 4t\mathbf{j}}{(4t^2 + 1)^{3/2}}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{4 + 16t^2}{(4t^2 + 1)^3}} = \sqrt{\frac{4(1 + 4t^2)}{(4t^2 + 1)^3}} = \frac{2}{4t^2 + 1}.$$

$$\text{Since } \mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|},$$

$$\mathbf{N}(t) = \frac{\frac{2\mathbf{i} + 4t\mathbf{j}}{(4t^2 + 1)^{3/2}}}{\frac{2}{4t^2 + 1}} = \frac{\mathbf{i} + 2t\mathbf{j}}{\sqrt{4t^2 + 1}} \quad \text{and} \quad \mathbf{N}(1) = \boxed{\frac{\sqrt{5}}{5}\mathbf{i} + \frac{2\sqrt{5}}{5}\mathbf{j}}.$$

30. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 3t^2\mathbf{i} + 3\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{9t^4 + 9} = 3\sqrt{t^4 + 1}.$$

Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \frac{3t^2\mathbf{i} + 3\mathbf{j}}{3\sqrt{t^4 + 1}} = \frac{t^2\mathbf{i} + \mathbf{j}}{\sqrt{t^4 + 1}} \quad \text{and} \quad \mathbf{T}(1) = \boxed{\frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = \frac{[2t\sqrt{t^4 + 1} - t^2(\frac{1}{2})(t^4 + 1)^{-1/2}(4t^3)]\mathbf{i} - (\frac{1}{2})(t^4 + 1)^{-1/2}(4t^3)\mathbf{j}}{t^4 + 1}.$$

We can multiply the numerator and the denominator by $\sqrt{t^4 + 1}$ to simplify.

$$\mathbf{T}'(t) = \frac{[(2t)(t^4 + 1) - 2t^5]\mathbf{i} - 2t^3\mathbf{j}}{(t^4 + 1)^{3/2}} = \frac{2t\mathbf{i} - 2t^3\mathbf{j}}{(t^4 + 1)^{3/2}} = \frac{(2t)(\mathbf{i} - t^2\mathbf{j})}{(t^4 + 1)^{3/2}}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{(2t)^2(1 + t^4)}{(t^4 + 1)^3}} = \frac{2t}{t^4 + 1}.$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{(2t)(\mathbf{i} - t^2\mathbf{j})}{(t^4 + 1)^{3/2}}}{\frac{2t}{t^4 + 1}} = \frac{\mathbf{i} - t^2\mathbf{j}}{\sqrt{t^4 + 1}} \quad \text{and} \quad \mathbf{N}(1) = \boxed{\frac{\sqrt{2}}{2}\mathbf{i} - \frac{\sqrt{2}}{2}\mathbf{j}}.$$

31. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$. Using the Quotient Rule to find the derivative of $\mathbf{r}(t) = \frac{2t}{t+1}\mathbf{i} - \frac{t^2}{t+1}\mathbf{j}$,

$$\mathbf{r}'(t) = \frac{2(t+1) - 2t}{(t+1)^2}\mathbf{i} - \frac{2t(t+1) - t^2}{(t+1)^2}\mathbf{j} = \frac{2\mathbf{i} - t(2+t)\mathbf{j}}{(t+1)^2}$$

so $\|\mathbf{r}'(t)\| = \sqrt{\frac{4+t^2(2+t)^2}{(t+1)^4}} = \frac{\sqrt{4+4t^2+4t^3+t^4}}{(t+1)^2}$. Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \frac{\frac{2\mathbf{i} - t(2+t)\mathbf{j}}{(t+1)^2}}{\frac{\sqrt{4+4t^2+4t^3+t^4}}{(t+1)^2}} = \frac{2\mathbf{i} - t(2+t)\mathbf{j}}{\sqrt{4+4t^2+4t^3+t^4}} \quad \text{and} \quad \mathbf{T}(1) = \boxed{\frac{2\sqrt{13}}{13}\mathbf{i} - \frac{3\sqrt{13}}{13}\mathbf{j}}.$$

We find the derivative of the $x(t) = \frac{2}{\sqrt{4+4t^2+4t^3+t^4}}$ component of $\mathbf{T}(t)$.

$$\frac{dx}{dt} = \frac{-(8t + 12t^2 + 4t^3)}{(4 + 4t^2 + 4t^3 + t^4)^{3/2}} = \frac{-4t(2 + 3t + t^2)}{(4 + 4t^2 + 4t^3 + t^4)^{3/2}} = \frac{-4t(t+1)(t+2)}{(4 + 4t^2 + 4t^3 + t^4)^{3/2}}$$

To find the derivative of the $y(t) = \frac{-t(2+t)}{\sqrt{4+4t^2+4t^3+t^4}}$ component of $\mathbf{T}(t)$, we use the Quotient and Chain Rules.

$$\frac{dy}{dt} = \frac{(-2 - 2t)\sqrt{4 + 4t^2 + 4t^3 + t^4} + t(2 + t)(\frac{1}{2})(4 + 4t^2 + 4t^3 + t^4)^{-1/2}(8t + 12t^2 + 4t^3)}{4 + 4t^2 + 4t^3 + t^4}$$

We can multiply the numerator and the denominator by $\sqrt{4 + 4t^2 + 4t^3 + t^4}$ to simplify.

$$\begin{aligned} \frac{dy}{dt} &= \frac{(-2 - 2t)(4 + 4t^2 + 4t^3 + t^4) + t(2 + t)(4t + 6t^2 + 2t^3)}{(4 + 4t^2 + 4t^3 + t^4)^{3/2}} \\ &= \frac{-8 - 8t - 8t^2 - 16t^3 - 10t^4 - 2t^5 + 8t^2 + 16t^3 + 10t^4 + 2t^5}{(4 + 4t^2 + 4t^3 + t^4)^{3/2}} \\ &= \frac{-8 - 8t}{(4 + 4t^2 + 4t^3 + t^4)^{3/2}} = \frac{-8(1 + t)}{(4 + 4t^2 + 4t^3 + t^4)^{3/2}} \end{aligned}$$

Since $\mathbf{T}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j}$,

$$\mathbf{T}'(t) = \frac{-4t(t+1)(t+2)\mathbf{i} - 8(1+t)\mathbf{j}}{(4+4t^2+4t^3+t^4)^{3/2}}.$$

Then

$$\begin{aligned}\|\mathbf{T}'(t)\| &= \sqrt{\frac{16t^2(t+1)^2(t+2)^2 + 64(1+t)^2}{(4+4t^2+4t^3+t^4)^3}} \\ &= \frac{4(t+1)\sqrt{t^2(t+2)^2+4}}{(4+4t^2+4t^3+t^4)^{3/2}} \\ &= \frac{4(t+1)\sqrt{t^4+4t^3+4t^2+4}}{(4+4t^2+4t^3+t^4)^{3/2}} \\ &= \frac{4(t+1)}{4+4t^2+4t^3+t^4}.\end{aligned}$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{-4t(t+1)(t+2)\mathbf{i} - 8(1+t)\mathbf{j}}{(4+4t^2+4t^3+t^4)^{3/2}}}{\frac{4(t+1)}{4+4t^2+4t^3+t^4}} = \frac{-t(t+2)\mathbf{i} - 2\mathbf{j}}{\sqrt{t^4+4t^3+4t^2+4}} \quad \text{and} \quad \mathbf{N}(1) = \boxed{-\frac{3\sqrt{13}}{13}\mathbf{i} - \frac{2\sqrt{13}}{13}\mathbf{j}}.$$

32. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \frac{1}{2\sqrt{t}}\mathbf{i} + \frac{1}{2}\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{\frac{1}{4t} + \frac{1}{4}} = \sqrt{\frac{1+t}{4t}} = \frac{1}{2}\sqrt{\frac{1+t}{t}}.$$

Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \frac{\frac{1}{2\sqrt{t}}\mathbf{i} + \frac{1}{2}\mathbf{j}}{\frac{1}{2}\sqrt{\frac{1+t}{t}}} = \frac{\mathbf{i} + \sqrt{t}\mathbf{j}}{\sqrt{1+t}} = \frac{1}{\sqrt{1+t}}\mathbf{i} + \sqrt{\frac{t}{1+t}}\mathbf{j} \quad \text{and} \quad \mathbf{T}(4) = \boxed{\frac{\sqrt{5}}{5}\mathbf{i} + \frac{2\sqrt{5}}{5}\mathbf{j}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = -\frac{1}{2(1+t)^{3/2}}\mathbf{i} + \frac{1}{2}\sqrt{\frac{1+t}{t}} \left[\frac{1+t-t}{(1+t)^2} \right] \mathbf{j} = -\frac{1}{2(1+t)^{3/2}}\mathbf{i} + \frac{1}{2\sqrt{t}(1+t)^{3/2}}\mathbf{j}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{1}{4(1+t)^3} + \frac{1}{4t(1+t)^3}} = \sqrt{\frac{t+1}{4t(1+t)^3}} = \frac{1}{2\sqrt{t}(1+t)}.$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{-\frac{1}{2(1+t)^{3/2}}\mathbf{i} + \frac{1}{2\sqrt{t}(1+t)^{3/2}}\mathbf{j}}{\frac{1}{2\sqrt{t}(1+t)}} = -\sqrt{\frac{t}{1+t}}\mathbf{i} + \frac{1}{\sqrt{1+t}}\mathbf{j} \quad \text{and} \quad \mathbf{N}(4) = \boxed{-\frac{2\sqrt{5}}{5}\mathbf{i} + \frac{\sqrt{5}}{5}\mathbf{j}}.$$

33. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = e^t\mathbf{i} - e^{-t}\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{e^{2t} + e^{-2t}}.$$

Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \frac{e^t\mathbf{i} - e^{-t}\mathbf{j}}{\sqrt{e^{2t} + e^{-2t}}} \quad \text{and} \quad \mathbf{T}(0) = \boxed{\frac{\sqrt{2}}{2}\mathbf{i} - \frac{\sqrt{2}}{2}\mathbf{j}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = \frac{(e^t \mathbf{i} + e^{-t} \mathbf{j})\sqrt{e^{2t} + e^{-2t}} - (e^t \mathbf{i} - e^{-t} \mathbf{j})(\frac{1}{2})(e^{2t} + e^{-2t})^{-1/2}(2e^{2t} - 2e^{-2t})}{e^{2t} + e^{-2t}}.$$

We can multiply the numerator and the denominator by $\sqrt{e^{2t} + e^{-2t}}$ to simplify.

$$\begin{aligned} \mathbf{T}'(t) &= \frac{(e^t \mathbf{i} + e^{-t} \mathbf{j})(e^{2t} + e^{-2t}) - (e^t \mathbf{i} - e^{-t} \mathbf{j})(e^{2t} - e^{-2t})}{(e^{2t} + e^{-2t})^{3/2}} \\ &= \frac{(e^{3t} + e^{-t})\mathbf{i} + (e^t + e^{-3t})\mathbf{j} - (e^{3t} - e^{-t})\mathbf{i} + (e^t - e^{-3t})\mathbf{j}}{(e^{2t} + e^{-2t})^{3/2}} \\ &= \frac{2e^{-t}\mathbf{i} + 2e^t\mathbf{j}}{(e^{2t} + e^{-2t})^{3/2}} \end{aligned}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{4e^{-2t} + 4e^{2t}}{(e^{2t} + e^{-2t})^3}} = \sqrt{\frac{4(e^{-2t} + e^{2t})}{(e^{2t} + e^{-2t})^3}} = \frac{2}{e^{2t} + e^{-2t}}$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{2e^{-t}\mathbf{i} + 2e^t\mathbf{j}}{(e^{2t} + e^{-2t})^{3/2}}}{\frac{2}{e^{2t} + e^{-2t}}} = \frac{e^{-t}\mathbf{i} + e^t\mathbf{j}}{\sqrt{e^{2t} + e^{-2t}}} \quad \text{and} \quad \mathbf{N}(0) = \boxed{\frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j}}.$$

34. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2e^{2t}\mathbf{i} - e^{-t}\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4e^{4t} + e^{-2t}}.$$

Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \frac{2e^{2t}\mathbf{i} - e^{-t}\mathbf{j}}{\sqrt{4e^{4t} + e^{-2t}}} \quad \text{and} \quad \mathbf{T}(0) = \boxed{\frac{2\sqrt{5}}{5}\mathbf{i} - \frac{\sqrt{5}}{5}\mathbf{j}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = \frac{(4e^{2t}\mathbf{i} + e^{-t}\mathbf{j})(\sqrt{4e^{4t} + e^{-2t}}) - (2e^{2t}\mathbf{i} - e^{-t}\mathbf{j})(\frac{1}{2})(4e^{4t} + e^{-2t})^{-1/2}(16e^{4t} - 2e^{-2t})}{4e^{4t} + e^{-2t}}.$$

We can multiply the numerator and the denominator by $\sqrt{4e^{4t} + e^{-2t}}$ to simplify.

$$\begin{aligned} \mathbf{T}'(t) &= \frac{(4e^{2t}\mathbf{i} + e^{-t}\mathbf{j})(4e^{4t} + e^{-2t}) - (2e^{2t}\mathbf{i} - e^{-t}\mathbf{j})(8e^{4t} - e^{-2t})}{(4e^{4t} + e^{-2t})^{3/2}} \\ &= \frac{16e^{6t}\mathbf{i} + 4\mathbf{i} + 4e^{3t}\mathbf{j} + e^{-3t}\mathbf{j} - (16e^{6t}\mathbf{i} - 2\mathbf{i} - 8e^{3t}\mathbf{j} + e^{-3t}\mathbf{j})}{(4e^{4t} + e^{-2t})^{3/2}} \\ &= \frac{6\mathbf{i} + 12e^{3t}\mathbf{j}}{(4e^{4t} + e^{-2t})^{3/2}} = \frac{6(\mathbf{i} + 2e^{3t}\mathbf{j})}{(4e^{4t} + e^{-2t})^{3/2}} \end{aligned}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{36(1 + 4e^{6t})}{(4e^{4t} + e^{-2t})^3}} = 6\sqrt{\frac{1 + 4e^{6t}}{(4e^{4t} + e^{-2t})^3}}.$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{6(\mathbf{i} + 2e^{3t}\mathbf{j})}{(4e^{4t} + e^{-2t})^{3/2}}}{6\sqrt{\frac{1 + 4e^{6t}}{(4e^{4t} + e^{-2t})^3}}} = \frac{\mathbf{i} + 2e^{3t}\mathbf{j}}{\sqrt{1 + 4e^{6t}}} \quad \text{and} \quad \mathbf{N}(0) = \boxed{\frac{\sqrt{5}}{5}\mathbf{i} + \frac{2\sqrt{5}}{5}\mathbf{j}}.$$

35. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = -3\mathbf{i} + 2\mathbf{j} - \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{9 + 4 + 1} = \sqrt{14}.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = \frac{-3\mathbf{i} + 2\mathbf{j} - \mathbf{k}}{\sqrt{14}} \quad \text{and} \quad \mathbf{T}(0) = \boxed{-\frac{3\sqrt{14}}{14}\mathbf{i} + \frac{\sqrt{14}}{7}\mathbf{j} - \frac{\sqrt{14}}{14}\mathbf{k}}.$$

Since $\mathbf{T}(t)$ is a constant vector, $\mathbf{T}'(t) = \mathbf{0}$, which means that $\|\mathbf{T}'(t)\| = 0$, so $\mathbf{N}(t)$ is not defined.

$$\mathbf{N}(0) \text{ is } \boxed{\text{undefined}}.$$

36. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} - \mathbf{j} + 3\mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{1 + 1 + 9} = \sqrt{11}.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = \frac{\mathbf{i} - \mathbf{j} + 3\mathbf{k}}{\sqrt{11}} \quad \text{and} \quad \mathbf{T}(0) = \boxed{\frac{\sqrt{11}}{11}\mathbf{i} - \frac{\sqrt{11}}{11}\mathbf{j} + \frac{3\sqrt{11}}{11}\mathbf{k}}.$$

Since $\mathbf{T}(t)$ is a constant vector, $\mathbf{T}'(t) = \mathbf{0}$, which means that $\|\mathbf{T}'(t)\| = 0$, so $\mathbf{N}(t)$ is not defined.

$$\mathbf{N}(0) \text{ is } \boxed{\text{undefined}}.$$

37. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = -2\sin t\mathbf{i} + 2\cos t\mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4\sin^2 t + 4\cos^2 t} = \sqrt{4(\sin^2 t + \cos^2 t)} = 2.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = -\sin t\mathbf{i} + \cos t\mathbf{k} \quad \text{and} \quad \mathbf{T}\left(\frac{\pi}{6}\right) = \boxed{-\frac{1}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{k}}.$$

Then $\mathbf{T}'(t) = -\cos t\mathbf{i} - \sin t\mathbf{k}$ and $\|\mathbf{T}'(t)\| = \sqrt{\cos^2 t + \sin^2 t} = 1$. Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = -\cos t\mathbf{i} - \sin t\mathbf{k} \quad \text{and} \quad \mathbf{N}\left(\frac{\pi}{6}\right) = \boxed{-\frac{\sqrt{3}}{2}\mathbf{i} - \frac{1}{2}\mathbf{k}}.$$

38. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = -\sin t\mathbf{j} + \cos t\mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{\sin^2 t + \cos^2 t} = 1.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = -\sin t\mathbf{j} + \cos t\mathbf{k} \quad \text{and} \quad \mathbf{T}\left(\frac{\pi}{6}\right) = \boxed{-\frac{1}{2}\mathbf{j} + \frac{\sqrt{3}}{2}\mathbf{k}}.$$

Then $\mathbf{T}'(t) = -\cos t\mathbf{j} - \sin t\mathbf{k}$ and $\|\mathbf{T}'(t)\| = \sqrt{\cos^2 t + \sin^2 t} = 1$. Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = -\cos t\mathbf{j} - \sin t\mathbf{k} \quad \text{and} \quad \mathbf{N}\left(\frac{\pi}{6}\right) = \boxed{-\frac{\sqrt{3}}{2}\mathbf{j} - \frac{1}{2}\mathbf{k}}.$$

39. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = -2\sin(2t)\mathbf{i} + 2\cos(2t)\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4\sin^2(2t) + 4\cos^2(2t)} = \sqrt{4[\sin^2(2t) + \cos^2(2t)]} = 2.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = -\sin(2t)\mathbf{i} + \cos(2t)\mathbf{j} \quad \text{and} \quad \mathbf{T}\left(\frac{\pi}{4}\right) = \boxed{-\mathbf{i}}.$$

$$\text{Then } \mathbf{T}'(t) = -2\cos(2t)\mathbf{i} - 2\sin(2t)\mathbf{j} \text{ and } \|\mathbf{T}'(t)\| = \sqrt{4\cos^2(2t) + 4\sin^2(2t)} = 2. \text{ Since } \mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|},$$

$$\mathbf{N}(t) = -\cos(2t)\mathbf{i} - \sin(2t)\mathbf{j} = \quad \text{and} \quad \mathbf{N}\left(\frac{\pi}{4}\right) = \boxed{-\mathbf{j}}.$$

40. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = -4\sin(2t)\mathbf{i} + 4\cos(2t)\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{16\sin^2(2t) + 16\cos^2(2t)} = 4.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = -\sin(2t)\mathbf{i} + \cos(2t)\mathbf{j} \quad \text{and} \quad \mathbf{T}\left(\frac{\pi}{2}\right) = \boxed{-\mathbf{j}}.$$

$$\text{Then } \mathbf{T}'(t) = -2\cos(2t)\mathbf{i} - 2\sin(2t)\mathbf{j} \text{ and } \|\mathbf{T}'(t)\| = \sqrt{4\cos^2(2t) + 4\sin^2(2t)} = 2. \text{ Since } \mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|},$$

$$\mathbf{N}(t) = -\cos(2t)\mathbf{i} - \sin(2t)\mathbf{j} \quad \text{and} \quad \mathbf{N}\left(\frac{\pi}{2}\right) = \boxed{\mathbf{i}}.$$

41. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$. $\mathbf{r}'(t) = (e^t \cos t - e^t \sin t)\mathbf{i} + (e^t \sin t + e^t \cos t)\mathbf{j} + e^t\mathbf{k}$ so

$$\begin{aligned} \|\mathbf{r}'(t)\| &= \sqrt{e^{2t} \cos^2 t - 2e^{2t} \sin t \cos t + e^{2t} \sin^2 t + e^{2t} \sin^2 t + 2e^{2t} \sin t \cos t + e^{2t} \cos^2 t + e^{2t}} \\ &= \sqrt{e^{2t}(\cos^2 t + \sin^2 t + \sin^2 t + \cos^2 t + 1)} = e^t \sqrt{3}. \end{aligned}$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = \frac{\sqrt{3}}{3}[(\cos t - \sin t)\mathbf{i} + (\sin t + \cos t)\mathbf{j} + \mathbf{k}] \quad \text{and} \quad \mathbf{T}(0) = \boxed{\frac{\sqrt{3}}{3}(\mathbf{i} + \mathbf{j} + \mathbf{k})}.$$

Then

$$\mathbf{T}'(t) = \frac{\sqrt{3}}{3}[(-\sin t - \cos t)\mathbf{i} + (\cos t - \sin t)\mathbf{j}]$$

and

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{1}{3}(\sin^2 t + 2\sin t \cos t + \cos^2 t + \cos^2 t - 2\sin t \cos t + \sin^2 t)} = \sqrt{\frac{2}{3}} = \frac{\sqrt{6}}{3}$$

$$\text{Since } \mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|},$$

$$\mathbf{N}(t) = \frac{\frac{\sqrt{3}}{3}[(-\sin t - \cos t)\mathbf{i} + (\cos t - \sin t)\mathbf{j}]}{\frac{\sqrt{6}}{3}} = \frac{\sqrt{2}}{2}[(-\sin t - \cos t)\mathbf{i} + (\cos t - \sin t)\mathbf{j}]$$

and

$$\mathbf{N}(0) = \boxed{-\frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j}}.$$

42. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= (-e^{-t} \cos t - e^{-t} \sin t)\mathbf{i} + (-e^{-t} \sin t + e^{-t} \cos t)\mathbf{j} + e^{-t}\mathbf{k} \\ &= e^{-t}[(-\cos t - \sin t)\mathbf{i} + (-\sin t + \cos t)\mathbf{j} + \mathbf{k}]\end{aligned}$$

so

$$\|\mathbf{r}'(t)\| = \sqrt{e^{-2t}(\cos^2 t + 2 \sin t \cos t + \sin^2 t + \sin^2 t - 2 \sin t \cos t + \cos^2 t + 1)} = e^{-t}\sqrt{3}.$$

Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \frac{\sqrt{3}}{3}[(-\cos t - \sin t)\mathbf{i} + (-\sin t + \cos t)\mathbf{j} + \mathbf{k}] \quad \text{and} \quad \mathbf{T}(0) = \boxed{-\frac{\sqrt{3}}{3}\mathbf{i} + \frac{\sqrt{3}}{3}\mathbf{j} + \frac{\sqrt{3}}{3}\mathbf{k}}.$$

Then

$$\mathbf{T}'(t) = \frac{\sqrt{3}}{3}[(\sin t - \cos t)\mathbf{i} + (-\cos t - \sin t)\mathbf{j}]$$

and

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{1}{3}(\sin^2 t - 2 \sin t \cos t + \cos^2 t + \cos^2 t + 2 \sin t \cos t + \sin^2 t)} = \sqrt{\frac{2}{3}} = \frac{\sqrt{6}}{3}.$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{\sqrt{3}}{3}[(\sin t - \cos t)\mathbf{i} + (-\cos t - \sin t)\mathbf{j}]}{\frac{\sqrt{6}}{3}} = \frac{\sqrt{2}}{2}[(\sin t - \cos t)\mathbf{i} + (-\cos t - \sin t)\mathbf{j}]$$

and

$$\mathbf{N}(0) = \boxed{\frac{-\sqrt{2}}{2}\mathbf{i} - \frac{\sqrt{2}}{2}\mathbf{j}}.$$

43. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} + \frac{3}{2}t^{1/2}\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{1 + \frac{9}{4}t} = \sqrt{\frac{4+9t}{4}} = \frac{1}{2}\sqrt{4+9t}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_1^8 \frac{1}{2}\sqrt{4+9t} dt$$

Let $u = 4 + 9t$. Then $du = 9dt$ so $dt = \frac{du}{9}$. Now we change the limits of integration. When $t = 1$, $u = 13$, and when $t = 8$, $u = 76$. Therefore,

$$\frac{1}{2} \int_1^8 \sqrt{4+9t} dt = \frac{1}{2} \int_{13}^{76} u^{1/2} \frac{du}{9} = \left[\frac{1}{18} \cdot \frac{2}{3} u^{3/2} \right]_{13}^{76} = \boxed{\frac{1}{27}(76^{3/2} - 13^{3/2})}.$$

44. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} + \frac{3}{2}t^{1/2}\mathbf{j} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{1 + \frac{9}{4}t} = \sqrt{\frac{4+9t}{4}} = \frac{1}{2}\sqrt{4+9t}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^4 \frac{1}{2}\sqrt{4+9t} dt$$

Let $u = 4 + 9t$. Then $du = 9dt$ so $dt = \frac{du}{9}$. Now we change the limits of integration. When $t = 0$, $u = 4$, and when $t = 4$, $u = 40$. Therefore,

$$\frac{1}{2} \int_0^4 \sqrt{4+9t} dt = \frac{1}{2} \int_4^{40} u^{1/2} \frac{du}{9} = \left[\frac{1}{18} \cdot \frac{2}{3} u^{3/2} \right]_4^{40} = \frac{1}{27} (40^{3/2} - 4^{3/2}) = \boxed{\frac{1}{27} (80\sqrt{10} - 8)}.$$

45. We can rewrite $\frac{t^6+2}{t^2}$ as $t^4 + 2t^{-2}$ to simplify differentiating the y -component of $\mathbf{r}(t)$. We find $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 8\mathbf{i} + (4t^3 - 4t^{-3})\mathbf{j} \text{ so}$$

$$\|\mathbf{r}'(t)\| = \sqrt{64 + 16t^6 - 32 + 16t^{-6}} = 4\sqrt{t^6 + 2 + t^{-6}} = 4\sqrt{(t^3 + t^{-3})^2} = 4(t^3 + t^{-3}).$$

Now we use the formula for arc length.

$$\begin{aligned} s &= \int_a^b \|\mathbf{r}'(t)\| dt = \int_1^2 4(t^3 + t^{-3}) dt = \left[4 \left(\frac{1}{4} t^4 - \frac{1}{2} t^{-2} \right) \right]_1^2 \\ &= [t^4 - 2t^{-2}]_1^2 = (2^4 - (2)(2)^{-2}) - (1^4 - (2)(1)^{-2}) = \left(16 - \frac{1}{2} \right) - (1 - 2) = \frac{31}{2} + 1 = \boxed{\frac{33}{2}} \end{aligned}$$

46. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} + \frac{3}{2}(1 - t^{2/3})^{1/2} \left(-\frac{2}{3} \right) t^{-1/3} \mathbf{j} = \mathbf{i} - \frac{\sqrt{1 - t^{2/3}}}{t^{1/3}} \mathbf{j} \text{ so}$$

$$\|\mathbf{r}'(t)\| = \sqrt{1 + \frac{1 - t^{2/3}}{t^{2/3}}} = \sqrt{\frac{t^{2/3} + 1 - t^{2/3}}{t^{2/3}}} = \sqrt{\frac{1}{t^{2/3}}} = t^{-1/3}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_{\frac{1}{8}}^1 t^{-1/3} dt = \left[\frac{3}{2} t^{2/3} \right]_{\frac{1}{8}}^1 = \frac{3}{2} \left[1 - \left(\frac{1}{8} \right)^{2/3} \right] = \frac{3}{2} \left(1 - \frac{1}{4} \right) = \boxed{\frac{9}{8}}$$

47. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} + 2\mathbf{j} + \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{1 + 4 + 1} = \sqrt{6}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^1 \sqrt{6} dt = [\sqrt{6}t]_0^1 = \boxed{\sqrt{6}}$$

48. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2\mathbf{i} + \mathbf{j} + 3\mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4 + 1 + 9} = \sqrt{14}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_1^3 \sqrt{14} dt = [\sqrt{14}t]_1^3 = \boxed{2\sqrt{14}}$$

49. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2\cos(2t)\mathbf{i} - 2\sin(2t)\mathbf{j} + \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4\cos^2(2t) + 4\sin^2(2t) + 1} = \sqrt{5}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^\pi \sqrt{5} dt = [\sqrt{5}t]_0^\pi = \boxed{\sqrt{5}\pi}$$

50. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \cos t \mathbf{i} - \sin t \mathbf{j} + b \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{\cos^2 t + \sin^2 t + b^2} = \sqrt{1 + b^2}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^{2\pi} \sqrt{1 + b^2} dt = \left[t \sqrt{1 + b^2} \right]_0^{2\pi} = \boxed{2\pi \sqrt{1 + b^2}}$$

51. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = e^t \mathbf{i} - e^{-t} \mathbf{j} + \sqrt{2} \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{e^{2t} + e^{-2t} + 2} = \sqrt{(e^t + e^{-t})^2} = e^t + e^{-t}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^1 (e^t + e^{-t}) dt = [e^t - e^{-t}]_0^1 = (e - e^{-1}) - (1 - 1) = \boxed{e - \frac{1}{e}}$$

52. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = -3 \cos^2 t \sin t \mathbf{i} + 3 \sin^2 t \cos t \mathbf{j} \quad \text{so}$$

$$\|\mathbf{r}'(t)\| = \sqrt{9 \cos^4 t \sin^2 t + 9 \sin^4 t \cos^2 t} = \sqrt{9 \cos^2 t \sin^2 t (\cos^2 t + \sin^2 t)} = 3 \cos t \sin t.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^{\pi/2} 3 \sin t \cos t dt$$

Let $u = \sin t$. Then $du = \cos t dt$. Now we change the limits of integration. When $t = 0$, $u = 0$, and when $t = \frac{\pi}{2}$, $u = 1$.

$$\int_0^{\pi/2} 3 \sin t \cos t dt = \int_0^1 3u du = \left[\frac{3}{2} u^2 \right]_0^1 = \frac{3}{2} (1 - 0) = \boxed{\frac{3}{2}}$$

53. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = (e^t \cos t - e^t \sin t) \mathbf{i} + (e^t \sin t + e^t \cos t) \mathbf{j} + e^t \mathbf{k} \quad \text{so}$$

$$\begin{aligned} \|\mathbf{r}'(t)\| &= \sqrt{e^{2t} \cos^2 t - 2e^{2t} \cos t \sin t + e^{2t} \sin^2 t + e^{2t} \sin^2 t + 2e^{2t} \sin t \cos t + e^{2t} \cos^2 t + e^{2t}} \\ &= \sqrt{e^{2t} (2 \cos^2 t + 2 \sin^2 t + 1)} = e^t \sqrt{3}. \end{aligned}$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^{2\pi} e^t \sqrt{3} dt = \left[e^t \sqrt{3} \right]_0^{2\pi} = \sqrt{3} e^{2\pi} - \sqrt{3} = \boxed{\sqrt{3} (e^{2\pi} - 1)}$$

54. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2t \mathbf{i} - 2\sqrt{2} \mathbf{j} + 2t \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4t^2 + 8 + 4t^2} = \sqrt{8t^2 + 8} = (2\sqrt{2}) \sqrt{t^2 + 1}.$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^1 (2\sqrt{2}) \sqrt{t^2 + 1} dt$$

Let $\tan u = t$. Then $\sec^2 u \, du = dt$, and $t^2 + 1 = \tan^2 u + 1 = \sec^2 u$. Now we change the limits of integration. When $t = 0$, $u = 0$, and when $t = 1$, $u = \frac{\pi}{4}$, and

$$\int_0^1 (2\sqrt{2})\sqrt{t^2+1} \, dt = \int_0^{\pi/4} 2\sqrt{2} \cdot \sqrt{\sec^2 u} \sec^2 u \, du = \int_0^{\pi/4} 2\sqrt{2} \sec^3 u \, du$$

Using the secant reduction formula with $n = 3$,

$$\begin{aligned} \int_0^{\pi/4} 2\sqrt{2} \sec^3 u \, du &= 2\sqrt{2} \left[\frac{\sec u \tan u}{2} + \frac{1}{2} \ln |\sec u + \tan u| \right]_0^{\pi/4} \\ &= 2\sqrt{2} \left[\left(\frac{(\sqrt{2})(1)}{2} + \frac{\ln(\sqrt{2}+1)}{2} \right) - \left(0 + \frac{1}{2} \ln 1 \right) \right] \\ &= 2\sqrt{2} \left(\frac{(\sqrt{2})(1)}{2} + \frac{\ln(\sqrt{2}+1)}{2} \right) = \boxed{2 + \sqrt{2} \ln(\sqrt{2}+1)}. \end{aligned}$$

55. (a) The curve traced out by the vector function $\mathbf{r}(t)$ is below.

- (b) We find $\mathbf{r}'(t) = 3 \cos t \mathbf{i} + 4 \sin t \mathbf{j}$ so $\|\mathbf{r}'(t)\| = \sqrt{9 \cos^2 t + 16 \sin^2 t}$ and $s = \int_0^\pi \sqrt{9 \cos^2 t + 16 \sin^2 t} \, dt$.
Using Maple™, $s \approx \boxed{11.052}$.

56. (a) The curve traced out by the vector function $\mathbf{r}(t)$ is below.

- (b) We find $\mathbf{r}'(t) = -5 \sin t \mathbf{i} + 3 \cos t \mathbf{j}$ so $\|\mathbf{r}'(t)\| = \sqrt{25 \sin^2 t + 9 \cos^2 t}$ and $s = \int_0^{\pi/2} \sqrt{25 \sin^2 t + 9 \cos^2 t} dt$.
Using MapleTM, $s \approx \boxed{6.382}$.

57. (a) The curve traced out by the vector function $\mathbf{r}(t)$ is below.

- (b) We find $\mathbf{r}'(t) = 2 \cos t \mathbf{i} - 8 \sin(2t) \mathbf{j}$ so $\|\mathbf{r}'(t)\| = \sqrt{4 \cos^2 t + 64 \sin^2(2t)}$ and $s = \int_0^{2\pi} \sqrt{4 \cos^2 t + 64 \sin^2(2t)} dt$.
Using MapleTM, $s \approx \boxed{33.637}$.

58. (a) The curve traced out by the vector function $\mathbf{r}(t)$ is below.

- (b) We find $\mathbf{r}'(t) = 8 \cos(2t) \mathbf{i} + 6 \sin t \mathbf{j}$ so $\|\mathbf{r}'(t)\| = \sqrt{64 \cos^2(2t) + 36 \sin^2 t}$ and $s = \int_0^{\pi/2} \sqrt{64 \cos^2(2t) + 36 \sin^2 t} dt$.
Using MapleTM, $s \approx \boxed{10.716}$.

Applications and Extensions

59. The vector function and its tangent vector will be orthogonal when their dot product is zero. Since $\mathbf{r}(t) = t^2 \mathbf{i} + (t^2 - 1) \mathbf{j} - t \mathbf{k}$, $\mathbf{r}'(t) = 2t \mathbf{i} + 2t \mathbf{j} - \mathbf{k}$.

$$\mathbf{r}(t) \cdot \mathbf{r}'(t) = (t^2)(2t) + (t^2 - 1)(2t) + (-t)(-1) = 4t^3 - t = t(4t^2 - 1)$$

Then $\mathbf{r}(t)$ and $\mathbf{r}'(t)$ are orthogonal when $t(4t^2 - 1) = 0$, or $\{t|t = -\frac{1}{2}, 0, \frac{1}{2}\}$. The points at which $\mathbf{r}(t)$ and its tangent vector are horizontal are $\boxed{\mathbf{r}(0) = -\mathbf{j}, \mathbf{r}\left(\frac{1}{2}\right) = \frac{1}{4}\mathbf{i} - \frac{3}{4}\mathbf{j} - \frac{1}{2}\mathbf{k}, \mathbf{r}\left(-\frac{1}{2}\right) = \frac{1}{4}\mathbf{i} - \frac{3}{4}\mathbf{j} + \frac{1}{2}\mathbf{k}}$.

60. A tangent vector at any point on the helix is given by $\mathbf{r}'(t) = -\sin t \mathbf{i} + \mathbf{j} + \cos t \mathbf{k}$, and the direction of the y -axis can be represented by the vector $c\mathbf{j}$ for $c \neq 0$. Then $\|\mathbf{r}'(t)\| = \sqrt{\sin^2 t + 1 + \cos^2 t} = \sqrt{2}$ and $\|c\mathbf{j}\| = c$. The cosine of the angle θ between $\mathbf{r}'(t)$ and the y -axis is

$$\cos \theta = \frac{\mathbf{r}'(t) \cdot c\mathbf{j}}{\|\mathbf{r}'(t)\| \|c\mathbf{j}\|} = \frac{c}{(\sqrt{2})(c)} = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2},$$

$$\text{so } \theta = \boxed{\frac{\pi}{4}}.$$

61. A tangent vector at any point on the helix is given by $\mathbf{r}'(t) = 3 \cos t \mathbf{i} - 3 \sin t \mathbf{j} + 4\mathbf{k}$, so $\|\mathbf{r}'(t)\| = \sqrt{9 \cos^2 t + 9 \sin^2 t + 16} = 5$. The cosine of the angle θ between $\mathbf{r}'(t)$ and $\mathbf{k}$ is

$$\cos \theta = \frac{\mathbf{r}'(t) \cdot \mathbf{k}}{\|\mathbf{r}'(t)\| \|\mathbf{k}\|} = \frac{4}{5},$$

$$\text{so } \theta = \cos^{-1}\left(\frac{4}{5}\right) \approx \boxed{37^\circ}.$$

62. A tangent vector at any point on the helix is given by $\mathbf{r}'(t) = -2 \sin t \mathbf{i} + 2 \cos t \mathbf{j} + \mathbf{k}$, so $\|\mathbf{r}'(t)\| = \sqrt{4 \sin^2 t + 4 \cos^2 t + 1} = \sqrt{5}$. The cosine of the angle θ between $\mathbf{r}'(t)$ and $\mathbf{k}$ is

$$\cos \theta = \frac{\mathbf{r}'(t) \cdot \mathbf{k}}{\|\mathbf{r}'(t)\| \|\mathbf{k}\|} = \frac{1}{\sqrt{5}},$$

$$\text{so } \theta = \cos^{-1}\left(\frac{1}{\sqrt{5}}\right) \approx \boxed{63^\circ}.$$

63. For $\mathbf{r}_1(t_1) = \mathbf{r}_2(t_2) = (1, 0, 1)$, $t_1 = 1$ and $t_2 = 0$. We begin by finding $\mathbf{r}'_1(t_1)$, $\|\mathbf{r}'_1(t_1)\|$, $\mathbf{r}'_2(t_2)$, and $\|\mathbf{r}'_2(t_2)\|$. Since $\mathbf{r}'_1(t_1) = \mathbf{i} + \pi \cos(\pi t_1)\mathbf{j}$ and $\mathbf{r}'_2(t_2) = \mathbf{j} + \mathbf{k}$,

$$\begin{aligned} \mathbf{r}'_1(1) &= \mathbf{i} - \pi\mathbf{j} & \text{and} & \quad \|\mathbf{r}'_1(1)\| = \sqrt{1 + \pi^2} \\ \mathbf{r}'_2(0) &= \mathbf{j} + \mathbf{k} & \text{and} & \quad \|\mathbf{r}'_2(0)\| = \sqrt{2} \end{aligned}$$

The cosine of the angle θ between $\mathbf{r}'_1(1)$ and $\mathbf{r}'_2(0)$ is

$$\cos \theta = \frac{\mathbf{r}'_1(1) \cdot \mathbf{r}'_2(0)}{\|\mathbf{r}'_1(1)\| \|\mathbf{r}'_2(0)\|} = \frac{-\pi}{\sqrt{2 + 2\pi^2}},$$

$$\text{so } \theta = \cos^{-1}\left(\frac{-\pi}{\sqrt{2 + 2\pi^2}}\right) \approx 2.310 \text{ rad} \approx \boxed{132.361^\circ}.$$

64. For $\mathbf{r}_1(t_1) = \mathbf{r}_2(t_2) = (0, 0, 0)$, $t_1 = 0$ and $t_2 = 0$. We begin by finding $\mathbf{r}'_1(t_1)$, $\|\mathbf{r}'_1(t_1)\|$, $\mathbf{r}'_2(t_2)$, and $\|\mathbf{r}'_2(t_2)\|$. Since $\mathbf{r}'_1(t_1) = 2 \cos(2t_1)\mathbf{i} + \cos t_1\mathbf{j} + \mathbf{k}$ and $\mathbf{r}'_2(t_2) = 2t_2\mathbf{i} + \mathbf{j} + 3(t_2)^2\mathbf{k}$,

$$\begin{aligned} \mathbf{r}'_1(0) &= 2\mathbf{i} + \mathbf{j} + \mathbf{k} & \text{and} & \quad \|\mathbf{r}'_1(0)\| = \sqrt{4 + 1 + 1} = \sqrt{6} \\ \mathbf{r}'_2(0) &= \mathbf{j} & \text{and} & \quad \|\mathbf{r}'_2(0)\| = \sqrt{1} = 1. \end{aligned}$$

The cosine of the angle θ between $\mathbf{r}'_1(0)$ and $\mathbf{r}'_2(0)$ is

$$\cos \theta = \frac{\mathbf{r}'_1(0) \cdot \mathbf{r}'_2(0)}{\|\mathbf{r}'_1(0)\| \|\mathbf{r}'_2(0)\|} = \frac{1}{\sqrt{6}},$$

$$\text{so } \theta = \cos^{-1}\left(\frac{\sqrt{6}}{6}\right) \approx \boxed{65.905^\circ}.$$

65. For $\mathbf{r}_1(t_1) = \mathbf{r}_2(t_2) = (0, -1, 0)$, $t_1 = 0$ and $t_2 = 1$. We begin by finding $\mathbf{r}'_1(t_1)$, $\|\mathbf{r}'_1(t_1)\|$, $\mathbf{r}'_2(t_2)$, and $\|\mathbf{r}'_2(t_2)\|$. Since $\mathbf{r}'_1(t_1) = e^{t_1}\mathbf{i} + \pi \sin(\pi t_1)\mathbf{j} + \mathbf{k}$ and $\mathbf{r}'_2(t_2) = -\mathbf{i} + \mathbf{k}$,

$$\begin{aligned}\mathbf{r}'_1(0) &= \mathbf{i} + \mathbf{k} & \text{and} & \quad \|\mathbf{r}'_1(0)\| = \sqrt{2} \\ \mathbf{r}'_2(1) &= -\mathbf{i} + \mathbf{k} & \text{and} & \quad \|\mathbf{r}'_2(1)\| = \sqrt{2}.\end{aligned}$$

The cosine of the angle θ between $\mathbf{r}'_1(0)$ and $\mathbf{r}'_2(1)$ is

$$\cos \theta = \frac{\mathbf{r}'_1(0) \cdot \mathbf{r}'_2(1)}{\|\mathbf{r}'_1(0)\| \|\mathbf{r}'_2(1)\|} = 0,$$

$$\text{so } \theta = \cos^{-1}(0) = \boxed{90^\circ}.$$

66. For $\mathbf{r}_1(t_1) = \mathbf{r}_2(t_2) = (4, 1, 1)$, $t_1 = 2$ and $t_2 = 1$. We begin by finding $\mathbf{r}'_1(t_1)$, $\|\mathbf{r}'_1(t_1)\|$, $\mathbf{r}'_2(t_2)$, and $\|\mathbf{r}'_2(t_2)\|$. Since $\mathbf{r}'_1(t_1) = 2t_1\mathbf{i} - \mathbf{j} - \mathbf{k}$ and $\mathbf{r}'_2(t_2) = 2t_2\mathbf{i} - \mathbf{j} + \mathbf{k}$,

$$\begin{aligned}\mathbf{r}'_1(2) &= 4\mathbf{i} - \mathbf{j} - \mathbf{k} & \text{and} & \quad \|\mathbf{r}'_1(2)\| = \sqrt{16 + 1 + 1} = \sqrt{18} = 3\sqrt{2} \\ \mathbf{r}'_2(1) &= 2\mathbf{i} - \mathbf{j} + \mathbf{k} & \text{and} & \quad \|\mathbf{r}'_2(1)\| = \sqrt{4 + 1 + 1} = \sqrt{6}.\end{aligned}$$

The cosine of the angle θ between $\mathbf{r}'_1(2)$ and $\mathbf{r}'_2(1)$ is

$$\cos \theta = \frac{\mathbf{r}'_1(2) \cdot \mathbf{r}'_2(1)}{\|\mathbf{r}'_1(2)\| \|\mathbf{r}'_2(1)\|} = \frac{8}{(3\sqrt{2})(\sqrt{6})} = \frac{8}{6\sqrt{3}} = \frac{4\sqrt{3}}{9},$$

$$\text{so } \theta = \cos^{-1}\left(\frac{4\sqrt{3}}{9}\right) \approx \boxed{39.664^\circ}.$$

67. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2t\mathbf{i} - \mathbf{j} - \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4t^2 + 1 + 1} = \sqrt{4t^2 + 2}.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = \frac{2t\mathbf{i} - \mathbf{j} - \mathbf{k}}{\sqrt{4t^2 + 2}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = \frac{2i\sqrt{4t^2 + 2} - (2t\mathbf{i} - \mathbf{j} - \mathbf{k})\left(\frac{1}{2}\right)(4t^2 + 2)^{-1/2}(8t)}{4t^2 + 2}.$$

We can multiply the numerator and the denominator by $\sqrt{4t^2 + 2}$ to simplify.

$$\begin{aligned}\mathbf{T}'(t) &= \frac{(2i)(4t^2 + 2) - (4t)(2t\mathbf{i} - \mathbf{j} - \mathbf{k})}{(4t^2 + 2)^{3/2}} = \frac{8t^2\mathbf{i} + 4\mathbf{i} - 8t^2\mathbf{i} + 4t\mathbf{j} + 4t\mathbf{k}}{(4t^2 + 2)^{3/2}} \\ &= \frac{4\mathbf{i} + 4t\mathbf{j} + 4t\mathbf{k}}{(4t^2 + 2)^{3/2}}\end{aligned}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{16 + 16t^2 + 16t^2}{(4t^2 + 2)^3}} = \sqrt{\frac{8(2 + 4t^2)}{(4t^2 + 2)^3}} = \frac{2\sqrt{2}}{4t^2 + 2}.$$

$$\text{Since } \mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|},$$

$$\mathbf{N}(t) = \frac{\frac{4\mathbf{i} + 4t\mathbf{j} + 4t\mathbf{k}}{(4t^2 + 2)^{3/2}}}{\frac{2\sqrt{2}}{4t^2 + 2}} = \frac{\frac{2}{\sqrt{2}}\mathbf{i} + \frac{2}{\sqrt{2}}t\mathbf{j} + \frac{2}{\sqrt{2}}t\mathbf{k}}{\sqrt{4t^2 + 2}} = \frac{\sqrt{2}(\mathbf{i} + t\mathbf{j} + t\mathbf{k})}{\sqrt{4t^2 + 2}} = \boxed{\frac{\mathbf{i} + t\mathbf{j} + t\mathbf{k}}{\sqrt{2t^2 + 1}}}$$

The binormal vector $\mathbf{B}(t) = \mathbf{T}(t) \times \mathbf{N}(t)$, so

$$\begin{aligned}\mathbf{B}(t) &= \left[\frac{2t\mathbf{i} - \mathbf{j} - \mathbf{k}}{\sqrt{4t^2 + 2}} \right] \times \left[\frac{\sqrt{2}(\mathbf{i} + t\mathbf{j} + t\mathbf{k})}{\sqrt{4t^2 + 2}} \right] = \frac{\sqrt{2}}{4t^2 + 2} ([2t\mathbf{i} - \mathbf{j} - \mathbf{k}] \times [\mathbf{i} + t\mathbf{j} + t\mathbf{k}]) \\ &= \frac{\sqrt{2}}{4t^2 + 2} \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2t & -1 & -1 \\ 1 & t & t \end{vmatrix} = \frac{\sqrt{2}}{2(2t^2 + 1)} [(-t + t)\mathbf{i} - (2t^2 + 1)\mathbf{j} + (2t^2 + 1)\mathbf{k}] \\ &= \boxed{-\frac{\sqrt{2}}{2}\mathbf{j} + \frac{\sqrt{2}}{2}\mathbf{k}}.\end{aligned}$$

68. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} - \mathbf{j} + 2t\mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{1 + 1 + 4t^2} = \sqrt{2 + 4t^2}.$$

$$\text{Since } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|},$$

$$\mathbf{T}(t) = \boxed{\frac{\mathbf{i} - \mathbf{j} + 2t\mathbf{k}}{\sqrt{4t^2 + 2}}}.$$

Using the Quotient and Chain Rules,

$$\mathbf{T}'(t) = \frac{2\mathbf{k}\sqrt{4t^2 + 2} - (\mathbf{i} - \mathbf{j} + 2t\mathbf{k})\left(\frac{1}{2}\right)(4t^2 + 2)^{-1/2}(8t)}{4t^2 + 2}.$$

We can multiply the numerator and the denominator by $\sqrt{4t^2 + 2}$ to simplify.

$$\mathbf{T}'(t) = \frac{(2\mathbf{k})(4t^2 + 2) - (4t)(\mathbf{i} - \mathbf{j} + 2t\mathbf{k})}{(4t^2 + 2)^{3/2}} = \frac{-4t\mathbf{i} + 4t\mathbf{j} + 4\mathbf{k}}{(4t^2 + 2)^{3/2}}$$

Then

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{16t^2 + 16t^2 + 16}{(4t^2 + 2)^3}} = \sqrt{\frac{8(4t^2 + 2)}{(4t^2 + 2)^3}} = \frac{2\sqrt{2}}{4t^2 + 2}.$$

$$\text{Since } \mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|},$$

$$\mathbf{N}(t) = \frac{\frac{-4t\mathbf{i} + 4t\mathbf{j} + 4\mathbf{k}}{(4t^2 + 2)^{3/2}}}{\frac{2\sqrt{2}}{4t^2 + 2}} = \frac{-\frac{2}{\sqrt{2}}t\mathbf{i} + \frac{2}{\sqrt{2}}t\mathbf{j} + \frac{2}{\sqrt{2}}\mathbf{k}}{\sqrt{4t^2 + 2}} = \boxed{\frac{\sqrt{2}(-t\mathbf{i} + t\mathbf{j} + \mathbf{k})}{\sqrt{4t^2 + 2}}}$$

The binormal vector $\mathbf{B}(t) = \mathbf{T}(t) \times \mathbf{N}(t)$, so

$$\begin{aligned}\mathbf{B}(t) &= \left[\frac{\mathbf{i} - \mathbf{j} + 2t\mathbf{k}}{\sqrt{4t^2 + 2}} \right] \times \left[\frac{\sqrt{2}(-t\mathbf{i} + t\mathbf{j} + \mathbf{k})}{\sqrt{4t^2 + 2}} \right] = \frac{\sqrt{2}}{4t^2 + 2} ([\mathbf{i} - \mathbf{j} + 2t\mathbf{k}] \times [-t\mathbf{i} + t\mathbf{j} + \mathbf{k}]) \\ &= \frac{\sqrt{2}}{4t^2 + 2} \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -1 & 2t \\ -t & t & 1 \end{vmatrix} = \frac{\sqrt{2}}{2(2t^2 + 1)} [(-1 - 2t^2)\mathbf{i} - (1 + 2t^2)\mathbf{j} + (t - t)\mathbf{k}] \\ &= \boxed{-\frac{\sqrt{2}}{2}\mathbf{i} - \frac{\sqrt{2}}{2}\mathbf{j}}.\end{aligned}$$

69. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = -\sin t\mathbf{i} + \cos t\mathbf{j} + \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{\sin^2 t + \cos^2 t + 1} = \sqrt{2}.$$

Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \frac{-\sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k}}{\sqrt{2}} = \boxed{\frac{\sqrt{2}}{2}(-\sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k})}.$$

Then

$$\mathbf{T}'(t) = \frac{-\cos t \mathbf{i} - \sin t \mathbf{j}}{\sqrt{2}}$$

and

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{\cos^2 t + \sin^2 t}{2}} = \frac{1}{\sqrt{2}}.$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{-\cos t \mathbf{i} - \sin t \mathbf{j}}{\sqrt{2}}}{\frac{1}{\sqrt{2}}} = \boxed{-\cos t \mathbf{i} - \sin t \mathbf{j}}$$

The binormal vector $\mathbf{B}(t) = \mathbf{T}(t) \times \mathbf{N}(t)$, so

$$\begin{aligned} \mathbf{B}(t) &= \left[\frac{-\sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k}}{\sqrt{2}} \right] \times [-\cos t \mathbf{i} - \sin t \mathbf{j}] = \frac{1}{\sqrt{2}}([-\sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k}] \times [-\cos t \mathbf{i} - \sin t \mathbf{j}]) \\ &= \frac{1}{\sqrt{2}} \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\sin t & \cos t & 1 \\ -\cos t & -\sin t & 0 \end{vmatrix} = \frac{\sqrt{2}}{2}[\sin t \mathbf{i} - \cos t \mathbf{j} + (\sin^2 t + \cos^2 t)\mathbf{k}] \\ &= \boxed{\frac{\sqrt{2}}{2}(\sin t \mathbf{i} - \cos t \mathbf{j} + \mathbf{k})}. \end{aligned}$$

70. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2 \cos t \mathbf{i} - 2 \sin t \mathbf{j} + 3 \mathbf{k} \quad \text{so} \quad \|\mathbf{r}'(t)\| = \sqrt{4 \cos^2 t + 4 \sin^2 t + 9} = \sqrt{13}.$$

Since $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$,

$$\mathbf{T}(t) = \boxed{\frac{2 \cos t \mathbf{i} - 2 \sin t \mathbf{j} + 3 \mathbf{k}}{\sqrt{13}}}.$$

Then

$$\mathbf{T}'(t) = \frac{-2 \sin t \mathbf{i} - 2 \cos t \mathbf{j}}{\sqrt{13}}$$

and

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{4 \sin^2 t + 4 \cos^2 t}{13}} = \frac{2}{\sqrt{13}}.$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{-2 \sin t \mathbf{i} - 2 \cos t \mathbf{j}}{\sqrt{13}}}{\frac{2}{\sqrt{13}}} = \boxed{-\sin t \mathbf{i} - \cos t \mathbf{j}}$$

The binormal vector $\mathbf{B}(t) = \mathbf{T}(t) \times \mathbf{N}(t)$, so

$$\begin{aligned}\mathbf{B}(t) &= \left[\frac{2 \cos t \mathbf{i} - 2 \sin t \mathbf{j} + 3 \mathbf{k}}{\sqrt{13}} \right] \times [-\sin t \mathbf{i} - \cos t \mathbf{j}] = -\frac{1}{\sqrt{13}} ([2 \cos t \mathbf{i} - 2 \sin t \mathbf{j} + 3 \mathbf{k}] \times [\sin t \mathbf{i} + \cos t \mathbf{j}]) \\ &= -\frac{1}{\sqrt{13}} \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 \cos t & -2 \sin t & 3 \\ \sin t & \cos t & 0 \end{vmatrix} = -\frac{1}{\sqrt{13}} [-3 \cos t \mathbf{i} + 3 \sin t \mathbf{j} + (2 \cos^2 t + 2 \sin^2 t) \mathbf{k}] \\ &= \left[\frac{3\sqrt{13}}{13} \cos t \mathbf{i} - \frac{3\sqrt{13}}{13} \sin t \mathbf{j} - \frac{2\sqrt{13}}{13} \mathbf{k} \right].\end{aligned}$$

71. Let $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$. The tangent vector at t_0 is $\mathbf{r}'(t_0) = x'(t_0)\mathbf{i} + y'(t_0)\mathbf{j} + z'(t_0)\mathbf{k}$. Recall that a nonzero vector $\mathbf{r}'(t_0)$ in space can be described with its three direction angles and its magnitude, $\|\mathbf{r}'(t_0)\|$. The direction angles are defined as

$$\begin{aligned}\alpha &= \text{the angle between } \mathbf{r}'(t_0) \text{ and } \mathbf{i}, 0 \leq \alpha \leq \pi, \\ \beta &= \text{the angle between } \mathbf{r}'(t_0) \text{ and } \mathbf{j}, 0 \leq \beta \leq \pi, \\ \gamma &= \text{the angle between } \mathbf{r}'(t_0) \text{ and } \mathbf{k}, 0 \leq \gamma \leq \pi.\end{aligned}$$

From the Theorem about the Angle Between Vectors,

$$\cos \alpha = \frac{\mathbf{r}'(t_0) \cdot \mathbf{i}}{\|\mathbf{r}'(t_0)\| \|\mathbf{i}\|}, \quad \cos \beta = \frac{\mathbf{r}'(t_0) \cdot \mathbf{j}}{\|\mathbf{r}'(t_0)\| \|\mathbf{j}\|}, \quad \text{and} \quad \cos \gamma = \frac{\mathbf{r}'(t_0) \cdot \mathbf{k}}{\|\mathbf{r}'(t_0)\| \|\mathbf{k}\|},$$

so the direction cosines are
$$\cos \alpha = \frac{x'(t_0)}{\|\mathbf{r}'(t_0)\|}, \cos \beta = \frac{y'(t_0)}{\|\mathbf{r}'(t_0)\|}, \text{ and } \cos \gamma = \frac{z'(t_0)}{\|\mathbf{r}'(t_0)\|}.$$

72. The tangent vector to the helix is $\mathbf{r}'(t) = -a \sin t \mathbf{i} + a \cos t \mathbf{j} + b \mathbf{k}$, and the direction of the z -axis can be represented by the vector $c \mathbf{k}$ for $c \neq 0$. Then $\|\mathbf{r}'(t)\| = \sqrt{a^2 \sin^2 t + a^2 \cos^2 t + b^2} = \sqrt{a^2 + b^2}$ and $\|c \mathbf{k}\| = c$. The cosine of the angle θ between $\mathbf{r}'(t)$ and the z -axis is

$$\cos \theta = \frac{\mathbf{r}'(t) \cdot c \mathbf{k}}{\|\mathbf{r}'(t)\| \|c \mathbf{k}\|} = \frac{(b)(c)}{\sqrt{a^2 + b^2}(c)} = \frac{b}{\sqrt{a^2 + b^2}},$$

so $\theta = \cos^{-1} \left(\frac{b}{\sqrt{a^2 + b^2}} \right)$. Since a and b are real numbers, θ is a constant.

Challenge Problems

73. We begin by finding $\mathbf{r}'(t) = 2t \mathbf{i} + 3t^2 \mathbf{j} + 2 \mathbf{k}$ and $\|\mathbf{r}'(t)\| = \sqrt{9t^4 + 4t^2 + 4}$. We wish to approximate $\int_0^2 \|\mathbf{r}'(t)\| dt = \int_0^2 \sqrt{9t^4 + 4t^2 + 4}$ using $n = 4$, $\Delta t = \frac{b-a}{n} = \frac{1}{2}$. Then using Simpson's Rule,

$$\begin{aligned}\int_0^2 \|\mathbf{r}'(t)\| dt &\approx \frac{2-0}{3 \cdot 4} \left[\|\mathbf{r}'(0)\| + 4 \left\| \mathbf{r}'\left(\frac{1}{2}\right) \right\| + 2 \|\mathbf{r}'(1)\| + 4 \left\| \mathbf{r}'\left(\frac{3}{2}\right) \right\| + \|\mathbf{r}'(2)\| \right] \\ &= \frac{1}{6} \left[2 + 4 \left(\frac{\sqrt{89}}{4} \right) + 2(\sqrt{17}) + 4 \left(\frac{\sqrt{937}}{4} \right) + 2\sqrt{41} \right] \approx \boxed{10.516}\end{aligned}$$

74. We begin by finding $\mathbf{r}'(t) = 3 \cos t \mathbf{i} + 4 \sin t \mathbf{j}$ and $\|\mathbf{r}'(t)\| = \sqrt{9 \cos^2 t + 16 \sin^2 t}$. We wish to approximate $\int_0^\pi \|\mathbf{r}'(t)\| dt = \int_0^\pi \sqrt{9 \cos^2 t + 16 \sin^2 t} dt$.

(a) Using $n = 4$, $\Delta t = \frac{b-a}{n} = \frac{\pi}{4}$. Then Simpson's Rule gives

$$\begin{aligned}\int_0^\pi \|\mathbf{r}'(t)\| dt &\approx \frac{\pi-0}{3 \cdot 4} \left[\|\mathbf{r}'(0)\| + 4 \left\| \mathbf{r}'\left(\frac{\pi}{4}\right) \right\| + 2 \left\| \mathbf{r}'\left(\frac{\pi}{2}\right) \right\| + 4 \left\| \mathbf{r}'\left(\frac{3\pi}{4}\right) \right\| + \|\mathbf{r}'(\pi)\| \right] \\ &= \frac{\pi}{12} \left[3 + (4) \left(\frac{5\sqrt{2}}{2} \right) + (2)(4) + (4) \left(\frac{5\sqrt{2}}{2} \right) + 3 \right] \approx \boxed{11.070}\end{aligned}$$

(b) Using $n = 6$, $\Delta t = \frac{b-a}{n} = \frac{\pi}{6}$. Then the Trapezoidal Rule gives

$$\begin{aligned} \int_0^\pi \|\mathbf{r}'(t)\| dt &\approx \frac{\pi-0}{2 \cdot 6} \left[\|\mathbf{r}'(0)\| + 2 \left\| \mathbf{r}'\left(\frac{\pi}{6}\right) \right\| + 2 \left\| \mathbf{r}'\left(\frac{\pi}{3}\right) \right\| + \dots + 2 \left\| \mathbf{r}'\left(\frac{5\pi}{6}\right) \right\| + \|\mathbf{r}'(\pi)\| \right] \\ &= \frac{\pi}{12} \left[3 + (2) \left(\frac{\sqrt{43}}{2} \right) + (2) \left(\frac{\sqrt{57}}{2} \right) + (2)(4) + (2) \left(\frac{\sqrt{57}}{2} \right) + (2) \left(\frac{\sqrt{43}}{2} \right) + 3 \right] \\ &\approx \boxed{11.052} \end{aligned}$$

(c) Both answers are close to the result given by technology of 11.052. The Trapezoidal Rule with $n = 6$ gives a better estimate than Simpson's Rule with $n = 4$.

75. We begin by finding $\mathbf{r}'(t) = 2 \cos t \mathbf{i} - 8 \sin(2t) \mathbf{j}$ and $\|\mathbf{r}'(t)\| = \sqrt{4 \cos^2 t + 64 \sin^2(2t)} = 2\sqrt{\cos^2 t + 16 \sin^2(2t)}$.

We wish to approximate $\int_0^{2\pi} \|\mathbf{r}'(t)\| dt = \int_0^{2\pi} 2\sqrt{\cos^2 t + 16 \sin^2(2t)} dt$.

(a) Using $n = 4$, $\Delta t = \frac{b-a}{n} = \frac{\pi}{2}$. Then Simpson's Rule gives

$$\begin{aligned} \int_0^{2\pi} \|\mathbf{r}'(t)\| dt &\approx \frac{2\pi-0}{3 \cdot 4} \left[\|\mathbf{r}'(0)\| + 4 \left\| \mathbf{r}'\left(\frac{\pi}{2}\right) \right\| + 2 \|\mathbf{r}'(\pi)\| + 4 \left\| \mathbf{r}'\left(\frac{3\pi}{2}\right) \right\| + \|\mathbf{r}'(2\pi)\| \right] \\ &= \frac{\pi}{6} [2 + (4)(0) + (2)(2) + (4)(0) + 2] = \frac{4\pi}{3} \approx \boxed{4.189} \end{aligned}$$

(b) Using $n = 6$, $\Delta t = \frac{b-a}{n} = \frac{\pi}{6}$. Then the Trapezoidal Rule gives

$$\begin{aligned} \int_0^\pi \|\mathbf{r}'(t)\| dt &\approx \frac{2\pi-0}{2 \cdot 6} \left[\|\mathbf{r}'(0)\| + 2 \left\| \mathbf{r}'\left(\frac{\pi}{3}\right) \right\| + 2 \left\| \mathbf{r}'\left(\frac{2\pi}{3}\right) \right\| + \dots + 2 \left\| \mathbf{r}'\left(\frac{5\pi}{3}\right) \right\| + \|\mathbf{r}'(2\pi)\| \right] \\ &= \frac{\pi}{6} [2 + (2)(7) + (2)(7) + (2)(2) + (2)(7) + (2)(7) + 2] \\ &= \frac{32\pi}{3} \approx \boxed{33.510} \end{aligned}$$

(c) The result from the Trapezoidal Rule with $n = 6$ is close to the result given by technology of 33.637 while Simpson's Rule with $n = 4$ gives a bad approximation. Looking at the graph of $\|\mathbf{r}'(t)\|$, we see that at two of the points used in the Simpson's Rule approximation, $\|\mathbf{r}'(t)\| = 0$, so the parabolic arcs used to approximate $\|\mathbf{r}'(t)\|$ give rise to an underestimate of the integral.

The graph of
 $\|\mathbf{r}'(t)\| = 2\sqrt{\cos^2 t + 16 \sin^2(2t)}$.

76. We begin by finding $\mathbf{r}'(t) = t^2\mathbf{i} + \mathbf{j}$ and $\|\mathbf{r}'(t)\| = \sqrt{t^4 + 1}$. We wish to approximate $s = \int_0^{1/2} \|\mathbf{r}'(t)\| dt = \int_0^{1/2} \sqrt{t^4 + 1} dt$ by expanding the integrand, $\sqrt{t^4 + 1}$, in a binomial series with $x = t^4$ and $m = \frac{1}{2}$, which gives

$$(1 + t^4)^{1/2} = 1 + \frac{1}{2}t^4 - \frac{1}{8}t^8 + \cdots$$

Using the integration property of power series,

$$\begin{aligned} \int_0^{1/2} \sqrt{t^4 + 1} dt &= \int_0^{1/2} \left(1 + \frac{1}{2}t^4 - \frac{1}{8}t^8 + \cdots \right) dx \\ &= \left[t + \frac{1}{2(5)}t^5 - \frac{1}{8(9)}t^9 + \cdots \right]_0^{1/2} \\ &= \frac{1}{2} + \frac{1}{10(2)^5} - \frac{1}{72(2)^9} + \cdots \\ &\approx 0.5 + 0.003125 - 0.0000271 + \cdots \end{aligned}$$

Since this series satisfies the two conditions of the Alternating Series Test, the error due to the first two terms as an approximation is less than the third term, $\frac{1}{72(2)^9} \approx 2.7127 \times 10^{-5}$, so

$$\int_0^{1/2} \sqrt{t^4 + 1} dt \approx \frac{1}{2} + \frac{1}{10(2)^5} \approx \boxed{0.5031}.$$

11.3 Arc Length as Parameter; Curvature

Concepts and Vocabulary

1. d by the Theorem on Criterion for Arc Length as Parameter
2. False. The curvature of a line is 0.
3. False. The curvature of a circle of radius R is $\frac{1}{R}$, the reciprocal of its radius.
4. True. $\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\|$
5. False. $\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$
6. If $y = f(x)$ is a twice differentiable function, $\kappa = \frac{|f''(x)|}{(1 + [f'(x)]^2)^{3/2}}$.
7. Since the equation $x^2 + (y - 2)^2 = 9$ represents a circle of radius 3 with center at $(0, 2)$, the curvature of the circle is the reciprocal of its radius, or $\kappa = \frac{1}{3}$.
8. False. The radius ρ of the osculating circle is $\frac{1}{\kappa}$, provided $\kappa \neq 0$.

Skill Building

9. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = -4 \sin t \mathbf{i} - 4 \cos t \mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{16 \sin^2 t + 16 \cos^2 t} = 4 \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| \neq 1$ for all t , no, the parameter t does not measure arc length along C .

10. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 3 \cos(3t) \mathbf{i} - 3 \sin(3t) \mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{9 \cos^2(3t) + 9 \sin^2(3t)} = 3 \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| \neq 1$ for all t , no, the parameter t does not measure arc length along C .

11. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2t \mathbf{i} + \mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{4t^2 + 1} \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| \neq 1$ for all t , no, the parameter t does not measure arc length along C .

12. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{i} + 3t^2 \mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{1 + 9t^4} \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| \neq 1$ for all t , no, the parameter t does not measure arc length along C .

13. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2\mathbf{i} + 3\mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{4 + 9} = \sqrt{13} \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| \neq 1$ for all t , no, the parameter t does not measure arc length along C .

14. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{1} = 1 \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| = 1$ for all t , yes, the parameter t is arc length as measured along C .

15. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \frac{2}{\sqrt{13}}\mathbf{i} + \frac{3}{\sqrt{13}}\mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{\frac{4}{13} + \frac{9}{13}} = 1 \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| = 1$ for all t , yes, the parameter t is arc length as measured along C .

16. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = 2t\mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{4t^2} = 2t \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| \neq 1$ for all t , no, the parameter t does not measure arc length along C .

17. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = \cos t \mathbf{i} - \sin t \mathbf{j} + \mathbf{k} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{\cos^2 t + \sin^2 t + 1} = \sqrt{2} \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| \neq 1$ for all t , no, the parameter t does not measure arc length along C .

18. We begin by finding $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$.

$$\mathbf{r}'(t) = a \cos t \mathbf{i} - a \sin t \mathbf{j} + \sqrt{1 - a^2} \mathbf{k} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{a^2 \cos^2 t + a^2 \sin^2 t + 1 - a^2} = 1 \quad \text{for all } t.$$

Since $\|\mathbf{r}'(t)\| = 1$ for all t , yes, the parameter t is arc length as measured along C .

19. Curvature is a measure of how sharply a curve bends. The curve bends the most sharply at P and the least sharply at Q , so the rank is $P R Q$.

20. Curvature is a measure of how sharply a curve bends. The curve bends the most sharply at Q and the least sharply at R , so the rank is $Q P R$.

21. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, and $\|\mathbf{T}'(t)\|$.

$$\begin{aligned} \mathbf{r}'(t) &= 2t\mathbf{i} - \frac{2}{t^2}\mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{4t^2 + \frac{4}{t^4}} = 2\sqrt{\frac{t^6 + 1}{t^4}} = \frac{2\sqrt{t^6 + 1}}{t^2} \\ \mathbf{T}(t) &= \frac{2t\mathbf{i} - \frac{2}{t^2}\mathbf{j}}{\frac{2\sqrt{t^6+1}}{t^2}} = \frac{t^3}{\sqrt{t^6 + 1}}\mathbf{i} - \frac{1}{\sqrt{t^6 + 1}}\mathbf{j} \\ \mathbf{T}'(t) &= \frac{3t^2\sqrt{t^6 + 1} - t^3(\frac{1}{2})(t^6 + 1)^{-1/2}(6t^5)}{t^6 + 1}\mathbf{i} + \frac{6t^5}{2(t^6 + 1)^{3/2}}\mathbf{j} \end{aligned}$$

We simplify $\mathbf{T}(t)$ by multiplying the numerator and the denominator of the $\mathbf{i}$ -component by $\sqrt{t^6 + 1}$ to get

$$\begin{aligned} \mathbf{T}'(t) &= \frac{3t^2(t^6 + 1) - 3t^8}{(t^6 + 1)^{3/2}}\mathbf{i} + \frac{3t^5}{(t^6 + 1)^{3/2}}\mathbf{j} = \frac{3t^8 + 3t^2 - 3t^8}{(t^6 + 1)^{3/2}}\mathbf{i} + \frac{3t^5}{(t^6 + 1)^{3/2}}\mathbf{j} \\ &= \frac{3t^2}{(t^6 + 1)^{3/2}}\mathbf{i} + \frac{3t^5}{(t^6 + 1)^{3/2}}\mathbf{j}, \end{aligned}$$

so

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{9t^4}{(t^6 + 1)^3} + \frac{9t^{10}}{(t^6 + 1)^3}} = 3t^2 \sqrt{\frac{1 + t^6}{(t^6 + 1)^3}} = \frac{3t^2}{t^6 + 1}.$$

Then

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\frac{3t^2}{t^6+1}}{\frac{2\sqrt{t^6+1}}{t^2}} = \frac{3t^4}{2(t^6 + 1)^{3/2}}.$$

22. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, and $\|\mathbf{T}'(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= 2\mathbf{i} + 3t^2\mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{4 + 9t^4} \\ \mathbf{T}(t) &= \frac{2\mathbf{i} + 3t^2\mathbf{j}}{\sqrt{4 + 9t^4}} \\ \mathbf{T}'(t) &= \frac{-36t^3}{(4 + 9t^4)^{3/2}}\mathbf{i} + \frac{6t\sqrt{4 + 9t^4} - 3t^2(\frac{1}{2})(4 + 9t^4)^{-1/2}(36t^3)}{(4 + 9t^4)^{3/2}}\mathbf{j}\end{aligned}$$

We simplify $\mathbf{T}(t)$ by multiplying the numerator and the denominator of the $\mathbf{j}$ -component by $\sqrt{4 + 9t^4}$ to get

$$\mathbf{T}(t) = \frac{-36t^3}{(4 + 9t^4)^{3/2}}\mathbf{i} + \frac{6t(4 + 9t^4) - 54t^5}{(4 + 9t^4)^{3/2}}\mathbf{j} = \frac{-36t^3}{(4 + 9t^4)^{3/2}}\mathbf{i} + \frac{24t}{(4 + 9t^4)^{3/2}}\mathbf{j},$$

so

$$\|\mathbf{T}'(t)\| = \sqrt{\frac{(-36t^3)^2}{(4 + 9t^4)^3} + \frac{(24t)^2}{(4 + 9t^4)^3}} = \sqrt{\frac{(12t)^2[(-3t^2)^2 + 2^2]}{(4 + 9t^4)^3}} = 12t\sqrt{\frac{9t^4 + 4}{(4 + 9t^4)^3}} = \frac{12t}{4 + 9t^4}.$$

Then

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\frac{12t}{4 + 9t^4}}{\sqrt{4 + 9t^4}} = \boxed{\frac{12t}{(4 + 9t^4)^{3/2}}}.$$

23. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, and $\|\mathbf{T}'(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= 2\cos t\mathbf{i} - 2\sin t\mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{4\cos^2 t + 4\sin^2 t} = 2 \\ \mathbf{T}(t) &= \cos t\mathbf{i} - \sin t\mathbf{j} \\ \mathbf{T}'(t) &= -\sin t\mathbf{i} - \cos t\mathbf{j} \\ \|\mathbf{T}'(t)\| &= \sqrt{\sin^2 t + \cos^2 t} = 1\end{aligned}$$

Then

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \boxed{\frac{1}{2}}.$$

24. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, and $\|\mathbf{T}'(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= -\sin t\mathbf{i} + 2\cos t\mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{\sin^2 t + 4\cos^2 t} = \sqrt{\sin^2 t + \cos^2 t + 3\cos^2 t} = \sqrt{1 + 3\cos^2 t} \\ \mathbf{T}(t) &= \frac{-\sin t\mathbf{i} + 2\cos t\mathbf{j}}{\sqrt{1 + 3\cos^2 t}}\end{aligned}$$

We differentiate the components of $\mathbf{T}(t)$ individually. For the $\mathbf{i}$ -component,

$$\frac{d}{dt} \frac{-\sin t}{\sqrt{1 + 3\cos^2 t}} = \frac{-\cos t\sqrt{1 + 3\cos^2 t} + \sin t(\frac{1}{2})(1 + 3\cos^2 t)^{-1/2}(-6\cos t\sin t)}{1 + 3\cos^2 t}.$$

We multiply the numerator and denominator by $\sqrt{1 + 3 \cos^2 t}$ to get

$$\begin{aligned} \frac{d}{dt} \frac{-\sin t}{\sqrt{1 + 3 \cos^2 t}} &= \frac{-\cos t(1 + 3 \cos^2 t) - 3 \sin^2 t \cos t}{(1 + 3 \cos^2 t)^{3/2}} \\ &= \frac{-\cos t - 3 \cos^3 t - 3 \sin^2 t \cos t}{(1 + 3 \cos^2 t)^{3/2}} = \frac{-\cos t - 3 \cos t(\cos^2 t + \sin^2 t)}{(1 + 3 \cos^2 t)^{3/2}} \\ &= \frac{-4 \cos t}{(1 + 3 \cos^2 t)^{3/2}}. \end{aligned}$$

Similarly, for the $\mathbf{j}$ -component,

$$\frac{d}{dt} \frac{2 \cos t}{\sqrt{1 + 3 \cos^2 t}} = \frac{-2 \sin t \sqrt{1 + 3 \cos^2 t} - 2 \cos t(\frac{1}{2})(1 + 3 \cos^2 t)^{-1/2}(-6 \cos t \sin t)}{1 + 3 \cos^2 t}.$$

We multiply the numerator and denominator by $\sqrt{1 + 3 \cos^2 t}$ to get

$$\begin{aligned} \frac{d}{dt} \frac{2 \cos t}{\sqrt{1 + 3 \cos^2 t}} &= \frac{-2 \sin t(1 + 3 \cos^2 t) + 6 \cos^2 t \sin t}{(1 + 3 \cos^2 t)^{3/2}} \\ &= \frac{-2 \sin t - 6 \sin t \cos^2 t + 6 \cos^2 t \sin t}{(1 + 3 \cos^2 t)^{3/2}} = \frac{-2 \sin t}{(1 + 3 \cos^2 t)^{3/2}}, \end{aligned}$$

so combining the components, we have

$$\mathbf{T}'(t) = -\frac{4 \cos t}{(1 + 3 \cos^2 t)^{3/2}} \mathbf{i} - \frac{2 \sin t}{(1 + 3 \cos^2 t)^{3/2}} \mathbf{j}.$$

$$\begin{aligned} \|\mathbf{T}'(t)\| &= \sqrt{\frac{16 \cos^2 t + 4 \sin^2 t}{(1 + 3 \cos^2 t)^3}} = 2 \sqrt{\frac{3 \cos^2 t + \cos^2 t + \sin^2 t}{(1 + 3 \cos^2 t)^3}} \\ &= 2 \sqrt{\frac{3 \cos^2 t + 1}{(1 + 3 \cos^2 t)^3}} = \frac{2}{1 + 3 \cos^2 t}. \end{aligned}$$

Then

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\frac{2}{1 + 3 \cos^2 t}}{\sqrt{1 + 3 \cos^2 t}} = \boxed{\frac{2}{(1 + 3 \cos^2 t)^{3/2}}}.$$

25. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, and $\|\mathbf{T}'(t)\|$.

$$\begin{aligned} \mathbf{r}'(t) &= (3 - 3t^2)\mathbf{i} + 6t\mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{9 - 18t^2 + 9t^4 + 36t^2} = \sqrt{9 + 18t^2 + 9t^4} = \sqrt{9(1 + t^2)^2} = 3(1 + t^2) \\ \mathbf{T}(t) &= \frac{(3 - 3t^2)\mathbf{i} + 6t\mathbf{j}}{3(1 + t^2)} = \frac{(1 - t^2)\mathbf{i} + 2t\mathbf{j}}{1 + t^2} \\ \mathbf{T}'(t) &= \frac{-2t(1 + t^2) - (1 - t^2)2t}{(1 + t^2)^2} \mathbf{i} + \frac{2(1 + t^2) - 2t(2t)}{(1 + t^2)^2} \mathbf{j} \\ &= \frac{-2t - 2t^3 - 2t + 2t^3}{(1 + t^2)^2} \mathbf{i} + \frac{2 + 2t^2 - 4t^2}{(1 + t^2)^2} \mathbf{j} = \frac{-4t}{(1 + t^2)^2} \mathbf{i} + \frac{2 - 2t^2}{(1 + t^2)^2} \mathbf{j} \\ \|\mathbf{T}'(t)\| &= \sqrt{\frac{16t^2 + 4 - 8t^2 + 4t^4}{(1 + t^2)^4}} = \sqrt{\frac{4t^4 + 8t^2 + 4}{(1 + t^2)^4}} = 2 \sqrt{\frac{(t^2 + 1)^2}{(1 + t^2)^4}} = \frac{2}{1 + t^2} \end{aligned}$$

Then

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\frac{2}{1 + t^2}}{3(1 + t^2)} = \boxed{\frac{2}{3(1 + t^2)^2}}.$$

26. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, and $\|\mathbf{T}'(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= (3 - 3t^2)\mathbf{i} + (3 + 3t^2)\mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{9 - 18t^2 + 9t^4 + 9 + 18t^2 + 9t^4} = \sqrt{18 + 18t^4} = 3\sqrt{2 + 2t^4} \\ \mathbf{T}(t) &= \frac{(3 - 3t^2)\mathbf{i} + (3 + 3t^2)\mathbf{j}}{3\sqrt{2 + 2t^4}} = \frac{(1 - t^2)\mathbf{i} + (1 + t^2)\mathbf{j}}{\sqrt{2 + 2t^4}}\end{aligned}$$

We differentiate the components of $\mathbf{T}(t)$ individually. For the $\mathbf{i}$ -component,

$$\frac{d}{dt} \left[\frac{(1 - t^2)\mathbf{i}}{\sqrt{2 + 2t^4}} \right] = \frac{-2t\sqrt{2 + 2t^4} - (1 - t^2)(\frac{1}{2})(2 + 2t^4)^{-1/2}(8t^3)}{2 + 2t^4}$$

We multiply the numerator and denominator by $\sqrt{2 + 2t^4}$ to get

$$\frac{d}{dt} \left[\frac{(1 - t^2)\mathbf{i}}{\sqrt{2 + 2t^4}} \right] = \frac{-2t(2 + 2t^4) - (1 - t^2)4t^3}{(2 + 2t^4)^{3/2}} = \frac{-4t - 4t^5 - 4t^3 + 4t^5}{(2 + 2t^4)^{3/2}} = \frac{-4t(1 + t^2)}{(2 + 2t^4)^{3/2}}.$$

Similarly, for the $\mathbf{j}$ -component,

$$\frac{d}{dt} \left[\frac{(1 + t^2)\mathbf{j}}{\sqrt{2 + 2t^4}} \right] = \frac{2t\sqrt{2 + 2t^4} - (1 + t^2)(\frac{1}{2})(2 + 2t^4)^{-1/2}(8t^3)}{2 + 2t^4}$$

We multiply the numerator and denominator by $\sqrt{2 + 2t^4}$ to get

$$\frac{d}{dt} \left[\frac{(1 + t^2)\mathbf{j}}{\sqrt{2 + 2t^4}} \right] = \frac{2t(2 + 2t^4) - (1 + t^2)4t^3}{(2 + 2t^4)^{3/2}} = \frac{4t + 4t^5 - 4t^3 - 4t^5}{(2 + 2t^4)^{3/2}} = \frac{4t(1 - t^2)}{(2 + 2t^4)^{3/2}},$$

so combining terms gives us

$$\mathbf{T}'(t) = \frac{-4t(1 + t^2)}{(2 + 2t^4)^{3/2}}\mathbf{i} + \frac{4t(1 - t^2)}{(2 + 2t^4)^{3/2}}\mathbf{j}.$$

$$\begin{aligned}\|\mathbf{T}'(t)\| &= \sqrt{\frac{16t^2(1 + t^2)^2 + 16t^2(1 - t^2)^2}{(2 + 2t^4)^3}} = 4t\sqrt{\frac{1 + 2t^2 + t^4 + 1 - 2t^2 + t^4}{(2 + 2t^4)^3}} \\ &= 4t\sqrt{\frac{2 + 2t^4}{(2 + 2t^4)^3}} = \frac{4t}{2 + 2t^4} = \frac{2t}{1 + t^4}\end{aligned}$$

Then since $\|\mathbf{r}'(t)\| = 3\sqrt{2 + 2t^4} = 3(\sqrt{2})\sqrt{1 + t^4}$,

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\frac{2t}{1 + t^4}}{3(\sqrt{2})\sqrt{1 + t^4}} = \frac{2t}{3\sqrt{2}(1 + t^4)^{3/2}} = \boxed{\frac{\sqrt{2}t}{3(1 + t^4)^{3/2}}}.$$

27. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= \mathbf{i} + 2\mathbf{j} + \mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{1 + 4 + 1} = \sqrt{6} \\ \mathbf{r}''(t) &= \mathbf{0}\end{aligned}$$

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \mathbf{r}'(t) \times \mathbf{0} = \mathbf{0}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \boxed{0}$$

as we would expect for a line.

28. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= 2\mathbf{i} + \mathbf{j} + 3\mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{4 + 1 + 9} = \sqrt{14} \\ \mathbf{r}''(t) &= \mathbf{0}\end{aligned}$$

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \mathbf{r}'(t) \times \mathbf{0} = \mathbf{0}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \boxed{0}$$

as we would expect for a line.

29. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= 2\cos(2t)\mathbf{i} - 2\sin(2t)\mathbf{j} + \mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{4\cos^2(2t) + 4\sin^2(2t) + 1} = \sqrt{5} \\ \mathbf{r}''(t) &= -4\sin(2t)\mathbf{i} - 4\cos(2t)\mathbf{j}\end{aligned}$$

$$\begin{aligned}\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2\cos(2t) & -2\sin(2t) & 1 \\ -4\sin(2t) & -4\cos(2t) & 0 \end{vmatrix} \\ &= 4\cos(2t)\mathbf{i} - 4\sin(2t)\mathbf{j} + [-8\cos^2(2t) - 8\sin^2(2t)]\mathbf{k} \\ &= 4\cos(2t)\mathbf{i} - 4\sin(2t)\mathbf{j} - 8\mathbf{k} \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{16\cos^2(2t) + 16\sin^2(2t) + 64} = \sqrt{80} = 4\sqrt{5}\end{aligned}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{4\sqrt{5}}{(\sqrt{5})^3} = \boxed{\frac{4}{5}}.$$

30. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= \cos t\mathbf{i} - \sin t\mathbf{j} + b\mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{\cos^2 t + \sin^2 t + b^2} = \sqrt{1 + b^2} \\ \mathbf{r}''(t) &= -\sin t\mathbf{i} - \cos t\mathbf{j}\end{aligned}$$

$$\begin{aligned}\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos t & -\sin t & b \\ -\sin t & -\cos t & 0 \end{vmatrix} = b\cos t\mathbf{i} - b\sin t\mathbf{j} + (-\cos^2 t - \sin^2 t)\mathbf{k} \\ &= b\cos t\mathbf{i} - b\sin t\mathbf{j} - \mathbf{k} \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{b^2\cos^2 t + b^2\sin^2 t + 1} = \sqrt{b^2 + 1}\end{aligned}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\sqrt{b^2 + 1}}{(\sqrt{1 + b^2})^3} = \boxed{\frac{1}{b^2 + 1}}.$$

31. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= e^t\mathbf{i} - e^{-t}\mathbf{j} + \sqrt{2}\mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{e^{2t} + 2 + e^{-2t}} = \sqrt{(e^t + e^{-t})^2} = e^t + e^{-t} \\ \mathbf{r}''(t) &= e^t\mathbf{i} + e^{-t}\mathbf{j}\end{aligned}$$

$$\begin{aligned}\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ e^t & -e^{-t} & \sqrt{2} \\ e^t & e^{-t} & 0 \end{vmatrix} = -\sqrt{2}e^{-t}\mathbf{i} + \sqrt{2}e^t\mathbf{j} + 2\mathbf{k} \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{2e^{-2t} + 2e^{2t} + 4} = \sqrt{2(e^t + e^{-t})^2} = \sqrt{2}(e^t + e^{-t})\end{aligned}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\sqrt{2}(e^t + e^{-t})}{(e^t + e^{-t})^3} = \frac{\sqrt{2}}{(e^t + e^{-t})^2} = \boxed{\frac{\sqrt{2}e^{2t}}{(e^{2t} + 1)^2}}.$$

32. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= e^t\mathbf{i} + 2e^{2t}\mathbf{j} - e^{-t}\mathbf{k} \\ \|\mathbf{r}'(t)\| &= \sqrt{e^{2t} + 4e^{4t} + e^{-2t}} = \sqrt{\frac{4e^{6t} + e^{4t} + 1}{e^{2t}}} = \frac{\sqrt{4e^{6t} + e^{4t} + 1}}{e^t} \\ \mathbf{r}''(t) &= e^t\mathbf{i} + 4e^{2t}\mathbf{j} + e^{-t}\mathbf{k} \\ \mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ e^t & 2e^{2t} & -e^{-t} \\ e^t & 4e^{2t} & e^{-t} \end{vmatrix} = (2e^t + 4e^t)\mathbf{i} - (1 + 1)\mathbf{j} + (4e^{3t} - 2e^{3t})\mathbf{k} \\ &= 6e^t\mathbf{i} - 2\mathbf{j} + 2e^{3t}\mathbf{k} \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{36e^{2t} + 4 + 4e^{6t}} = 2\sqrt{e^{6t} + 9e^{2t} + 1}\end{aligned}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{2\sqrt{e^{6t} + 9e^{2t} + 1}}{\left(\frac{\sqrt{4e^{6t} + e^{4t} + 1}}{e^t}\right)^3} = \boxed{\frac{2e^{3t}\sqrt{e^{6t} + 9e^{2t} + 1}}{(4e^{6t} + e^{4t} + 1)^{3/2}}}.$$

33. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= -3\cos^2 t \sin t \mathbf{i} + 3\sin^2 t \cos t \mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{9\cos^4 t \sin^2 t + 9\sin^4 t \cos^2 t} = \sqrt{9\sin^2 t \cos^2 t (\cos^2 t + \sin^2 t)} = 3\sin t \cos t \\ \mathbf{r}''(t) &= (6\cos t \sin^2 t - 3\cos^3 t)\mathbf{i} + (6\sin t \cos^2 t - 3\sin^3 t)\mathbf{j} \\ \mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -3\cos^2 t \sin t & 3\sin^2 t \cos t & 0 \\ 6\cos t \sin^2 t - 3\cos^3 t & 6\sin t \cos^2 t - 3\sin^3 t & 0 \end{vmatrix} \\ &= (-18\sin^2 t \cos^4 t + 9\sin^4 t \cos^2 t - 18\sin^4 t \cos^2 t + 9\sin^2 t \cos^4 t)\mathbf{k} \\ &= (-9\sin^2 t \cos^4 t - 9\sin^4 t \cos^2 t)\mathbf{k} \\ &= -9\sin^2 t \cos^2 t (\cos^2 t + \sin^2 t)\mathbf{k} = -9\sin^2 t \cos^2 t \mathbf{k} \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{(-9\sin^2 t \cos^2 t)^2} = 9\sin^2 t \cos^2 t\end{aligned}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{9\sin^2 t \cos^2 t}{(3\sin t \cos t)^3} = \boxed{\frac{1}{|3\sin t \cos t|}}.$$

34. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= -12 \cos^2 t \sin t \mathbf{i} + 12 \sin^2 t \cos t \mathbf{k} \\ \|\mathbf{r}'(t)\| &= \sqrt{144 \cos^4 t \sin^2 t + 144 \sin^4 t \cos^2 t} = \sqrt{144 \cos^2 t \sin^2 t (\cos^2 t + \sin^2 t)} = 12 \sin t \cos t \\ \mathbf{r}''(t) &= (24 \cos t \sin^2 t - 12 \cos^3 t) \mathbf{i} + (24 \sin t \cos^2 t - 12 \sin^3 t) \mathbf{k} \\ \mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -12 \cos^2 t \sin t & 0 & 12 \sin^2 t \cos t \\ 24 \cos t \sin^2 t - 12 \cos^3 t & 0 & 24 \sin t \cos^2 t - 12 \sin^3 t \end{vmatrix} \\ &= 288 \sin^4 t \cos^2 t - 144 \sin^2 t \cos^4 t - (-288 \sin^2 t \cos^4 t + 144 \sin^4 t \cos^2 t) \\ &= 144 \sin^4 t \cos^2 t + 144 \sin^2 t \cos^4 t = 144 \sin^2 t \cos^2 t (\sin^2 t + \cos^2 t) \\ &= 144 \sin^2 t \cos^2 t \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{(144 \sin^2 t \cos^2 t)^2} = 144 \sin^2 t \cos^2 t\end{aligned}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{144 \sin^2 t \cos^2 t}{(12 \sin t \cos t)^3} = \boxed{\frac{1}{|12 \sin t \cos t|}}.$$

35. To find the curvature of $f(x)$ at $(1, 1)$, we need to find $f'(x)$, $f'(1)$, $f''(x)$, $f''(1)$, and $|f''(1)|$.

$$\begin{aligned}f'(x) &= 2x & f'(1) &= 2 \\ f''(x) &= 2 & f''(1) &= 2 & |f''(1)| &= 2 \\ \kappa &= \frac{|f''(1)|}{(1 + [f'(1)]^2)^{3/2}} = \frac{2}{(1 + 2^2)^{3/2}} = \frac{2}{5\sqrt{5}} = \boxed{\frac{2\sqrt{5}}{25}}.\end{aligned}$$

36. To find the curvature of $f(x)$ at $(1, 1)$, we need to find $f'(x)$, $f'(1)$, $f''(x)$, $f''(1)$, and $|f''(1)|$.

$$\begin{aligned}f'(x) &= 2 - 2x & f'(1) &= 0 \\ f''(x) &= -2 & f''(1) &= -2 & |f''(1)| &= 2 \\ \kappa &= \frac{|f''(1)|}{(1 + [f'(1)]^2)^{3/2}} = \frac{2}{(1 + 0^2)^{3/2}} = \boxed{2}.\end{aligned}$$

37. To find the curvature of $f(x)$ at $(1, 0)$, we need to find $f'(x)$, $f'(1)$, $f''(x)$, $f''(1)$, and $|f''(1)|$.

$$\begin{aligned}f'(x) &= 2x - 3x^2 & f'(1) &= -1 \\ f''(x) &= 2 - 6x & f''(1) &= -4 & |f''(1)| &= 4 \\ \kappa &= \frac{|f''(1)|}{(1 + [f'(1)]^2)^{3/2}} = \frac{4}{(1 + [-1]^2)^{3/2}} = \frac{4}{2\sqrt{2}} = \boxed{\sqrt{2}}.\end{aligned}$$

38. To find the curvature of $f(x)$ at $(1, 1)$, we need to find $f'(x)$, $f'(1)$, $f''(x)$, $f''(1)$, and $|f''(1)|$.

$$\begin{aligned}f'(x) &= -\frac{3}{2}x^{-5/2} & f'(1) &= -\frac{3}{2} \\ f''(x) &= \frac{15}{4}x^{-7/2} & f''(1) &= \frac{15}{4} & |f''(1)| &= \frac{15}{4} \\ \kappa &= \frac{|f''(1)|}{(1 + [f'(1)]^2)^{3/2}} = \frac{\frac{15}{4}}{\left(1 + \left[-\frac{3}{2}\right]^2\right)^{3/2}} = \frac{\frac{15}{4}}{\left(\frac{4+9}{4}\right)^{3/2}} = \frac{15}{4} \cdot \frac{8}{13\sqrt{13}} = \frac{30}{13\sqrt{13}} = \boxed{\frac{30\sqrt{13}}{169}}.\end{aligned}$$

39. To find the curvature of $f(x)$ at $(2, \sqrt{2})$, we need to find $f'(x)$, $f'(2)$, $f''(x)$, $f''(2)$, and $|f''(2)|$.

$$f'(x) = \frac{1}{2}x^{-1/2} \quad f'(2) = \frac{1}{2\sqrt{2}} = \frac{\sqrt{2}}{4}$$

$$f''(x) = -\frac{1}{4}x^{-3/2} \quad f''(2) = -\frac{1}{8\sqrt{2}} = -\frac{\sqrt{2}}{16} \quad |f''(2)| = \frac{\sqrt{2}}{16}$$

$$\kappa = \frac{|f''(2)|}{(1 + [f'(2)]^2)^{3/2}} = \frac{\frac{\sqrt{2}}{16}}{\left(1 + \left(\frac{\sqrt{2}}{4}\right)^2\right)^{3/2}} = \frac{\frac{\sqrt{2}}{16}}{\left[\frac{9}{8}\right]^{3/2}} = \frac{\sqrt{2}}{16} \cdot \frac{8\sqrt{8}}{27} = \boxed{\frac{2}{27}}.$$

40. To find the curvature of $f(x)$ at $(1, 1)$, we need to find $f'(x)$, $f'(1)$, $f''(x)$, $f''(1)$, and $|f''(1)|$.

$$f'(x) = -\frac{1}{2}x^{-3/2} \quad f'(1) = -\frac{1}{2}$$

$$f''(x) = \frac{3}{4}x^{-5/2} \quad f''(1) = \frac{3}{4} \quad |f''(1)| = \frac{3}{4}$$

$$\kappa = \frac{|f''(1)|}{(1 + [f'(1)]^2)^{3/2}} = \frac{\frac{3}{4}}{\left(1 + \left[-\frac{1}{2}\right]^2\right)^{3/2}} = \frac{\frac{3}{4}}{\left(\frac{5}{4}\right)^{3/2}} = \frac{6}{5\sqrt{5}} = \boxed{\frac{6\sqrt{5}}{25}}.$$

41. To find the curvature of $f(x)$ at $(0, 2)$, we need to find $f'(x)$, $f'(0)$, $f''(x)$, $f''(0)$, and $|f''(0)|$. We use implicit differentiation.

$$\frac{d}{dx}(4x^2 + 9y^2) = \frac{d}{dx}(36)$$

$$8x + 18y \frac{dy}{dx} = 0$$

$$\frac{dy}{dx} = -\frac{8x}{18y} = -\frac{4x}{9y}$$

At $(0, 2)$, $\frac{dy}{dx} = -\frac{(4)(0)}{(9)(2)} = 0$. To get $f''(x)$, we use implicit differentiation again.

$$\frac{d}{dx}\left(8x + 18y \frac{dy}{dx}\right) = \frac{d}{dx}(0)$$

$$8 + 18\left(\frac{dy}{dx}\right)^2 + 18y \frac{d^2y}{dx^2} = 0$$

$$\frac{d^2y}{dx^2} = -\frac{4 + 9\left(\frac{dy}{dx}\right)^2}{9y}$$

At $(0, 2)$, $\frac{d^2y}{dx^2} = -\frac{4+9(0^2)}{9(2)} = -\frac{2}{9}$, so $|f''(0)| = \frac{2}{9}$. Then

$$\kappa = \frac{|f''(0)|}{(1 + [f'(0)]^2)^{3/2}} = \frac{\frac{2}{9}}{(1 + [0]^2)^{3/2}} = \boxed{\frac{2}{9}}.$$

42. To find the curvature of $f(x)$ at $(\frac{\pi}{4}, \sqrt{2} - 1)$, we need to find $f'(x)$, $f'(\frac{\pi}{4})$, $f''(x)$, $f''(\frac{\pi}{4})$, and $|f''(\frac{\pi}{4})|$.

$$f'(x) = \sec x \tan x \quad f'\left(\frac{\pi}{4}\right) = \sqrt{2}$$

$$f''(x) = \sec x \tan^2 x + \sec^3 x \quad f''\left(\frac{\pi}{4}\right) = \sqrt{2} + 2\sqrt{2} = 3\sqrt{2} \quad \left|f''\left(\frac{\pi}{4}\right)\right| = 3\sqrt{2}$$

$$\kappa = \frac{|f''(\frac{\pi}{4})|}{(1 + [f'(\frac{\pi}{4})]^2)^{3/2}} = \frac{3\sqrt{2}}{(1 + [\sqrt{2}]^2)^{3/2}} = \boxed{\frac{\sqrt{6}}{3}}.$$

43. To find the curvature of $f(x)$ at $(0, 1)$, we need to find $f'(x)$, $f'(0)$, $f''(x)$, $f''(0)$, and $|f''(0)|$.

$$f'(x) = e^x \quad f'(0) = 1$$

$$f''(x) = e^x \quad f''(0) = 1 \quad |f''(0)| = 1$$

$$\kappa = \frac{|f''(0)|}{(1 + [f'(0)]^2)^{3/2}} = \frac{1}{(1 + 1^2)^{3/2}} = \frac{1}{2\sqrt{2}} = \boxed{\frac{\sqrt{2}}{4}}.$$

44. To find the curvature of $f(x)$ at $(2, \ln 3)$, we need to find $f'(x)$, $f'(2)$, $f''(x)$, $f''(2)$, and $|f''(2)|$.

$$f'(x) = \frac{1}{x+1} \quad f'(2) = \frac{1}{3}$$

$$f''(x) = -\frac{1}{(x+1)^2} \quad f''(2) = -\frac{1}{9} \quad |f''(2)| = \frac{1}{9}$$

$$\kappa = \frac{|f''(2)|}{(1 + [f'(2)]^2)^{3/2}} = \frac{\frac{1}{9}}{\left(1 + \left[\frac{1}{3}\right]^2\right)^{3/2}} = \frac{\frac{1}{9}}{\left(\frac{10}{9}\right)^{3/2}} = \boxed{\frac{3\sqrt{10}}{100}}.$$

45. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $f'(x)$, $f'(1)$, $f''(x)$, $f''(1)$, and $|f''(1)|$.

$$f'(x) = 3x^2 - 6 \quad f'(1) = -3$$

$$f''(x) = 6x \quad f''(1) = 6 \quad |f''(1)| = 6$$

$$\kappa = \frac{|f''(1)|}{(1 + [f'(1)]^2)^{3/2}} = \frac{6}{(1 + [-3]^2)^{3/2}} = \frac{6}{10\sqrt{10}} = \frac{3}{5\sqrt{10}}.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \boxed{\frac{5\sqrt{10}}{3}}.$$

46. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $f'(x)$, $f'(-1)$, $f''(x)$, $f''(-1)$, and $|f''(-1)|$.

$$f'(x) = -\frac{2}{x^3} \quad f'(-1) = -2$$

$$f''(x) = \frac{6}{x^4} \quad f''(-1) = 6 \quad |f''(-1)| = 6$$

$$\kappa = \frac{|f''(-1)|}{(1 + [f'(-1)]^2)^{3/2}} = \frac{6}{(1 + [-2]^2)^{3/2}} = \frac{6}{5\sqrt{5}}.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \boxed{\frac{5\sqrt{5}}{6}}.$$

47. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $f'(x)$, $f'(\frac{\pi}{2})$, $f''(x)$, $f''(\frac{\pi}{2})$, and $|f''(\frac{\pi}{2})|$.

$$\begin{aligned} f'(x) &= \cos x & f'\left(\frac{\pi}{2}\right) &= 0 \\ f''(x) &= -\sin x & f''\left(\frac{\pi}{2}\right) &= -1 & \left|f''\left(\frac{\pi}{2}\right)\right| &= 1 \end{aligned}$$

$$\kappa = \frac{|f''(\frac{\pi}{2})|}{(1 + [f'(\frac{\pi}{2})]^2)^{3/2}} = \frac{1}{(1 + [0]^2)^{3/2}} = 1.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \boxed{1}.$$

48. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $f'(x)$, $f'(0)$, $f''(x)$, $f''(0)$, and $|f''(0)|$.

$$\begin{aligned} f'(x) &= -e^{-x} & f'(0) &= -1 \\ f''(x) &= e^{-x} & f''(0) &= 1 & |f''(0)| &= 1 \end{aligned}$$

$$\kappa = \frac{|f''(0)|}{(1 + [f'(0)]^2)^{3/2}} = \frac{1}{(1 + [-1]^2)^{3/2}} = \frac{1}{2\sqrt{2}}.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \boxed{2\sqrt{2}}.$$

49. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $f'(x)$, $f'(1)$, $f''(x)$, $f''(1)$, and $|f''(1)|$. We use implicit differentiation.

$$\begin{aligned} \frac{d}{dx}(x^2 + xy + y^2) &= \frac{d}{dx}(3) \\ 2x + y + x\frac{dy}{dx} + 2y\frac{dy}{dx} &= 0 \\ \frac{dy}{dx}(x + 2y) &= -2x - y \\ \frac{dy}{dx} &= \frac{-2x - y}{x + 2y} \end{aligned}$$

At $(1, 1)$, $\frac{dy}{dx} = \frac{(-2)(1)-1}{1+2(1)} = -1$. To get $f''(x)$, we use implicit differentiation again.

$$\begin{aligned} \frac{d}{dx}\left(2x + y + x\frac{dy}{dx} + 2y\frac{dy}{dx}\right) &= \frac{d}{dx}(0) \\ 2 + \frac{dy}{dx} + \frac{dy}{dx} + x\frac{d^2y}{dx^2} + 2\left(\frac{dy}{dx}\right)^2 + 2y\frac{d^2y}{dx^2} &= 0 \end{aligned}$$

$$\frac{d^2y}{dx^2}(x+2y) = -2 - 2\frac{dy}{dx} - 2\left(\frac{dy}{dx}\right)^2$$

$$\frac{d^2y}{dx^2} = \frac{-2 - 2\frac{dy}{dx} - 2\left(\frac{dy}{dx}\right)^2}{x+2y}$$

At $(1, 1)$, $\frac{d^2y}{dx^2} = \frac{-2-2(-1)-2(-1)^2}{1+2(1)} = -\frac{2}{3}$, so $|f''(1)| = \frac{2}{3}$. Then

$$\kappa = \frac{|f''(1)|}{(1 + [f'(1)]^2)^{3/2}} = \frac{\frac{2}{3}}{(1 + [-1]^2)^{3/2}} = \frac{\frac{2}{3}}{2\sqrt{2}} = \frac{2}{6\sqrt{2}} = \frac{1}{3\sqrt{2}}.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \boxed{3\sqrt{2}}.$$

50. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $f'(x)$, $f'(0)$, $f''(x)$, $f''(0)$, and $|f''(0)|$. We use implicit differentiation.

$$\frac{d}{dx}(y^2 - y + x) = \frac{d}{dx}(0)$$

$$2y\frac{dy}{dx} - \frac{dy}{dx} + 1 = 0$$

$$(2y - 1)\frac{dy}{dx} = -1$$

$$\frac{dy}{dx} = -\frac{1}{2y - 1}$$

At $(0, 0)$, $\frac{dy}{dx} = 1$. To get $f''(x)$, we use implicit differentiation again.

$$\frac{d}{dx}\left((2y - 1)\frac{dy}{dx}\right) = \frac{d}{dx}(-1)$$

$$2\left(\frac{dy}{dx}\right)^2 + (2y - 1)\frac{d^2y}{dx^2} = 0$$

$$\frac{d^2y}{dx^2} = \frac{-2\left(\frac{dy}{dx}\right)^2}{2y - 1}$$

At $(0, 0)$, $\frac{d^2y}{dx^2} = 2$, so $|f''(0)| = 2$. Then

$$\kappa = \frac{|f''(0)|}{(1 + [f'(0)]^2)^{3/2}} = \frac{2}{(1 + [-1]^2)^{3/2}} = \frac{2}{2\sqrt{2}} = \frac{1}{\sqrt{2}}.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \boxed{\sqrt{2}}.$$

51. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $f'(x)$, $f'(\frac{\pi}{4})$, $f''(x)$, $f''(\frac{\pi}{4})$, and $|f''(\frac{\pi}{4})|$.

$$f'(x) = \frac{\sec x \tan x}{\sec x} = \tan x \quad f'\left(\frac{\pi}{4}\right) = 1$$

$$f''(x) = \sec^2 x \quad f''\left(\frac{\pi}{4}\right) = 2 \quad \left|f''\left(\frac{\pi}{4}\right)\right| = 2$$

$$\kappa = \frac{|f''(\frac{\pi}{4})|}{(1 + [f'(\frac{\pi}{4})]^2)^{3/2}} = \frac{2}{(1 + [1]^2)^{3/2}} = \frac{2}{2\sqrt{2}} = \frac{1}{\sqrt{2}}.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \boxed{\sqrt{2}}.$$

52. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $f'(x)$, $f'(0)$, $f''(x)$, $f''(0)$, and $|f''(0)|$.

$$\begin{aligned} f'(x) &= \sinh x & f'(0) &= 0 \\ f''(x) &= \cosh x & f''(0) &= 1 & |f''(0)| &= 1 \end{aligned}$$

$$\kappa = \frac{|f''(0)|}{(1 + [f'(0)]^2)^{3/2}} = \frac{1}{(1 + [0]^2)^{3/2}} = 1.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \boxed{1}.$$

53. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned} \mathbf{r}'(t) &= 6t\mathbf{i} + (3 - 3t^2)\mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{36t^2 + 9 - 18t^2 + 9t^4} = 3\sqrt{t^4 + 2t^2 + 1} = 3\sqrt{(t^2 + 1)^2} = 3(t^2 + 1) \\ \mathbf{r}''(t) &= 6\mathbf{i} - 6t\mathbf{j} \end{aligned}$$

$$\begin{aligned} \mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 6t & 3 - 3t^2 & 0 \\ 6 & -6t & 0 \end{vmatrix} \\ &= (-36t^2 - 18 + 18t^2)\mathbf{k} \\ &= -18(t^2 + 1)\mathbf{k} \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{[-18(t^2 + 1)]^2} = 18(t^2 + 1) \end{aligned}$$

The curvature

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{18(t^2 + 1)}{[3(t^2 + 1)]^3} = \frac{2}{3(t^2 + 1)^2}$$

and the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = \frac{3}{2}(t^2 + 1)^2,$$

so the radius at $t = 1$ is $\rho = \frac{3}{2}(2^2) = \boxed{6}$.

54. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned} \mathbf{r}'(t) &= \mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{1 + 4t^2 + 9t^4} \\ \mathbf{r}''(t) &= 2\mathbf{j} + 6t\mathbf{k} \end{aligned}$$

$$\begin{aligned}
\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2t & 3t^2 \\ 0 & 2 & 6t \end{vmatrix} \\
&= (12t^2 - 6t^2)\mathbf{i} - 6t\mathbf{j} + 2\mathbf{k} = 6t^2\mathbf{i} - 6t\mathbf{j} + 2\mathbf{k} \\
&= 2(3t^2\mathbf{i} - 3t\mathbf{j} + \mathbf{k}) \\
\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= 2\sqrt{9t^4 + 9t^2 + 1}
\end{aligned}$$

The curvature

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{2\sqrt{9t^4 + 9t^2 + 1}}{(1 + 4t^2 + 9t^4)^{3/2}}$$

and the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = \frac{(1 + 4t^2 + 9t^4)^{3/2}}{2\sqrt{9t^4 + 9t^2 + 1}},$$

so the radius at $t = 1$ is $\rho = \frac{14\sqrt{14}}{2\sqrt{19}} = \boxed{\frac{7\sqrt{266}}{19}}$.

55. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}
\mathbf{r}'(t) &= \cos t \mathbf{i} - 2 \sin(2t) \mathbf{j} & \|\mathbf{r}'(t)\| &= \sqrt{\cos^2 t + 4 \sin^2(2t)} \\
\mathbf{r}''(t) &= -\sin t \mathbf{i} - 4 \cos(2t) \mathbf{j}
\end{aligned}$$

Using double-angle formulas,

$$\begin{aligned}
\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos t & -2 \sin(2t) & 0 \\ -\sin t & -4 \cos(2t) & 0 \end{vmatrix} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos t & -4 \sin t \cos t & 0 \\ -\sin t & 4 \sin^2 t - 4 \cos^2 t & 0 \end{vmatrix} \\
&= (4 \sin^2 t \cos t - 4 \cos^3 t - 4 \sin^2 t \cos t) \mathbf{k} = -4 \cos^3 t \mathbf{k} \\
\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{(-4 \cos^3 t)^2} = |4 \cos^3 t|
\end{aligned}$$

The curvature

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{|4 \cos^3 t|}{[\cos^2 t + 4 \sin^2(2t)]^{3/2}}$$

and the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = \frac{[\cos^2 t + 4 \sin^2(2t)]^{3/2}}{|4 \cos^3 t|},$$

so the radius at $t = \frac{\pi}{4}$ is

$$\rho = \frac{[\frac{1}{2} + (4)(1)]^{3/2}}{4(\frac{1}{\sqrt{2}})^3} = \frac{\frac{27}{2\sqrt{2}}}{\sqrt{2}} = \boxed{\frac{27}{4}}.$$

56. See Problem 30 where it was shown that $\kappa = \frac{1}{1+b^2}$. Then the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = 1 + b^2,$$

so the radius at $t = \frac{\pi}{4}$ is $\rho = \boxed{1 + b^2}$.

57. See Problem 29 where it was shown that $\kappa = \frac{4}{5}$. Then the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = \frac{5}{4},$$

so the radius at $t = \frac{\pi}{4}$ is $\rho = \boxed{\frac{5}{4}}$.

58. See Problem 33 where it was shown that $\kappa = \frac{1}{3 \sin t \cos t}$. Then the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = 3 \sin t \cos t,$$

so the radius at $t = \frac{\pi}{3}$ is $\rho = 3(\frac{\sqrt{3}}{2})(\frac{1}{2}) = \boxed{\frac{3\sqrt{3}}{4}}$.

59. See Problem 31 where it was shown that $\kappa = \frac{\sqrt{2}}{(e^t + e^{-t})^2}$. Then the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = \frac{(e^t + e^{-t})^2}{\sqrt{2}},$$

so the radius at $t = 0$ is $\rho = \frac{4}{\sqrt{2}} = \boxed{2\sqrt{2}}$.

60. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= a(3 - 3t^2)\mathbf{i} + 6at\mathbf{j} + a(3 + 3t^2)\mathbf{k} \\ \|\mathbf{r}'(t)\| &= a\sqrt{9 - 18t^2 + 9t^4 + 36t^2 + 9 + 18t^2 + 9t^4} \\ &= 3\sqrt{2}a\sqrt{1 + 2t^2 + t^4} = 3\sqrt{2}a\sqrt{(1 + t^2)^2} = 3\sqrt{2}a(1 + t^2) \\ \mathbf{r}''(t) &= -6ta\mathbf{i} + 6a\mathbf{j} + 6at\mathbf{k}\end{aligned}$$

$$\begin{aligned}\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a(3 - 3t^2) & 6at & a(3 + 3t^2) \\ -6ta & 6a & 6at \end{vmatrix} = 18a^2 \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 - t^2 & 2t & 1 + t^2 \\ -t & 1 & t \end{vmatrix} \\ &= 18a^2[(2t^2 - 1 - t^2)\mathbf{i} - (t - t^3 + t + t^3)\mathbf{j} + (1 - t^2 + 2t^2)\mathbf{k}] \\ &= 18a^2[(t^2 - 1)\mathbf{i} - 2t\mathbf{j} + (t^2 + 1)\mathbf{k}] \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= 18a^2\sqrt{t^4 - 2t^2 + 1 + 4t^2 + t^4 + 2t^2 + 1} = 18a^2\sqrt{2t^4 + 4t^2 + 2} \\ &= 18\sqrt{2}a^2\sqrt{(t^2 + 1)^2} = 18\sqrt{2}a^2(t^2 + 1)\end{aligned}$$

The curvature

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{18\sqrt{2}a^2(t^2 + 1)}{[3\sqrt{2}a(1 + t^2)]^3} = \frac{1}{3a(1 + t^2)^2}$$

and the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = 3a(1 + t^2)^2,$$

so the radius at $t = 1$ is $\rho = \boxed{12a}$.

61. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$. Differentiating and simplifying using the double-angle formulas,

$$\begin{aligned}\mathbf{r}'(t) &= -12a \cos^2 t \sin t \mathbf{i} + 12a \sin^2 t \cos t \mathbf{j} - 6a \sin(2t) \mathbf{k} \\ &= -12a \cos^2 t \sin t \mathbf{i} + 12a \sin^2 t \cos t \mathbf{j} - 12a \sin t \cos t \mathbf{k} \\ \|\mathbf{r}'(t)\| &= \sqrt{144a^2 \cos^4 t \sin^2 t + 144a^2 \sin^4 t \cos^2 t + 144a^2 \sin^2 t \cos^2 t} \\ &= \sqrt{144a^2 \sin^2 t \cos^2 t (\cos^2 t + \sin^2 t) + 144a^2 \sin^2 t \cos^2 t} = 12a\sqrt{2} \sin t \cos t \\ \mathbf{r}''(t) &= (24a \cos t \sin^2 t - 12a \cos^3 t) \mathbf{i} + (24a \sin t \cos^2 t - 12a \sin^3 t) \mathbf{j} - (12a \cos^2 t - 12a \sin^2 t) \mathbf{k}\end{aligned}$$

Using a property of cross products, we can factor out common terms in both $\mathbf{r}'(t)$ and $\mathbf{r}''(t)$ to get

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = 144a^2 \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\cos^2 t \sin t & \sin^2 t \cos t & -\sin t \cos t \\ 2 \cos t \sin^2 t - \cos^3 t & 2 \sin t \cos^2 t - \sin^3 t & \sin^2 t - \cos^2 t \end{vmatrix}$$

We consider the sub-determinants separately. For the $\mathbf{i}$ sub-determinant,

$$\begin{aligned}\begin{vmatrix} \sin^2 t \cos t & -\sin t \cos t \\ 2 \sin t \cos^2 t - \sin^3 t & \sin^2 t - \cos^2 t \end{vmatrix} \mathbf{i} &= (\sin^4 t \cos t - \sin^2 t \cos^3 t + 2 \sin^2 t \cos^3 t - \sin^4 t \cos t) \mathbf{i} \\ &= \sin^2 t \cos^3 t \mathbf{i}\end{aligned}$$

For the $\mathbf{j}$ sub-determinant,

$$\begin{aligned}-\begin{vmatrix} -\cos^2 t \sin t & -\sin t \cos t \\ 2 \cos t \sin^2 t - \cos^3 t & \sin^2 t - \cos^2 t \end{vmatrix} \mathbf{j} &= -(\cos^4 t \sin t - \cos^2 t \sin^3 t + 2 \sin^3 t \cos^2 t - \sin t \cos^4 t) \mathbf{j} \\ &= -\sin^3 t \cos^2 t \mathbf{j}\end{aligned}$$

For the $\mathbf{k}$ sub-determinant,

$$\begin{aligned}\begin{vmatrix} -\cos^2 t \sin t & \sin^2 t \cos t \\ 2 \cos t \sin^2 t - \cos^3 t & 2 \sin t \cos^2 t - \sin^3 t \end{vmatrix} \mathbf{k} &= (\sin^4 t \cos^2 t - 2 \sin^2 t \cos^4 t - 2 \sin^4 t \cos^2 t + \sin^2 t \cos^4 t) \mathbf{k} \\ &= (-\sin^4 t \cos^2 t - \sin^2 t \cos^4 t) \mathbf{k} \\ &= -\sin^2 t \cos^2 t (\sin^2 t + \cos^2 t) \mathbf{k} = -\sin^2 t \cos^2 t \mathbf{k}\end{aligned}$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = 144a^2 [\sin^2 t \cos^3 t \mathbf{i} - \sin^3 t \cos^2 t \mathbf{j} + \sin^2 t \cos^2 t \mathbf{k}]$$

and

$$\begin{aligned}\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= 144a^2 \sqrt{\sin^4 t \cos^6 t + \sin^6 t \cos^4 t + \sin^4 t \cos^4 t} \\ &= 144a^2 \sqrt{\sin^4 t \cos^4 t (\sin^2 t + \cos^2 t + 1)} = 144\sqrt{2}a^2 \sin^2 t \cos^2 t\end{aligned}$$

The curvature

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{144\sqrt{2}a^2 \sin^2 t \cos^2 t}{(12a\sqrt{2} \sin t \cos t)^3} = \frac{1}{24a \sin t \cos t}$$

and the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = 24a \sin t \cos t,$$

so the radius at $t = \frac{\pi}{4}$ is $\rho = \boxed{12a}$.

62. To find the radius of the osculating circle, we need to find the curvature κ , so we first find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= \mathbf{i} + 2\mathbf{j} - \frac{5t}{\sqrt{1-5t^2}}\mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{1+4+\frac{25t^2}{1-5t^2}} = \sqrt{\frac{5}{1-5t^2}} \\ \mathbf{r}''(t) &= \frac{-5\sqrt{1-5t^2} + 5t(\frac{1}{2})(1-5t^2)^{-1/2}(-10t)}{1-5t^2}\end{aligned}$$

We can multiply the numerator and the denominator by $\sqrt{1-5t^2}$ to simplify.

$$\mathbf{r}''(t) = \frac{-5(1-5t^2) - 25t^2}{(1-5t^2)^{3/2}}\mathbf{k} = \frac{-5}{(1-5t^2)^{3/2}}\mathbf{k}$$

$$\begin{aligned}\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & \frac{-5t}{\sqrt{1-5t^2}} \\ 0 & 0 & \frac{-5}{(1-5t^2)^{3/2}} \end{vmatrix} = \frac{-10}{(1-5t^2)^{3/2}}\mathbf{i} + \frac{5}{(1-5t^2)^{3/2}}\mathbf{j} \\ \|\mathbf{r}'(t) \times \mathbf{r}''(t)\| &= \sqrt{\frac{100}{(1-5t^2)^3} + \frac{25}{(1-5t^2)^3}} = \sqrt{\frac{125}{(1-5t^2)^3}} = \frac{5\sqrt{5}}{(1-5t^2)^{3/2}}\end{aligned}$$

The curvature

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\frac{5\sqrt{5}}{(1-5t^2)^{3/2}}}{\left(\frac{5}{1-5t^2}\right)^{3/2}} = 1$$

and the radius of the osculating circle

$$\rho = \frac{1}{\kappa} = 1,$$

so the radius at $t = 0$ is $\rho = \boxed{1}$.

Applications and Extensions

63. If $f(x) = ax^2 + bx + c$, then $f'(x) = 2ax + b$ and $f''(x) = 2a$. Then

$$\kappa(x) = \frac{|2a|}{(1 + [2ax + b]^2)^{3/2}} = \frac{|2a|}{(4a^2x^2 + 4abx + b^2 + 1)^{3/2}}$$

and

$$\rho(x) = \frac{1}{\kappa(x)} = \frac{(4a^2x^2 + 4abx + b^2 + 1)^{3/2}}{|2a|}.$$

To find the minimum radius of curvature, we use $\rho'(x)$ to find the critical point(s).

$$\rho'(x) = \frac{3(4a^2x^2 + 4abx + b^2 + 1)^{1/2}(8a^2x + 4ab)}{2|2a|} = \frac{3a}{|a|}(4a^2x^2 + 4abx + b^2 + 1)^{1/2}(2ax + b)$$

$\rho'(x) = 0$ when $2ax + b = 0$ or at $x = -\frac{b}{2a}$ which is the vertex of the parabola. To show that there is a minimum at $x = -\frac{b}{2a}$, we use the Second Derivative Test.

$$\begin{aligned}\rho''(x) &= \frac{3a}{|a|} \left(\frac{1}{2} \right) (4a^2x^2 + 4abx + b^2 + 1)^{-1/2} (8a^2x + 4ab)(2ax + b) + \frac{3a}{|a|} (4a^2x^2 + 4abx + b^2 + 1)^{1/2} (2a) \\ &= \frac{6a^2[(2ax + b)^2 + 4a^2x^2 + 4abx + b^2 + 1]}{|a|\sqrt{4a^2x^2 + 4abx + b^2 + 1}} = \frac{6a^2[8a^2x^2 + 8abx + 2b^2 + 1]}{|a|\sqrt{4a^2x^2 + 4abx + b^2 + 1}}\end{aligned}$$

Then

$$\rho''\left(-\frac{b}{2a}\right) = \frac{6a^2[8a^2\left(\frac{b^2}{4a^2}\right) + 8ab\left(-\frac{b}{2a}\right) + 2b^2 + 1]}{|a|\sqrt{4a^2\left(\frac{b^2}{4a^2}\right) + 4ab\left(-\frac{b}{2a}\right) + b^2 + 1}} = \frac{6a^2}{|a|}.$$

Since $\rho''\left(-\frac{b}{2a}\right) > 0$, by the Second Derivative Test, $\rho\left(-\frac{b}{2a}\right)$ is a minimum. The radius of curvature of the parabola $y = ax^2 + bx + c$ is a minimum at its vertex. ■

64. The ellipse $b^2x^2 + a^2y^2 = a^2b^2$ intersects the axes at $(\pm a, 0)$ and $(0, \pm b)$. To find the radius of curvature, we first need to find the curvature, so we need $f'(x)$, $f''(x)$, and $|f'''(x)|$. We use implicit differentiation.

$$\frac{d}{dx}(b^2x^2 + a^2y^2) = \frac{d}{dx}(a^2b^2)$$

$$2b^2x + 2a^2y\frac{dy}{dx} = 0$$

$$\frac{dy}{dx} = -\frac{b^2x}{a^2y}$$

To get $f''(x)$, we use implicit differentiation again.

$$\frac{d}{dx}\left(2b^2x + 2a^2y\frac{dy}{dx}\right) = \frac{d}{dx}(0)$$

$$2b^2 + 2a^2\left(\frac{dy}{dx}\right)^2 + 2a^2y\frac{d^2y}{dx^2} = 0$$

$$\begin{aligned}\frac{d^2y}{dx^2} &= \frac{-b^2 - a^2\left(\frac{dy}{dx}\right)^2}{a^2y} = \frac{-b^2 - a^2\left(-\frac{b^2x}{a^2y}\right)^2}{a^2y} = \frac{-a^2b^2y^2 - b^4x^2}{a^4y^3} \\ &= \frac{-b^2(a^2y^2 + b^2x^2)}{a^4y^3} = \frac{-b^2(a^2b^2)}{a^4y^3} = \frac{-b^4}{a^2y^3}\end{aligned}$$

Then

$$\kappa = \frac{|f''(x)|}{(1 + [f'(x)]^2)^{3/2}} = \frac{\left|\frac{-b^4}{a^2y^3}\right|}{\left(1 + \left[-\frac{b^2x}{a^2y}\right]^2\right)^{3/2}} = \frac{\frac{b^4}{a^2y^3}}{\left(\frac{a^4y^2 + b^4x^2}{a^4y^2}\right)^{3/2}} = \frac{a^4b^4}{(a^4y^2 + b^4x^2)^{3/2}}.$$

The radius ρ of the osculating circle is

$$\rho = \frac{1}{\kappa} = \frac{(a^4y^2 + b^4x^2)^{3/2}}{a^4b^4},$$

so at $(\pm a, 0)$,

$$\rho = \frac{(b^4a^2)^{3/2}}{a^4b^4} = \frac{b^2}{a}$$

and at $(0, \pm b)$,

$$\rho = \frac{(a^4b^2)^{3/2}}{a^4b^4} = \frac{a^2}{b}.$$

■

65. To find the curvature, we will need $f'(x)$, $f''(x)$, and $|f''(x)|$.

$$f'(x) = \frac{1}{x} \quad f''(x) = -\frac{1}{x^2} \quad |f''(x)| = \frac{1}{x^2}$$

$$\kappa(x) = \frac{|f''(x)|}{(1 + [f'(x)]^2)^{3/2}} = \frac{\frac{1}{x^2}}{\left(1 + \left[\frac{1}{x}\right]^2\right)^{3/2}} = \frac{x}{(x^2 + 1)^{3/2}}.$$

The maximum curvature occurs at a critical point.

$$\begin{aligned} \kappa'(x) &= \frac{(x^2 + 1)^{3/2} - x(\frac{3}{2})(x^2 + 1)^{1/2}(2x)}{(x^2 + 1)^3} = \frac{(x^2 + 1) - 3x^2}{(x^2 + 1)^{5/2}} \\ &= \frac{1 - 2x^2}{(x^2 + 1)^{5/2}} \end{aligned}$$

The critical points of κ occur at $x = \pm \frac{\sqrt{2}}{2}$, but $x = -\frac{\sqrt{2}}{2}$ is not in the domain of $\ln x$. Since $\kappa'(x) > 0$ for $x < \frac{\sqrt{2}}{2}$ and $\kappa'(x) < 0$ for $x > \frac{\sqrt{2}}{2}$, the maximum curvature occurs at $\left(\frac{\sqrt{2}}{2}, \ln \frac{\sqrt{2}}{2}\right)$.

66. To find the curvature, we will need $f'(x)$, $f''(x)$, and $|f''(x)|$.

$$f'(x) = e^x \quad f''(x) = e^x \quad |f''(x)| = e^x$$

$$\kappa(x) = \frac{|f''(x)|}{(1 + [f'(x)]^2)^{3/2}} = \frac{e^x}{(1 + [e^x]^2)^{3/2}} = \frac{e^x}{(1 + e^{2x})^{3/2}}.$$

The maximum curvature occurs at a critical point.

$$\kappa'(x) = \frac{e^x(1 + e^{2x})^{3/2} - e^x(\frac{3}{2})(1 + e^{2x})^{1/2}(2e^{2x})}{(1 + e^{2x})^3} = \frac{e^x(1 + e^{2x} - 3e^{2x})}{(1 + e^{2x})^{5/2}} = \frac{e^x(1 - 2e^{2x})}{(1 + e^{2x})^{5/2}}$$

The critical points of κ occur when $1 - 2e^{2x} = 0$, or when $x = \frac{1}{2} \ln \frac{1}{2}$. Since $\kappa'(x) > 0$ for $x < \frac{1}{2} \ln \frac{1}{2}$ and $\kappa'(x) < 0$ for $x > \frac{1}{2} \ln \frac{1}{2}$, the maximum curvature occurs at $\left(\frac{1}{2} \ln \frac{1}{2}, \frac{\sqrt{2}}{2}\right)$.

67. To find the curvature, we will need $f'(x)$, $f''(x)$, and $|f''(x)|$.

$$f'(x) = x^2 \quad f''(x) = 2x \quad |f''(x)| = |2x|$$

$$\kappa(x) = \frac{|f''(x)|}{(1 + [f'(x)]^2)^{3/2}} = \frac{|2x|}{(1 + [x^2]^2)^{3/2}} = \frac{|2x|}{(1 + x^4)^{3/2}}.$$

The maximum curvature occurs at a critical point.

Assuming $x > 0$, $\kappa(x) = \frac{|2x|}{(1+x^4)^{3/2}} = \frac{2x}{(1+x^4)^{3/2}}$, and

$$\kappa'(x) = \frac{2(1 + x^4)^{3/2} - 2x(\frac{3}{2})(1 + x^4)^{1/2}(4x^3)}{(1 + x^4)^3} = \frac{2 + 2x^4 - 12x^4}{(1 + x^4)^{5/2}} = \frac{2 - 10x^4}{(1 + x^4)^{5/2}}.$$

The critical point of $\kappa(x)$ for $x > 0$ occurs at $x = (\frac{1}{5})^{1/4}$. Since $\kappa'(x) > 0$ for $0 < x < (\frac{1}{5})^{1/4}$ and $\kappa'(x) < 0$ for $x > (\frac{1}{5})^{1/4}$, a maximum κ occurs at $x = (\frac{1}{5})^{1/4}$.

Similarly, assuming $x < 0$, $\kappa(x) = \frac{|2x|}{(1+x^4)^{3/2}} = \frac{-2x}{(1+x^4)^{3/2}}$, and

$$\kappa'(x) = \frac{-2(1+x^4)^{3/2} + 2x(\frac{3}{2})(1+x^4)^{1/2}(4x^3)}{(1+x^4)^3} = \frac{-2 - 2x^4 + 12x^4}{(1+x^4)^{5/2}} = \frac{-2 + 10x^4}{(1+x^4)^{5/2}}.$$

The critical point of $\kappa(x)$ for $x < 0$ occurs at $x = -(\frac{1}{5})^{1/4}$. Since $\kappa'(x) > 0$ for $x < -(\frac{1}{5})^{1/4}$, and $\kappa'(x) < 0$ for $-(\frac{1}{5})^{1/4} < x < 0$, a maximum κ occurs at $x = -(\frac{1}{5})^{1/4}$.

Note that

$$\kappa\left(-\left(\frac{1}{5}\right)^{1/4}\right) = \kappa\left(\left(\frac{1}{5}\right)^{1/4}\right) = \frac{2\left(\left(\frac{1}{5}\right)^{1/4}\right)}{\left(1 + \left[\left(\frac{1}{5}\right)^{1/4}\right]^4\right)^{3/2}} = \frac{5\sqrt[4]{5}\sqrt{6}}{18},$$

so the maximum curvature occurs at $\left(\pm\left(\frac{1}{5}\right)^{1/4}, f\left(\pm\left(\frac{1}{5}\right)^{1/4}\right)\right) = \left(\pm\left(\frac{1}{5}\right)^{1/4}, \frac{1}{3}\left[\pm\left(\frac{1}{5}\right)^{1/4}\right]^3\right)$

$$= \left[\left(\pm\left(\frac{1}{5}\right)^{1/4}, \pm\frac{1}{3}\left(\frac{1}{5}\right)^{3/4}\right)\right].$$

68. To find the curvature, we will need $f'(x)$, $f''(x)$, and $|f''(x)|$.

$$f'(x) = \cos x \quad f''(x) = -\sin x \quad |f''(x)| = |\sin x|$$

We can restrict the domain to $0 \leq x \leq \pi$ to ensure that $\sin x$ is positive and then use the periodicity of the sine curve to find other maxima.

$$\kappa(x) = \frac{|f''(x)|}{(1 + [f'(x)]^2)^{3/2}} = \frac{\sin x}{(1 + \cos^2 x)^{3/2}}.$$

The maximum curvature occurs at a critical point.

$$\begin{aligned} \kappa'(x) &= \frac{\cos x(1 + \cos^2 x)^{3/2} - \sin x(\frac{3}{2})(1 + \cos^2 x)^{1/2}(-2 \sin x \cos x)}{(1 + \cos^2 x)^3} \\ &= \frac{\cos x + \cos^3 x + 3 \sin^2 x \cos x}{(1 + \cos^2 x)^{5/2}} = \frac{\cos x(1 + \cos^2 x + 3 \sin^2 x)}{(1 + \cos^2 x)^{5/2}} \end{aligned}$$

The critical points of κ occur when $\cos x = 0$ or when $x = \frac{(2k+1)\pi}{2}$. The maximum curvature occurs at

$$\left[\left(\frac{[2k+1]\pi}{2}, \pm 1\right)\right].$$

69. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned} \mathbf{r}'(t) &= -\alpha \sin t \mathbf{i} + \alpha \cos t \mathbf{j} + \mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{\alpha^2 \sin^2 t + \alpha^2 \cos^2 t + 1} = \sqrt{\alpha^2 + 1} \\ \mathbf{r}''(t) &= -\alpha \cos t \mathbf{i} - \alpha \sin t \mathbf{j} \end{aligned}$$

$$\begin{aligned} \mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\alpha \sin t & \alpha \cos t & 1 \\ -\alpha \cos t & -\alpha \sin t & 0 \end{vmatrix} = \alpha \sin t \mathbf{i} - \alpha \cos t \mathbf{j} + (\alpha^2 \sin^2 t + \alpha^2 \cos^2 t) \mathbf{k} \\ &= \alpha \sin t \mathbf{i} - \alpha \cos t \mathbf{j} + \alpha^2 \mathbf{k} \end{aligned}$$

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = \sqrt{\alpha^2 \sin^2 t + \alpha^2 \cos^2 t + \alpha^4} = \alpha \sqrt{1 + \alpha^2}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\alpha\sqrt{1+\alpha^2}}{(\sqrt{\alpha^2+1})^3} = \frac{\alpha}{\alpha^2+1},$$

and to find the α that maximizes the curvature, we find $\kappa'(\alpha) = \frac{\alpha^2+1-\alpha(2\alpha)}{(\alpha^2+1)^2} = \frac{1-\alpha^2}{(\alpha^2+1)^2}$. Since $\alpha > 0$, the critical point is $\alpha = 1$. Since $\kappa'(\alpha) > 0$ for $\alpha < 1$ and $\kappa'(\alpha) < 0$ for $\alpha > 1$, the maximum curvature occurs for $\boxed{\alpha = 1}$.

70. The curvature of a plane curve is given by $\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{(\|\mathbf{r}'(t)\|)^3}$ or $\kappa = \frac{|f''(x)|}{(1+[f'(x)]^2)^{3/2}}$. At a point of inflection, $\mathbf{r}''(t) = \mathbf{0}$ or $f''(x) = 0$, which means $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = 0$ or $|f''(x)| = 0$. Then at a point of inflection of a plane curve the curvature is $\boxed{\kappa = 0}$.

71. To find the curvature of $f(x)$, we need to find $f'(x)$, $f''(x)$, and $|f''(x)|$.

$$f'(x) = a \sinh \frac{x}{a} \left(\frac{1}{a} \right) = \sinh \frac{x}{a} \quad f''(x) = \frac{1}{a} \cosh \frac{x}{a} \quad |f''(x)| = \frac{1}{a} \cosh \frac{x}{a}$$

$$\kappa = \frac{|f''(x)|}{(1+[f'(x)]^2)^{3/2}} = \frac{\frac{1}{a} \cosh \frac{x}{a}}{(1+\sinh^2 \frac{x}{a})^{3/2}} = \frac{\frac{1}{a} \cosh \frac{x}{a}}{(\cosh^2 \frac{x}{a})^{3/2}} = \frac{1}{a \cosh^2 \frac{x}{a}} = \frac{a}{a^2 \cosh^2 \frac{x}{a}} = \frac{a}{y^2}.$$

■

72. To find the curvature of $f(x)$ at $(1, 1)$, we need to find $f'(x)$, $f'(1)$, $f''(x)$, $f''(1)$, and $|f''(1)|$. We use implicit differentiation.

$$\frac{d}{dx} [y^2(2-x)] = \frac{d}{dx} (x^3)$$

$$2y \frac{dy}{dx} (2-x) - y^2 = 3x^2$$

$$\frac{dy}{dx} = \frac{3x^2 + y^2}{2y(2-x)}$$

At $(1, 1)$, $\frac{dy}{dx} = \frac{4}{(2)(1)} = 2$. To get $f''(x)$, we use implicit differentiation again.

$$\frac{d}{dx} \left[2y \frac{dy}{dx} (2-x) - y^2 \right] = \frac{d}{dx} (3x^2)$$

$$2 \left(\frac{dy}{dx} \right)^2 (2-x) + 2y \frac{d^2y}{dx^2} (2-x) - 2y \frac{dy}{dx} - 2y \frac{dy}{dx} = 6x$$

We now substitute $(1, 1)$ into the above equation to solve for $\frac{d^2y}{dx^2}$.

$$(2)(2)^2(2-1) + 2(1) \frac{d^2y}{dx^2} (2-1) - 2(1)(2) - (2)(1)(2) = 6(1)$$

$$2 \frac{d^2y}{dx^2} = 6$$

so at $(1, 1)$, $\frac{d^2y}{dx^2} = 3$. Then

$$\kappa = \frac{|f''(1)|}{(1+[f'(1)]^2)^{3/2}} = \frac{3}{(1+[2]^2)^{3/2}} = \frac{3}{5\sqrt{5}} = \boxed{\frac{3\sqrt{5}}{25}}.$$

73. Since $\mathbf{r}(t)(\theta) = (\theta - \sin \theta)\mathbf{i} + (1 - \cos \theta)\mathbf{j}$,

$$\begin{aligned}\mathbf{r}'(\theta) &= (1 - \cos \theta)\mathbf{i} + \sin \theta\mathbf{j} & \|\mathbf{r}'(t)\| &= \sqrt{1 - 2\cos \theta + \cos^2 \theta + \sin^2 \theta} = \sqrt{2 - 2\cos \theta} \\ \mathbf{r}''(t) &= \sin \theta\mathbf{i} + \cos \theta\mathbf{j}\end{aligned}$$

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 - \cos \theta & \sin \theta & 0 \\ \sin \theta & \cos \theta & 0 \end{vmatrix} = (\cos \theta - \cos^2 \theta - \sin^2 \theta)\mathbf{k} = (\cos \theta - 1)\mathbf{k}$$

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = |\cos \theta - 1|$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{|\cos \theta - 1|}{[\sqrt{2(1 - \cos \theta)}]^3} = \frac{|1 - \cos \theta|}{2\sqrt{2}(1 - \cos \theta)^{3/2}} = \frac{1}{2\sqrt{2}(1 - \cos \theta)^{1/2}}.$$

The cycloid reaches its maximum when $y(\theta) = 1 - \cos(\theta)$ is maximized, and since $-1 \leq \cos \theta \leq 1$, the maximum y value of 2 occurs at $\theta = (2n + 1)\pi$. The curvature of the cycloid at the highest point of

an arch is $\kappa = \frac{1}{2\sqrt{2}(1 - (-1))^{1/2}} = \boxed{\frac{1}{4}}$.

74. (a) We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= -3t^2\mathbf{i} + 2t\mathbf{j} & \|\mathbf{r}'(t)\| &= \sqrt{9t^4 + 4t^2} = t\sqrt{9t^2 + 4} \\ \mathbf{r}''(t) &= -6t\mathbf{i} + 2\mathbf{j}\end{aligned}$$

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -3t^2 & 2t & 0 \\ -6t & 2 & 0 \end{vmatrix} = (-6t^2 + 12t^2)\mathbf{k} = 6t^2\mathbf{k}$$

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = 6t^2$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{6t^2}{t^3(9t^2 + 4)^{3/2}} = \boxed{\frac{6}{t(9t^2 + 4)^{3/2}}, t \neq 0}.$$

(b) From the figure below generated by Maple™, we can see that at $t = 0$ the curve has a cusp. The curve is not smooth at $t = 0$, so the curvature is undefined.

75. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, and $\|\mathbf{T}'(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= (-e^{-t} \cos t - e^{-t} \sin t)\mathbf{i} + (-e^{-t} \sin t + e^{-t} \cos t)\mathbf{j} \\ \|\mathbf{r}'(t)\| &= \sqrt{e^{-2t} \cos^2 t + 2e^{-2t} \sin t \cos t + e^{-2t} \sin^2 t + e^{-2t} \sin^2 t - 2e^{-t} \sin t \cos t + e^{-2t} \cos^2 t} \\ &= e^{-t} \sqrt{2} \\ \mathbf{T}(t) &= \frac{(-e^{-t} \cos t - e^{-t} \sin t)\mathbf{i} + (-e^{-t} \sin t + e^{-t} \cos t)\mathbf{j}}{e^{-t} \sqrt{2}} \\ &= \frac{1}{\sqrt{2}}(-\cos t - \sin t)\mathbf{i} + \frac{1}{\sqrt{2}}(-\sin t + \cos t)\mathbf{j} \\ \mathbf{T}'(t) &= \frac{1}{\sqrt{2}}(\sin t - \cos t)\mathbf{i} + \frac{1}{\sqrt{2}}(-\cos t - \sin t)\mathbf{j} \\ \|\mathbf{T}'(t)\| &= \sqrt{\frac{1}{2}(\sin^2 t - 2 \sin t \cos t + \cos^2 t + \cos^2 t + 2 \sin t \cos t + \sin^2 t)} = 1\end{aligned}$$

Then

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{1}{e^{-t} \sqrt{2}} = \boxed{\frac{e^t \sqrt{2}}{2}}.$$

As $t \rightarrow \infty$, $\kappa \rightarrow \infty$. We see that as $t \rightarrow \infty$, the spiral wraps more and more tightly around the origin.

76. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= -2a \sin t \mathbf{i} + 2a \cos t \mathbf{j} + 2bt \mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{4a^2 \sin^2 t + 4a^2 \cos^2 t + 4b^2 t^2} = 2\sqrt{a^2 + b^2 t^2} \\ \mathbf{r}''(t) &= -2a \cos t \mathbf{i} - 2a \sin t \mathbf{j} + 2b \mathbf{k}\end{aligned}$$

$$\begin{aligned}\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2a \sin t & 2a \cos t & 2bt \\ -2a \cos t & -2a \sin t & 2b \end{vmatrix} \\ &= (4ab \cos t + 4abt \sin t)\mathbf{i} - (-4ab \sin t + 4abt \cos t)\mathbf{j} + (4a^2 \sin^2 t + 4a^2 \cos^2 t)\mathbf{k} \\ &= 4ab(\cos t + t \sin t)\mathbf{i} - 4ab(-\sin t + t \cos t)\mathbf{j} + 4a^2 \mathbf{k}\end{aligned}$$

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = 4a\sqrt{b^2(\cos^2 t + t^2 \sin^2 t + \sin^2 t + t^2 \cos^2 t) + a^2} = 4a\sqrt{b^2(1 + t^2) + a^2}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{4a\sqrt{b^2(1 + t^2) + a^2}}{8(a^2 + b^2 t^2)^{3/2}} = \boxed{\frac{a\sqrt{b^2(1 + t^2) + a^2}}{2(a^2 + b^2 t^2)^{3/2}}}$$

77. We can express equation for the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ as the vector function $\mathbf{r}(t) = a \cos t \mathbf{i} + b \sin t \mathbf{j}$, $0 \leq t \leq 2\pi$. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= -a \sin t \mathbf{i} + b \cos t \mathbf{j} & \|\mathbf{r}'(t)\| &= \sqrt{a^2 \sin^2 t + b^2 \cos^2 t} \\ \mathbf{r}''(t) &= -a \cos t \mathbf{i} - b \sin t \mathbf{j}\end{aligned}$$

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -a \sin t & b \cos t & 0 \\ -a \cos t & -b \sin t & 0 \end{vmatrix} = (ab \sin^2 t + ab \cos^2 t)\mathbf{k} = ab \mathbf{k}$$

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = ab$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{ab}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}},$$

and it has its minimum value where the denominator is largest. Since $a > b$, the denominator is largest when $\sin t = 1$ and $\cos t = 0$, or at $t = \frac{\pi}{2}, \frac{3\pi}{2}$, which corresponds to the points $(0, \pm b)$. Similarly, the curvature has its maximum value where the denominator is smallest. Since $a > b$, the denominator is smallest when $\sin t = 0$ and $\cos t = 1$, or at $t = 0, \pi$, which corresponds to the points $(\pm a, 0)$. ■

78. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{r}''(t)$, $\mathbf{r}'(t) \times \mathbf{r}''(t)$, and $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= -a \sin t \mathbf{i} + a \cos t \mathbf{j} + \mathbf{k} & \|\mathbf{r}'(t)\| &= \sqrt{a^2 \sin^2 t + a^2 \cos^2 t + 1} = \sqrt{a^2 + 1} \\ \mathbf{r}''(t) &= -a \cos t \mathbf{i} - a \sin t \mathbf{j}\end{aligned}$$

$$\begin{aligned}\mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -a \sin t & a \cos t & 1 \\ -a \cos t & -a \sin t & 0 \end{vmatrix} = a \sin t \mathbf{i} - a \cos t \mathbf{j} + (a^2 \sin^2 t + a^2 \cos^2 t) \mathbf{k} \\ &= a \sin t \mathbf{i} - a \cos t \mathbf{j} + a^2 \mathbf{k}\end{aligned}$$

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = \sqrt{a^2 \sin^2 t + a^2 \cos^2 t + a^4} = a\sqrt{1 + a^2}$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{a\sqrt{1 + a^2}}{(a^2 + 1)^{3/2}} = \frac{a}{a^2 + 1},$$

which is a constant. ■

79. We need to find $\mathbf{r}'(t)$ and $\|\mathbf{r}'(t)\|$ so that we can determine the arc length function.

$$\mathbf{r}'(t) = 2\mathbf{i} + 2\mathbf{j} + \mathbf{k} \quad \|\mathbf{r}'(t)\| = \sqrt{4 + 4 + 1} = 3.$$

Since the arc length function from $t = 0$ to an arbitrary t is given by

$$s(t) = \int_0^t \|\mathbf{r}'(u)\| du,$$

$$s(t) = \int_0^t 3 du = [3u]_0^t = 3t.$$

Then $t = \frac{s}{3}$ for $0 \leq s \leq 6$, and the vector equation for C using the arc length s as the parameter is

$$\boxed{\mathbf{r}(s) = \frac{2s}{3}\mathbf{i} + \frac{2s-3}{3}\mathbf{j} + \frac{s}{3}\mathbf{k}, \quad 0 \leq s \leq 6.}$$

80. The vector equations in Problems 13 and 15 represent the same line, but in one of them the parameter used is arc length and the other it is not. Since

$$\mathbf{r}'(t) = a\mathbf{i} + c\mathbf{j} \quad \|\mathbf{r}'(t)\| = \sqrt{a^2 + c^2},$$

$$s(t) = \int_0^t \sqrt{a^2 + c^2} du = \sqrt{a^2 + c^2} t$$

and $t = \frac{s}{\sqrt{a^2 + c^2}}$. The line whose parameter is arc length is $\boxed{\mathbf{r}(s) = \left(\frac{as}{\sqrt{a^2 + c^2}} + b\right)\mathbf{i} + \left(\frac{cs}{\sqrt{a^2 + c^2}} + d\right)\mathbf{j}}.$

81. Every point P on the curve C is traced out by the vector function $\mathbf{r}(t)$. The vector connecting P and $\mathbf{C}(t)$ at any t must be perpendicular to the unit tangent vector $\mathbf{T}(t)$, so it must be a scalar multiple of the principal unit normal vector. Since the radius of the osculating circle is $\rho = \frac{1}{\kappa}$, $\mathbf{C}(t) = \mathbf{r}(t) + \rho\mathbf{N}(t)$. ■
82. To find the radius of the osculating circle, we need $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, and $\|\mathbf{T}'(t)\|$.

$$\begin{aligned}\mathbf{r}'(t) &= a \cos t \mathbf{i} - a \sin t \mathbf{j} + a^2 \mathbf{k} \\ \|\mathbf{r}'(t)\| &= \sqrt{a^2 \cos^2 t + a^2 \sin^2 t + a^4} = \sqrt{a^2 + a^4} = a\sqrt{1 + a^2} \\ \mathbf{T}(t) &= \frac{a \cos t \mathbf{i} - a \sin t \mathbf{j} + a^2 \mathbf{k}}{a\sqrt{1 + a^2}} = \frac{1}{\sqrt{1 + a^2}} (\cos t \mathbf{i} - \sin t \mathbf{j} + a \mathbf{k}) \\ \mathbf{T}'(t) &= \frac{1}{\sqrt{1 + a^2}} (-\sin t \mathbf{i} - \cos t \mathbf{j}) \quad \|\mathbf{T}'(t)\| = \frac{1}{\sqrt{1 + a^2}} \sqrt{\sin^2 t + \cos^2 t} = \frac{1}{\sqrt{1 + a^2}}\end{aligned}$$

Then

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\frac{1}{\sqrt{1+a^2}}}{a\sqrt{1+a^2}} = \frac{1}{a(1+a^2)},$$

so the radius of the osculating circle for the helix at any t is $\rho = \boxed{a(1+a^2)}$. To find the center of the osculating circle, we use the result from Problem 81.

$$\mathbf{C}(t) = \mathbf{r}(t) + \rho\mathbf{N}(t)$$

We just found ρ , so we need only to find $\mathbf{N}(t)$.

$$\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|} = \frac{\frac{1}{\sqrt{1+a^2}}(-\sin t \mathbf{i} - \cos t \mathbf{j})}{\frac{1}{\sqrt{1+a^2}}} = -\sin t \mathbf{i} - \cos t \mathbf{j}$$

- (a) The center of the osculating circle at $t = \frac{\pi}{2}$ is

$$\begin{aligned}\mathbf{C}\left(\frac{\pi}{2}\right) &= \mathbf{r}\left(\frac{\pi}{2}\right) + a(1+a^2)\mathbf{N}\left(\frac{\pi}{2}\right) \\ &= a\mathbf{i} + a^2\frac{\pi}{2}\mathbf{k} + (a+a^3)(-\mathbf{i}) \\ &= \boxed{-a^3\mathbf{i} + a^2\frac{\pi}{2}\mathbf{k}}.\end{aligned}$$

- (b) The center of the osculating circle at $t = \pi$ is

$$\begin{aligned}\mathbf{C}(\pi) &= \mathbf{r}(\pi) + a(1+a^2)\mathbf{N}(\pi) \\ &= -a\mathbf{j} + a^2\pi\mathbf{k} + (a+a^3)(\mathbf{j}) \\ &= \boxed{a^3\mathbf{j} + a^2\pi\mathbf{k}}.\end{aligned}$$

83. $\mathbf{T}(s)$ is the unit tangent vector, which means that $\mathbf{T}(s) \cdot \mathbf{T}(s) = \|\mathbf{T}(s)\|^2 = 1$. Differentiating this equation,

$$\frac{d}{ds}[\mathbf{T}(s) \cdot \mathbf{T}(s)] = \frac{d}{ds}(1) = 0$$

Using the dot product formula for derivatives,

$$\frac{d}{ds}[\mathbf{T}(s) \cdot \mathbf{T}(s)] = \mathbf{T}'(s) \cdot \mathbf{T}(s) + \mathbf{T}(s) \cdot \mathbf{T}'(s) = 2\mathbf{T}'(s) \cdot \mathbf{T}(s)$$

Then $\mathbf{T}'(s) \cdot \mathbf{T}(s) = 0$, so $\mathbf{T}'(s)$ and $\mathbf{T}(s)$ are orthogonal. The principal unit normal vector $\mathbf{N}(s)$ is a scalar multiple of $\mathbf{T}'(s)$, so it must also be orthogonal to $\mathbf{T}(s)$. Since one of the properties of the cross product is that $\mathbf{v} \times \mathbf{w}$ is orthogonal to both $\mathbf{v}$ and $\mathbf{w}$, $\mathbf{B}(s) = \mathbf{T}(s) \times \mathbf{N}(s)$ must be orthogonal to both $\mathbf{T}(s)$ and $\mathbf{N}(s)$, $\mathbf{T}$, $\mathbf{N}$, and $\mathbf{B}$ are mutually orthogonal. ■

84. By the definition of curvature, $\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\|$. Since $\frac{d\mathbf{T}}{dt} = \frac{d\mathbf{T}}{ds} \frac{ds}{dt}$, and $\frac{ds}{dt} = \|\mathbf{r}'(t)\| \neq 0$,

$$\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\| = \left\| \frac{\frac{d\mathbf{T}}{dt}}{\frac{ds}{dt}} \right\| = \frac{\left\| \frac{d\mathbf{T}}{dt} \right\|}{\frac{ds}{dt}} = \frac{\|\mathbf{T}'(t)\|}{\frac{ds}{dt}}.$$

Using $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\kappa \mathbf{N} = \left(\frac{\|\mathbf{T}'(t)\|}{\frac{ds}{dt}} \right) \left(\frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|} \right) = \frac{\mathbf{T}'(t)}{\frac{ds}{dt}} = \frac{\frac{d\mathbf{T}}{dt}}{\frac{ds}{dt}} = \frac{d\mathbf{T}}{ds}$$

by the Chain Rule. ■

85. In Problem 83 we established that $\mathbf{T}$ is orthogonal to $\mathbf{N}$, so the angle between them must be $\theta = \frac{\pi}{2}$. Using one of the properties of the cross product,

$$\mathbf{B} = \mathbf{T} \times \mathbf{N} \quad \text{so} \quad \|\mathbf{B}\| = \|\mathbf{T} \times \mathbf{N}\| = \|\mathbf{T}\| \|\mathbf{N}\| \sin \frac{\pi}{2} = \|\mathbf{T}\| \|\mathbf{N}\| = 1.$$

Then $\mathbf{B}$ is a unit vector, which means that $\mathbf{B} \cdot \mathbf{B} = \|\mathbf{B}\|^2 = 1$. Differentiating this equation,

$$\frac{d}{ds} [\mathbf{B} \cdot \mathbf{B}] = \frac{d}{ds} (1) = 0$$

Using the dot product formula for derivatives,

$$\frac{d}{ds} [\mathbf{B} \cdot \mathbf{B}] = \mathbf{B}' \cdot \mathbf{B} + \mathbf{B} \cdot \mathbf{B}' = 2\mathbf{B}' \cdot \mathbf{B}$$

Then $\mathbf{B}' \cdot \mathbf{B} = 0$, so $\mathbf{B}'$ and $\mathbf{B}$ are orthogonal.

Using the Chain Rule and the cross product formula for derivatives,

$$\begin{aligned} \frac{d}{ds} (\mathbf{B}) &= \frac{d}{ds} (\mathbf{T} \times \mathbf{N}) = \frac{\frac{d}{dt} (\mathbf{T} \times \mathbf{N})}{\frac{ds}{dt}} = \frac{\frac{d}{dt} (\mathbf{T} \times \mathbf{N})}{\|\mathbf{r}'(t)\|} \\ &= \frac{1}{\|\mathbf{r}'(t)\|} [(\mathbf{T}' \times \mathbf{N}) + (\mathbf{T} \times \mathbf{N}')] \\ &= \frac{1}{\|\mathbf{r}'(t)\|} \left[\left(\mathbf{T}' \times \frac{\mathbf{T}'}{\|\mathbf{T}'\|} \right) + (\mathbf{T} \times \mathbf{N}') \right] \\ &= \frac{1}{\|\mathbf{r}'(t)\|} [\mathbf{0} + (\mathbf{T} \times \mathbf{N}')] = \frac{\mathbf{T} \times \mathbf{N}'}{\|\mathbf{r}'(t)\|}. \end{aligned}$$

By one of the properties of the cross product, since $\frac{d\mathbf{B}}{ds} = \frac{\mathbf{T} \times \mathbf{N}'}{\|\mathbf{r}'(t)\|}$, $\frac{d\mathbf{B}}{ds}$ is orthogonal to $\mathbf{T}$. ■

86. In Problem 83 we showed that $\mathbf{T}$, $\mathbf{N}$, and $\mathbf{B}$ form a collection of mutually orthogonal unit vectors, so since $\mathbf{B} = \mathbf{T} \times \mathbf{N}$, we must also have $\mathbf{T} = \mathbf{N} \times \mathbf{B}$ and $\mathbf{N} = \mathbf{B} \times \mathbf{T}$ as we do with the unit vectors $\mathbf{i}$, $\mathbf{j}$, and $\mathbf{k}$. Then

$$\begin{aligned} \frac{d}{ds} (\mathbf{N}) &= \frac{d}{ds} (\mathbf{B} \times \mathbf{T}) = (\mathbf{B}' \times \mathbf{T}) + (\mathbf{B} \times \mathbf{T}') \\ &= [(-\tau \mathbf{N}) \times \mathbf{T}] + [\mathbf{B} \times (\kappa \mathbf{N})] = -\tau (\mathbf{N} \times \mathbf{T}) + \kappa (\mathbf{B} \times \mathbf{N}) \\ &= -\tau (-\mathbf{B}) + \kappa (-\mathbf{T}) = \tau \mathbf{B} - \kappa \mathbf{T} \end{aligned}$$
■

87. We need $\mathbf{r}'(s)$ and $\|\mathbf{r}'(s)\|$.

$$\mathbf{r}'(s) = \frac{\sqrt{2}}{2} [\cos s \mathbf{i} - \sin s \mathbf{j} + \mathbf{k}] \quad \|\mathbf{r}'(s)\| = \frac{\sqrt{2}}{2} \sqrt{\cos^2 s + \sin^2 s + 1} = \frac{\sqrt{2}}{2} \sqrt{2} = 1$$

Then

$$\mathbf{T}(s) = \boxed{\frac{\sqrt{2}}{2} \cos s \mathbf{i} - \frac{\sqrt{2}}{2} \sin s \mathbf{j} + \frac{\sqrt{2}}{2} \mathbf{k}}$$

and

$$\mathbf{T}'(s) = \frac{\sqrt{2}}{2} [-\sin s \mathbf{i} - \cos s \mathbf{j}] \quad \|\mathbf{T}'(s)\| = \frac{\sqrt{2}}{2}$$

so

$$\mathbf{N}(s) = \frac{\mathbf{T}'(s)}{\|\mathbf{T}'(s)\|} = \boxed{-\sin s \mathbf{i} - \cos s \mathbf{j}}$$

and

$$\kappa = \frac{\|\mathbf{T}'(s)\|}{\|\mathbf{r}'(s)\|} = \boxed{\frac{\sqrt{2}}{2}}.$$

The binormal vector $\mathbf{B}$ is defined as $\mathbf{B}(s) = \mathbf{T}(s) \times \mathbf{N}(s)$, so

$$\begin{aligned} \mathbf{B}(s) &= \mathbf{T}(s) \times \mathbf{N}(s) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\sqrt{2}}{2} \cos s & -\frac{\sqrt{2}}{2} \sin s & \frac{\sqrt{2}}{2} \\ -\sin s & -\cos s & 0 \end{vmatrix} \\ &= \frac{\sqrt{2}}{2} \cos s \mathbf{i} - \frac{\sqrt{2}}{2} \sin s \mathbf{j} - \left(\frac{\sqrt{2}}{2} \cos^2 s + \frac{\sqrt{2}}{2} \sin^2 s \right) \mathbf{k} \\ &= \boxed{\frac{\sqrt{2}}{2} \cos s \mathbf{i} - \frac{\sqrt{2}}{2} \sin s \mathbf{j} - \frac{\sqrt{2}}{2} \mathbf{k}}. \end{aligned}$$

Challenge Problems

88. We represent the polar curve $r = f(\theta)$ as

$$\mathbf{r}(\theta) = r \cos \theta \mathbf{i} + r \sin \theta \mathbf{j} = f(\theta) \cos \theta \mathbf{i} + f(\theta) \sin \theta \mathbf{j}.$$

Note that $\mathbf{r}(\theta)$ is a vector function and $r = f(\theta)$ is a polar equation with $\frac{dr}{d\theta} = f'(\theta)$. We need $\mathbf{r}'(\theta)$, $\|\mathbf{r}'(\theta)\|$, $\mathbf{r}''(\theta)$, $\mathbf{r}'(\theta) \times \mathbf{r}''(\theta)$, and $\|\mathbf{r}'(\theta) \times \mathbf{r}''(\theta)\|$.

$$\mathbf{r}'(\theta) = [f'(\theta) \cos \theta - f(\theta) \sin \theta] \mathbf{i} + [f'(\theta) \sin \theta + f(\theta) \cos \theta] \mathbf{j}$$

Since $\|\mathbf{r}'(\theta)\|^2 = [f'(\theta) \cos \theta - f(\theta) \sin \theta]^2 + [f'(\theta) \sin \theta + f(\theta) \cos \theta]^2$,

$$[f'(\theta) \cos \theta - f(\theta) \sin \theta]^2 = [f'(\theta)]^2 \cos^2 \theta - 2f(\theta)f'(\theta) \sin \theta \cos \theta + [f(\theta)]^2 \sin^2 \theta,$$

and

$$[f'(\theta) \sin \theta + f(\theta) \cos \theta]^2 = [f'(\theta)]^2 \sin^2 \theta + 2f(\theta)f'(\theta) \sin \theta \cos \theta + [f(\theta)]^2 \cos^2 \theta,$$

$$\|\mathbf{r}'(\theta)\| = \sqrt{[f'(\theta)]^2 + [f(\theta)]^2} = \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}.$$

Using the Product Rule and combining like terms,

$$\mathbf{r}''(\theta) = [f''(\theta) \cos \theta - 2f'(\theta) \sin \theta - f(\theta) \cos \theta] \mathbf{i} + [f''(\theta) \sin \theta + 2f'(\theta) \cos \theta - f(\theta) \sin \theta] \mathbf{j}$$

so

$$\mathbf{r}'(\theta) \times \mathbf{r}''(\theta) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ f'(\theta) \cos \theta - f(\theta) \sin \theta & f'(\theta) \sin \theta + f(\theta) \cos \theta & 0 \\ f''(\theta) \cos \theta - 2f'(\theta) \sin \theta - f(\theta) \cos \theta & f''(\theta) \sin \theta + 2f'(\theta) \cos \theta - f(\theta) \sin \theta & 0 \end{vmatrix}$$

The **i** and **j** components become **0**. To find the **k** terms, we distribute both

$$[f'(\theta) \cos \theta - f(\theta) \sin \theta][f''(\theta) \sin \theta + 2f'(\theta) \cos \theta - f(\theta) \sin \theta]$$

and

$$-[f'(\theta) \sin \theta + f(\theta) \cos \theta][f''(\theta) \cos \theta - 2f'(\theta) \sin \theta - f(\theta) \cos \theta].$$

$$\begin{aligned} f'(\theta) \cos \theta [f''(\theta) \sin \theta + 2f'(\theta) \cos \theta - f(\theta) \sin \theta] &= f'(\theta) f''(\theta) \sin \theta \cos \theta + 2[f'(\theta)]^2 \cos^2 \theta - f(\theta) f'(\theta) \sin \theta \cos \theta \\ -f(\theta) \sin \theta [f''(\theta) \sin \theta + 2f'(\theta) \cos \theta - f(\theta) \sin \theta] &= -f(\theta) f''(\theta) \sin^2 \theta - 2f(\theta) f'(\theta) \sin \theta \cos \theta + [f(\theta)]^2 \sin^2 \theta \\ -f'(\theta) \sin \theta [f''(\theta) \cos \theta - 2f'(\theta) \sin \theta - f(\theta) \cos \theta] &= -f'(\theta) f''(\theta) \sin \theta \cos \theta + 2[f'(\theta)]^2 \sin^2 \theta + f(\theta) f'(\theta) \sin \theta \cos \theta \\ -f(\theta) \cos \theta [f''(\theta) \cos \theta - 2f'(\theta) \sin \theta - f(\theta) \cos \theta] &= -f(\theta) f''(\theta) \cos^2 \theta + 2f(\theta) f'(\theta) \sin \theta \cos \theta + [f(\theta)]^2 \cos^2 \theta \end{aligned}$$

Adding these terms together, we find

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = ([f(\theta)]^2 + 2[f'(\theta)]^2 - f(\theta)f''(\theta))\mathbf{k}$$

and

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = |[f(\theta)]^2 + 2[f'(\theta)]^2 - f(\theta)f''(\theta)| = \left| r^2 + 2 \left(\frac{dr}{d\theta} \right)^2 - r \frac{d^2r}{d\theta^2} \right|.$$

The curvature is

$$\kappa = \frac{\|\mathbf{r}'(\theta) \times \mathbf{r}''(\theta)\|}{\|\mathbf{r}'(\theta)\|^3} = \frac{\left| r^2 + 2 \left(\frac{dr}{d\theta} \right)^2 - r \frac{d^2r}{d\theta^2} \right|}{\left[r^2 + \left(\frac{dr}{d\theta} \right)^2 \right]^{3/2}}.$$

■

89. Differentiating r gives $\frac{dr}{d\theta} = -4 \sin(2\theta)$ and $\frac{d^2r}{d\theta^2} = -8 \cos(2\theta)$. At $\theta = \frac{\pi}{12}$, $r\left(\frac{\pi}{12}\right) = \sqrt{3}$, $r'\left(\frac{\pi}{12}\right) = -2$, and $r''\left(\frac{\pi}{12}\right) = -4\sqrt{3}$. We use the formula given in Problem 88 and evaluate κ .

$$\kappa = \frac{|(\sqrt{3})^2 + 2(-2)^2 - \sqrt{3}(-4\sqrt{3})|}{[(\sqrt{3})^2 + (-2)^2]^{3/2}} = \frac{23}{7\sqrt{7}} = \boxed{\frac{23}{7^{3/2}}}$$

90. Differentiating r gives $\frac{dr}{d\theta} = ae^{a\theta}$ and $\frac{d^2r}{d\theta^2} = a^2e^{a\theta}$. At $\theta = \frac{\pi}{2}$, $r\left(\frac{\pi}{2}\right) = e^{a\pi/2}$, $r'\left(\frac{\pi}{2}\right) = ae^{a\pi/2}$, and $r''\left(\frac{\pi}{2}\right) = a^2e^{a\pi/2}$. We use the formula given in Problem 88 and evaluate κ .

$$\kappa = \frac{|(e^{a\pi/2})^2 + 2(ae^{a\pi/2})^2 - e^{a\pi/2}a^2e^{a\pi/2}|}{[(e^{a\pi/2})^2 + (ae^{a\pi/2})^2]^{3/2}} = \frac{|e^{a\pi} + 2a^2e^{a\pi} - a^2e^{a\pi}|}{(e^{a\pi} + a^2e^{a\pi})^{3/2}} = \boxed{\frac{1}{\sqrt{e^{a\pi}(1+a^2)}}}$$

91. Differentiating r gives $\frac{dr}{d\theta} = a$ and $\frac{d^2r}{d\theta^2} = 0$. At $\theta = 1$, $r(1) = a$, $r'(1) = a$, and $r''(1) = 0$. We use the formula given in Problem 88 and evaluate κ .

$$\kappa = \frac{|a^2 + 2(a)^2 - a(0)|}{[(a)^2 + (a)^2]^{3/2}} = \frac{3}{2\sqrt{2}a} = \boxed{\frac{3\sqrt{2}}{4a}}.$$

92. We represent the polar curve $r = 1 - \cos \theta$ as

$$\mathbf{r}(\theta) = (1 - \cos \theta) \cos \theta \mathbf{i} + (1 - \cos \theta) \sin \theta \mathbf{j}.$$

Then

$$\mathbf{r}'(\theta) = [\sin \theta \cos \theta - (1 - \cos \theta) \sin \theta] \mathbf{i} + [\sin^2 \theta + (1 - \cos \theta) \cos \theta] \mathbf{j}$$

and

$$\mathbf{r}'(0) = 0\mathbf{i} + 0\mathbf{j} = \mathbf{0}.$$

Since $\mathbf{r}'(\theta) = \mathbf{0}$ at $\theta = 0$, $\mathbf{r}(\theta)$ is not smooth and $\boxed{\kappa \text{ does not exist}}$ for $\theta = 0$. Equivalently, recognizing the polar curve as a cardioid with a cusp at $\theta = 0$ is sufficient to conclude that the curvature does not exist there.

93. Differentiating r gives $\frac{dr}{d\theta} = -2\cos\theta$ and $\frac{d^2r}{d\theta^2} = 2\sin\theta$. At $\theta = \frac{\pi}{6}$, $r\left(\frac{\pi}{6}\right) = 2$, $r'\left(\frac{\pi}{6}\right) = -\sqrt{3}$, and $r''\left(\frac{\pi}{6}\right) = 1$. We use the formula given in Problem 88 and evaluate κ .

$$\kappa = \frac{|2^2 + 2(-\sqrt{3})^2 - 2(1)|}{[2^2 + (-\sqrt{3})^2]^{3/2}} = \boxed{\frac{8\sqrt{7}}{49}}$$

94. Differentiating r gives $\frac{dr}{d\theta} = -3\sin\theta$ and $\frac{d^2r}{d\theta^2} = -3\cos\theta$. At $\theta = \frac{\pi}{3}$, $r\left(\frac{\pi}{3}\right) = \frac{7}{2}$, $r'\left(\frac{\pi}{3}\right) = -\frac{3\sqrt{3}}{2}$, and $r''\left(\frac{\pi}{3}\right) = -\frac{3}{2}$. We use the formula given in Problem 88 and evaluate κ .

$$\kappa = \frac{\left|\left(\frac{7}{2}\right)^2 + 2\left(-\frac{3\sqrt{3}}{2}\right)^2 - \left(\frac{7}{2}\right)\left(-\frac{3}{2}\right)\right|}{\left[\left(\frac{7}{2}\right)^2 + \left(-\frac{3\sqrt{3}}{2}\right)^2\right]^{3/2}} = \frac{31}{(19)^{3/2}} = \boxed{\frac{31\sqrt{19}}{361}}$$

95. From the figure we see that h is less than x by $\rho\sin\phi$ and k is greater than y by $\rho\cos\phi$, so

$$h = x - \rho\sin\phi \quad k = y + \rho\cos\phi.$$

The point P is on the principal unit normal vector, which has a slope of $\frac{-1}{y'}$. We know slope represents the change in y over the change in x . The change in y has a magnitude of 1, so the side of the triangle adjacent to ϕ has length 1. The change in x has a magnitude of y' , so the side of the triangle opposite ϕ has a magnitude of y' . By the Pythagorean Theorem, the hypotenuse of the triangle has a magnitude of $\sqrt{1 + (y')^2}$. Using the relations $\sin\phi = \frac{\text{opposite}}{\text{hypotenuse}}$ and $\cos\phi = \frac{\text{adjacent}}{\text{hypotenuse}}$,

$$\sin\phi = \frac{y'}{\sqrt{1 + (y')^2}} \quad \cos\phi = \frac{1}{\sqrt{1 + (y')^2}}.$$

Since $\rho = \frac{[1 + (y')^2]^{3/2}}{|y''|}$,

$$\rho\sin\phi = \left(\frac{[1 + (y')^2]^{3/2}}{|y''|}\right) \left(\frac{y'}{\sqrt{1 + (y')^2}}\right) = \frac{y'[1 + (y')^2]}{y''}$$

and

$$\rho\cos\phi = \left(\frac{[1 + (y')^2]^{3/2}}{|y''|}\right) \left(\frac{1}{\sqrt{1 + (y')^2}}\right) = \frac{1 + (y')^2}{y''}.$$

Then

$$h = x - \rho\sin\phi = x - \frac{y'[1 + (y')^2]}{y''} \quad k = y + \rho\cos\phi = y + \frac{1 + (y')^2}{y''}$$

96. We need y' , $y'(1)$, y'' , and $y''(1)$.

$$y' = 2x \quad y'(1) = 2 \quad y'' = 2 \quad y''(1) = 2$$

From Problem 95, we know

$$h = x - \frac{y'[1 + (y')^2]}{y''} \quad k = y + \frac{1 + (y')^2}{y''},$$

so

$$h = 1 - \frac{2[1 + (2)^2]}{2} = -4 \quad k = 1 + \frac{1 + (2)^2}{2} = \frac{7}{2}.$$

The coordinates of the center of curvature are $\boxed{\left(-4, \frac{7}{2}\right)}$.

97. We need y' , $y'(\frac{\pi}{2})$, y'' , and $y''(\frac{\pi}{2})$.

$$y' = \cos x \quad y'(\frac{\pi}{2}) = 0 \quad y'' = -\sin x \quad y''(\frac{\pi}{2}) = -1$$

From Problem 95, we know

$$h = x - \frac{y'[1 + (y')^2]}{y''} \quad k = y + \frac{1 + (y')^2}{y''},$$

so

$$h = \frac{\pi}{2} - \frac{0[1 + (0)^2]}{-1} = \frac{\pi}{2} \quad k = 1 + \frac{1 + (0)^2}{-1} = 0.$$

The coordinates of the center of curvature are $\boxed{(\frac{\pi}{2}, 0)}$.

98. We need y' , $y'(0)$, y'' , and $y''(0)$.

$$y' = \frac{x+1-x}{(x+1)^2} = \frac{1}{(x+1)^2} \quad y'(0) = 1 \quad y'' = -2(x+1)^{-3} = \frac{-2}{(x+1)^3} \quad y''(0) = -2$$

From Problem 95, we know

$$h = x - \frac{y'[1 + (y')^2]}{y''} \quad k = y + \frac{1 + (y')^2}{y''},$$

so

$$h = 0 - \frac{[1 + (1)^2]}{-2} = 1 \quad k = 0 + \frac{1 + (1)^2}{-2} = -1.$$

The coordinates of the center of curvature are $\boxed{(1, -1)}$.

99. We need y' , $y'(2)$, y'' , and $y''(2)$. We use implicit differentiation.

$$\begin{aligned} \frac{d}{dx} [x^3 + y^3] &= \frac{d}{dx} (4xy) \\ 3x^2 + 3y^2 \frac{dy}{dx} &= 4y + 4x \frac{dy}{dx} \\ \frac{dy}{dx} &= \frac{3x^2 - 4y}{4x - 3y^2} \end{aligned}$$

At $(2, 2)$, $\frac{dy}{dx} = \frac{4}{-4} = -1$. To get y'' , we use implicit differentiation again.

$$\begin{aligned} \frac{d}{dx} \left[3x^2 + 3y^2 \frac{dy}{dx} \right] &= \frac{d}{dx} \left(4y + 4x \frac{dy}{dx} \right) \\ 6x + 6y \left(\frac{dy}{dx} \right)^2 + 3y^2 \frac{d^2y}{dx^2} &= 4 \frac{dy}{dx} + 4 \frac{dy}{dx} + 4x \frac{d^2y}{dx^2} \end{aligned}$$

We now substitute $(2, 2)$ into the above equation to solve for $\frac{d^2y}{dx^2}$.

$$\begin{aligned} (6)(2) + (6)(2)(-1)^2 + 3(2)^2 \frac{d^2y}{dx^2} &= 8(-1) + 4(2) \frac{d^2y}{dx^2} \\ 24 + 12 \frac{d^2y}{dx^2} &= -8 + 8 \frac{d^2y}{dx^2} \end{aligned}$$

so at $(2, 2)$, $\frac{d^2y}{dx^2} = -8$. From Problem 95, we know

$$h = x - \frac{y'[1 + (y')^2]}{y''} \quad k = y + \frac{1 + (y')^2}{y''},$$

so

$$h = 2 - \frac{(-1)[1 + (-1)^2]}{-8} = \frac{7}{4} \quad k = 2 + \frac{1 + (-1)^2}{-8} = \frac{7}{4}.$$

The coordinates of the center of curvature are $\boxed{\left(\frac{7}{4}, \frac{7}{4}\right)}$.

100. We need y' , $y'(2)$, y'' , and $y''(2)$. We use implicit differentiation.

$$\frac{d}{dx}[xy] = \frac{d}{dx}(4)$$

$$y + x \frac{dy}{dx} = 0$$

$$\frac{dy}{dx} = -\frac{y}{x}$$

At $(2, 2)$, $\frac{dy}{dx} = -\frac{2}{2} = -1$. To get y'' , we use implicit differentiation again.

$$\frac{d}{dx}\left[y + x \frac{dy}{dx}\right] = \frac{d}{dx}(0)$$

$$\frac{dy}{dx} + \frac{dy}{dx} + x \frac{d^2y}{dx^2} = 0$$

We now substitute $(2, 2)$ into the above equation to solve for $\frac{d^2y}{dx^2}$.

$$(2)(-1) + 2 \frac{d^2y}{dx^2} = 0$$

so at $(2, 2)$, $\frac{d^2y}{dx^2} = 1$.

From Problem 95, we know

$$h = x - \frac{y'[1 + (y')^2]}{y''} \quad k = y + \frac{1 + (y')^2}{y''},$$

so

$$h = 2 - \frac{(-1)[1 + (-1)^2]}{1} = 4 \quad k = 2 + \frac{1 + (-1)^2}{1} = 4.$$

The coordinates of the center of curvature are $\boxed{(4, 4)}$.

101. To use the result from Problem 95, we need y' and y'' .

$$y' = x \quad y'' = 1$$

Then

$$h = x - x \left(\frac{1 + x^2}{1} \right) = -x^3 \quad k = \frac{1}{2}x^2 + \frac{1 + x^2}{1} = \frac{3}{2}x^2 + 1$$

Solve for x in the equation for k .

$$x = \sqrt{\frac{2}{3}(k - 1)}$$

Substitute x into the equation for h .

$$h = - \left[\sqrt{\frac{2}{3}(k - 1)} \right]^3 = - \left[\frac{2}{3}(k - 1) \right]^{3/2}$$

Square both sides.

$$h^2 = \left[\frac{2}{3}(k - 1) \right]^3 = \frac{8}{27}(k - 1)^3$$

102. We use the result from Problem 81 to find the position vector for the evolute of the ellipse. The components of $\mathbf{C}(t) = \mathbf{r}(t) + \rho \mathbf{N}(t)$ will be the parametric equations for this evolute. We need to find $\mathbf{r}'(t)$, $\|\mathbf{r}'(t)\|$, $\mathbf{T}(t)$, $\mathbf{T}'(t)$, $\|\mathbf{T}'(t)\|$, and $\mathbf{N}(t)$.

$$\mathbf{r}'(t) = -a \sin t \mathbf{i} + b \cos t \mathbf{j} \quad \|\mathbf{r}'(t)\| = \sqrt{a^2 \sin^2 t + b^2 \cos^2 t}$$

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{-a \sin t \mathbf{i} + b \cos t \mathbf{j}}{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t}}$$

We differentiate the components individually.

$$\begin{aligned} \frac{d}{dt} \left(\frac{-a \sin t}{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t}} \right) &= \frac{-a \cos t \sqrt{a^2 \sin^2 t + b^2 \cos^2 t} + \frac{a \sin t (2a^2 \sin t \cos t - 2b^2 \sin t \cos t)}{2(a^2 \sin^2 t + b^2 \cos^2 t)^{1/2}}}{a^2 \sin^2 t + b^2 \cos^2 t} \\ &= \frac{-a \cos t (a^2 \sin^2 t + b^2 \cos^2 t) + a \sin t (a^2 \sin t \cos t - b^2 \sin t \cos t)}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \\ &= \frac{-ab^2 \cos^3 t - ab^2 \sin^2 t \cos t}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \\ &= \frac{-ab^2 \cos t (\cos^2 t + \sin^2 t)}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \\ &= \frac{-ab^2 \cos t}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \end{aligned}$$

and

$$\begin{aligned} \frac{d}{dt} \left(\frac{b \cos t}{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t}} \right) &= \frac{-b \sin t \sqrt{a^2 \sin^2 t + b^2 \cos^2 t} - \frac{b \cos t (2a^2 \sin t \cos t - 2b^2 \sin t \cos t)}{2(a^2 \sin^2 t + b^2 \cos^2 t)^{1/2}}}{a^2 \sin^2 t + b^2 \cos^2 t} \\ &= \frac{-b \sin t (a^2 \sin^2 t + b^2 \cos^2 t) - b \cos t (a^2 \sin t \cos t - b^2 \sin t \cos t)}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \\ &= \frac{-a^2 b \sin^3 t - a^2 b \sin t \cos^2 t}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \\ &= \frac{-a^2 b \sin t (\sin^2 t + \cos^2 t)}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \\ &= \frac{-a^2 b \sin t}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \end{aligned}$$

so

$$\mathbf{T}'(t) = \frac{-ab^2 \cos t \mathbf{i} - a^2 b \sin t \mathbf{j}}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} = \frac{-ab}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} (b \cos t \mathbf{i} + a \sin t \mathbf{j}).$$

Then

$$\|\mathbf{T}'(t)\| = \frac{ab}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} \sqrt{b^2 \cos^2 t + a^2 \sin^2 t} = \frac{ab}{a^2 \sin^2 t + b^2 \cos^2 t}.$$

We know $\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|}$ and $\rho = \frac{1}{\kappa}$, so

$$\rho = \frac{\|\mathbf{r}'(t)\|}{\|\mathbf{T}'(t)\|} = \frac{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t}}{\frac{ab}{a^2 \sin^2 t + b^2 \cos^2 t}} = \frac{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}}{ab}.$$

Since $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$,

$$\mathbf{N}(t) = \frac{\frac{-ab}{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}} (b \cos t \mathbf{i} + a \sin t \mathbf{j})}{\frac{ab}{a^2 \sin^2 t + b^2 \cos^2 t}} = \frac{-b \cos t \mathbf{i} - a \sin t \mathbf{j}}{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t}}.$$

We next find and simplify $\rho\mathbf{N}(t)$.

$$\begin{aligned}\rho\mathbf{N}(t) &= \frac{(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}}{ab} \left(\frac{-b \cos t \mathbf{i} - a \sin t \mathbf{j}}{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t}} \right) = \frac{(a^2 \sin^2 t + b^2 \cos^2 t)(-b \cos t \mathbf{i} - a \sin t \mathbf{j})}{ab} \\ &= -\frac{\cos t(a^2 \sin^2 t + b^2 \cos^2 t)}{a} \mathbf{i} - \frac{\sin t(a^2 \sin^2 t + b^2 \cos^2 t)}{b} \mathbf{j}\end{aligned}$$

Then

$$\begin{aligned}\mathbf{C}(t) &= \mathbf{r}(t) + \rho\mathbf{N}(t) = a \cos t \mathbf{i} + b \sin t \mathbf{j} - \frac{\cos t(a^2 \sin^2 t + b^2 \cos^2 t)}{a} \mathbf{i} - \frac{\sin t(a^2 \sin^2 t + b^2 \cos^2 t)}{b} \mathbf{j} \\ &= \left[a \cos t - \frac{\cos t(a^2 \sin^2 t + b^2 \cos^2 t)}{a} \right] \mathbf{i} + \left[b \sin t - \frac{\sin t(a^2 \sin^2 t + b^2 \cos^2 t)}{b} \right] \mathbf{j} \\ &= \left[\frac{a^2 \cos t - \cos t(a^2 \sin^2 t + b^2 \cos^2 t)}{a} \right] \mathbf{i} + \left[\frac{b^2 \sin t - \sin t(a^2 \sin^2 t + b^2 \cos^2 t)}{b} \right] \mathbf{j} \\ &= \frac{\cos t(a^2 - a^2 \sin^2 t - b^2 \cos^2 t)}{a} \mathbf{i} + \frac{\sin t(b^2 - a^2 \sin^2 t - b^2 \cos^2 t)}{b} \mathbf{j} \\ &= \frac{\cos t(a^2 \cos^2 t - b^2 \cos^2 t)}{a} \mathbf{i} + \frac{\sin t(-a^2 \sin^2 t + b^2 \sin^2 t)}{b} \mathbf{j} = \frac{\cos^3 t(a^2 - b^2)}{a} \mathbf{i} - \frac{\sin^3 t(a^2 - b^2)}{b} \mathbf{j}\end{aligned}$$

so the parametric equations of the evolute of the ellipse are $\boxed{h = \frac{a^2 - b^2}{a} \cos^3 t \text{ and } k = -\frac{a^2 - b^2}{b} \sin^3 t}.$

To eliminate the parameter, we solve the h and k equations for $\cos t$ and $\sin t$, respectively.

$$\cos t = \left(\frac{ah}{a^2 - b^2} \right)^{1/3} \quad \sin t = \left(\frac{-bk}{a^2 - b^2} \right)^{1/3}$$

or

$$\cos^2 t = \left(\frac{ah}{a^2 - b^2} \right)^{2/3} \quad \sin^2 t = \left(\frac{bk}{a^2 - b^2} \right)^{2/3}$$

and the rectangular equation for the evolute is

$$\left(\frac{ah}{a^2 - b^2} \right)^{2/3} + \left(\frac{bk}{a^2 - b^2} \right)^{2/3} = 1$$

or

$$\boxed{(ah)^{2/3} + (bk)^{2/3} = (a^2 - b^2)^{2/3}}.$$

11.4 Motion Along a Curve

Applications and Extensions

Concepts and Vocabulary

1. True by the definition at the beginning of subsection 1.
2. False. We know the acceleration vector $\mathbf{a}(t)$ can be written in terms of the unit tangent vector $\mathbf{T}(t)$ and the principal unit normal vector as $\mathbf{N}(t)$ as $\mathbf{a}(t) = v'(t)\mathbf{T}(t) + [v(t)]^2\kappa\mathbf{N}(t)$. For a particle moving with constant speed, $v'(t) = 0$, so the tangential component is zero. The acceleration of the particle is directed along the unit normal vector, $\mathbf{N}$.
3. True. The vector in the direction of the velocity is the tangential component, and the vector perpendicular to the direction of the velocity is the normal component.
4. $a_{\mathbf{T}} = v'(t)$ is called the tangential component and $a_{\mathbf{N}} = [v(t)]^2\kappa$ is called the normal component.

Skill Building

5. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}t\mathbf{i} + \frac{d}{dt}t^2\mathbf{j} = \boxed{\mathbf{i} + 2t\mathbf{j}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}\mathbf{i} + \frac{d}{dt}2t\mathbf{j} = \boxed{2\mathbf{j}}$$

$$v(t) = \|\mathbf{r}'(t)\| = \sqrt{1^2 + (2t)^2} = \boxed{\sqrt{4t^2 + 1}}.$$

At $t = 0$, the velocity is $\mathbf{v}(0) = \mathbf{r}'(0) = \mathbf{i}$ and the acceleration is $\mathbf{a}(0) = \mathbf{r}''(0) = 2\mathbf{j}$.

- (b) The motion of the particle and the vectors $\mathbf{v}(0)$ and $\mathbf{a}(0)$ are graphed below.

6. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}t\mathbf{i} - \frac{d}{dt}t^3\mathbf{j} = \boxed{\mathbf{i} - 3t^2\mathbf{j}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(\mathbf{i} - 3t^2\mathbf{j}) = \boxed{-6t\mathbf{j}}$$

$$v(t) = \|\mathbf{r}'(t)\| = \sqrt{1^2 + (-3t^2)^2} = \boxed{\sqrt{9t^4 + 1}}.$$

At $t = 0$, the velocity is $\mathbf{v}(0) = \mathbf{r}'(0) = \mathbf{i}$ and the acceleration is $\mathbf{a}(0) = \mathbf{r}''(0) = \mathbf{0}$.

(b) The motion of the particle and the vectors $\mathbf{v}(0)$ and $\mathbf{a}(0)$ are graphed below.

7. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}(t^2 + 1)\mathbf{i} - \frac{d}{dt}(1 - t)\mathbf{j} = \boxed{2t\mathbf{i} - \mathbf{j}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(2t\mathbf{i} - \mathbf{j}) = \boxed{2\mathbf{i}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{(2t)^2 + (-1)^2} = \boxed{\sqrt{4t^2 + 1}}.\end{aligned}$$

At $t = 0$, the velocity is $\mathbf{v}(0) = \mathbf{r}'(0) = -\mathbf{j}$ and the acceleration is $\mathbf{a}(0) = \mathbf{r}''(0) = 2\mathbf{i}$.

(b) The motion of the particle and the vectors $\mathbf{v}(0)$ and $\mathbf{a}(0)$ are graphed below.

8. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}t^3\mathbf{i} + \frac{d}{dt}3t\mathbf{j} = \boxed{3t^2\mathbf{i} + 3\mathbf{j}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(3t^2\mathbf{i} + 3\mathbf{j}) = \boxed{6t\mathbf{i}}$$

$$v(t) = \|\mathbf{r}'(t)\| = \sqrt{(3t^2)^2 + 3^2} = \boxed{3\sqrt{t^4 + 1}}.$$

At $t = 0$, the velocity is $\mathbf{v}(0) = \mathbf{r}'(0) = 3\mathbf{j}$ and the acceleration is $\mathbf{a}(0) = \mathbf{r}''(0) = \mathbf{0}$.

- (b) The motion of the particle and the vectors $\mathbf{v}(0)$ and $\mathbf{a}(0)$ are graphed below.

9. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}4t\mathbf{i} - \frac{d}{dt}t^3\mathbf{j} = \boxed{4\mathbf{i} - 3t^2\mathbf{j}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(4\mathbf{i} - 3t^2\mathbf{j}) = \boxed{-6t\mathbf{j}}$$

$$v(t) = \|\mathbf{r}'(t)\| = \sqrt{4^2 + (-3t^2)^2} = \boxed{\sqrt{9t^4 + 16}}.$$

At $t = 0$, the velocity is $\mathbf{v}(0) = \mathbf{r}'(0) = 4\mathbf{i}$ and the acceleration is $\mathbf{a}(0) = \mathbf{r}''(0) = \mathbf{0}$.

- (b) The motion of the particle and the vectors $\mathbf{v}(0)$ and $\mathbf{a}(0)$ are graphed below.

10. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}t^3\mathbf{i} + \frac{d}{dt}\left(\frac{1}{2}t\right)\mathbf{j} = \boxed{3t^2\mathbf{i} + \frac{1}{2}\mathbf{j}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}\left(3t^2\mathbf{i} + \frac{1}{2}\mathbf{j}\right) = \boxed{6t\mathbf{i}}$$

$$v(t) = \|\mathbf{r}'(t)\| = \sqrt{(3t^2)^2 + \left(\frac{1}{2}\right)^2} = \sqrt{\frac{36t^4 + 1}{4}} = \boxed{\frac{1}{2}\sqrt{36t^4 + 1}}.$$

At $t = 0$, the velocity is $\mathbf{v}(0) = \mathbf{r}'(0) = \frac{1}{2}\mathbf{j}$ and the acceleration is $\mathbf{a}(0) = \mathbf{r}''(0) = \mathbf{0}$.

- (b) The motion of the particle and the vectors $\mathbf{v}(0)$ and $\mathbf{a}(0)$ are graphed below.

11. The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}t^2\mathbf{i} + \frac{d}{dt}t\mathbf{j} - \frac{d}{dt}3t^3\mathbf{k} = \boxed{2t\mathbf{i} + \mathbf{j} - 9t^2\mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(2t\mathbf{i} + \mathbf{j} - 9t^2\mathbf{k}) = \boxed{2\mathbf{i} - 18t\mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{(2t)^2 + 1^2 + (-9t^2)^2} = \boxed{\sqrt{81t^4 + 4t^2 + 1}}.\end{aligned}$$

12. The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}(t+1)\mathbf{i} + \frac{d}{dt}6t\mathbf{j} + \frac{d}{dt}t^2\mathbf{k} = \boxed{\mathbf{i} + 6\mathbf{j} + 2t\mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(\mathbf{i} + 6\mathbf{j} + 2t\mathbf{k}) = \boxed{2\mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{1^2 + 6^2 + (2t)^2} = \boxed{\sqrt{4t^2 + 37}}.\end{aligned}$$

13. The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}\sqrt{16-t^2}\mathbf{i} + \frac{d}{dt}t^2\mathbf{j} + \frac{d}{dt}t\mathbf{k} = \frac{1}{2}(16-t^2)^{-1/2}(-2t)\mathbf{i} + 2t\mathbf{j} + \mathbf{k} = \boxed{-\frac{t}{\sqrt{16-t^2}}\mathbf{i} + 2t\mathbf{j} + \mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}\left(\frac{-t}{\sqrt{16-t^2}}\mathbf{i} + 2t\mathbf{j} + \mathbf{k}\right) = \frac{-\sqrt{16-t^2} + t(\frac{1}{2})(16-t^2)^{-1/2}(-2t)}{16-t^2}\mathbf{i} + 2\mathbf{j} \\ &= \frac{t^2 - 16 - t^2}{(16-t^2)^{3/2}}\mathbf{i} + 2\mathbf{j} = \boxed{-\frac{16}{(16-t^2)^{3/2}}\mathbf{i} + 2\mathbf{j}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{\left(\frac{-t}{\sqrt{16-t^2}}\right)^2 + (2t)^2 + 1^2} = \boxed{\sqrt{\frac{t^2}{16-t^2} + 4t^2 + 1}}.\end{aligned}$$

14. The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}\left(\frac{1}{t^2}\right)\mathbf{i} + \frac{d}{dt}\left(\frac{t+1}{t^2}\right)\mathbf{j} + \frac{d}{dt}t\mathbf{k} = \frac{d}{dt}t^{-2}\mathbf{i} + \frac{d}{dt}(t^{-1} + t^{-2})\mathbf{j} + \frac{d}{dt}t\mathbf{k} \\ &= -2t^{-3}\mathbf{i} + (-t^{-2} - 2t^{-3})\mathbf{j} + \mathbf{k} = \boxed{-\frac{2}{t^3}\mathbf{i} - \frac{t+2}{t^3}\mathbf{j} + \mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}[-2t^{-3}\mathbf{i} + (-t^{-2} - 2t^{-3})\mathbf{j} + \mathbf{k}] = 6t^{-4}\mathbf{i} + (2t^{-3} + 6t^{-4})\mathbf{j} = \boxed{\frac{6}{t^4}\mathbf{i} + \frac{2(t+3)}{t^4}\mathbf{j}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{\left(-\frac{2}{t^3}\right)^2 + \left(\frac{t+2}{t^3}\right)^2 + 1^2} = \sqrt{\frac{4}{t^6} + \frac{t^2 + 4t + 4}{t^6} + 1} = \boxed{\frac{\sqrt{t^6 + t^2 + 4t + 8}}{t^3}}.\end{aligned}$$

15. The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}2\cos t\mathbf{i} + \frac{d}{dt}\sin t\mathbf{j} + \frac{d}{dt}t\mathbf{k} = \boxed{-2\sin t\mathbf{i} + \cos t\mathbf{j} + \mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(-2\sin t\mathbf{i} + \cos t\mathbf{j} + \mathbf{k}) = \boxed{-2\cos t\mathbf{i} - \sin t\mathbf{j}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{(2\sin t)^2 + \cos^2 t + 1} = \sqrt{4\sin^2 t + \cos^2 t + 1} = \sqrt{3\sin^2 t + \sin^2 t + \cos^2 t + 1} \\ &= \boxed{\sqrt{3\sin^2 t + 2}}.\end{aligned}$$

16. The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}t\mathbf{i} + \frac{d}{dt}\sin(4t)\mathbf{j} + \frac{d}{dt}\cos(4t)\mathbf{k} = \boxed{\mathbf{i} + 4\cos(4t)\mathbf{j} - 4\sin(4t)\mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(\mathbf{i} + 4\cos(4t)\mathbf{j} - 4\sin(4t)\mathbf{k}) = \boxed{-16\sin(4t)\mathbf{j} - 16\cos(4t)\mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{1^2 + [4\cos(4t)]^2 + [-4\sin(4t)]^2} = \sqrt{1 + 16\cos^2(4t) + 16\sin^2(4t)} = \boxed{\sqrt{17}}.\end{aligned}$$

17. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}\sin t\mathbf{i} + \frac{d}{dt}\cos t\mathbf{j} + \frac{d}{dt}\sin(2t)\mathbf{k} = \boxed{\cos t\mathbf{i} - \sin t\mathbf{j} + 2\cos(2t)\mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(\cos t\mathbf{i} - \sin t\mathbf{j} + 2\cos(2t)\mathbf{k}) = \boxed{-\sin t\mathbf{i} - \cos t\mathbf{j} - 4\sin(2t)\mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{\cos^2 t + \sin^2 t + 4\cos^2(2t)} = \boxed{\sqrt{4\cos^2(2t) + 1}}.\end{aligned}$$

(b) At $t = \frac{\pi}{2}$, the velocity is $\mathbf{v}(\frac{\pi}{2}) = \mathbf{r}'(\frac{\pi}{2}) = \boxed{-\mathbf{j} - 2\mathbf{k}}$, the acceleration is $\mathbf{a}(\frac{\pi}{2}) = \mathbf{r}''(\frac{\pi}{2}) = \boxed{-\mathbf{i}}$, and the speed is $v(\frac{\pi}{2}) = \|\mathbf{v}(\frac{\pi}{2})\| = \boxed{\sqrt{5}}$.

(c) The motion of the particle and the vectors $\mathbf{v}(\frac{\pi}{2})$ and $\mathbf{a}(\frac{\pi}{2})$ are graphed below.

18. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}(\sin t)\mathbf{i} + \frac{d}{dt}(\cos t)\mathbf{j} + \frac{d}{dt}(\sqrt{t})\mathbf{k} = \boxed{\cos t\mathbf{i} - \sin t\mathbf{j} + \frac{\sqrt{t}}{2t}\mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}\left(\cos t\mathbf{i} - \sin t\mathbf{j} + \frac{\sqrt{t}}{2t}\mathbf{k}\right) = \boxed{-\sin t\mathbf{i} - \cos t\mathbf{j} - \frac{\sqrt{t}}{4t^2}\mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{\cos^2 t + \sin^2 t + \frac{1}{4t}} = \sqrt{1 + \frac{1}{4t}} = \boxed{\sqrt{\frac{4t+1}{4t}}}.\end{aligned}$$

(b) At $t = \pi$, the velocity is $\mathbf{v}(\pi) = \mathbf{r}'(\pi) = \boxed{-\mathbf{i} + \frac{\sqrt{\pi}}{2\pi}\mathbf{k}}$, the acceleration is $\mathbf{a}(\pi) = \mathbf{r}''(\pi) = \boxed{\mathbf{j} - \frac{\sqrt{\pi}}{4\pi^2}\mathbf{k}}$, and the speed is $v(\pi) = \|\mathbf{v}(\pi)\| = \boxed{\sqrt{\frac{4\pi+1}{4\pi}}}$.

(c) The motion of the particle and the vectors $\mathbf{v}(\pi)$ and $\mathbf{a}(\pi)$ are graphed below.

19. To find the force $\mathbf{F}$ acting on the particle at any time t , we Use Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$. We begin by finding the acceleration $\mathbf{a}$ of the particle.

$$\begin{aligned}\mathbf{r}(t) &= e^t \mathbf{i} + e^{-t} \mathbf{j} \\ \mathbf{v}(t) &= \mathbf{r}'(t) = e^t \mathbf{i} - e^{-t} \mathbf{j} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = e^t \mathbf{i} + e^{-t} \mathbf{j} = \mathbf{r}(t)\end{aligned}$$

- (a) By Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = \boxed{m\mathbf{r}(t)}.$$

- (b) The magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = \boxed{\sqrt{e^{2t} + e^{-2t}}}.$$

20. To find the force $\mathbf{F}$ acting on the particle at any time t , we Use Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$. We begin by finding the acceleration $\mathbf{a}$ of the particle.

$$\begin{aligned}\mathbf{r}(t) &= e^{2t} \mathbf{i} + e^{-t} \mathbf{j} \\ \mathbf{v}(t) &= \mathbf{r}'(t) = 2e^{2t} \mathbf{i} - e^{-t} \mathbf{j} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = 4e^{2t} \mathbf{i} + e^{-t} \mathbf{j}\end{aligned}$$

- (a) By Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = \boxed{4me^{2t} \mathbf{i} + me^{-t} \mathbf{j}}.$$

- (b) The magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = \boxed{\sqrt{16e^{4t} + e^{-2t}}}.$$

21. To find the force $\mathbf{F}$ acting on the particle at any time t , we Use Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$. We begin by finding the acceleration $\mathbf{a}$ of the particle.

$$\begin{aligned}\mathbf{r}(t) &= t\mathbf{i} + e^t \mathbf{j} \\ \mathbf{v}(t) &= \mathbf{r}'(t) = \mathbf{i} + e^t \mathbf{j} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = e^t \mathbf{j}\end{aligned}$$

- (a) By Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = \boxed{me^t \mathbf{j}}.$$

(b) The magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = \sqrt{e^{2t}} = \boxed{e^t}.$$

22. To find the force $\mathbf{F}$ acting on the particle at any time t , we Use Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$. We begin by finding the acceleration $\mathbf{a}$ of the particle.

$$\begin{aligned}\mathbf{r}(t) &= t\mathbf{i} + \ln(1+t)\mathbf{j} \\ \mathbf{v}(t) = \mathbf{r}'(t) &= \mathbf{i} + \frac{1}{1+t}\mathbf{j} \\ \mathbf{a}(t) = \mathbf{r}''(t) &= -\frac{1}{(1+t)^2}\mathbf{j}\end{aligned}$$

(a) By Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = \boxed{-\frac{m}{(1+t)^2}\mathbf{j}}.$$

(b) The magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = \boxed{\frac{1}{(1+t)^2}}.$$

23. To find the force $\mathbf{F}$ acting on the particle at any time t , we Use Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$. We begin by finding the acceleration $\mathbf{a}$ of the particle.

$$\begin{aligned}\mathbf{r}(t) &= 3\sin(2t)\mathbf{i} + 3\cos(2t)\mathbf{j} \\ \mathbf{v}(t) = \mathbf{r}'(t) &= 6\cos(2t)\mathbf{i} - 6\sin(2t)\mathbf{j} \\ \mathbf{a}(t) = \mathbf{r}''(t) &= -12\sin(2t)\mathbf{i} - 12\cos(2t)\mathbf{j} = -4\mathbf{r}(t)\end{aligned}$$

(a) By Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = \boxed{-4m\mathbf{r}(t)}.$$

(b) The magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = \sqrt{144\sin^2(2t) + 144\cos^2(2t)} = \boxed{12}.$$

24. To find the force $\mathbf{F}$ acting on the particle at any time t , we Use Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$. We begin by finding the acceleration $\mathbf{a}$ of the particle.

$$\begin{aligned}\mathbf{r}(t) &= 4\sin t\mathbf{i} - 4\cos t\mathbf{j} \\ \mathbf{v}(t) = \mathbf{r}'(t) &= 4\cos t\mathbf{i} + 4\sin t\mathbf{j} \\ \mathbf{a}(t) = \mathbf{r}''(t) &= -4\sin t\mathbf{i} + 4\cos t\mathbf{j} = -\mathbf{r}(t)\end{aligned}$$

(a) By Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = \boxed{-m\mathbf{r}(t)}.$$

(b) The magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = \sqrt{16\sin^2 t + 16\cos^2 t} = \boxed{4}.$$

25. To find the force $\mathbf{F}$ acting on the particle at any time t , we Use Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$. We begin by finding the acceleration $\mathbf{a}$ of the particle.

$$\begin{aligned}\mathbf{r}(t) &= 2 \cos t \mathbf{i} - 3 \sin t \mathbf{j} \\ \mathbf{v}(t) = \mathbf{r}'(t) &= -2 \sin t \mathbf{i} - 3 \cos t \mathbf{j} \\ \mathbf{a}(t) = \mathbf{r}''(t) &= -2 \cos t \mathbf{i} + 3 \sin t \mathbf{j} = -\mathbf{r}(t)\end{aligned}$$

- (a) By Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = \boxed{-m\mathbf{r}(t)}.$$

- (b) The magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = \sqrt{4 \cos^2 t + 9 \sin^2 t} = \sqrt{4 \cos^2 t + 4 \sin^2 t + 5 \sin^2 t} = \boxed{\sqrt{4 + 5 \sin^2 t}}.$$

26. To find the force $\mathbf{F}$ acting on the particle at any time t , we Use Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$. We begin by finding the acceleration $\mathbf{a}$ of the particle.

$$\begin{aligned}\mathbf{r}(t) &= -\cos(3t)\mathbf{i} + 2 \sin(3t)\mathbf{j} \\ \mathbf{v}(t) = \mathbf{r}'(t) &= 3 \sin(3t)\mathbf{i} + 6 \cos(3t)\mathbf{j} \\ \mathbf{a}(t) = \mathbf{r}''(t) &= 9 \cos(3t)\mathbf{i} - 18 \sin(3t)\mathbf{j} = -9\mathbf{r}(t)\end{aligned}$$

- (a) By Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = \boxed{-9m\mathbf{r}(t)}.$$

- (b) The magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = 9\sqrt{\cos^2(3t) + 4 \sin^2(3t)} = 9\sqrt{\cos^2(3t) + \sin^2(3t) + 3 \sin^2(3t)} = \boxed{9\sqrt{1 + 3 \sin^2(3t)}}.$$

27. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) = \mathbf{r}'(t) &= \frac{d}{dt} (2t\mathbf{i} + (t+1)\mathbf{j}) = \boxed{2\mathbf{i} + \mathbf{j}} \\ \mathbf{a}(t) = \mathbf{r}''(t) &= \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (2\mathbf{i} + \mathbf{j}) = \boxed{\mathbf{0}} \\ v(t) = \|\mathbf{r}'(t)\| &= \boxed{\sqrt{5}}.\end{aligned}$$

- (b) Since the speed is constant, $a_{\mathbf{T}} = v'(t) = \boxed{0}$, and since $\mathbf{r}''(t) = \mathbf{0}$, $\mathbf{r}'(t) \times \mathbf{r}''(t) = \mathbf{0}$ which implies $\kappa = 0$ and $a_{\mathbf{N}} = \boxed{0}$.

28. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) = \mathbf{r}'(t) &= \frac{d}{dt} [(1-3t)\mathbf{i} + 2t\mathbf{j}] = \boxed{-3\mathbf{i} + 2\mathbf{j}} \\ \mathbf{a}(t) = \mathbf{r}''(t) &= \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (-3\mathbf{i} + 2\mathbf{j}) = \boxed{\mathbf{0}} \\ v(t) = \|\mathbf{r}'(t)\| &= \sqrt{9+4} = \boxed{\sqrt{13}}.\end{aligned}$$

- (b) Since the speed is constant, $a_{\mathbf{T}} = v'(t) = \boxed{0}$, and since $\mathbf{r}''(t) = \mathbf{0}$, $\mathbf{r}'(t) \times \mathbf{r}''(t) = \mathbf{0}$ which implies $\kappa = 0$ and $a_{\mathbf{N}} = \boxed{0}$.

29. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}(e^t \mathbf{i} + e^{2t} \mathbf{j}) = \boxed{e^t \mathbf{i} + 2e^{2t} \mathbf{j}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt}(e^t \mathbf{i} + 2e^{2t} \mathbf{j}) = \boxed{e^t \mathbf{i} + 4e^{2t} \mathbf{j}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{e^{2t} + 4e^{4t}} = \boxed{e^t \sqrt{1 + 4e^{2t}}}.\end{aligned}$$

- (b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \frac{1}{2}(e^{2t} + 4e^{4t})^{-1/2}(2e^{2t} + 16e^{4t}) = \frac{2e^{2t}(1 + 8e^{2t})}{2e^t \sqrt{1 + 4e^{2t}}} = \boxed{\frac{e^t(1 + 8e^{2t})}{\sqrt{1 + 4e^{2t}}}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ e^t & 2e^{2t} & 0 \\ e^t & 4e^{2t} & 0 \end{vmatrix} = (4e^{3t} - 2e^{3t})\mathbf{k} = 2e^{3t}\mathbf{k}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\|2e^{3t}\mathbf{k}\|}{e^t \sqrt{1 + 4e^{2t}}} = \frac{2e^{3t}}{e^t \sqrt{1 + 4e^{2t}}} = \boxed{\frac{2e^{2t}}{\sqrt{1 + 4e^{2t}}}}.$$

30. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}(e^{-t} \mathbf{i} + e^{-2t} \mathbf{j}) = \boxed{-e^{-t} \mathbf{i} - 2e^{-2t} \mathbf{j}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt}(-e^{-t} \mathbf{i} - 2e^{-2t} \mathbf{j}) = \boxed{e^{-t} \mathbf{i} + 4e^{-2t} \mathbf{j}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{e^{-2t} + 4e^{-4t}} = \boxed{e^{-t} \sqrt{1 + 4e^{-2t}}}.\end{aligned}$$

- (b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \frac{1}{2}(e^{-2t} + 4e^{-4t})^{-1/2}(-2e^{-2t} - 16e^{-4t}) = \frac{-e^{-2t}(1 + 8e^{-2t})}{e^{-t} \sqrt{1 + 4e^{-2t}}} = \boxed{\frac{-e^{-t}(1 + 8e^{-2t})}{\sqrt{1 + 4e^{-2t}}}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -e^{-t} & -2e^{-2t} & 0 \\ e^{-t} & 4e^{-2t} & 0 \end{vmatrix} = (-4e^{-3t} + 2e^{-3t})\mathbf{k} = -2e^{-3t}\mathbf{k}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\| -2e^{-3t}\mathbf{k} \|}{e^{-t}\sqrt{1+4e^{-2t}}} = \frac{2e^{-3t}}{e^{-t}\sqrt{1+4e^{-2t}}} = \boxed{\frac{2e^{-2t}}{\sqrt{1+4e^{-2t}}}}.$$

31. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}(2\sin t\mathbf{i} + \cos t\mathbf{j}) = \boxed{2\cos t\mathbf{i} - \sin t\mathbf{j}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(2\cos t\mathbf{i} - \sin t\mathbf{j}) = \boxed{-2\sin t\mathbf{i} - \cos t\mathbf{j}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{4\cos^2 t + \sin^2 t} = \sqrt{3\cos^2 t + \cos^2 t + \sin^2 t} = \boxed{\sqrt{3\cos^2 t + 1}}.\end{aligned}$$

(b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \frac{1}{2}(1 + 3\cos^2 t)^{-1/2}6\cos t(-\sin t) = \boxed{-\frac{3\sin t \cos t}{\sqrt{1 + 3\cos^2 t}}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2\kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2\cos t & -\sin t & 0 \\ -2\sin t & -\cos t & 0 \end{vmatrix} = (-2\cos^2 t - 2\sin^2 t)\mathbf{k} = -2\mathbf{k}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\| -2\mathbf{k} \|}{\sqrt{3\cos^2 t + 1}} = \boxed{\frac{2}{\sqrt{3\cos^2 t + 1}}}.$$

32. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt}(2\cos t\mathbf{i} + 3\sin t\mathbf{j}) = \boxed{-2\sin t\mathbf{i} + 3\cos t\mathbf{j}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(-2\sin t\mathbf{i} + 3\cos t\mathbf{j}) = \boxed{-2\cos t\mathbf{i} - 3\sin t\mathbf{j}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{4\sin^2 t + 9\cos^2 t} = \sqrt{4\sin^2 t + 4\cos^2 t + 5\cos^2 t} = \boxed{\sqrt{4 + 5\cos^2 t}}.\end{aligned}$$

(b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \frac{1}{2}(4 + 5\cos^2 t)^{-1/2}5\cos t(-2\sin t) = \boxed{-\frac{5\sin t \cos t}{\sqrt{4 + 5\cos^2 t}}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2\kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2 \sin t & 3 \cos t & 0 \\ -2 \cos t & -3 \sin t & 0 \end{vmatrix} = (6 \sin^2 t + 6 \cos^2 t) \mathbf{k} = 6 \mathbf{k}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|6\mathbf{k}\|}{\sqrt{4+5\cos^2 t}} = \boxed{\frac{6}{\sqrt{4+5\cos^2 t}}}.$$

33. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt} [(1-3t)\mathbf{i} + 2t\mathbf{j} - (5+t)\mathbf{k}] = \boxed{-3\mathbf{i} + 2\mathbf{j} - \mathbf{k}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (-3\mathbf{i} + 2\mathbf{j} - \mathbf{k}) = \boxed{\mathbf{0}}$$

$$v(t) = \|\mathbf{r}'(t)\| = \sqrt{9+4+1} = \boxed{\sqrt{14}}.$$

- (b) Since the speed is constant, $a_{\mathbf{T}} = v'(t) = \boxed{0}$, and since $\mathbf{r}''(t) = \mathbf{0}$, $\mathbf{r}'(t) \times \mathbf{r}''(t) = \mathbf{0}$ which implies $\kappa = 0$ and $a_{\mathbf{N}} = \boxed{0}$.

34. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt} [(2+t)\mathbf{i} + (2-t)\mathbf{j} + 3t\mathbf{k}] = \boxed{\mathbf{i} - \mathbf{j} + 3\mathbf{k}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (\mathbf{i} - \mathbf{j} + 3\mathbf{k}) = \boxed{\mathbf{0}}$$

$$v(t) = \|\mathbf{r}'(t)\| = \sqrt{1+1+9} = \boxed{\sqrt{11}}.$$

- (b) Since the speed is constant, $a_{\mathbf{T}} = v'(t) = \boxed{0}$, and since $\mathbf{r}''(t) = \mathbf{0}$, $\mathbf{r}'(t) \times \mathbf{r}''(t) = \mathbf{0}$ which implies $\kappa = 0$ and $a_{\mathbf{N}} = \boxed{0}$.

35. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt} (t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}) = \boxed{\mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (\mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k}) = \boxed{2\mathbf{j} + 6t\mathbf{k}}$$

$$v(t) = \|\mathbf{r}'(t)\| = \boxed{\sqrt{1+4t^2+9t^4}}.$$

- (b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \frac{8t + 36t^3}{2\sqrt{1+4t^2+9t^4}} = \boxed{\frac{18t^3 + 4t}{\sqrt{1+4t^2+9t^4}}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2t & 3t^2 \\ 0 & 2 & 6t \end{vmatrix} = (12t^2 - 6t^2)\mathbf{i} - 6t\mathbf{j} + 2\mathbf{k} = 2(3t^2\mathbf{i} - 3t\mathbf{j} + \mathbf{k})$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|2(3t^2\mathbf{i} - 3t\mathbf{j} + \mathbf{k})\|}{\sqrt{1+4t^2+9t^4}} = \boxed{\frac{2\sqrt{9t^4+9t^2+1}}{\sqrt{1+4t^2+9t^4}}}.$$

36. (a) The velocity, acceleration, and speed are

$$\begin{aligned} \mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt} \left(\frac{t^2}{t+1}\mathbf{i} + \frac{1}{t+1}\mathbf{j} + \frac{t}{t+1}\mathbf{k} \right) = \frac{2t(t+1)-t^2}{(t+1)^2}\mathbf{i} - \frac{1}{(t+1)^2}\mathbf{j} + \frac{t+1-t}{(t+1)^2}\mathbf{k} \\ &= \boxed{\frac{t(t+2)}{(t+1)^2}\mathbf{i} - \frac{1}{(t+1)^2}\mathbf{j} + \frac{1}{(t+1)^2}\mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt} \left[\frac{t(t+2)}{(t+1)^2}\mathbf{i} - \frac{1}{(t+1)^2}\mathbf{j} + \frac{1}{(t+1)^2}\mathbf{k} \right] \\ &= \frac{(2t+2)(t+1)^2 - t(t+2)(2)(t+1)}{(t+1)^4}\mathbf{i} + \frac{2}{(t+1)^3}\mathbf{j} - \frac{2}{(t+1)^3}\mathbf{k} \\ &= \boxed{\frac{2}{(t+1)^3}\mathbf{i} + \frac{2}{(t+1)^3}\mathbf{j} - \frac{2}{(t+1)^3}\mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{\frac{t^4+4t^3+4t^2+1+1}{(t+1)^4}} = \boxed{\frac{\sqrt{t^4+4t^3+4t^2+2}}{(t+1)^2}}. \end{aligned}$$

(b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \frac{\frac{1}{2}(t^4+4t^3+4t^2+2)^{-1/2}(4t^3+12t^2+8t)(t+1)^2 - (t^4+4t^3+4t^2+2)^{1/2}(2)(t+1)}{(t+1)^4}$$

To simplify, we multiply the numerator and denominator by $(t^4+4t^3+4t^2+2)^{1/2}$ and factor out a $t+1$ term.

$$\begin{aligned} a_{\mathbf{T}} &= \frac{(2t^3+6t^2+4t)(t+1) - 2(t^4+4t^3+4t^2+2)}{(t+1)^3\sqrt{t^4+4t^3+4t^2+2}} = \frac{2t^4+8t^3+10t^2+4t-2t^4-8t^3-8t^2-4}{(t+1)^3\sqrt{t^4+4t^3+4t^2+2}} \\ &= \boxed{\frac{2(t^2+2t-2)}{(t+1)^3\sqrt{t^4+4t^3+4t^2+2}}}. \end{aligned}$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2\kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\begin{aligned} \mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{t^2+2t}{(t+1)^2} & \frac{-1}{(t+1)^2} & \frac{1}{(t+1)^2} \\ \frac{2}{(t+1)^3} & \frac{2}{(t+1)^3} & \frac{-2}{(t+1)^3} \end{vmatrix} = \frac{2}{(t+1)^5} \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ t^2+2t & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix} \\ &= \frac{2}{(t+1)^5} [(t^2+2t+1)\mathbf{j} + (t^2+2t+1)\mathbf{k}] = \frac{2}{(t+1)^3}\mathbf{j} + \frac{2}{(t+1)^3}\mathbf{k} \end{aligned}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\left\| \frac{2}{(t+1)^3} \mathbf{j} + \frac{2}{(t+1)^3} \mathbf{k} \right\|}{\frac{\sqrt{t^4+4t^3+4t^2+2}}{(t+1)^2}} = \frac{\frac{2\sqrt{2}}{(t+1)^3}}{\frac{\sqrt{t^4+4t^3+4t^2+2}}{(t+1)^2}} = \boxed{\frac{2\sqrt{2}}{(t+1)\sqrt{t^4+4t^3+4t^2+2}}}.$$

37. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt} (3\mathbf{i} + \cos t \mathbf{j} + \sin t \mathbf{k}) = \boxed{-\sin t \mathbf{j} + \cos t \mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (-\sin t \mathbf{j} + \cos t \mathbf{k}) = \boxed{-\cos t \mathbf{j} - \sin t \mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{\sin^2 t + \cos^2 t} = \boxed{1}.\end{aligned}$$

- (b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \boxed{0}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & -\sin t & \cos t \\ 0 & -\cos t & -\sin t \end{vmatrix} = (\sin^2 t + \cos^2 t) \mathbf{i} = \mathbf{i}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\|\mathbf{i}\|}{1} = \boxed{1}.$$

38. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt} (t \mathbf{i} + \sin t \mathbf{j} + \cos t \mathbf{k}) = \boxed{\mathbf{i} + \cos t \mathbf{j} - \sin t \mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (\mathbf{i} + \cos t \mathbf{j} - \sin t \mathbf{k}) = \boxed{-\sin t \mathbf{j} - \cos t \mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{1^2 + \cos^2 t + \sin^2 t} = \boxed{\sqrt{2}}.\end{aligned}$$

- (b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \boxed{0}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & \cos t & -\sin t \\ 0 & -\sin t & -\cos t \end{vmatrix} = -\mathbf{i} + \cos t \mathbf{j} - \sin t \mathbf{k}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\|-\mathbf{i} + \cos t \mathbf{j} - \sin t \mathbf{k}\|}{\sqrt{2}} = \frac{\sqrt{1^2 + \cos^2 t + \sin^2 t}}{\sqrt{2}} = \boxed{1}.$$

39. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt} (\ln t \mathbf{i} + \sqrt{t} \mathbf{j} + t^{3/2} \mathbf{k}) = \boxed{\frac{1}{t} \mathbf{i} + \frac{1}{2\sqrt{t}} \mathbf{j} + \frac{3}{2} \sqrt{t} \mathbf{k}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} \left(\frac{1}{t} \mathbf{i} + \frac{1}{2\sqrt{t}} \mathbf{j} + \frac{3}{2} \sqrt{t} \mathbf{k} \right) = \boxed{-\frac{1}{t^2} \mathbf{i} - \frac{1}{4t^{3/2}} \mathbf{j} + \frac{3}{4\sqrt{t}} \mathbf{k}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{\frac{1}{t^2} + \frac{1}{4t} + \frac{9}{4}t} = \sqrt{\frac{4+t+9t^3}{4t^2}} = \boxed{\frac{\sqrt{9t^3+t+4}}{2t}}.\end{aligned}$$

- (b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \frac{2t(\frac{1}{2})(9t^3+t+4)^{-1/2}(27t^2+1) - (9t^3+t+4)^{1/2}(2)}{4t^2}$$

We simplify by multiplying the numerator and the denominator by $(9t^3+t+4)^{1/2}$.

$$a_{\mathbf{T}} = \frac{27t^3+t-18t^3-2t-8}{4t^2\sqrt{9t^3+t+4}} = \boxed{\frac{9t^3-t-8}{4t^2\sqrt{9t^3+t+4}}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{1}{t} & \frac{1}{2\sqrt{t}} & \frac{3}{2}\sqrt{t} \\ -\frac{1}{t^2} & -\frac{1}{4t^{3/2}} & \frac{3}{4\sqrt{t}} \end{vmatrix} = \frac{3}{4t} \mathbf{i} - \frac{9}{4t^{3/2}} \mathbf{j} + \frac{1}{4t^{5/2}} \mathbf{k}$$

so

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = \sqrt{\frac{9}{16t^2} + \frac{81}{16t^3} + \frac{1}{16t^5}} = \sqrt{\frac{9t^3+81t^2+1}{16t^5}}$$

and

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\frac{\sqrt{9t^3+81t^2+1}}{4t^{5/2}}}{\frac{\sqrt{9t^3+t+4}}{2t}} = \boxed{\frac{\sqrt{9t^3+81t^2+1}}{2t^{3/2}\sqrt{9t^3+t+4}}}.$$

40. (a) The velocity, acceleration, and speed are

$$\begin{aligned}\mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt} (\cos(2t) \mathbf{i} + \sin(2t) \mathbf{j} - 5\mathbf{k}) = \boxed{-2\sin(2t) \mathbf{i} + 2\cos(2t) \mathbf{j}} \\ \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (-2\sin(2t) \mathbf{i} + 2\cos(2t) \mathbf{j}) = \boxed{-4\cos(2t) \mathbf{i} - 4\sin(2t) \mathbf{j}} \\ v(t) &= \|\mathbf{r}'(t)\| = \sqrt{4\sin^2(2t) + 4\cos^2(2t)} = \boxed{2}.\end{aligned}$$

- (b) Since the speed is constant, $a_{\mathbf{T}} = v'(t) = \boxed{0}$. To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2\sin(2t) & 2\cos(2t) & 0 \\ -4\cos(2t) & -4\sin(2t) & 0 \end{vmatrix} = [8\sin^2(2t) + 8\cos^2(2t)]\mathbf{k} = 8\mathbf{k}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{8}{2} = \boxed{4}.$$

41. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}(e^t \cos t \mathbf{i} + e^t \sin t \mathbf{j} + e^t \mathbf{k}) = \boxed{(e^t \cos t - e^t \sin t)\mathbf{i} + (e^t \sin t + e^t \cos t)\mathbf{j} + e^t \mathbf{k}}$$

$$\begin{aligned} \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}[(e^t \cos t - e^t \sin t)\mathbf{i} + (e^t \sin t + e^t \cos t)\mathbf{j} + e^t \mathbf{k}] \\ &= (e^t \cos t - e^t \sin t - e^t \sin t - e^t \cos t)\mathbf{i} + (e^t \sin t + e^t \cos t + e^t \cos t - e^t \sin t)\mathbf{j} + e^t \mathbf{k} \\ &= \boxed{-2e^t \sin t \mathbf{i} + 2e^t \cos t \mathbf{j} + e^t \mathbf{k}} \end{aligned}$$

$$\begin{aligned} v(t) &= \|\mathbf{r}'(t)\| \\ &= \sqrt{e^{2t} \cos^2 t - 2e^{2t} \sin t \cos t + e^{2t} \sin^2 t + e^{2t} \sin^2 t + 2e^{2t} \sin t \cos t + e^{2t} \cos^2 t + e^{2t}} \\ &= \sqrt{e^{2t}(\cos^2 t + \sin^2 t + \sin^2 t + \cos^2 t + 1)} = \boxed{e^t \sqrt{3}}. \end{aligned}$$

- (b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \boxed{e^t \sqrt{3}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\begin{aligned} \mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ e^t \cos t - e^t \sin t & e^t \sin t + e^t \cos t & e^t \\ -2e^t \sin t & 2e^t \cos t & e^t \end{vmatrix} \\ &= (e^{2t} \sin t - e^{2t} \cos t)\mathbf{i} - (e^{2t} \cos t + e^{2t} \sin t)\mathbf{j} + (2e^{2t} \cos^2 t + 2e^{2t} \sin^2 t)\mathbf{k} \\ &= [e^{2t}(\sin t - \cos t)]\mathbf{i} - [e^{2t}(\cos t + \sin t)]\mathbf{j} + 2e^{2t}\mathbf{k} \end{aligned}$$

so

$$\begin{aligned} a_{\mathbf{N}} &= \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\|[e^{2t}(\sin t - \cos t)]\mathbf{i} - [e^{2t}(\cos t + \sin t)]\mathbf{j} + 2e^{2t}\mathbf{k}\|}{e^t \sqrt{3}} \\ &= \frac{e^{2t} \sqrt{\sin^2 t - 2 \sin t \cos t + \cos^2 t + \cos^2 t + 2 \sin t \cos t + \sin^2 t + 4}}{e^t \sqrt{3}} \\ &= \frac{e^{2t} \sqrt{6}}{e^t \sqrt{3}} = \boxed{e^t \sqrt{2}}. \end{aligned}$$

42. (a) The velocity, acceleration, and speed are

$$\begin{aligned}
 \mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt} (e^{-t} \cos t \mathbf{i} + e^{-t} \sin t \mathbf{j} - e^{-t} \mathbf{k}) \\
 &= \boxed{(-e^{-t} \cos t - e^{-t} \sin t) \mathbf{i} + (-e^{-t} \sin t + e^{-t} \cos t) \mathbf{j} + e^{-t} \mathbf{k}} \\
 \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} [(-e^{-t} \cos t - e^{-t} \sin t) \mathbf{i} + (-e^{-t} \sin t + e^{-t} \cos t) \mathbf{j} + e^{-t} \mathbf{k}] \\
 &= (e^{-t} \cos t + e^{-t} \sin t + e^{-t} \sin t - e^{-t} \cos t) \mathbf{i} + (e^{-t} \sin t - e^{-t} \cos t - e^{-t} \cos t - e^{-t} \sin t) \mathbf{j} - e^{-t} \mathbf{k} \\
 &= \boxed{2e^{-t} \sin t \mathbf{i} - 2e^{-t} \cos t \mathbf{j} - e^{-t} \mathbf{k}} \\
 v(t) &= \|\mathbf{r}'(t)\| \\
 &= \sqrt{e^{-2t} \cos^2 t + 2e^{-2t} \sin t \cos t + e^{-2t} \sin^2 t + e^{-2t} \sin^2 t - 2e^{-2t} \sin t \cos t + e^{-2t} \cos^2 t + e^{-2t}} \\
 &= \sqrt{e^{-2t} (\cos^2 t + \sin^2 t + \sin^2 t + \cos^2 t + 1)} = \boxed{e^{-t} \sqrt{2}}.
 \end{aligned}$$

- (b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \boxed{-e^{-t} \sqrt{2}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\begin{aligned}
 \mathbf{r}'(t) \times \mathbf{r}''(t) &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -e^{-t} \cos t - e^{-t} \sin t & -e^{-t} \sin t + e^{-t} \cos t & e^{-t} \\ 2e^{-t} \sin t & -2e^{-t} \cos t & -e^{-t} \end{vmatrix} \\
 &= (e^{-2t} \sin t + e^{-2t} \cos t) \mathbf{i} - (e^{-2t} \cos t - e^{-2t} \sin t) \mathbf{j} + (2e^{-2t} \sin^2 t - 2e^{-2t} \cos^2 t) \mathbf{k} \\
 &= [e^{-2t} (\sin t + \cos t)] \mathbf{i} - [e^{-2t} (\cos t - \sin t)] \mathbf{j} + 2e^{-2t} \mathbf{k}
 \end{aligned}$$

so

$$\begin{aligned}
 a_{\mathbf{N}} &= \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\|[e^{-2t} (\sin t + \cos t)] \mathbf{i} - [e^{-2t} (\cos t - \sin t)] \mathbf{j} + 2e^{-2t} \mathbf{k}\|}{e^{-t} \sqrt{2}} \\
 &= \frac{e^{-2t} \sqrt{\sin^2 t + 2 \sin t \cos t + \cos^2 t + \cos^2 t - 2 \sin t \cos t + \sin^2 t + 4}}{e^{-t} \sqrt{2}} \\
 &= \frac{e^{-2t} \sqrt{6}}{e^{-t} \sqrt{2}} = \boxed{e^{-t} \sqrt{3}}.
 \end{aligned}$$

43. (a) The velocity, acceleration, and speed are

$$\begin{aligned}
 \mathbf{v}(t) &= \mathbf{r}'(t) = \frac{d}{dt} (a \cos t \mathbf{i} + b \sin t + ct \mathbf{k}) = \boxed{-a \sin t \mathbf{i} + b \cos t \mathbf{j} + c \mathbf{k}} \\
 \mathbf{a}(t) &= \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (-a \sin t \mathbf{i} + b \cos t \mathbf{j} + c \mathbf{k}) = \boxed{-a \cos t \mathbf{i} - b \sin t \mathbf{j}} \\
 v(t) &= \|\mathbf{r}'(t)\| = \boxed{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t + c^2}}.
 \end{aligned}$$

(b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \frac{1}{2}(a^2 \sin^2 t + b^2 \cos^2 t + c^2)^{-1/2} (2a^2 \sin t \cos t - 2b^2 \sin t \cos t)$$

$$= \frac{(a^2 - b^2) \sin t \cos t}{\sqrt{a^2 \sin^2 t + b^2 \cos^2 t + c^2}}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -a \sin t & b \cos t & c \\ -a \cos t & -b \sin t & 0 \end{vmatrix} = bc \sin t \mathbf{i} - ac \cos t \mathbf{j} + (ab \sin^2 t + ab \cos^2 t) \mathbf{k}$$

$$= bc \sin t \mathbf{i} - ac \cos t \mathbf{j} + ab \mathbf{k}$$

and

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = \sqrt{b^2 c^2 \sin^2 t + a^2 c^2 \cos^2 t + a^2 b^2}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \sqrt{\frac{b^2 c^2 \sin^2 t + a^2 c^2 \cos^2 t + a^2 b^2}{a^2 \sin^2 t + b^2 \cos^2 t + c^2}}.$$

44. (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt} (\cosh t \mathbf{i} + \sinh t \mathbf{j} + t \mathbf{k}) = \sinh t \mathbf{i} + \cosh t \mathbf{j} + \mathbf{k}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} (\sinh t \mathbf{i} + \cosh t \mathbf{j} + \mathbf{k}) = \cosh t \mathbf{i} + \sinh t \mathbf{j}$$

Since $\cosh^2 t - \sinh^2 t = 1$, $\sinh^2 t + 1 = \cosh^2 t$, so

$$v(t) = \|\mathbf{r}'(t)\| = \sqrt{\sinh^2 t + \cosh^2 t + 1} = \sqrt{2 \cosh^2 t} = \cosh t \sqrt{2}.$$

(b) The tangential component of the acceleration is

$$a_{\mathbf{T}} = v'(t) = \sinh t \sqrt{2}.$$

To find the normal component of the acceleration, note that

$$a_{\mathbf{N}} = [v(t)]^2 \kappa \quad \text{and} \quad \kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{[v(t)]^3} \quad \text{so} \quad a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|}.$$

Then

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \sinh t & \cosh t & 1 \\ \cosh t & \sinh t & 0 \end{vmatrix} = -\sinh t \mathbf{i} + \cosh t \mathbf{j} + (\sinh^2 t - \cosh^2 t) \mathbf{k} = -\sinh t \mathbf{i} + \cosh t \mathbf{j} - \mathbf{k}$$

so

$$a_{\mathbf{N}} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|} = \frac{\|-\sinh t \mathbf{i} + \cosh t \mathbf{j} - \mathbf{k}\|}{\cosh t \sqrt{2}} = \frac{\sqrt{\sinh^2 t + \cosh^2 t + 1}}{\cosh t \sqrt{2}} = \frac{\sqrt{2 \cosh^2 t}}{\cosh t \sqrt{2}} = 1.$$

Applications and Extensions

45. The velocity and acceleration of a particle moving on the cycloid are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \boxed{(\pi - \pi \cos(\pi t))\mathbf{i} + \pi \sin(\pi t)\mathbf{j}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \boxed{\pi^2 \sin(\pi t)\mathbf{i} + \pi^2 \cos(\pi t)\mathbf{j}}.$$

46. (a) The velocity and acceleration of a particle moving on the parabola are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \boxed{(2t - 2)\mathbf{i} + \mathbf{j}}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \boxed{2\mathbf{i}}.$$

- (b) The speed of the particle is $v(t) = \|\mathbf{r}'(t)\| = \sqrt{4t^2 - 8t + 4 + 1} = \sqrt{4t^2 - 8t + 5}$. The speed $v(t) = \sqrt{4t^2 - 8t + 5} = 0$ when $4t^2 - 8t + 5 = 0$. Using the quadratic formula,

$$t = \frac{8 \pm \sqrt{64 - 4(4)(5)}}{2(4)} = \frac{8 \pm \sqrt{-16}}{8},$$

so the speed of the particle is never 0.

47. We parametrize the equation $y = 3x^2 - x^3$. We choose $x(t) = \frac{1}{3}t$ because we know the horizontal component of the velocity is equal to $\frac{1}{3}$. Then

$$\mathbf{r}(t) = \frac{1}{3}t\mathbf{i} + \left(\frac{1}{3}t^2 - \frac{1}{27}t^3\right)\mathbf{j}.$$

The velocity and acceleration vectors are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{1}{3}\mathbf{i} + \left(\frac{2}{3}t - \frac{1}{9}t^2\right)\mathbf{j}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \left(\frac{2}{3} - \frac{2}{9}t\right)\mathbf{j}$$

The velocity $\mathbf{v}$ is horizontal when $\frac{2}{3}t - \frac{1}{9}t^2 = \frac{1}{9}t(6 - t) = 0$ or at $t = 0$ and $t = 6$. We find

$$\mathbf{v}(0) = \frac{1}{3}\mathbf{i} \quad \boxed{\mathbf{a}(0) = \frac{2}{3}\mathbf{j}} \quad \mathbf{v}(6) = \frac{1}{3}\mathbf{i} \quad \boxed{\mathbf{a}(6) = -\frac{2}{3}\mathbf{j}}.$$

The graph below shows the motion of the particle in addition to $\mathbf{v}(0)$, $\mathbf{a}(0)$, $\mathbf{v}(0)$, and $\mathbf{v}(6)$.

48. Let the speed of the particle be $\|\mathbf{v}(t)\| = c$. Then

$$\mathbf{v}(t) \cdot \mathbf{v}(t) = \|\mathbf{v}(t)\|^2 = c^2.$$

We can differentiate this equation.

$$\begin{aligned}\frac{d}{dt}(\mathbf{v}(t) \cdot \mathbf{v}(t)) &= \frac{d}{dt}(c^2) \\ \mathbf{v}'(t) \cdot \mathbf{v}(t) + \mathbf{v}(t) \cdot \mathbf{v}'(t) &= 0 \\ 2\mathbf{v}(t) \cdot \mathbf{v}'(t) &= 0\end{aligned}$$

which is equivalent to

$$2\mathbf{v}(t) \cdot \mathbf{a}(t) = 0.$$

Since $\mathbf{v}(t) \cdot \mathbf{a}(t) = 0$, the velocity and acceleration vectors are orthogonal. ■

49. By definition, $a_{\mathbf{N}} = [v(t)]^2 \kappa$ and $\kappa = \frac{|f''(x)|}{(1+[f'(x)]^2)^{3/2}}$. At a point of inflection, $f''(x) = 0$, so $\kappa = 0$ which makes $a_{\mathbf{N}} = 0$. ■
50. (a) If $\mathbf{r}(t) = e^t \mathbf{i} + e^{-t} \mathbf{j}$, then $\mathbf{v}(t) = e^t \mathbf{i} - e^{-t} \mathbf{j}$ and $\mathbf{a}(t) = e^t \mathbf{i} + e^{-t} \mathbf{j}$. Then $\mathbf{a}(t) = \mathbf{r}(t)$, and since $\mathbf{r}(t)$ is a set of vectors that begin at the origin and point away from it, $\mathbf{a}(t)$ must always point away from the origin, and consequently $\mathbf{F} = m\mathbf{a}$ must also be directed away from the origin.
- (b) We found $\mathbf{v}(t) = e^t \mathbf{i} - e^{-t} \mathbf{j}$, so $v(t) = \|\mathbf{v}(t)\| = \sqrt{e^{2t} + e^{-2t}}$. The minimum speed of the particle must occur at a critical point.

$$v'(t) = \frac{1}{2}(e^{2t} + e^{-2t})^{-1/2}(2e^{2t} - 2e^{-2t}) = \frac{e^{2t} - e^{-2t}}{\sqrt{e^{2t} + e^{-2t}}}$$

The minimum speed of the particle occurs when $v'(t) = 0$ or at $\boxed{t=0}$, and the speed at that time $v(0) = \sqrt{1+1} = \boxed{\sqrt{2}}$.

- (c) The tangential component of acceleration $a_{\mathbf{T}} = v'(t) = \frac{e^{2t} - e^{-2t}}{\sqrt{e^{2t} + e^{-2t}}}$, so $a_{\mathbf{T}}(0) = \boxed{0}$. To find the normal component of acceleration, we find $\mathbf{r}'(t) \times \mathbf{r}''(t)$.

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ e^t & -e^{-t} & 0 \\ e^t & e^{-t} & 0 \end{vmatrix} = (1+1)\mathbf{k} = 2\mathbf{k}$$

Then $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = 2$ and

$$a_{\mathbf{N}} = \frac{2}{\sqrt{e^{2t} + e^{-2t}}} \quad \text{so} \quad a_{\mathbf{N}}(0) = \frac{2}{\sqrt{2}} = \boxed{\sqrt{2}}.$$

- (d) We were considering the time at which the minimum speed occurred, so $a_{\mathbf{T}} = v'(t) = 0$. At $t = 0$, $\mathbf{a}(0) = \mathbf{i} + \mathbf{j}$, so $\|\mathbf{a}(0)\| = \sqrt{2}$. If the tangential component of the acceleration is 0, then $\|\mathbf{a}(t)\| = a_{\mathbf{N}} = \sqrt{2}$.
51. If $y = \frac{1}{2}x^2$, then $y' = x$ and $y'' = 1$. Since $v(t) = v_0 = 2$, $v'(t) = a_{\mathbf{T}} = \boxed{0}$. To find $a_{\mathbf{N}}$, we can use $a_{\mathbf{N}} = [v(t)]^2 \kappa$ where $\kappa = \frac{|f''(x)|}{(1+[f'(x)]^2)^{3/2}}$.

$$\kappa = \frac{|f''(x)|}{(1+[f'(x)]^2)^{3/2}} = \frac{1}{(1+x^2)^{3/2}} \quad \text{and} \quad [v(t)]^2 = 2^2 = 4$$

so

$$a_{\mathbf{N}} = \boxed{\frac{4}{(1+x^2)^{3/2}}}.$$

52. Given $\mathbf{r}(t) = \alpha \cosh t \mathbf{i} + \beta \sinh t \mathbf{j}$, $\mathbf{v}(t) = \alpha \sinh t \mathbf{i} + \beta \cosh t \mathbf{j}$ and $\mathbf{a}(t) = \alpha \sinh t \mathbf{i} + \beta \cosh t \mathbf{j} = \mathbf{r}(t)$. Then $\mathbf{F} = m\mathbf{a} = m\mathbf{r}$. Since $\mathbf{F}$ is a scalar multiple of $\mathbf{r}$, the force acting on the particle is in the direction of $\mathbf{r}$. ■

53. Using Newton's Second Law of Motion with circular motion, $\|F\| = m \left(\frac{v_0^2}{R} \right)$.

- (a) The speed of the motorcycle is increased by 10% from 120 km/h to 132 km/h. At a speed of 120 km/h, $\|\mathbf{F}\| \approx 1667$ N. With $v_0 = 132$ km/h,

$$\|\mathbf{F}\| = 150 \text{ kg} \left[\frac{(132 \text{ km/h})^2}{100 \text{ m}} \right] \left(\frac{1000 \text{ m}}{1 \text{ km}} \right)^2 \left(\frac{1 \text{ hr}}{3600 \text{ s}} \right)^2 \approx 2017 \text{ N}.$$

The frictional force needs to increase by $2017 \text{ N} - 1667 \text{ N} = \boxed{350 \text{ N}}$.

- (b) If the radius of the track is halved from 100 m to 50 m and we wish to keep the frictional force at 1667 N, the speed v can be found using

$$150 \text{ kg} \left[\frac{(v \text{ km/h})^2}{50 \text{ m}} \right] \left(\frac{1000 \text{ m}}{1 \text{ km}} \right)^2 \left(\frac{1 \text{ hr}}{3600 \text{ s}} \right)^2 = 1667$$

or

$$\frac{25}{108} v^2 = 1667$$

which means $v \approx 85$ km/h. The motorcycle should be driven

$$120 \text{ km/h} - 85 \text{ km/h} = \boxed{35 \text{ km/h more slowly}}.$$

54. Using Newton's Second Law of Motion with circular motion, $\|F\| = m \left(\frac{v_0^2}{R} \right)$.

$$\|\mathbf{F}\| = 1000 \text{ kg} \left[\frac{(200 \text{ km/h})^2}{75 \text{ m}} \right] \left(\frac{1000 \text{ m}}{1 \text{ km}} \right)^2 \left(\frac{1 \text{ hr}}{3600 \text{ s}} \right)^2 \approx \boxed{41152 \text{ N}}.$$

55. Using Newton's Second Law of Motion with circular motion, $\|F\| = m \left(\frac{v_0^2}{R} \right)$. If the circumference of the Large Hadron Collider is 26,659 m, then its radius is

$$R = \frac{26659 \text{ m}}{2\pi} \approx 4243 \text{ m}$$

$$\|\mathbf{F}\| = m \left[\frac{(299792455.3 \text{ m/s})^2}{4243 \text{ m}} \right] \approx \boxed{2.118 \times 10^{13} m \text{ N}}$$

where m is the mass of a proton in kg.

56. Using Newton's Second Law of Motion with circular motion, $\|F\| = m \left(\frac{v_0^2}{R} \right)$. If the radius of the route is 1 km = 1000 m, then

$$\|\mathbf{F}\| = m \left[\frac{(280000 \text{ km/s})^2}{1000 \text{ m}} \right] \left(\frac{1000 \text{ m}}{1 \text{ km}} \right)^2 \approx \boxed{7.84 \times 10^{13} m \text{ N}}$$

where m is the mass of a proton in kg.

57. If $\mathbf{r}(t) = 4 \cos t \mathbf{i} - 2 \cos(2t) \mathbf{j}$, then the velocity, acceleration, and magnitude of the acceleration are

$$\mathbf{v}(t) = -4 \sin t \mathbf{i} + 4 \sin(2t) \mathbf{j}$$

$$\mathbf{a}(t) = -4 \cos t \mathbf{i} + 8 \cos(2t) \mathbf{j}$$

$$\|\mathbf{a}(t)\| = \sqrt{16 \cos^2 t + 64 \cos^2(2t)} = 4\sqrt{\cos^2 t + 4 \cos^2(2t)}$$

so $\|\mathbf{F}(t)\| = m\|\mathbf{a}(t)\| = 4m\sqrt{\cos^2 t + 4\cos^2(2t)}$. Using the identity $\cos(2t) = 2\cos^2 t - 1$, $4\cos^2(2t) = 4(2\cos^2 t - 1)^2 = 4(4\cos^4 t - 4\cos^2 t + 1)$, so letting $F = \|\mathbf{F}\|$,

$$\|\mathbf{F}\| = F = 4m\sqrt{\cos^2 t + 16\cos^4 t - 16\cos^2 t + 4} = 4m\sqrt{16\cos^4 t - 15\cos^2 t + 4}$$

The maximum force will occur at a critical point.

$$F'(t) = 2m[16\cos^4 t - 15\cos^2 t + 4]^{-1/2}[-64\cos^3 t \sin t + 30\cos t \sin t] = \frac{4m \sin t \cos t (-32\cos^2 t + 15)}{\sqrt{16\cos^4 t - 15\cos^2 t + 4}}$$

$F'(t) = 0$ at $t = n\pi, \frac{(2n+1)\pi}{2}, \cos^{-1}\left(\frac{\sqrt{30}}{8}\right) + n\pi, \cos^{-1}\left(-\frac{\sqrt{30}}{8}\right) + n\pi$, but $F'(t)$ only changes from positive to negative at $t = n\pi$ and $t = \frac{(2n+1)\pi}{2}$.

$$F(n\pi) = 4m\sqrt{1+4} = 4m\sqrt{5} \quad \text{and} \quad F\left[\frac{(2n+1)\pi}{2}\right] = 4m\sqrt{4} = 8m.$$

The maximum magnitude of force is $F = \boxed{4\sqrt{5}m}$.

58. For $\mathbf{r}(t) = (v_0 \cos \theta)t\mathbf{i} + [(v_0 \sin \theta)t - \frac{1}{2}gt^2]\mathbf{j}$, the velocity, acceleration, and speed of the golf ball are

$$\mathbf{v}(t) = v_0 \cos \theta \mathbf{i} + (v_0 \sin \theta - gt)\mathbf{j}$$

$$\mathbf{a}(t) = -g\mathbf{j}$$

$$v(t) = \sqrt{v_0^2 - 2v_0 \sin \theta gt + g^2 t^2}$$

(a) The highest point on the ball's trajectory occurs when $v_0 \sin \theta - gt = 0$ or at $t = \frac{v_0 \sin \theta}{g}$. To find the curvature κ , we need $\mathbf{r}' \times \mathbf{r}'' = \mathbf{v} \times \mathbf{a}$.

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ v_0 \cos \theta & v_0 \sin \theta - gt & 0 \\ 0 & -g & 0 \end{vmatrix} = -gv_0 \cos \theta \mathbf{k}$$

Then

$$\kappa = \frac{\|\mathbf{r}' \times \mathbf{r}''\|}{\|\mathbf{r}'\|^3} = \frac{gv_0 \cos \theta}{(v_0^2 - 2v_0 \sin \theta gt + g^2 t^2)^{3/2}}$$

and

$$\begin{aligned} \kappa\left(\frac{v_0 \sin \theta}{g}\right) &= \frac{gv_0 \cos \theta}{\left[v_0^2 - 2v_0 \sin \theta g\left(\frac{v_0 \sin \theta}{g}\right) + g^2\left(\frac{v_0 \sin \theta}{g}\right)^2\right]^{3/2}} \\ &= \frac{gv_0 \cos \theta}{(v_0^2 - v_0^2 \sin^2 \theta)^{3/2}} = \frac{gv_0 \cos \theta}{(v_0^2 \cos^2 \theta)^{3/2}} = \boxed{\frac{g}{v_0^2 \cos^2 \theta}}. \end{aligned}$$

(b) Since

$$a_{\mathbf{T}} = v'(t) = \frac{-v_0 g \sin \theta + g^2 t}{\sqrt{v_0^2 - 2v_0 \sin \theta gt + g^2 t^2}},$$

$$a_{\mathbf{T}}\left(\frac{v_0 \sin \theta}{g}\right) = \frac{-v_0 g \sin \theta + g^2\left(\frac{v_0 \sin \theta}{g}\right)}{\sqrt{v_0^2 - 2v_0 \sin \theta g\left(\frac{v_0 \sin \theta}{g}\right) + g^2\left(\frac{v_0 \sin \theta}{g}\right)^2}} = \boxed{0}.$$

Then

$$\begin{aligned} a_{\mathbf{N}} &= [v(t)]^2 \kappa = (v_0^2 - 2v_0 \sin \theta gt + g^2 t^2) \left[\frac{gv_0 \cos \theta}{(v_0^2 - 2v_0 \sin \theta gt + g^2 t^2)^{3/2}} \right] \\ &= \frac{gv_0 \cos \theta}{(v_0^2 - 2v_0 \sin \theta gt + g^2 t^2)^{1/2}} \end{aligned}$$

and

$$\begin{aligned} a_{\mathbf{N}} \left(\frac{v_0 \sin \theta}{g} \right) &= \frac{gv_0 \cos \theta}{\left[v_0^2 - 2v_0 \sin \theta g \left(\frac{v_0 \sin \theta}{g} \right) + g^2 \left(\frac{v_0 \sin \theta}{g} \right)^2 \right]^{1/2}} \\ &= \frac{gv_0 \cos \theta}{(v_0^2 - v_0^2 \sin^2 \theta)^{1/2}} = \frac{gv_0 \cos \theta}{v_0 \cos \theta} = \boxed{g}. \end{aligned}$$

These components are physically reasonable because at the height of the trajectory, the rate of change of speed is 0, so $a_{\mathbf{T}} = 0$. All acceleration then points in the direction of $a_{\mathbf{N}}$, meaning $a_{\mathbf{N}} = g$.

59. We are given $\mathbf{r}(t) = \frac{1-t^2}{1+t^2}\mathbf{i} + \frac{2t}{1+t^2}\mathbf{j}$.

(a) Then

$$\begin{aligned} \mathbf{v}(t) = \mathbf{r}'(t) &= \frac{-2t(1+t^2) - (1-t^2)(2t)}{(1+t^2)^2}\mathbf{i} + \frac{2(1+t^2) - 2t(2t)}{(1+t^2)^2}\mathbf{j} \\ &= \boxed{-\frac{4t}{(1+t^2)^2}\mathbf{i} + \frac{2(1-t^2)}{(1+t^2)^2}\mathbf{j}}. \end{aligned}$$

(b) $\boxed{\text{No}}$, the particle is never at rest. For the particle to be at rest, both components of $\mathbf{v}$ must be zero. The x -component of the velocity vector is zero for $t = 0$, and the y -component of the velocity vector is zero for $t = \pm 1$. Since there is no t such that both components are zero at the same time, the particle is never at rest.

(c) As $t \rightarrow \infty$,

$$\lim_{t \rightarrow \infty} \left(\frac{1-t^2}{1+t^2}\mathbf{i} + \frac{2t}{1+t^2}\mathbf{j} \right) = \lim_{t \rightarrow \infty} \left(\frac{1-t^2}{1+t^2} \right)\mathbf{i} + \lim_{t \rightarrow \infty} \left(\frac{2t}{1+t^2} \right)\mathbf{j} = -\mathbf{i},$$

so the particle approaches the point $\boxed{(-1, 0)}$ as t increases without bound.

60. (a) We can express $\mathbf{r}(t)$ in parametric form with $x(t) = e^{-t} \cos t$ and $y(t) = e^{-t} \sin t$, so

$$\frac{x}{e^{-t}} = \cos t \quad \frac{y}{e^{-t}} = \sin t,$$

$$\left(\frac{x}{e^{-t}} \right)^2 + \left(\frac{y}{e^{-t}} \right)^2 = 1$$

or

$$x^2 + y^2 = e^{-2t}.$$

Since $x^2 + y^2 = r^2$,

$$r^2 = e^{-2t} \quad \text{or} \quad r = e^{-t}.$$

(b) The path of the particle is shown below.

(c) First we find $\mathbf{v}$.

$$\mathbf{v} = \frac{d}{dt}(e^{-t} \cos t \mathbf{i} + e^{-t} \sin t \mathbf{j}) = (-e^{-t} \cos t - e^{-t} \sin t) \mathbf{i} + (-e^{-t} \sin t + e^{-t} \cos t) \mathbf{j}$$

To find the angle between $\mathbf{r}$ and $\mathbf{v}$, we use

$$\cos^{-1} \left(\frac{\mathbf{r} \cdot \mathbf{v}}{\|\mathbf{r}\| \|\mathbf{v}\|} \right).$$

Since

$$\mathbf{r} \cdot \mathbf{v} = -e^{-2t} \cos^2 t - e^{-2t} \sin t \cos t - e^{-2t} \sin^2 t + e^{-2t} \sin t \cos t = -e^{-2t}$$

and

$$\|\mathbf{r}\| = \sqrt{e^{-2t} \cos^2 t + e^{-2t} \sin^2 t} = e^{-t}$$

$$\|\mathbf{v}\| = \sqrt{e^{-2t} \cos^2 t + 2e^{-2t} \sin t \cos t + e^{-2t} \sin^2 t + e^{-2t} \sin^2 t - 2e^{-2t} \sin t \cos t + e^{-2t} \cos^2 t} = e^{-t} \sqrt{2},$$

$$\cos^{-1} \left[\frac{-e^{-2t}}{(e^{-t})(e^{-t} \sqrt{2})} \right] = \cos^{-1} \left(\frac{-1}{\sqrt{2}} \right) = \cos^{-1} \left(\frac{-\sqrt{2}}{2} \right) = \frac{3\pi}{4} = \boxed{135^\circ}.$$

61. (a) If $\mathbf{r}(t) = 4 \cos t \mathbf{i} - 2 \cos(2t) \mathbf{j}$, then $x = 4 \cos t$ and $y = -2 \cos(2t)$ with $-4 \leq x \leq 4$ and $-2 \leq y \leq 2$. Using the double-angle identity $\cos(2t) = 2 \cos^2 t - 1$,

$$y = -2 \cos(2t) = -2(2 \cos^2 t - 1) = 2 - 4 \cos^2 t.$$

We can eliminate the parameter using $\cos t = \frac{x}{4}$ so that

$$y = 2 - 4 \left(\frac{x}{4} \right)^2 = 2 - \frac{x^2}{4}, \quad -4 \leq x \leq 4.$$

The motion of the particle oscillates on the arc of a parabola.

- (b) The path of the particle is shown below.

- (c) The velocity and acceleration of the particle are

$$\begin{aligned} \mathbf{v}(t) &= -4 \sin t \mathbf{i} + 4 \sin(2t) \mathbf{j} \\ \mathbf{a}(t) &= -4 \cos t \mathbf{i} + 8 \cos(2t) \mathbf{j}. \end{aligned}$$

The velocity is 0 at $t = n\pi$ where n is an integer, and the acceleration is $\mathbf{a}(n\pi) = \boxed{\pm 4\mathbf{i} + 8\mathbf{j} \text{ where } n \text{ is an integer}}$.

62. If $\mathbf{r}'(t) = \mathbf{b} \times \mathbf{r}(t)$ and $\mathbf{b}$ is a constant vector, then $\mathbf{b}' = \mathbf{0}$ and

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}[\mathbf{b} \times \mathbf{r}(t)] = \mathbf{b}' \times \mathbf{r}(t) + \mathbf{b} \times \mathbf{r}'(t) = \mathbf{b} \times \mathbf{r}'(t).$$

Since $\mathbf{a}(t) = \mathbf{b} \times \mathbf{r}'(t)$ and the cross product of two vectors is orthogonal to both vectors, $\mathbf{a}(t)$ is perpendicular to both $\mathbf{b}$ and $\mathbf{r}'(t)$. ■

If $\mathbf{a}(t) = \mathbf{r}''(t)$ and $\mathbf{r}'(t)$ are perpendicular, then $\mathbf{r}''(t) \cdot \mathbf{r}'(t) = 0$. Because

$$2\mathbf{r}''(t) \cdot \mathbf{r}'(t) = \frac{d}{dt}[\mathbf{r}'(t) \cdot \mathbf{r}'(t)] = 0,$$

$$\mathbf{r}'(t) \cdot \mathbf{r}'(t) = \|\mathbf{r}'(t)\|^2 = c,$$

which implies that $\|\mathbf{r}'(t)\| = v(t)$ is constant. ■

63. Since the *Odyssey* is in an orbit at a constant height of 400 km above Mars' surface, it is in a circular orbit. From Equation (2) and Example 4, the magnitude of the acceleration of a satellite in circular orbit is $\|\mathbf{a}(t)\| = \frac{v_0^2}{R}$. Since $R = 3390 + 400 \text{ km} = 3790000 \text{ m}$ and $\|\mathbf{a}(t)\| = 3.71 \text{ m/s}^2$ on Mars,

$$v_0 = \sqrt{\|\mathbf{a}(t)\|R} = \sqrt{(3.71)(3790000)} \approx \boxed{3750 \text{ m/s}}.$$

64. Power is $\mathbf{F} \cdot \mathbf{v}$ and from Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a} = m\mathbf{v}'$, so

$$\text{Power} = \mathbf{F} \cdot \mathbf{v} = m\mathbf{v}' \cdot \mathbf{v} = \frac{m}{2} \frac{d}{dt}(\mathbf{v} \cdot \mathbf{v}) = \frac{d}{dt} \left(\frac{m}{2} \|\mathbf{v}\|^2 \right).$$

Since kinetic energy $= \frac{1}{2}m\|\mathbf{v}(t)\|^2$, power is the rate of change of its kinetic energy. ■

65. Momentum is $\mathbf{p}(t) = m\mathbf{v}(t)$, so

$$\frac{d\mathbf{p}}{dt} = m \frac{d\mathbf{v}}{dt} = m\mathbf{a} = \mathbf{F}.$$

66. Since the angular momentum $\mathbf{L}(t) = \mathbf{r}(t) \times m\mathbf{v}(t)$,

$$\frac{d\mathbf{L}}{dt} = (\mathbf{r}' \times m\mathbf{v}) + (\mathbf{r} \times m\mathbf{v}') = m(\mathbf{v} \times \mathbf{v}) + (\mathbf{r} \times m\mathbf{a}) = \mathbf{0} + \mathbf{r} \times \mathbf{F} = \boldsymbol{\tau}.$$

67. We know that for a central field of force $\mathbf{F}(t) = u(t)\mathbf{r}(t)$ and torque is $\boldsymbol{\tau} = \mathbf{r} \times \mathbf{F}$. Then

$$\boldsymbol{\tau} = \mathbf{r} \times \mathbf{F} = \mathbf{r} \times [u\mathbf{r}] = u(\mathbf{r} \times \mathbf{r}) = \mathbf{0}.$$

A central field of force produces zero torque. ■

68. From Equation (2) in Example 3, $\|\mathbf{a}\| = \frac{v^2}{r}$ for a circular orbit. Then

$$F_{\text{elec}} = \frac{ke^2}{r^2} = \frac{mv^2}{r}$$

and

$$v = \sqrt{\frac{ke^2}{mr}}.$$

69. (a) The push against the seat is in the direction of the motion, so this force is the tangential force, $m \frac{dv}{dt}$.
 (b) The push against the door is centripetal force or normal force, $mv^2\kappa$.
 (c) The normal force varies linearly with the curvature of the road.
 (d) The normal force varies quadratically with the speed of the car. ■

70. The normal component of acceleration is $a_N = [v(t)]^2 \kappa$, so if $a_N = 0$ for all t , $\kappa = 0$, which means the motion of the particle is in a straight line. ■

71. If $\mathbf{r}$ lies on a sphere, then $\|\mathbf{r}\|$ is constant, which means $\mathbf{r} \cdot \mathbf{r} = \|\mathbf{r}\|^2 = c$. Then

$$\begin{aligned}\frac{d}{dt}(\mathbf{r} \cdot \mathbf{r}) &= \frac{d}{dt}(c) \\ (\mathbf{r}' \cdot \mathbf{r}) + (\mathbf{r} \cdot \mathbf{r}') &= 0 \\ 2\mathbf{r} \cdot \mathbf{r}' &= 0,\end{aligned}$$

so the tangent vector $\mathbf{r}'$ is always orthogonal to $\mathbf{r}$. ■

Challenge Problems

72. (a) Since $\mathbf{r}(t) = t\mathbf{R}(t)$,

$$\mathbf{v}(t) = \mathbf{r}'(t) = \mathbf{R}(t) + t\mathbf{R}'(t) = \cos(\omega t)\mathbf{i} + \sin(\omega t)\mathbf{j} + t\mathbf{v}_d$$

where $\mathbf{v}_d = \mathbf{R}'(t)$. ■

(b) From part (a), $\mathbf{v}(t) = \mathbf{R}(t) + t\mathbf{R}'(t)$,

$$\mathbf{a}(t) = \mathbf{v}'(t) = \mathbf{r}''(t) = \mathbf{R}'(t) + \mathbf{R}'(t) + t\mathbf{R}''(t) = 2\mathbf{R}'(t) + t\mathbf{R}''(t) = 2\mathbf{v}_d + t\mathbf{a}_d$$

where $\mathbf{v}_d = \mathbf{R}'(t)$ and $\mathbf{a}_d = \mathbf{R}''(t)$. ■

73. (a) Since $\mathbf{r}(t) = t^2\mathbf{R}(t)$,

$$\mathbf{v}(t) = \mathbf{r}'(t) = 2t\mathbf{R}(t) + t^2\mathbf{R}'(t) = \boxed{2t\cos(\omega t)\mathbf{i} + 2t\sin(\omega t)\mathbf{j} + t^2\mathbf{v}_d}$$

and

$$\begin{aligned}\mathbf{a}(t) &= \mathbf{v}'(t) = \mathbf{r}''(t) = 2\mathbf{R}(t) + 2t\mathbf{R}'(t) + 2t\mathbf{R}'(t) + t^2\mathbf{R}''(t) = 2\mathbf{R}(t) + 4t\mathbf{R}'(t) + t^2\mathbf{R}''(t) \\ &= \boxed{2\cos(\omega t)\mathbf{i} + 2\sin(\omega t)\mathbf{j} + 4t\mathbf{v}_d + t^2\mathbf{a}_d}\end{aligned}$$

where $\mathbf{v}_d = \mathbf{R}'(t)$ and $\mathbf{a}_d = \mathbf{R}''(t)$. ■

(b) From Problem 72(b), the Coriolis acceleration is the extra term(s) other than the acceleration of the rotating disk $\mathbf{a}_d$. In this case, it is $\boxed{2\cos(\omega t)\mathbf{i} + 2\sin(\omega t)\mathbf{j} + 4t\mathbf{v}_d}$.

74. Both $\boxed{\mathbf{T} \times \mathbf{r}}$ and $\boxed{\mathbf{T} \times \mathbf{N}}$ are orthogonal to $\mathbf{T}$ since the cross product of two vectors is orthogonal to both vectors.

75. We are given $\mathbf{u}_r = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$ and $\mathbf{u}_\theta = -\sin \theta \mathbf{i} + \cos \theta \mathbf{j}$.

(a) Then $\|\mathbf{u}_r\| = \sqrt{\cos^2 \theta + \sin^2 \theta} = 1$ and $\|\mathbf{u}_\theta\| = \sqrt{\sin^2 \theta + \cos^2 \theta} = 1$, so $\mathbf{u}_r$ and $\mathbf{u}_\theta$ are unit vectors.

$$\mathbf{u}_r \cdot \mathbf{u}_\theta = -\sin \theta \cos \theta + \sin \theta \cos \theta = 0$$

Since the dot product of $\mathbf{u}_r$ and $\mathbf{u}_\theta$ is zero, the vectors are orthogonal.

(b) The derivatives of the $\mathbf{u}$ vectors with respect to θ are

$$\begin{aligned}\frac{d\mathbf{u}_r}{d\theta} &= -\sin \theta \mathbf{i} + \cos \theta \mathbf{j} = \mathbf{u}_\theta \\ \frac{d\mathbf{u}_\theta}{d\theta} &= -\cos \theta \mathbf{i} - \sin \theta \mathbf{j} = -\mathbf{u}_r.\end{aligned}$$

■

(c) Since $\mathbf{r}(t)$ has polar coordinates $(r(t), \theta(t))$,

$$\begin{aligned}\mathbf{r}(t) &= r(t) \cos(\theta(t))\mathbf{i} + r(t) \sin(\theta(t))\mathbf{j} \\ \|\mathbf{r}(t)\| &= \sqrt{[r(t)]^2 \cos^2(\theta(t)) + [r(t)]^2 \sin^2(\theta(t))} = r(t)\end{aligned}$$

and $\mathbf{r}(t) = r(t) \cos(\theta(t))\mathbf{i} + r(t) \sin(\theta(t))\mathbf{j} = \|\mathbf{r}(t)\|[\cos(\theta(t))\mathbf{i} + \sin(\theta(t))\mathbf{j}] = \|\mathbf{r}(t)\|\mathbf{u}_r$. ■

(d) From part (c), $\mathbf{r}(t) = \|\mathbf{r}(t)\|\mathbf{u}_r = r(t)\mathbf{u}_r$ and from part (b), $\frac{d\mathbf{u}_r}{d\theta} = \mathbf{u}_\theta$. Then

$$\begin{aligned}\mathbf{v}(t) = \mathbf{r}'(t) &= \frac{d}{dt}\mathbf{r}(t) = \frac{dr}{dt}\mathbf{u}_r + r\frac{d\mathbf{u}_r}{dt} = \frac{dr}{dt}\mathbf{u}_r + r\frac{d\mathbf{u}_r}{d\theta}\frac{d\theta}{dt} \\ &= \frac{dr}{dt}\mathbf{u}_r + r\frac{d\theta}{dt}\mathbf{u}_\theta = r'\mathbf{u}_r + r\theta'\mathbf{u}_\theta\end{aligned}$$

(e) From part (b), $\frac{d\mathbf{u}_\theta}{d\theta} = -\mathbf{u}_r$ and $\frac{d\mathbf{u}_r}{d\theta} = \mathbf{u}_\theta$, so

$$\begin{aligned}\mathbf{a}(t) = \mathbf{v}'(t) &= \frac{d}{dt}\mathbf{v}(t) = \frac{d^2r}{dt^2}\mathbf{u}_r + \frac{dr}{dt}\frac{d\mathbf{u}_r}{dt} + \frac{dr}{dt}\frac{d\theta}{dt}\mathbf{u}_\theta + r\frac{d^2\theta}{dt^2}\mathbf{u}_\theta + r\frac{d\theta}{dt}\frac{d\mathbf{u}_\theta}{dt} \\ &= \frac{d^2r}{dt^2}\mathbf{u}_r + \frac{dr}{dt}\left(\frac{d\mathbf{u}_r}{d\theta}\frac{d\theta}{dt}\right) + \frac{dr}{dt}\frac{d\theta}{dt}\mathbf{u}_\theta + r\frac{d^2\theta}{dt^2}\mathbf{u}_\theta + r\frac{d\theta}{dt}\left(\frac{d\mathbf{u}_\theta}{d\theta}\frac{d\theta}{dt}\right) \\ &= \frac{d^2r}{dt^2}\mathbf{u}_r + \frac{dr}{dt}\mathbf{u}_\theta\frac{d\theta}{dt} + \frac{dr}{dt}\frac{d\theta}{dt}\mathbf{u}_\theta + r\frac{d^2\theta}{dt^2}\mathbf{u}_\theta + r\left(\frac{d\theta}{dt}\right)^2(-\mathbf{u}_r) \\ &= [r'' - r(\theta')^2]\mathbf{u}_r + [r\theta'' + 2r'\theta']\mathbf{u}_\theta\end{aligned}$$

76. If $r = 2 + \cos t$ and $\theta = 2t$, then $r' = -\sin t$, $r'' = -\cos t$, $\theta' = 2$, and $\theta'' = 0$, so from Problem 75 parts (d) and (e),

$$\begin{aligned}\mathbf{v}(t) &= r'\mathbf{u}_r + r\theta'\mathbf{u}_\theta = \boxed{-\sin t\mathbf{u}_r + 2(\cos t + 2)\mathbf{u}_\theta} \\ \mathbf{a}(t) &= [r'' - r(\theta')^2]\mathbf{u}_r + [r\theta'' + 2r'\theta']\mathbf{u}_\theta \\ &= [(-\cos t) - (2 + \cos t)(2)^2]\mathbf{u}_r + [(2 + \cos t)(0) + 2(-\sin t)(2)]\mathbf{u}_\theta \\ &= \boxed{-(5\cos t + 8)\mathbf{u}_r - 4\sin t\mathbf{u}_\theta}.\end{aligned}$$

77. To convert rectangular equations into polar equations, we use $x = r \cos \theta$ and $y = r \sin \theta$, so $\mathbf{r}(t) = e^{2t} \cos t \mathbf{i} + e^{2t} \sin t \mathbf{j}$ implies $\boxed{r(t) = e^{2t} \text{ where } \theta = t}$. Then $r' = 2e^{2t}$, $r'' = 4e^{2t}$, $\theta' = 1$, and $\theta'' = 0$, so from Problem 75 parts (d) and (e),

$$\begin{aligned}\mathbf{v}(t) &= r'\mathbf{u}_r + r\theta'\mathbf{u}_\theta = 2e^{2t}\mathbf{u}_r + e^{2t}(1)\mathbf{u}_\theta = \boxed{2r\mathbf{u}_r + r\mathbf{u}_\theta} \\ \mathbf{a}(t) &= [r'' - r(\theta')^2]\mathbf{u}_r + [r\theta'' + 2r'\theta']\mathbf{u}_\theta = [4e^{2t} - e^{2t}(1)^2]\mathbf{u}_r + [e^{2t}(0) + 2(2e^{2t})(1)]\mathbf{u}_\theta \\ &= \boxed{3r\mathbf{u}_r + 4r\mathbf{u}_\theta}\end{aligned}$$

78. (a) Using the results from Problem 75,

$$\mathbf{r}'(t) \cdot \mathbf{r}(t) = (r'\mathbf{u}_r + r\theta'\mathbf{u}_\theta) \cdot (r\mathbf{u}_r) = rr'\mathbf{u}_r \cdot \mathbf{u}_r + r^2\theta'\mathbf{u}_\theta \cdot \mathbf{u}_r = rr'\mathbf{u}_r \cdot \mathbf{u}_r = rr'\|\mathbf{u}_r\|^2 = rr'$$

Since $\mathbf{r}'(t) \cdot \mathbf{r}(t) = rr' = 0$, either $r = 0$ or $r' = 0$. If $r = 0$, then $\mathbf{r}(t)$ is a single point at the pole. If $r' = 0$, then r is a constant, meaning $\mathbf{r}(t) = r\mathbf{u}_r$ is a sphere centered at the origin. ■

(b) If the acceleration and velocity vectors are orthogonal for all t , the velocity will change direction without changing its magnitude, so the motion is circular.

(c) If velocity and position vectors are parallel or anti-parallel for all t , the motion is in a straight line radially toward or away from the origin.

11.5 Integrals of Vector Functions; Projectile Motion

Concepts and Vocabulary

1. True by the statement of the integral of a vector function in subsection 1.
2. False. We must insert a constant of integration into each component.

Skill Building

3. We integrate each component individually.

$$\begin{aligned}
 \int \sin t \mathbf{i} dt - \int \cos t \mathbf{j} dt + \int t \mathbf{k} dt &= (-\cos t + c_1) \mathbf{i} + (-\sin t + c_2) \mathbf{j} + \left(\frac{1}{2}t^2 + c_3\right) \mathbf{k} \\
 &= -\cos t \mathbf{i} - \sin t \mathbf{j} + \frac{1}{2}t^2 \mathbf{k} + c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k} \\
 &= \boxed{-\cos t \mathbf{i} - \sin t \mathbf{j} + \frac{1}{2}t^2 \mathbf{k} + \mathbf{c}}
 \end{aligned}$$

4. We integrate each component individually.

$$\begin{aligned}
 \int \cos t \mathbf{i} dt + \int \sin t \mathbf{j} dt - \int \mathbf{k} dt &= (\sin t + c_1) \mathbf{i} + (-\cos t + c_2) \mathbf{j} + (-t + c_3) \mathbf{k} \\
 &= \boxed{\sin t \mathbf{i} - \cos t \mathbf{j} - t \mathbf{k} + \mathbf{c}}
 \end{aligned}$$

5. We integrate each component individually.

$$\begin{aligned}
 \int t^2 \mathbf{i} dt - \int t \mathbf{j} dt + \int e^t \mathbf{k} dt &= \left(\frac{1}{3}t^3 + c_1\right) \mathbf{i} + \left(-\frac{1}{2}t^2 + c_2\right) \mathbf{j} + (e^t + c_3) \mathbf{k} \\
 &= \frac{1}{3}t^3 \mathbf{i} - \frac{1}{2}t^2 \mathbf{j} + e^t \mathbf{k} + c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k} \\
 &= \boxed{\frac{1}{3}t^3 \mathbf{i} - \frac{1}{2}t^2 \mathbf{j} + e^t \mathbf{k} + \mathbf{c}}
 \end{aligned}$$

6. We integrate each component individually.

$$\begin{aligned}
 \int e^t \mathbf{i} dt - \int \sqrt{t} \mathbf{j} dt + \int t^2 \mathbf{k} dt &= (e^t + c_1) \mathbf{i} + \left(-\frac{2}{3}t^{3/2} + c_2\right) \mathbf{j} + \left(\frac{1}{3}t^3 + c_3\right) \mathbf{k} \\
 &= e^t \mathbf{i} - \frac{2}{3}t^{3/2} \mathbf{j} + \frac{1}{3}t^3 \mathbf{k} + c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k} \\
 &= \boxed{e^t \mathbf{i} - \frac{2}{3}t^{3/2} \mathbf{j} + \frac{1}{3}t^3 \mathbf{k} + \mathbf{c}}
 \end{aligned}$$

7. We integrate each component individually. We use integration by parts for the integrals of the first two components. For $\int \ln t dt$, we choose

$$u = \ln t \quad \text{and} \quad dv = dt.$$

Then

$$du = \frac{1}{t} dt \quad \text{and} \quad v = \int dt = t$$

and

$$\int \ln t dt = t \ln t - \int t \left(\frac{1}{t}\right) dt = t \ln t - \int dt = t \ln t - t.$$

For $\int t \ln t \, dt$, we choose

$$u = \ln t \quad \text{and} \quad dv = t \, dt.$$

Then

$$du = \frac{1}{t} \, dt \quad \text{and} \quad v = \int t \, dt = \frac{1}{2} t^2$$

and

$$\int t \ln t \, dt = \frac{1}{2} t^2 \ln t - \int \frac{1}{2} t^2 \left(\frac{1}{t} \right) dt = \frac{1}{2} t^2 \ln t - \frac{1}{2} \int t \, dt = \frac{1}{2} t^2 \ln t - \frac{1}{4} t^2.$$

$$\begin{aligned} \int \ln t \, \mathbf{i} \, dt - \int t \ln t \, \mathbf{j} \, dt - \int 2\mathbf{k} \, dt &= (t \ln t - t + c_1) \mathbf{i} + \left(-\frac{t^2}{2} \ln t + \frac{t^2}{4} + c_2 \right) \mathbf{j} + (-2t + c_3) \mathbf{k} \\ &= (t \ln t - t) \mathbf{i} + \left(\frac{t^2}{4} - \frac{t^2}{2} \ln t \right) \mathbf{j} - 2t \mathbf{k} + c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k} \\ &= \boxed{(t \ln t - t) \mathbf{i} + \left(\frac{t^2}{4} - \frac{t^2}{2} \ln t \right) \mathbf{j} - 2t \mathbf{k} + \mathbf{c}} \end{aligned}$$

8. We integrate each component individually. We use integration by parts for the integrals of the second component. For $\int \ln t \, dt$, we choose

$$u = \ln t \quad \text{and} \quad dv = dt.$$

Then

$$du = \frac{1}{t} \, dt \quad \text{and} \quad v = \int dt = t$$

and

$$\int \ln t \, dt = t \ln t - \int t \left(\frac{1}{t} \right) dt = t \ln t - \int dt = t \ln t - t.$$

$$\begin{aligned} \int \mathbf{i} \, dt + \int \ln t \, \mathbf{j} \, dt + \int \frac{1}{t} \mathbf{k} \, dt &= (t + c_1) \mathbf{i} + (t \ln t - t + c_2) \mathbf{j} + (\ln t + c_3) \mathbf{k} \\ &= t \mathbf{i} + (t \ln t - t) \mathbf{j} + \ln t \mathbf{k} + c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k} \\ &= \boxed{t \mathbf{i} + (t \ln t - t) \mathbf{j} + \ln t \mathbf{k} + \mathbf{c}} \end{aligned}$$

9. We integrate each component individually. We use the substitution $u = t - 2$, $du = dt$ for the first two components.

$$\begin{aligned} \int (t - 2) \mathbf{i} \, dt - \int (t - 2)^2 \mathbf{j} \, dt + \int \mathbf{k} \, dt &= \left[\frac{1}{2} (t - 2)^2 + c_1 \right] \mathbf{i} - \left[\frac{1}{3} (t - 2)^3 + c_2 \right] \mathbf{j} + (t + c_3) \mathbf{k} \\ &= \frac{1}{2} (t - 2)^2 \mathbf{i} - \frac{1}{3} (t - 2)^3 \mathbf{j} + t \mathbf{k} + c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k} \\ &= \boxed{\frac{1}{2} (t - 2)^2 \mathbf{i} - \frac{1}{3} (t - 2)^3 \mathbf{j} + t \mathbf{k} + \mathbf{c}} \end{aligned}$$

Note that if we do not use substitution to integrate the first term, the answer is

$$\left(\frac{1}{2} t^2 - 2t \right) \mathbf{i} - \frac{1}{3} (t - 2)^3 \mathbf{j} + t \mathbf{k} + \mathbf{c},$$

which varies from the answer above by only a constant. Both answers are correct.

10. We integrate each component individually. We use the substitution $u = 3t + 1$, $du = 3dt$, $\frac{du}{3} = dt$ for each component.

$$\begin{aligned} \int (3t+1)\mathbf{i} dt + \int (3t+1)^2\mathbf{j} dt + \int (3t+1)^{-1}\mathbf{k} dt &= \left[\frac{(3t+1)^2}{6} + c_1 \right] \mathbf{i} + \left[\frac{(3t+1)^3}{9} + c_2 \right] \mathbf{j} + \left[\frac{\ln(3t+1)}{3} + c_3 \right] \mathbf{k} \\ &= \frac{(3t+1)^2}{6} \mathbf{i} + \frac{(3t+1)^3}{9} \mathbf{j} + \frac{\ln(3t+1)}{3} \mathbf{k} + c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k} \\ &= \boxed{\frac{(3t+1)^2}{6} \mathbf{i} + \frac{(3t+1)^3}{9} \mathbf{j} + \frac{\ln(3t+1)}{3} \mathbf{k} + \mathbf{c}} \end{aligned}$$

11. The general solution to the differential equation is

$$\mathbf{r}(t) = \int \mathbf{r}'(t) dt = \int (e^t \mathbf{i} - \ln t \mathbf{j} + 2t \mathbf{k}) dt = (e^t + c_1) \mathbf{i} + (-t \ln t + t + c_2) \mathbf{j} + (t^2 + c_3) \mathbf{k}.$$

Now we use the initial condition $\mathbf{r}(1) = \mathbf{j} + \mathbf{k}$

$$\mathbf{r}(1) = (e + c_1) \mathbf{i} + (1 + c_2) \mathbf{j} + (1 + c_3) \mathbf{k} = \mathbf{j} + \mathbf{k}$$

from which we find

$$c_1 = -e \quad c_2 = 0 \quad c_3 = 0.$$

The vector function $\mathbf{r} = \mathbf{r}(t) = \boxed{(e^t - e) \mathbf{i} + (t - t \ln t) \mathbf{j} + t^2 \mathbf{k}}$.

12. The general solution to the differential equation is

$$\mathbf{r}(t) = \int \mathbf{r}'(t) dt = \int \left(t \mathbf{i} + e^{-t} \mathbf{j} - \frac{1}{t} \mathbf{k} \right) dt = \left(\frac{1}{2} t^2 + c_1 \right) \mathbf{i} + (-e^{-t} + c_2) \mathbf{j} + (-\ln t + c_3) \mathbf{k}.$$

Now we use the initial condition $\mathbf{r}(1) = \mathbf{i} - \mathbf{j} + 2\mathbf{k}$

$$\mathbf{r}(1) = \left(\frac{1}{2} + c_1 \right) \mathbf{i} + \left(-\frac{1}{e} + c_2 \right) \mathbf{j} + c_3 \mathbf{k}$$

from which we find

$$c_1 = \frac{1}{2} \quad c_2 = \frac{1}{e} - 1 \quad c_3 = 2.$$

The vector function $\mathbf{r} = \mathbf{r}(t) = \boxed{\left(\frac{1}{2} t^2 + \frac{1}{2} \right) \mathbf{i} + \left(\frac{1}{e} - 1 - e^{-t} \right) \mathbf{j} + (2 - \ln t) \mathbf{k}}$.

13. The general solution to the differential equation is

$$\mathbf{r}(t) = \int \mathbf{r}'(t) dt = \int (2 \sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k}) dt = (-2 \cos t + c_1) \mathbf{i} + (\sin t + c_2) \mathbf{j} + (t + c_3) \mathbf{k}.$$

Now we use the initial condition $\mathbf{r}(0) = \mathbf{i} - \mathbf{j}$

$$\mathbf{r}(0) = (-2 + c_1) \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k}$$

from which we find

$$c_1 = 3 \quad c_2 = -1 \quad c_3 = 0.$$

The vector function $\mathbf{r} = \mathbf{r}(t) = \boxed{(3 - 2 \cos t) \mathbf{i} + (\sin t - 1) \mathbf{j} + t \mathbf{k}}$.

14. The general solution to the differential equation is

$$\mathbf{r}(t) = \int \mathbf{r}'(t) dt = \int [\cos(2t)\mathbf{i} + \sin(2t)\mathbf{j} + 2\mathbf{k}] dt = \left(\frac{1}{2}\sin(2t) + c_1\right)\mathbf{i} + \left(-\frac{1}{2}\cos(2t) + c_2\right)\mathbf{j} + (2t + c_3)\mathbf{k}.$$

Now we use the initial condition $\mathbf{r}(0) = \mathbf{i} + \mathbf{k}$

$$\mathbf{r}(0) = c_1\mathbf{i} + \left(-\frac{1}{2} + c_2\right)\mathbf{j} + c_3\mathbf{k}$$

from which we find

$$c_1 = 1 \quad c_2 = \frac{1}{2} \quad c_3 = 1.$$

The vector function $\mathbf{r} = \mathbf{r}(t) = \boxed{\left(\frac{1}{2}\sin(2t) + 1\right)\mathbf{i} + \left[-\frac{1}{2}\cos(2t) + \frac{1}{2}\right]\mathbf{j} + (2t + 1)\mathbf{k}}.$

15. The general solution to the differential equation is

$$\mathbf{r}(t) = \int \mathbf{r}'(t) dt = \int (t^{-1}\mathbf{i} + t\mathbf{j} + t^2\mathbf{k}) dt = (\ln t + c_1)\mathbf{i} + \left(\frac{1}{2}t^2 + c_2\right)\mathbf{j} + \left(\frac{1}{3}t^3 + c_3\right)\mathbf{k}.$$

Now we use the initial condition $\mathbf{r}(1) = \mathbf{i} + \mathbf{j} + \mathbf{k}$

$$\mathbf{r}(1) = c_1\mathbf{i} + \left(\frac{1}{2} + c_2\right)\mathbf{j} + \left(\frac{1}{3} + c_3\right)\mathbf{k}$$

from which we find

$$c_1 = 1 \quad c_2 = \frac{1}{2} \quad c_3 = \frac{2}{3}.$$

The vector function $\mathbf{r} = \mathbf{r}(t) = \boxed{(\ln t + 1)\mathbf{i} + \frac{1}{2}(t^2 + 1)\mathbf{j} + \frac{1}{3}(t^3 + 2)\mathbf{k}}.$

16. The general solution to the differential equation is

$$\mathbf{r}(t) = \int \mathbf{r}'(t) dt = \int \left(t^3\mathbf{i} + \frac{1}{t+1}\mathbf{j} + \mathbf{k}\right) dt = \left(\frac{1}{4}t^4 + c_1\right)\mathbf{i} + (\ln(t+1) + c_2)\mathbf{j} + (t + c_3)\mathbf{k}.$$

Now we use the initial condition $\mathbf{r}(0) = \mathbf{i} + \mathbf{j} + \mathbf{k}$

$$\mathbf{r}(0) = c_1\mathbf{i} + c_2\mathbf{j} + c_3\mathbf{k}$$

from which we find

$$c_1 = 1 \quad c_2 = 1 \quad c_3 = 1.$$

The vector function $\mathbf{r} = \mathbf{r}(t) = \boxed{\left(\frac{1}{4}t^4 + 1\right)\mathbf{i} + (\ln(t+1) + 1)\mathbf{j} + (t + 1)\mathbf{k}}.$

17. The velocity vector $\mathbf{v}(t)$ is

$$\mathbf{v}(t) = \int \mathbf{a}(t) dt = \int -32\mathbf{k} dt = c_1\mathbf{i} + c_2\mathbf{j} + (-32t + c_3)\mathbf{k}.$$

Since $\mathbf{v}(0) = \mathbf{0}$, $c_1 = 0$, $c_2 = 0$, and $c_3 = 0$, so the velocity vector is

$$\mathbf{v}(t) = \boxed{-32t\mathbf{k}}$$

and the speed is

$$v(t) = \|\mathbf{v}(t)\| = \sqrt{(-32t)^2} = \boxed{32t}.$$

The position vector of the particle is given by

$$\mathbf{r}(t) = \int \mathbf{v}(t) dt = \int -32t\mathbf{k} dt = d_1\mathbf{i} + d_2\mathbf{j} + (-16t^2 + d_3)\mathbf{k}.$$

Since $\mathbf{r}(0) = \mathbf{0}$, $d_1 = 0$, $d_2 = 0$, and $d_3 = 0$, the position vector is given by

$$\mathbf{r}(t) = \boxed{-16t^2\mathbf{k}}.$$

18. The velocity vector $\mathbf{v}(t)$ is
